It is difficult to conceive that a causal relationship exists between metabolic craniopathy and gout, or that a common pathogenesis can explain the phenomena observed in both diseases It seems agreed that the brain is frequently the site of extensive changes in metabolic craniopathy, and the higher incidence of the disease in mental institutions has been the source of many contributions and numerous studies Other causative factors, however, have been suggested Knies and LeFever[2] reviewed the important causes that may evoke an osseous overgrowth in the cranium infection, injury, arteriosclerosis and senescent atrophy, and dyspituitarism Of these, the last appears to serve best as an explanation of the manifestations Morphologic alterations of the pituitary gland and its adjacent structures have been often observed [6 19 22] Constitutional and endocrinopathic states implicating an abnormal form of pituitary function in metabolic craniopathy have been frequent and impressive Bartelheimer[23] reported a case of Morgagni's syndrome accompanied by hyperglycemia and glycosuria which was resistant to insulin therapy It was concluded that an overfunction of

* According to the authors of the test, 'C Q scale is based on the clinicoexperimental observation that in mild degrees of mental deterioration, and in other conditions involving intellectual impairment, vocabulary is relatively unaffected, but the capacity for abstract (conceptual) thinking declines rapidly The scale consists of a vocabulary test and an abstract thinking test, and impairment is measured by the extent to which the individual's abstract thinking falls short of his vocabulary The deficit is expressed conveniently in the C Q' Pathology is probably present when the C Q falls below 70 A C Q of 84 is considered only moderately suspicious In view of the tendency, however, for dull individuals to earn low quotients, little, if any, importance can be attached to the slight deficit found in this case It is of interest, also, that in the Wechsler-Bellevue scales the patient achieved his highest score in the test which is predominantly a measure of the ability to generalize and think abstractly The observation corroborates the negative findings, as far as intellectual impairment is concerned, on the Shipley-Hartford Retreat scale. The disparity between the two tests is of no clinical significance

the anterior lobe of the pituitary was at fault Schiff and Trelles[6] suggested that the metabolic faults were the effects of an altered function of the posterior lobe. Although hyperostosis and osteoma of the skull were considered separate entities by Schneider,[24] the frequent association of both diseases with diabetes insipidus suggested that they were alike in their dependency upon a dyspituitarism which resulted from a senile atrophy of the gland Clinical observations by Mortimer[25] support the frequent accompaniment of calvarial changes in patients with obesity premature senility delayed maturity, diabetes insipidus Fröhlich's syndrome, and longstanding acromegaly The greater tendency for the symptom complex to appear in women is explained by the diminished pituitary functional state in that sex Henschen[26] has also found hyperostosis in individuals who manifest pituitary syndromes especially women in postmenopausal states. Morel s studies led him to believe that polyphagia, polydipsia polyuria and sleep disturbances should be common complaints in those afflicted with the disease, but Moore[7] could not confirm this impression. Experimental investigations by Mortimer and his coworkers[27 28 29] indicate that the constitutional and developmental aberrations involving fat and calcium metabolism are reflections of an endocrine dysfunction particularly hypopituitarism and that the cranial dysplasia is dependent upon the hypophyseal disorder Although the peculiar, selective and characteristic localization of the process to the internal table of the frontal bone finds experimental basis in this work, the pathogenesis of the diffuse cerebral lesions remains speculative

The cause of gout is unknown, but hyperuricomia remains an essential feature of the disease even if the uric acid content of the blood fluctuates from day to day Grabfield suggested that the cause of gout might be sought in disturbances involving renal innervation [30] and that the beneficial effects of cinchophen might be assigned to the uricosuric action exerted upon the sympathetic nerves controlling renal function,[31] but recent studies[32] indicated that there is no depression of the ability of the kidneys to excrete urate, and that the renal changes in patients with gout are the result and not the cause of the metabolic dyscrasia. The therapeutic action of cinchophen is then attributed to its ability to depress tubular reabsorption of urate. Even if the hypothesis advanced by Grabfield were true however the functional derangement would appear to be restricted to the sympathetic renal innervation for it is acknowledged that the blocking action of ergotamine on the sympathetic nerve endings impairs the kidney exactly as does denervation,[1] there is no participation by the pituitary or its neighboring structures. In gout diuresis has been shown to enhance the excretion of chlorides and minerals, and to precede and accompany the acute attacks of arthritis,[33] in metabolic craniopathy the polyuria is constant and determined by the intensity and location of the lesion in and about the pituitary body While an alteration in the metabolism of fat seems to prevail in hyperostosis frontalis interna such cannot be clearly indicated in gout Lockie[34] provoked acute attacks in gouty subjects by the excessive administration of fat, and subsequently, successful results were obtained with low-fat diets by Bartels,[35] but Bauer and Klemperer[36] could not regularly precipitate gouty seizures with high-fat diets, nor could the disease be controlled when fat was eliminated

Although it is inconceivable that gout and metabolic craniopathy can be related in spite of the common manifestations, e.g , disturbances in water and possibly fat metabolism, hypertension, hereditary and familial nature of the diseases, frequently accompanying obesity, and occasional provocation by trauma, it is of interest that other osseous diseases and endocrine dyscrasias have been associated with gout Talbott and Coombs[37] record two cases of Paget's disease coexisting with gout. Rosenberg[37] presented a victim of gout who demonstrated several endocrinopathic features, including bisexual genitalia hirsutism, obesity, undeveloped breasts, and a predominantly female personality

Summary and Conclusions

1 A case of gout coexisting with metabolic craniopathy is presented

2 A common pathogenesis is not demonstrable and the association of the two diseases is purely coincidental.

The author wishes to acknowledge the kind assistance of Cpl. David Keppel Ph.D for administering the psychologic tests.

organisms, undulant-fever agglutination test was normal The electrocardiogram disclosed a left-axis deviation but the characters were within normal limits

X-ray studies of the gallbladder showed that its function was normal and intravenous pyelography likewise revealed normal shadows Roentgenographic examination of the heart did not demonstrate any enlargement or unusual outline The skull revealed a moderate number of symmetrical, irregular densities, particularly well seen in the inner table of the frontal bones Extracalvarial bony changes of the mandibles, except for prognathism, were not demonstrable The left big toe showed a punched out area at the base of the first phalanx The roentgen films taken of the hands were normal Shadows of the sella turcica were with out abnormalities or defects and the pineal gland did not appear calcified

A complete neurologic examination failed to manifest any central or peripheral nerve disturbances Psychologic studies were undertaken and on the Wechsler-Bellevue scales of mental ability,[17] the patient achieved a total standard score of 63, which is equivalent to an I Q of 77 and a mental age of 10 years and 5 months These results placed the patient in the "dull-normal" category of intelligence, slightly above the borderline-feeble-minded level (the patient completed only six grades of grammar school) The scores were higher in the verbal tests than in the performance tests The Shipley-Hartford Retreat scale for measuring intellectual impairment[18] or deterioration was administered and gave the following results vocabulary raw score, 18, vocabulary mental age, 12 3, abstraction raw score, 10, abstraction mental age, 10 5, total raw score, 28, total mental age, 10 9, conceptual quotient, (C Q.) 84.*

Discussion

The outstanding manifestations of this syndrome of craniopathy are the triad of Morgagni—hyperostosis frontalis interna, obesity, and virilism[2]—and neuropsychiatric features of Stewart[19] and Morel [6] In a monograph that reviews an exhaustive investigation, Morel regarded the expressions of the disease as manifestations of endocrine, metabolic, and neuropsychiatric disturbances Additions to the literature amply serve to testify that the syndrome may reveal itself by a varied symptomatology This usually consists of the following elements calvarial hyperostosis (Moore described four types), obesity, sexual and menstrual changes in the female, gonadal deficiency in the male, hypertension, and neurologic and psychiatric aberrations For diagnostic purposes, however, it is not necessary that all of these manifestations, "with the exception of the pathognomonic roentgen findings of hyperostosis interna, be found in an individual case."[1] In this instance the obesity and internal frontal hyperostosis were the outstanding phenomena, although the family history of obesity was very suggestive It cannot be considered that the psychologic studies, as measured by the Wechsler-Bellevue scales and the Shipley-Hartford Retreat tests, pointed to an intellectual deterioration of the subject Particular attention was directed to personality changes, the emotional display and expressions that might betray depression, anxiety, drowsiness, or nervousness Tests were performed to detect muscular weakness, incoordination, and faults in gait or equilibrium, but the responses were always considered to be normal Interrogation failed to elicit complaints of fatigability, headache, diminished vision, diplopia, dizziness, defective hearing, memory loss, speech difficulties, increased desire to sleep, or narcolepsy Tenderness on pressure over the skull was not found, examination of the neurologic status failed to disclose any central or peripheral nerve defects, the ophthalmoscopic appearance of the retinal structures was normal The sex characters were of the ordinary male nature and there was no evidence of impaired gonadal function The obesity was limited to the face, neck, and the trunk, and a mild form of mammary enlargement was present The laboratory findings were consistent with those published by other authors decreased carbohydrate tolerance, varying high values for the cholesterol blood content, and normal blood calcium, phosphorus, and phosphatase determinations Although hypertension occurs more frequently than is encountered casually, it is by no means always present [20]

It is difficult to conceive that a causal relationship exists between metabolic craniopathy and gout, or that a common pathogenesis can explain the phenomena observed in both diseases It seems agreed that the brain is frequently the site of extensive changes in metabolic craniopathy, and the higher incidence of the disease in mental institutions has been the source of many contributions and numerous studies Other causative factors, however, have been suggested Knies and LeFever[2] reviewed the important causes that may evoke an osseous overgrowth in the cranium infection, injury, arteriosclerosis and senescent atrophy, and dyspituitarism Of these, the last appears to serve best as an explanation of the manifestations Morphologic alterations of the pituitary gland and its adjacent structures have been often observed [6 19 22] Constitutional and endocrinopathic states implicating an abnormal form of pituitary function in metabolic craniopathy have been frequent and impressive Bartelheimer[23] reported a case of Morgagni's syndrome accompanied by hyperglycemia and glycosuria which was resistant to insulin therapy It was concluded that an overfunction of

MULTIPLE HEMORRHAGIC TELANGIECTASIS (RENDU OSLER-WEBER DISEASE)

REPORT OF 4 CASES

SAMUEL GITLOW, M.D., F.A.C.P., and HERMAN L. FROSCH, M.D., F.A.C.P., New York City

MULTIPLE hemorrhagic telangiectasis is a relatively rare condition and because of its infrequency the diagnosis is often not thought of and is therefore missed. It is for this reason that the presentation of any case should be accompanied by a short description of the condition despite the fact that it has been very adequately described by many workers, notably Rendu,[1] Osler,[2] Weber,[3] and Goldstein.[4]

Of all the names given the condition (Rendu-Osler disease, Osler's disease, Rendu-Osler-Weber disease, Weber's disease and Goldstein's disease, and Goldstein's heredofamilial angiomatosis) perhaps the best was that of Osler, telangiectasia hereditaria hemorrhagica. This name excludes the cases in which there is no hereditary background, of which there are many in the literature. It is for this reason that the name multiple hemorrhagic telangiectases is suggested. Osler's name may be reserved for those cases with a hereditary background.

The hereditary factor is a dominant one when present and as a result the condition tends to appear in all generations.[4] It may, however, be atavistic[5] and skip one or more generations. It must be remembered that like hemophilia, telangiectasia is a family taint, and therefore patients may try to avoid mentioning it (Hottenroth[6]). Heredity may also be entirely absent as in our Case 4.[3]

The lesions are perfectly evident when available for examination. They occur most commonly in the nose on the septal mucosa or over Kiesselbach's area. These are usually the earliest lesions, for in almost all cases the first symptom is usually profuse and frequent epistaxis, next in frequency the lesions are found in the mouth, on the tip and sides of the tongue, on the buccal mucosa and on the vermilion border of the lips, next comes the skin of the face, the alae of the nose the fingers, especially at the tips and under the nails, on the palms of the hands, and finally over any part of the skin, the conjunctiva, and the internal organs, such as reported in the stomach, intestines urinary bladder, lungs, brain uterus, and most likely the liver.

The disease usually starts with epistaxis in early adult life but may even start in infancy. Later usually in the fourth or fifth decade, there is a spread of the lesions to the various locations especially on the skin and mucosae and the bleedings increase in severity and frequency. Despite the many episodes of severe hemorrhage with the resultant anemia, patients seldom die of hemorrhage (said to be less than 4 per cent by Houser).[9] Death usually occurs from exhaustion or intercurrent disease.

The lesions vary very much in size, from a pinpoint to 1 cm. or more.[2] They are usually slightly raised in the center and look like a small angioma, which they may indeed be. Other lesions are perfectly flat and look like a purpuric spot but on closer examination are seen to consist of dilated vessels which usually arise from a central point which often is the raised center described above. There are also lesions which look like spider petechiae or nevi, venectases, and real hemorrhagic angiomata (called angiomatosus hereditaria hemorrhagica by Ullmann).[10] Lesions sometimes recede and disappear. Perhaps angiomatosus retinae, or Hippel-Lindau disease, is related.

For diagnosis one has the lesions, the normal blood findings, except for the anemia, the repeated hemorrhages, and often the hereditary history. This forms the triad mentioned by Larrabee and Littman,[8] viz. (1) heredity, (2) visible telangiectases with pathologic distribution, (3) tendency for the lesions to bleed.

The condition has to be differentiated from hemophilia, purpura hemorrhagica, and the blood dyscrasias. This is not difficult, for they all have abnormal blood findings, viz. for hemophilia the family history of transmission through the female line to males and the prolonged coagulation time, for purpura hemorrhagica the diminished blood platelets, the prolonged bleeding time, and defective clot retraction, and for the blood dyscrasias their individual cell counts, cell difference from normal and bone-marrow findings.

Pathologically the lesions consist of dilated capillaries, both veins and arteries. The walls of the vessels are very thin, often consisting of only a single layer of endothelium covered by a very thin epidermis (Hanes,[12] Steiner[13]). There is only a single stratum of connective tissue interspersed between the vessel coils (Sterman and Seal).[14] The papillae and undulations of the stratum germinativum are obliterated. The muscular and elastic layers of the vessel walls are conspicuously deficient. There are also connective tissue changes in the skin (Pardo-Castello and Farinas).[15]

Pathogenetically the defect in the vessels is thought to be developmental in the vessel wall and the mesenchyme of the skin (Rosenthal and Unna).[16] Curtus[17] considered the condition a status varicosus. Gottron[18] considered it an alteration of the vessel nervous system (vasomotor) which results in altered circulation.

The color of the lesions is due to the blood circulating in the vessels, because Storey and Akamatsu[19] removed a finger lesion which was purple before but blanched after removal.

Capillaroscopy by Cañas in the article by Castello and Farinas[15] (Frank and Bindseil[20] Memmesheimer[21]), shows widening of the finest venules and capillaries at the periphery with an aneurysmal dilatation at the center like a coiling of the smallest vessels. The dilated vessels lie so close together that they look like a single vessel convolution. These changes extend to a distance below the papillary layer of the skin. The lesions are well defined from the environment.

Bleeding from the lesions results from the slightest trauma or even without any evident provocation Epistaxis may follow blowing the nose, sneezing, or coughing, or only change in weather Bleeding from involved organs may occur at any time The hemorrhage is usually severe and very difficult to stop even if accessible, as in the nose

The treatments used for epistaxis have been cautery, radiation, septum resection in the nose, and tying off the ethmoidal vessels

The course is chronic and, as stated, starts with frequently recurring epistaxis which becomes more severe with time Later organ bleedings may occur Patients usually live a fairly long life but may die of exhaustion from frequent anemia or of an intercurrent disease

The prognosis is poor as to cure but fair as to recovery from any episode The use of moccasin snake venom as a preventive measure has been stressed by Peck and Rosenthal [22] This is supposed to alter the endothelial permeability of the vessels and so prevent bleedings They report 3 cases successfully managed by this regime

Report of Cases

Case 1—J D, aged 40, was first admitted to Morrisania Hospital on October 24, 1931, having been referred from the New York Post-Graduate Hospital His chief complaint was extreme weakness, tarry stools, pain in the epigastrium, and sinus trouble The diagnosis was peptic ulcer His brother had died of a heart condition The rest of the family history was negative He had lost 20 pounds in the past year He was a moderate drinker but did not smoke He may have had rheumatic fever Tonsillectomy and adenoidectomy were done in 1918 He had a gonorrheal infection in 1910 but gave no history of syphilis He was dyspneic and had palpitation on slight exertion but no cough or hemoptysis Bloody stools had been present for the past two years

One week before admission the patient had epigastric pain and nausea but no vomiting He passed blood in the stool and became very weak

On physical examination at this time the patient was very pale, pulse was 100, and several tarry and wine-colored stools were seen There was some tenderness and rigidity in the epigastrium The liver was moderately enlarged The blood pressure was 120/80 Physical examination was otherwise essentially negative Diagnosis was bleeding peptic ulcer

Course On October 30 the patient bled slightly from the gums At this time a few petechiae were found on the vermilion border of both lips These did not have white centers The liver was enlarged On November 1 the pulse was 80, and the blood pressure 90/30 A tourniquet test was negative On October 30 x-ray of the chest was negative The hemoglobin was 75 per cent, red blood cells, 3,190,000, white blood cells, 4,850, with polymorphonuclear cells, 61 per cent, lymphocytes, 2 per cent, and monocytes, 2 per cent Platelets were somewhat low—65,000 The clotting time was one and a half minutes The red cell fragility in saline solution showed hemolysis to start at 0 38 per cent and to be complete at 0 32 per cent Occult blood was persistently present in the stool Later counts of platelets showed them to be present in normal numbers up to 300,000 His temperature was between 100 and 103 F for the first week and then normal He was given daily transfusion of 500 cc of blood and by November 12 his hemoglobin was 78 per cent and red cells 5,100,000 He was discharged much improved.

He was readmitted on February 22, 1936 He had attended the Morrisania Dispensary Cardiac Clinic for nine months because of precordial pain Four days before admission he had a severe attack of precordial pain with nausea, vomiting, and perspiration Two weeks before this he had become cyanotic and was treated in the emergency clinic for epistaxis

He was now acutely ill and had cyanosis of the face and fingers His pulse was 120 and his temperature 102 4 F There was a systolic murmur over the aortic area His blood pressure was 124/60 There were rales throughout both lung fields, with more at the bases

Between the last admission and this one the patient had had frequent epistaxis, for which he was admitted to Lincoln Hospital two years ago

On February 23 he had epistaxis On February 26 his heart was found enlarged to the left and downward There was diffuse pulsation at the apex. There was a systolic murmur over the mitral area and a rougher one over the pulmonic area. The second pulmonic sound was accentuated There was venous engorgement in the neck A pericardial friction rub was also heard. This disappeared by March 7 Now a family history of spontaneous bleeding was obtained in the following relatives mother, brother, niece, and sons

He had frequent nosebleeds and during his stay his left knee and wrist were swollen for a week The tourniquet test was again negative Bleeding time was eight minutes and two and a half minutes, coagulation time seven minutes Platelets numbered 250,000

The electrocardiograph and Wassermann were negative Urea nitrogen in the blood was 17 mg per 100 cc

X-ray and fluoroscopy of the chest showed left ventricular enlargement and the cardiac configuration of hypertensive and aortic disease

Blood pressure ranged from 104 to 140 mm of mercury systolic and 60 to 74 diastolic

The urine was negative

The temperature was irregularly remittent from 100 to 104 F the first week, 100 to 101 the second, 99 to 101 the third, and then gradually declined to normal His pulse was 100 to 120

He was discharged improved

The third admission was on June 2, 1936, when he reported tarry stools On May 29 he had had epistaxis which persisted until admission Physical examination was as before Findings were about the same except that there was stippling of the red blood cells suggesting lead poisoning The urine showed 0 48 mg of lead per liter (normal 0 3–0 38) but there was no clinical evidence of lead poisoning It has been stated that unless lead reaches a concentration of 0 1 mg per 100 cc in the urine there is no clinical lead poisoning

The nose and throat department found some ulcerations on the right septum of the nose

The patient was discharged improved on August 7, 1936 He was again admitted on December 2, 1937, because of tarry stools The positive findings this time were (1) secondary anemia, (2) rough systolic murmur at apex, (3) liver 3 cm below the costal margin, spleen not felt, and (4) external hemorrhage

Gastric analysis at this time showed free hydrochloric acid, 80 points at two hours. The stools were tarry

Nose examination revealed a bleeding spot 2 cm posteriorly on the left side of the septum. This was cauterized with chromic acid by Dr G B Gilmore.

A sugar-tolerance test was done, using 100 Gm of dextrose as the dose Fasting blood sugar was 80, one half hour after the dextrose it was 125, one hour after, 95 two hours after 105, three hours after, 85, and four hours after 70 Thus, while the curve was low it was otherwise normal.

Gastrointestinal x rays were done on December 31, 1937 and January 3 1938 Both series were negative X-ray of the chest showed congestive changes in the mesial half of both lung fields

He was discharged, improved, on January 28, 1938.

On February 1, 1938 he was admitted for persistent epistaxis. The bleeding point on the septum was cauterized and he was discharged on February 5, improved

His sixth admission was on December 22, 1938 for anemia. This time he had cyanosis of the lips and nose. There were scattered fine petechiae over the hard palate The heart was enlarged to the left. The sounds were of good quality There was a soft systolic murmur at the heart apex. The liver reached one fingerbreadth below the free costal margin. The spleen was felt only on deep inspiration.

The Rumpel-Leeds (tourniquet) test was again negative. The nasal examination showed a very prominent vein on the septum

A section of bone marrow showed normal cellularity with a preponderance of granulocytes. Megakaryocytes were seen. The marrow was not significant in differential count otherwise nor in type of cells.

The stool showed occult blood There was anemia. The platelets numbered 185,000

He was discharged on January 27 1939, and was admitted again on August 17, 1940 for tarry stools and anemia. He was given transfusion several times. He developed pneumonia while in the hospital and was given sulfadiazine. X ray confirmed the diagnosis

All blood findings were normal except the hemoglobin, which was 32 per cent The sternal marrow this time was markedly erythroblastic. The fragility test showed beginning hemolysis at 0 42 per cent saline complete at 0 28 per cent Vitamin-C excretion was found to be 26 mg. in twenty-four hours. The icterus index was 7 0, urobilinogen in the urine was positive in 1 10 and 1:20 dilution

On August 29 he gave the following history his mother, two brothers, a daughter, a grandchild, a nephew, and a niece had similar hemorrhagic manifestations. His mother had telangiectasia, secondary anemia multiple lipomata, epistaxis, and possibly cirrhosis of the liver

The electrocardiograph showed left-axis deviation and a pulse-respiration interval of 0 18 to 0 22 second The prothrombin time was 80 per cent of normal He was discharged, improved December 4, 1940

His last admission was on February 11, 1941, and he was discharged on March 31, 1941

Comment This is a patient with telangiectasia hereditaria hemorrhagia who has all the evidence for a diagnosis (*1*) frequent severe epistaxes, (*2*) typical lesions, (*3*) hereditary history He also had gastrointestinal hemorrhages.

Case 2—I M , a man aged 61, was admitted to Lebanon Hospital, on the service of Dr H L. Frosch, on June 24, 1942 He expired the next day This patient had had nasal hemorrhages for the past twenty years. His previous history was otherwise negative For several days he had had cough, fever, dizziness malaise and weakness

On physical examination he was found to be obese, short necked, deep chested, and very anemic. Small telangiectatic spots were seen over the face and other parts of the body, the conjunctivae were pale. There was some dullness and diminished breathing over the right base and rhonchi over the entire chest The heart was negative The liver was felt two fingersbreadth below the right costal margin. The spleen was not felt. There was marked pretibial and sacral edema. The diagnosis at the time was telangiectasia and bronchopneumonia. Temperature upon admission was 103 F and rose to 104.

Course He was given a blood transfusion on the day of admission, digitalis, morphine, and an oxygen tent. The patient bled from both nostrils the next day He was foaming at the mouth from pulmonary edema. Respirations were 10 per minute and the pulse was 108 to 112 full and bounding Another transfusion was given this day at 10 30 A.M., but he expired at 11 30 A.M.

Laboratory findings showed a hemoglobin of 28 per cent before transfusion and 43 per cent after, with red blood cells, 2,760 000, and white blood cells, 20,800 The blood morphologically showed marked achromia, anisocytosis poikilocytosis and very numerous platelets. There were no abnormal cells. The final diagnosis was telangiectasia, bronchopneumonia, and secondary anemia.

A postmortem was done by Dr Joseph C Ehrlich, pathologist at Lebanon Hospital There was marked pitting edema of the extremities There were no petechiae. Over the face, mostly on both cheeks near the temporal areas, there were small nodules varying in size from a few mm to 1 cm. in diameter They were blue to bluish red in color and were somewhat elevated These nodules were surrounded by dilated vessels in spider-like arrangement Dilated skin vessels ran perpendicularly down from the corners of the mouth to the mandibular region. There were similar nodules on the lips tongue and nasal mucosa. There was an ulceration on the left side of the nasal septum which was the site of the epistaxis There were varicosities of the lower part of both legs and a few small veins a few mm in diameter on the chest.

The abdomen showed adhesions between the diaphragm spleen, and liver There was bilateral inguinal herniae.

There were dense old adhesions over both lungs and between both lungs and the diaphragm

The heart weighed 675 Gm There was a patent foramen ovale. The myocardium of the right ventricle showed fatty infiltration The coronary arteries were moderately sclerotic but their lumina were not narrowed The aorta showed many yellow sclerotic plaques

The lungs weighed 2,000 Gm. There were old adhesions all over the right upper and lower lobes. They were hypocrepitant and voluminous. On section the upper lobe was consolidated and somewhat gray The rest of the lungs were grayish-red.

The liver weighed 2 100 Gm. It was adherent to the diaphragm. There were small yellowish spots irregularly scattered over the liver The color was

grayish-brown On section the architecture was normal

There was no gross telangiectasis in the larynx or trachea

The spleen weighed 600 Gm Its capsule was adherent to the diaphragm On section the spleen appeared very soft The knife scraped a large amount of pulp The splenic architecture could not be distinguished because of softness The cut surface was dark red

There were no telangiectases in the esophagus, stomach, or intestines There was a small pedunculated polyp in the sigmoid

Pathologic Diagnosis The cause of death was exsanguination and toxic infections, and possibly sepsis There was congenital familial telangiectasia of the face, lips, tongue, and nasal mucosa, bronchopneumonia of the right upper and lower lobes, old pleural adhesions, pulmonary congestion and edema, anemia, patent foramen ovale, fatty infiltration of the myocardium, sclerosis of the aorta, acute infectious splenitis, chronic perisplenitis, congestive and fatty changes in the liver (septic), fatty infiltration of the pancreas, slight arterio- and arteriolosclerosis of the kidneys, inguinal herniae, and bilateral hydrocele

Comment The history of epistaxis with lesions as stated and heredity leads to the diagnosis of telangiectasia The coronary sclerosis resulted in severe episodes of left ventricular failure The edema of back and legs was probably due to hypoproteinemia

Case 3—W F, a 59-year-old woman, was admitted to the Morrisania City Hospital for the first time on November 27, 1941 and discharged the same day because she refused to stay She came because of severe epistaxis for seven hours, giving a history of similar episodes for thirty years She had been given transfusion recently Her daughter suffers from the same condition On physical examination telangiectases were noted on the posterior portion of the dorsum of the tongue, the nasal septum, the trunk, and upper extremities

The ear, nose, and throat consultant stated that the patient had multiple small telangiectatic spots on both sides of the nasal cartilaginous septum, the lips, and the tongue

The diagnosis at this time was familial multiple telangiectasia

She was again seen with epistaxis on December 1, 1941 The bleeding was controlled and she refused to stay

The next admission was again for nosebleed on August 11, 1942 This was controlled and she was discharged on August 13, 1942 Her condition was good The Wassermann test was negative, her blood pressure was 130/66 Red blood cells numbered 4,300,000

She was again in the hospital from October 20, 1942 to November 1, 1942 The only positive finding was an increased blood pressure of 160/100

The next admission was for epistaxis January 1, 1943 She had apparently lost considerable blood A transfusion of 300 cc of whole blood was given, followed by a severe reaction

She had the following stays in the hospital April 22, 1943 to April 28, June 7, 1943 to June 11, 1943, August 24 to September 4, 1943 Her blood was found to be Rh positive and 250 cc of whole blood was given, December 24, 1943 to January 5, 1944—the hemoglobin was 58 per cent, and 300 cc of whole blood was given, followed by chill and fever to 102 F, February 5 to February 20, 1944—500 cc of whole blood was given, with a mild reaction March 19, 1944 to March 29, 1944—hemoglobin, 66 per cent, April 14, 1944 to April 25, 1944—the liver could be felt two fingersbreadth below the free costal margin and the spleen was questionably enlarged, April 26 to May 5, 1944—hemoglobin, 55 per cent, red blood count 2,800,000, white blood count, 4,000, platelets, 100,000, bleeding time one half minute, coagulating time five minutes, differential polymorphonuclears 59 per cent, lymphocytes 41 per cent, the red blood cells were hyperchromic, moderately microcytic and macrocytic, there was slight poikilocytosis and polychromatophilia, transfusion was given, followed by a severe reaction with fever up to 104 F, July 11, 1944 to July 23, 1944 for mild epistaxis readily controlled by packing

The last admission was September 17, 1944. At this time the tumor clinic consultant stated that radiation therapy is of no value in hereditary telangiectasia She was discharged September 24, 1944

In July, 1942 the patient received a full course of moccasin-snake-venom therapy which seemed to be of no avail At that time the hemoglobin was 75 per cent, red blood cells, 4,000,000, white blood cells, 6,200, polymorphonuclears, 58 per cent, lymphocytes, 28 per cent, eosinophiles, 7 per cent, basophiles, 1 per cent, nonsegmented leukocytes, 6 per cent Platelets were 200,000, reticulocytes, 0 5 per cent, bleeding time, one minute, coagulation time, fifteen minutes, clot retraction, one and a half hours The urine was negative, with a specific gravity of 1 010 to 1 014.

Comment This is a woman with telangiectasia in which no complete heredity is evident except that her daughter has the condition

Case 4—Mrs B M, a widow aged 68, was admitted to Lebanon Hospital, on the service of Dr S Gitlow, on April 11, 1943 for severe hematemesis She had been at Lebanon Hospital in 1942, on the service of Dr Benjamin Sherwin, for the same complaint and twice later to the Westchester Square Hospital

She had also been to the Crown Point Hospital, in Brooklyn. On most or all of these occasions x-rays of the gastrointestinal tract were taken and they were entirely negative At Lebanon Hospital on the previous admission the final diagnosis was gastric hemorrhage of unknown origin As far as we could determine, no other diagnosis had been made except a tentative one of gastric malignancy There was no significant past history No epistaxis had occurred either recently or in early life The family history was also entirely negative for any hemorrhagic tendency

On physical examination the patient was found to be obese and, although very anemic, was not emaciated even at death The face was covered with larger and smaller purpuric-like reddish to purple spots, some with slightly raised centers Similar spots were found on the volar surfaces of the forearms, on the abdomen, palms of hands and soles of feet, under the fingernails, tips of fingers, on nasal mucosa, buccal and palate mucosae, sides of tongue, vermilion border of both lips, lower lid conjuctiva, and later on the bulbar conjuctiva The accessible lesions blanched on pressure and were therefore not purpuric. There was a soft systolic murmur at the cardiac apex. The liver and spleen were not felt

On further questioning the patient stated that the spots had begun to appear three years before and had increased in number one year before this

At first the impression was that the patient had a malignant lesion of the stomach and some form

of capillary disease This was finally narrowed down to multiple telangiectasia with probable bleeding lesions in the esophagus or stomach or both causing hematemesis.

The course in the hospital was stormy She had numerous hematemeses with well intervals, and developed bronchopneumonia and an upper respiratory infection, from which she recovered. She developed a marked aversion for food which she ate sparingly, and as often as not vomited what she ate

For treatment she received a number of transfusions, liver extract and iron, and a bland diet One transfusion was made into the tibial marrow, all were done by Dr H L Frosch. The veins were exceedingly small about the elbow and had to be cut down upon in order to be entered

In the last few weeks the patient developed a massive edema which was considered to be nutritional. Her blood had a protein level of 4.7

The rest of the laboratory findings were consistent with the diagnosis of multiple telangiectasia. The blood showed a secondary anemia. A specimen of vomitus contained free hydrochloric acid The blood showed an eosinophilia of 5 to 11 per cent, which was explained by the liver treatment The bleeding and coagulation time were both normal ruling out hemophilia and thrombocytopenic purpura. Urine and blood chemistry except for hypoproteinemia, were normal Temperature was generally normal The tourniquet test was negative.

An interesting observation was that the intensity of color of the lesions varied with the grade of anemia.

Comment We have a patient with multiple telangiectatic lesions, only one of which visibly bled (on the lip) but not excessively She had numerous severe hematemeses over a period of about two years. The period between her hemorrhages became shorter and shorter She finally died of anemia and exhaustion. X-ray studies of the gastrointestinal tract on at least three occasions were entirely negative. May we not, therefore, assume that the patient bled from telangiectatic lesions in the stomach or esophagus? Of course, malignancy on the posterior wall of the stomach and not demonstrable by the x-ray cannot be ruled out entirely but is rather unlikely Unfortunately, no gastroscopic study could be made, for Renshaw[23] in 1939 was able to visualize such lesions in this way

Our patient, Case 1, also had blood in the stools for several years. In this case all the criteria for telangiectasia hemorrhagica hereditaria were present. In this case there was a cardiac complication and the liver was enlarged, although it is not clear whether this was part of the cardiac decompensation or chronic passive congestion. However, the bleeding in this case may have been either from esophageal varices or from severe congestive changes in the bowel. The liver may, on the other hand, have been the seat of telangiectatic changes or cirrhosis[14–18] with the secondary changes described. These changes also suggested a strain on the reticuloendothelial system.[17] This case does not conform to Case 4, in which there was no hepatic or cardiac involvement.

Goldstein[25] reviewed the literature of obscure gastric bleeding. There are numerous cases of telangiectasia with gastrointestinal bleeding in the literature.[22] Griggs and Baker,[26] in 1941, reported 3 such cases from the Los Angeles Hospital Osler had 3 cases in his original series of cases.

There are several reports in the literature of the association of cirrhosis or involvement of the liver in telangiectatic disease.[1,19,21,22] Of course there are the vascular nevi found in cirrhosis of the liver which are an expression of collateral circulation due to obstruction of the portal circulation These are, however secondary to the hepatic disease. In these cases there may be a special form of hepatic involvement due to either the hematopoietic stress[28] from frequent bleeding or actual telangiectatic or hemangiomatous involvement of the liver In such cases hematemesis may be due to rupture of esophageal varices. In Case 4 there was no evidence of hepatic involvement There was no hepatic or splenic enlargement, no jaundice and no ascites. It was felt that the low blood protein was due to lack of food, for the patient had eaten very little for at least six months An attempt to raise the blood proteins by amino acid concentrates was unsuccessful

In addition, the veins above the elbow were extremely fine They were no wider than a thin intravenous needle This indicated some dysplasia of the vessels, which fits in with this theory of the pathogenesis of the lesions.

Summary

Four cases of multiple hemorrhagic telangiectasia are presented They all had the characteristic visible lesions. Two patients bled from the gastrointestinal tract. Three of the cases had all the criteria for diagnosis of the condition, viz. (1) visible lesions, (2) epistaxis, and (3) heredity The other had visible lesions, no heredity, and no epistaxis. Case 2 was observed only a short time but autopsy confirmed the diagnosis.

Multiple hemorrhagic telangiectasia is a relatively rare disease. The condition must be thought of in any hemorrhagic disease for lesions may bleed externally or internally Usually the diagnosis is reached by the history of epistaxis of severe nature, visible lesions, hereditary history, and negative findings for the blood dyscrasias.

Patients rarely die of their hemorrhagic episodes. In our cases none did so Two of the patients are still alive, one died of pneumonia with pulmonary edema, and one of anemia, exhaustion, and infection.

The color of the lesions varies with the grade of anemia.

TROPICAL DISEASES IN THE UNITED STATES

Some diseases supposed to be peculiar to the tropics occur in parts of the United States Once a disease is detected in an apparently new environment, it is apt to be encountered more frequently thereafter

Few physicians were at one time aware of the prevalence of pellagra in the United States In the early 1900's Babcock, at that time medical superintendent of the South Carolina State Hospital for the Insane, while visiting in Italy, familiarized himself with the clinical aspects of pellagra He was convinced that the disease prevailed in the insane-hospital population group of his native state, and he verified this impression His observations attracted the attention of other psychiatrists concerned with the institutional care of the insane, eventually pellagra, especially in the Southern states became widely recognized

In 1909 the Rockefeller Commission, headed by Stiles, made a county-by-county survey of a number of Southern states and discovered the presence of uncinariasis in a large percentage of the native poor In 1920 Symmers and Frost[1] first described granuloma inguinale in two native-born American Negros in Bellevue Hospital, neither of whom had ever been outside the United States Within a few years the disease had been recognized in practically every state in the Union Much the same statement applies to lymphogranuloma venereum, which was once regarded as strictly a tropical malady, whereas it is now known to be common in the United States, especially among the colored population

Parsons and Zarafonetis[2] have recently pointed out that "histoplasmosis for many years was believed to be a rare tropical disease" but that "during the past decade the disease has been found widespread in the United States " They recorded 9 cases originating in Michigan between November, 1938 and December, 1940 The disease has also been observed in Minnesota, California, Iowa, Tennessee, Ohio, Missouri, Mississippi, Maryland, Virginia, Kentucky, Florida, Indiana, Alabama, Texas, Illinois, Washington, D C, Oklahoma, Louisiana, New York, and North Carolina In view of the fact that histoplasmosis may be easily overlooked or misinterpreted, it is within the range of probability that it is even commoner than at present suspected

Only 9 cases of chromomycosis have thus far been recorded in this country In nearby Cuba, on the other hand, Pardo-Costello encountered 20 histologically proved cases in a period of two and one-half years and the disease is correspondingly common in Brazil and Puerto Rico Many American dermatologists believe that it occurs more frequently in this country than published reports indicate and that it is often overlooked

Among other tropical diseases to be reckoned with in the United States are typhus, schistosomiasis, cutaneous and visceral leishmaniasis, pinta, onchocerciasis, ancylostomiasis, maduromycosis, yaws, and some of the numerous helminthiases These and probably others will be imported in greater or less numbers not only by returning military personnel but as a result of augmented travel by air Of those just named, pinta and onchocerciasis are endemic in Mexico and Central America to the extent of many thousands of cases and are thus perilously close to the Texas border, while the others are none too far removed Onchocerciasis, which is transmitted by a species of fly that infests some of the Western states, is said to display a distinct tendency to migrate northward (Johnstone and Larsen)

Tropical diseases threaten the health of the people of the United States sufficiently to warrant systematic efforts to identify and control them American schools of medicine should provide adequate and required instruction in tropical diseases In various seaports laboratories for the routine diagnosis and scientific investigation of these diseases, such as has been recently inaugurated by the Department of Health of the City of New York, should be established Among other cities, Charleston, San Francisco, Baltimore, and New Orleans would be admirable sites for the location of such laboratories, since, among other advantages, each of these cities would provide collaboration with existing medical schools Doubtless, also, steamship companies and air lines that are engaged in the tropical trade would embrace the opportunity to participate in programs of this sort The United Fruit Company for many years has given commendable attention to the problems in question —*J A M A, Dec 8, 1945*

RECOVERY OF A PATIENT WITH AGRANULOCYTOSIS BY THE ADMINISTRATION OF BLOOD FROM A FEBRILE DONOR

WARREN H ELLER, M.D., Sayville, New York

(From the Southside Hospital)

THE patient, a woman, T N, aged 50 years, was first seen on the morning of April 8, 1944.

She complained of a sore throat and painful swallowing which had started twenty four hours previously Her past history was irrelevant to the present illness.

The physical examination revealed a well nourished woman breathing stertorously The temperature was 103 F, the pulse 120 and regular in rhythm, respirations 24 Throat examination showed both tonsils to be greatly enlarged the mucous membrane was edamatous and brilliant red. Her lungs were resonant on percussion On auscultation, only normal bronchovesicular breath sounds were heard Her heart was not enlarged, there were no murmurs. Blood pressure was 140/80 The remainder of the examination was irrelevant.

Sulfadiazine was administered in the accepted weight-grain dosage Fluids were to be forced and hot saline irrigations of the throat instituted.

After forty-eight hours, her condition was unchanged Examination of her throat showed no improvement of the tonsils. The mucous membrane of the pharynx was parched, with an adherent glistening white membrane over it Her temperature was 105 F The pulse rate was 140 and irregular Apex examination revealed *the same irregularity* The blood pressure had dropped to 120/74 She was irrational

The patient was hospitalized that afternoon Her white cell count showed only 1,950 leukocytes with a differential of 95 per cent small mononuclears, 2 per cent basophiles, and 3 per cent large monocytes. The hemoglobin was 74 per cent and erythrocytes were 3,740,000

With the diagnoses of agranulocytosis and auricular fibrillation made, digitalization was started, also pentosenucleotide K 96, which was administered daily as follows 0 7 Gm in 100 cc. of normal saline solution intravenously and 0 7 Gm in 10 cc. of normal saline solution intramuscularly The patient received an indirect transfusion of 500 cc. of citrated blood Sulfadiazine was stopped.

On the fourth day, her throat was very parched. Many very moist rales could be heard in the bases of both lungs. Her heart was still fibrillating The temperature had risen to 106 F Throat culture showed a light growth of staphylococcus and streptococcus.

A consultant the next day concurred with the diagnoses of agranulocytopenia, hypostatic pneumonia, and auricular fibrillation His recommendations were as follows (1) stop digitalis instead, use strophanthus 0.25 mg intravenously twice daily, (2) transfuse with blood taken from a febrile donor, (3) continue the pentose nucleotide K 96

The patient was cross-matched with three donors Ten cc. of lactogen was administered to the first donor intramuscularly at 8:30 the next morning Five hundred cc. of the donor's blood was taken at 4.30 P M and administered by the indirect method. This was repeated three days later

The second day after strophanthus was started, the patient's pulse had dropped to 100 but was still irregular The temperature was 102 F The third day the pulse was 80 and regular, as was the apex beat

That day her temperature did not rise above 101 F Her leukocyte count was 6 650 cells with 43 per cent polymorphonuclears and 58 per cent small lymphocytes.

The day following the second febrile blood donation her general condition was greatly improved The mucous membrane of the throat was moist and pale there was no evidence of the white membrane Her temperature did not rise above 99 F The pulse rate was 80 and of regular rhythm. The rales in the bases of her lungs were all gone. The blood count on the same day was erythrocytes, 4 410 000, hemoglobin 92 per cent, color index, 1 0, leukocytes, 8,700 with a differential count of 73 per cent polymorphonuclears, 3 per cent stabs, 3 per cent basophiles and 27 per cent mononuclears.

Her condition continued to improve so that on her discharge ten days later her complete blood count was erythrocytes, 4,840,000, hemoglobin 95 per cent, color index, 0 9, leukocytes, 0 950, with a differential count of 72 per cent polymorphonuclears, 3 per cent stabs, 24 per cent small mononuclears, 3 per cent eosinophiles, and 1 per cent basophiles.

Conclusions

This case clearly demonstrates the value of Strophanthus in auricular fibrillation and the definite value of blood taken from a febrile donor for transfusion to accelerate the production of polymorphonuclear leukocytes in the recovery from agranulocytosis. This represents but a single spectacular recovery

---

MOXON MEDAL GIVEN TO FLEMING FOR PENICILLIN WORK

The Royal College of Physicians has awarded the Moxon medal to Sir Alexander Fleming discoverer of penicillin, for his work on the drug.

The Weber Parkes prize and medal were awarded in absentia to Dr Eugene L. Opie, professor of pathology of Cornell University, for his work on the pathogenesis of pulmonary tuberculosis.—*N Y Herald Tribune, Oct 19, 1945*

CLINICOPATHOLOGIC CONFERENCES

FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL

Date January 7, 1946

Conducted by Dr Max Trubek and Dr Shirley Schmones-Wallach

Present Illness—The patient, A M, a 67-year-old white man, was admitted to Bellevue Hospital on October 13, 1945 A few months prior to admission the patient began to note progressive weight loss, nausea, anorexia and occasional vomiting, and constipation, he did not have a bowel movement or results with enemas for the four days prior to hospitalization About three to four weeks before admission, while performing a sedentary task, the patient experienced severe excruciating occipital headache The next day he noted weakness of the left arm with impaired function The condition progressed so that he lost the function of his left leg, then of the right leg, and finally he lost bladder control, although he had dribbling and dysuria, he never had hematuria or pyuria A few days after the occipital headache, the patient noted a severe pain across his lower chest, he experienced difficulty in breathing at this time At 4 00 P M, on the day of admission, while being carried down the stairs of his home, the patient suddenly developed severe pain along the lower ribs bilaterally, the pain radiated up to the midclavicular regions, shoulders, and intrascapular area The pain was excruciating and the patient became weak and perspired profusely His physican gave him 1/4 grain of morphine at that time, and sent the patient into the hospital

Past History—The patient had been a known cardiac for forty-six years and had been turned down by insurance companies for this period of time The Veterans Administration had declared him 75 per cent disabled The patient gave a vague history of rheumatic fever in previous years The only cardiac symptomatology had consisted of episodes of palpitations and rapid heart action for many years and 1 plus ankle edema for four years

Physical Examination—This revealed an apparently chronically and acutely ill man His temperature was 99 F, pulse, 120, respirations, 20, blood pressure, 128/70 There was evidence of recent weight loss There was no generalized lymphadenopathy, and no Virchow nodes, nor nuchal resistance The pupils reacted symmetrically The tongue was thick, dry, furred, and brown There was no tracheal fixation The lungs were clear anteriorly The heart was enlarged to the left, there was regular sinus tachycardia No thrills were noted A harsh musical systolic murmur was heard over the entire precordium There was a question of a short apical presystolic murmur, however, tachycardia precluded its exact valuation A short, rough diastolic murmur was also heard in the first left interspace Heart sounds were of poor quality P_2 and the auricular second sound were inaudible Ml was not accentuated The abdomen was distended There was an old healed right lower quadrant scar The abdominal wall was fairly soft, there was no rigidity or spasm There was, however, diffuse tenderness and exquisite rebound tenderness throughout There was no definite evidence of free fluid Only the admitting intern noted the bladder to be palpable up to the umbilicus All subsequent examiners found no definite viscera or masses palpable No intestinal sounds were heard on auscultation Rectal examination was essentially negative except for slight bogginess and tenderness in the cul-de-sac The extremities were warm All peripheral pulses were strong Knee and ankle reflexes were equal and active No clonus was present and there were normal plantar responses Abdominal reflexes were not elicited There was a small amount of voluntary motion in the right lower extremity, none in the left No change in muscle tone was noted nor was there spinal or boney thorax tenderness

Laboratory Data—The urine on October 15, 1945 was bloody, had a specific gravity of 1 022, was acid, with albumin 3 plus, glucose 0 On October 16 it was clear yellow, specific gravity was 1 022, acid, with albumin 2 plus, glucose 0, moderate red blood count, 5 to 8 white blood cells, and a few hyaline casts

The blood count on October 13 was red blood cells, 5,200,000, white blood cells, 11,400, 78 per cent polymorphonuclears, 20 per cent lymphocytes, 2 per cent monocytes On October 16 the white blood count was 13,150, 76 per cent polymorphonuclears, 11 per cent bands, 11 per cent lymphocytes, 2 per cent monocytes

The blood chemistry on October 15 was nonprotein nitrogen, 100, sugar, 91, carbon dioxides, 30 volumes per cent, blood amylase, 23 units On October 16, the nonprotein nitrogen was 180, creatinine, 3 0, calcium, 9 4, phosphorus, 10 4 On October 17 the nonprotein nitrogen was 65 Blood Wassermann test was negative

A spinal tap on October 15 showed a clear col-

orders fluid, initial pressure, 190, final pressure, 150, manometrics normal Cells, 0, Pandy, 1 plus, sugar, 77, chlorides, 740, protein, 66 Colloidal gold was normal X-rays on October 16, 1935 showed enormous gaseous distention of the large colon A film taken in recumbent position laterally revealed fluid levels There was a suggestion of intestinal obstruction No metastatic areas of the skull, lungs, or boney thorax were seen On October 17, there was moderate distention of the intestines by contained gas No fluid level was seen The chest showed a slight engorgement in the right lower lobe. The heart was somewhat globular, normal in size and position. An electrocardiogram on October 15 showed sinus tachycardia and low voltage

Course.—Following admission catheterization was attempted and gross blood was obtained The genitourinary consultant promptly recatheterized the patient with ease with a number 18 catheter, and again obtained about 200 cc. of dark-red urine, there were no clots, the blood appeared old He suggested an indwelling catheter with irrigation of the bladder until the return was clear The bladder returned consisted of dark-brown old blood until October 16, the fourth hospital day, when the urine appeared clear for the duration of the course. On admission, enemas were also attempted, however, only flatus, no fecal material, resulted At no time during the course was any fecal material passed For the first three hospital days the temperature did not rise above 100.8 F However, on October 16, the fourth hospital day, although there were no new physical findings on examination, the patient took a severe turn for the worse with the temperature rising to 102 6 F Gastric lavage on this day yielded 500 cc of dark-brown benzidine-positive fluid Clinical appearance was essentially the same on October 17 However, deterioration progressed so rapidly that the patient died on October 18 the sixth hospital day, with a temperature of 104 F and the sudden appearance of nuchal resistance Supportive, specific, and symptomatic therapy in the form of clysses, penicillin, vitamins, demerol, etc were administered during the patient's hospital course

Discussion

Dr Max Trubek One can attempt to separate related symptoms out of the confusion of this patient's diversified manifestations There seems to be evidence of a pre-existing chronic illness characterized by weight loss and constipation of increasing severity No mass was palpable by rectal examination, although a flat plate of the abdomen revealed enormous gaseous distention of the colon There was no bowel movement during four days prior to admission and enema washings were returned clear while in the hospital Carcinoma of the rectosigmoid would seem a justifiable consideration

Then we read of a succession of acute episodic manifestations beginning with a sudden "excruciating occipital headache" three weeks before admission Subsequently there was transitory paresis of the left arm, then complete motor paralysis of the left leg, weakness of the right leg, and disturbance of urinary bladder control Just prior to leaving his home for Bellevue Hospital there occurred a sudden intense bilateral chest pain with posterior radiation followed by a mild state of shock. Old blood was found in the urine after catheterization, but clear urine was later obtained Hematuria had not previously occurred

This multiplicity of recent phenomena occurring in so many body areas might be explained as the result of systemic embolization Metastatic lesions do not occur in such rapid succession and their effects are, as a rule, gradual We should have greater alterations in the spinal fluid, particularly the protein, when neurologic disturbances are secondary to metastatic disease The presence of valvular disease in our patient at least gives credence to the possibility of a superimposed bacterial endocarditis

A short, rough precordial systolic murmur was noted, its greatest intensity was at the apex and was transmitted beyond the midaxilla He actually had no functional circulatory disability The insurance and army rejections must have been on the basis of finding this murmur, with which he thrived for fifty years after his first disqualification A healed rheumatic valvulitis with hyalinization or calcification of the ring could result in just such a murmur, having the character of insufficiency without stenosis The aortic systolic murmur is transmitted upward to the clavicle and does not go to the left beyond the apex A small interventricular septal defect gives a somewhat similar systolic murmur, loudest to the left of the lower sternum

The azotemia was probably not on the basis of ordinary renal parenchymal disease The urine showed a good specific gravity of 1 022, the azotemia was variable, 100 mg, 180 mg, and the final reaching 65 mg per cent. Considering the transitory hematuria, he may have had renal infarction. Intestinal obstruction could have been the extrarenal factor to further account for nitrogen retention.

When I examined this man the abdomen was distended and so tender as to suggest the probability of peritonitis. Perforation of a necrotic carcinoma is a not infrequent preterminal event.

Dr. Charles H Nammack Dr Trubek's point of view is well taken, that is, that the pa-

tient had chronic cardiac disease with malignancy of the gastrointestinal tract superimposed

DR SAUL SOLOMON The chief presenting symptoms could be readily explained on the basis of a diffuse vascular disease such as periarteritis nodosa, or general arteriosclerosis with atheromatous degeneration and thrombosis, or multiple embolic phenomena There is insufficient evidence for the diagnosis of periarteritis nodosa

The second possibility is more likely There was evidence of general arteriosclerosis The neurologic symptoms described might have been due to hypertensive encephalopathy The hematuria and the intestinal obstruction, which seemed to be a dynamic ileus, can be explained by thrombosis in the renal and mesenteric vessels or by thrombosis of the aorta The absence of vascular manifestations in the lower extremities would make this latter possibility most unlikely

The third vascular condition which I referred to, namely, multiple emboli, could have originated from chronic valvular diseases or previous myocardial infarction The configuration of the heart is not that of a chronic valvular disease It is possible that this individual had a myocardial infarction long before the present illness with the development of mural thrombi These may loosen and embolize even years after the original infarction

Pathologic Discussion

Anatomic Diagnosis

Generalized arteriosclerosis
Sclerosis of cerebral arteries
Multiple anemic infarcts of brain
Dilatation of urinary bladder, clinical
Intraperitoneal rupture of urinary bladder
Subacute peritonitis with hemorrhage and organization
Thrombosis of left iliac vein
Embolism of pulmonary artery
Hemorrhagic infarct of lung, left lower lobe

DR HENRY SPITZ The main finding in this case was obviously the rupture of the urinary bladder The bladder was not distended, contained a small amount of cloudy blood-stained urine, and showed rather extensive mucosal hemorrhage in the posterior superior portion of the fundus In the center of this hemorrhagic area the wall was necrotic, but the necrotic edges were agglutinated and the perforation became apparent only upon delicate probing not applying any pressure Histologic examination of the edge of the perforation showed necrosis involving the entire thickness of the bladder wall surrounded by a broad zone of granulation tissue, which was heavily infiltrated by polymorphonuclear leukocytes The serosal aspect of the perforation was covered by fibrinous exudate and the omentum and the sigmoid colon were attached to it by fibrinous adhesions The pelvic peritoneum and the perirectal and periprostatic connective tissue was markedly congested, edematous, and focally hemorrhagic The entire peritoneum was dull, dusky, and covered by fibrin which caused agglutination of intestinal loops to each other and to the omentum The small and large intestines were moderately distended and filled with soft feces and gas The peritoneal cavity contained several ounces of bloody fluid The left common iliac vein was partly occluded by a thrombus which probably gave rise to pulmonary embolism and hemorrhagic infarction in the left lower lobe The remainder of the lungs showed moderate edema and scattered foci of lobular pneumonia The heart was of average size and showed considerable fibrosis of the mitral valve with calcification There was no fusion of the valves and no shortening of the chordae tendineae The aortic valve showed mild fibrosis of the cusps Histologically, no definite evidence of rheumatic fever could be found The brain was the seat of multiple anemic infarcts although the arteries of the circle of Willis showed only moderate arteriosclerosis

If one attempts to correlate the anatomic findings with the clinical picture, the following course of events suggests itself the patient suffered from cerebral arteriosclerosis and developed multiple cerebral infarcts This produced not only weakness and loss of sensation in the extremities, but also loss of sphincter control of the urinary bladder and marked distention of the bladder with ischuria paradoxa This led to rupture of the urinary bladder, associated with hematuria Generalized mild peritonitis developed but the point of rupture was sealed off by fibrinous exudate and adhesions to the omentum and adjacent viscera Paralytic ileus resulted and caused prerenal azotemia The kidneys showed no gross or histologic evidence of appreciable renal damage The sudden severe chest pain was obviously caused by pulmonary embolism Lobular pneumonia and moderate heart failure were terminal events

AN ABSTRACTING SERVICE FOR HUMAN BIOLOGY

The Trustees of *Biological Abstracts* announce the establishment, beginning in January, 1946, of a new section of *Biological Abstracts*—Section H, specially assembled Abstracts of Human Biology—intended for anthropologists, sociologists, psychologists, neurologists and psychiatrists, students of child development and human welfare, and students of man generally

PALATABILITY AND NUTRITION FACTORS

of

Campbell's STRAINED BABY SOUPS

Q What is the importance of palatability?

A A leading pediatrician has pointed out that even in the early months of life infants are able to detect minute differences in flavor The appealing palatability of Campbell s Strained Baby Soups is, therefore an advan tage It should further be pointed out that all the "tastes" in these soups are the wholly natural ones of the meats, vegetables and cereals used

Q Why are the different ingredients selected?

A Campbell s Strained Baby Soups are planned to provide a balance in nutrients to supplement the daily milk diet. Since it takes many different foods to supply the more than 50 nutrients needed for infant development and energy we use vegetables and a cereal in preparing each of the four meat soups. Flavor is improved, too For instance, liver has too strong a taste for many babies, but blended with vegetables palatability is then enhanced It should also be noted that these soups are intended for use as early in normal infancy as any other strained baby foods.

Q What measures are taken to conserve food constituents?

A The method of preparing and cook ing Campbell s Strained Baby Soups is based on years of exhaustive re-search to ascertain the best way of insuring the conservation of vitamins and retention of minerals. A compre-hensive analysis of each soup may be had upon request to Campbell Soup Company Camden, New Jersey

5 KINDS

LIVER
CHICKEN
LAMB
BEEF
VEGETABLE

All in Glass Jars

Campbell s Strained Baby Soups *represent fine* quality in ingredients in care and method of cooking in retention of minerals and conser vation of vitamins *and in good flavor* Every re-*source of Campbell s Kitchens is devoted to that aim.*

For congestive heart failure

NEXT IN IMPORTANCE TO DIGITALIS

In many cases of congestive heart failure mercurial diuretics are next in importance to digitalis in maintaining the patient's comfort and prolonging life.

Following an injection of Salyrgan-Theophylline in patients with marked edema the urinary output frequently amounts to three or four liters in twenty-four hours.

Through such diuresis the heart is relieved of the added burden of propelling the blood through the compressed blood vessels. The blood volume is decreased, and in all probability the efficiency of the heart is increased by elimination of myocardial edema.

•

Salyrgan-Theophylline is available in ampuls of 1 cc. and 2 cc. for intramuscular or intravenous administration. For oral use (as an adjunct to decrease the frequency of injections and when parenteral therapy is impracticable) tablets in bottles of 25, 100 and 500.

SALYRGAN-THEOPHYLLINE

"Salyrgan" registered trade mark U. S. Pat. Off. & Can.

Department of Workmen's Compensation

CONDUCTED BY DAVID J KALISKI, M D , DIRECTOR

Tantalum Oxide as a Dressing for Burns and Wounds*

THE following abstract of an article by Dr C T Olson,† Medical Director of Fansteel Metallurgical Corporation, would appear to be of great interest to physicians treating compensation patients The author repeatedly emphasizes that the application of the powder produced almost immediate cessation of pain and soreness in the injured part and frequently enabled the worker to continue at work when more complicated procedures would require either hospitalization or temporary absence from work.

Tantalum oxide, type 400, is soft and has the property of forming a film when rubbed on normal skin

Tantalum as a metal was first produced in this country in 1922 by Dr Clarence Balke In 1936 Burch and Carney, of Vanderbilt University, used metallic tantalum in surgery Its most successful application in surgery is in cranioplasty Of all metals it has the highest resistance to corrosion in vitro and in vivo

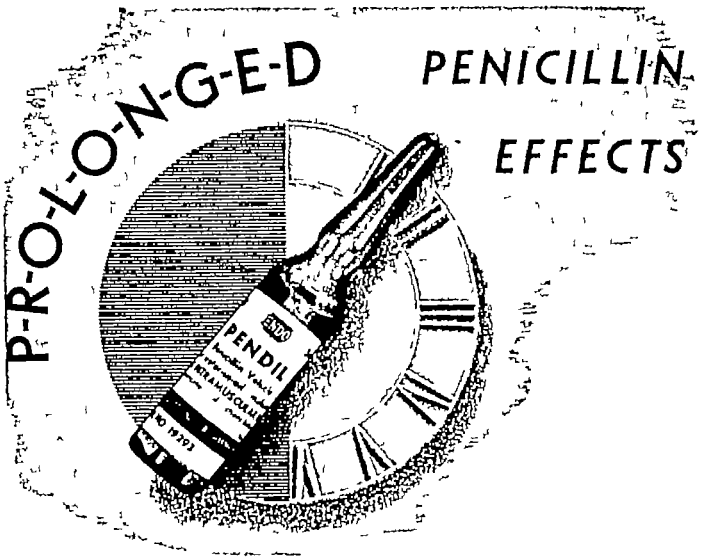
Tantalum is a metal, not an alloy, it is easily fabricated, nonmagnetic, and not subject to localized electrolytic couple reaction. The author found that when the foil could be placed in intimate contact with a wound where there had been loss of skin, epithelization occurred faster than by other methods, but the foil has a tendency to fragment and it is difficult to have it follow the anatomic curvatures and body surfaces The results are not good unless the foil can be placed with compression. It was suggested that the healing properties of tantalum metal were due to the oxide coating which is always present The laboratory prepared pure tantalum oxide powder for use as a dusting powder in place of gauze, either plain or medicated Even sterile vaseline gauze is not the most comfortable dressing and low-grade infections, particularly with the pyocyaneus group, often follow Tantalum oxide powder, type 400, seems to be the softest and produced the best films and is extremely soothing to chafed or irritated skin

An employee, aged 38, suffered a severe caustic burn on the dorsum of his foot It was handled in routine manner with dilution and neutralization for forty-eight hours and then covered with aseptic vaseline gauze with compression The employee complained of severe pain in the region of the burn, which persisted in spite of all attempts to ameliorate it He wanted to work and the company needed him on the job On March 5 the wound was covered with sterile tantalum oxide powder At this time the area involved was 2 inches in diameter with partial loss of thickness of skin over the entire area Weeping granulations were present Such a wound formerly would have been skin grafted, requiring hospitalization, to which the patient objected Almost immediately after the wound was covered with tantalum oxide powder he was free of pain, and two days later the wound was completely dry and covered with a very strong crust of tantalum oxide There were no signs of inflammatory reaction The crust was undisturbed, gradually separated, and was removed two weeks later There was complete healing with no scar tissue formation

Subsequently, the author used tantalum oxide powder on hundreds of patients without bad results He cites a case of injury causing a deep triangular gouge extending through the fingernail and down to the distal interphalangeal joint creases Most of the nail was gone and the bone exposed After meticulous cleansing and débridement the wound was packed with tantalum oxide powder The pain disappeared immediately and the patient was able to continue work The outer dressing was changed at frequent intervals but the crust was undisturbed There were no signs of wound seepage or inflammation The crust came away from the soft tissues at the end of two weeks and from the nailbed somewhat later There was complete nail regeneration ultimately The author comments that, particularly with nail injuries, when the traumatized area is very sensitive tantalum oxide powder has given extremely successful results with remarkable regeneration of tissues

In another case in which a punch press caught the worker's index finger and amputated the tip and which, if seen earlier, would have been repaired by skin graft, tantalum oxide treatment was inaugurated fifteen hours after the accident There was much oozing and pain and contamination of the wound After thorough cleansing and irrigation, the wound was packed full of tantalum oxide powder Within a few minutes there was no further bleeding and a crust had formed There was no more soreness in the end of the finger or signs of inflammatory reaction The crust was not disturbed and came off in one piece The skin had grown in completely, covering the tip of the finger with only a slight scar on one side Along with epithelization there was marked regeneration of the subcutaneous tissue which was more marked than if skin graft had been done The author believes that this case demonstrates that it is safe to use tantalum oxide powder in potentially contaminated cases

There was a large series of cases of burns, both chemical and thermal, treated with tantalum oxide Most of these were located on the hands, feet, forearms, and face, where it is extremely difficult to be sure of a clean wound in spite of the most meticulous cleansing



The author cites a number of extensive burns in which the use of the powder in deep as well as superficial burns was successful in avoiding scar formation The tantalum crust adheres to all the burned surfaces The wound remains dry and the crust firm Splinting may be necessary in deep and extensive burns to immobilize the part The crust may not separate from extensive burns for a number of weeks, but the outer dressing may be removed without fear of contamination The patients have

[Continued on page 652]

P-R-O-L-O-N-G-E-D PENICILLIN EFFECTS

The intramuscular injection of a water-in-oil emulsion of penicillin results in prolongation of penicillin effects as compared with similar amounts of penicillin in aqueous solution administered by the same route[1] A single injection of 150,000 units of penicillin in water-in-oil emulsion cured 101 of 105 cases of acute gonococcal infection[2] These results indicate that water-in-oil emulsions may prolong penicillin effects in other diseases in which penicillin is indicated, such as pneumococcic, staphylococcic, and streptococcic infections. • Pendil consists of a sterile mixture of cholesterol derivatives and highly refined peanut oil, which when mixed with an aqueous solution of penicillin, provides a free-flowing water-in-oil emulsion for intramuscular injection Pendil is supplied in 3 cc. ampules in boxes of 12, 25, and 100 ampules. Literature will be sent on request.

PENDIL
(PENICILLIN EMULSIFIER)
ENDO

ADVANTAGES OF PENDIL
Extended absorption of penicillin
Fewer injections per day required
Emulsions prepared simply and rapidly
No clogging of syringe
Syringe readily cleaned

THE VALUE OF KNOX GELATINE IN PEPTIC ULCER MANAGEMENT

Many physicians are finding Knox Gelatine a practical aid in the frequent between meal feedings that are so often desirable in the management of peptic ulcer

Given at hourly intervals, Knox Gelatine provides a satisfactory control of the gastric secretions and brings relief from the painful symptoms.

Also, many physicians regularly prescribe the *Special Ulcer Diet* described in the Knox booklet, "Peptic Ulcer Dietary" This is a complete diet bland, and liberal in calories and protein We will be happy to send you as many copies as you wish

For the *free Peptic Ulcer Dietary* and any of the other dietaries listed here address your request to Knox Gelatine, Box 474, Johnstown, N Y

FREE!

WILLIAM F MARTIN, ESQ

COUNSEL TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Ownership of X-Ray Plates

ON MANY occasions your counsel has been consulted on the question of ownership of x-ray plates, and it has always been his opinion that in the ordinary case x-ray plates are just as much the property of the physician as are his personal notes and records pertaining to the care of any given patient

There has been very little written by the courts upon the subject, and for years the most authoritative case upon the question was one decided in Michigan some time ago, which held that x-rays are owned by a physician and that a patient is not entitled to their possession in the absence of a specific agreement to the contrary This case, McGarry v J A Mercier Company, 272 Michigan 501, was commented on in these columns some years ago

A recent controversy over the possession of x-ray plates, which arose in the Small Claims Part of the Municipal Court of the City of New York a few weeks ago, led to a similar result The matter was tried before Honorable O Grant Esterbrook, Official Referee, who, in determining the case, handed down a well-written opinion, which we quote in full

"Briefly stated, the facts adduced at the trial of this case are as follows The plaintiff was injured by being struck by a taxicab, his attorney recommended that he call upon the defendant B, a duly licensed practicing physician of this State, and submit himself to a physical examination and diagnosis of the injuries, the defendant proceeded with such physical examination of the plaintiff and in the course thereof and before arriving at any professional conclusions requested the plaintiff to call upon the defendant S, another duly licensed and practicing physician of this State and one specializing in x-ray, this the plaintiff did and submitted to x-ray pictures being taken of his foot and lower limb, there were three pictures of exposures taken in all upon two plates After taking such pictures the defendant S was paid for his services and thereafter forwarded the x-ray pictures, together with his written report of his findings, interpretations, opinion, and diagnosis to the defendant B, this report of the defendant S was dated July 7, 1945 and was addressed to the defendant B, after receipt of the defendant S's report of his findings setting forth the history of the plaintiff's case, the disclosures of his examination of the plaintiff and the x-ray pictures, his diagnosis and opinion, a report of the defendant B, dated July 10, 1945, was forwarded to the plaintiff's attorney, who had sent the plaintiff to him for examination, likewise the defendant B was paid for his services to the plaintiff, the x-ray plates were retained by the defendant B and are still in his possession, on July 15, 1945, Mr C, attorney for the plaintiff in this case, by post card requested the defendant B to turn the said x-ray plates over to him as the substitute attorney for the plaintiff in his case, on October 20, 1945, the plaintiff made formal written request to the defendants to turn the said x-ray plates over to Mr C, neither of the said demands or requests have been complied with.

"The taking of the x-ray pictures, as I view it, are not pictures as the word is used in its ordinary and expected meaning, but the result of the highly technical and professional procedure of registering on highly sensitized and perishable material reflexes of bone structure, organs, and foreign bodies lodged within animal bodies and invisible to the eye The so-called x-ray picture is produced through the use of machines or apparatus of scientific manufacture and operable only by roentgenologists or persons schooled and expert in the manipulation of such machines, these machines when operated give off a form of radiant energy emanating from the surface of an electrically excited vacuum tube opposite the cathode electrode having the power of penetrating objects impervious to light or heat rays, affecting sensitive photographic films, and exciting fluorescence in certain solutions When a member of the body is exposed to these roentgen rays over the sensitized plate, the recordings of the interior are manifest on the plate through outlines and shadows and the roentgenologist reading the plate determines from the locations of the shadows, their relative density one to the other, whether the bone structure may be dislocated, fractured, diseased, or normal, and it is from such reading that he arrives at his diagnosis, hence the x-ray plate becomes the veritable foundation stone of the roentgenologist's diagnosis and report and it is essential that he retain it as a permanent record in support of his diagnosis, for should it be destroyed by unskillful handling or loss, the roentgenologist would have no means to justify the correctness of his diagnosis or findings in the event of challenge to his professional opinions

"What the plaintiff sought was a diagnosis of his ailments and professional advice as to how to treat them to effect a cure, and even though the x-ray plates were taken of the plaintiff's foot and lower limb they were so taken with his knowledge and consent that they were to be delivered to his physician for his professional aid and use and not as a work of art Nowhere in the evidence do I discover any trace of agreement or understanding between the plaintiff and the defendants that he was to receive the x-ray plates as his property from either defendant and I cannot read into the situation any implied agreement that they are

"In my opinion, the x-ray plates in question are the property of the defendant S, this being so, the possession of the plates by the defendant B in no way trespasses upon any vested right therein of the plaintiff

"Judgment is accordingly rendered in favor of the defendants, dismissing the complaint against both defendants"

for *better* pain relief

PRO-DOL provides the analgesic power of 5 gr of aspirin, but, by a special process incorporates 7 1/2 gr. of alumina gel in each full dose, protecting sensitive stomachs, as in ulcer cases. It buffers decomposition products of the aspirin, which otherwise splits into irritating free acids.

The combined use of an occlusive diaphragm and vaginal jelly remains, in the published opinions of competent clinicians, the most dependable method of conception control.

Dickinson[1] has long held that the use of jellies alone cannot be relied upon for complete protection. It is noteworthy that in the series of patients studied by Eastman and Scott[2], an occlusive diaphragm was employed in conjunction with a spermicidal jelly for effective results. Warner[3], in a carefully controlled study of 500 patients, emphasized the value of a diaphragm.

In view of the preponderant clinical evidence in its favor, we suggest that physicians will afford their patients a high degree of protection by prescribing the diaphragm and jelly technique.

You assure quality when you specify a product bearing the "RAMSES"* trademark.

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL *The members of the committee are Oliver W H Mitchell, M D , Chairman (428 Greenwood Place, Syracuse), George Baehr, M D , and Charles D Post, M D*

Council Committee Sponsors Course in Pulmonary Diseases and Tuberculosis

A COURSE of instruction in pulmonary diseases and tuberculosis is being offered by the Division of Tuberculosis of the New York State Department of Health, at any one of the following State Department of Health tuberculosis hospitals Hermann M Biggs Memorial Hospital, Ithaca, Homer Folks Tuberculosis Hospital, Oneonta, Mt Morris Tuberculosis Hospital, Mt Morris, or New York State Hospital, Ray Brook. The course is sponsored by the Council Committee on Public Health and Education of the Medical Society of the State of New York. By lectures, demonstrations, ward rounds, conferences, and field trips instruction will be given in bacteriology, pathology, diagnosis, treatment, administrative and public health aspects of pulmonary diseases and tuberculosis A candidate accepted for the course will act as a resident on the staff of the assigned hospital As such he will actively participate in the functions of the hospital The course will be elastic and allow for emphasis on those aspects of the problem in which the selected applicant is interested A career in sanatorium work, public health, opportunity for continued study or salaried positions will be available for physicians who manifest ability and interest in these fields

The course is intended primarily for medical officers returning from service with the Armed Forces

Others may apply if they possess the necessary qualifications Citizens of the United States who have graduated from approved medical schools may apply Preference will be given to physicians returning from military service

The minimum period of instruction will be for three months, but may extend up to twelve months maximum, as each applicant may desire Every effort will be made to individualize the experience so that the needs and desires of the enrollee will be adequately met

Each State Tuberculosis Hospital can accommodate four residents who will reside at the Hospital More can be accommodated if applicants reside in the adjacent community Each State Tuberculosis Hospital is fully approved by the American Medical Association and American College of Surgeons for residencies Service of six months or more can be applied to credit toward certification by the appropriate Board

Albany Medical College, University of Buffalo School of Medicine, University of Rochester School of Medicine and Dentistry, Syracuse University College of Medicine, and the U S Public Health Service have fully endorsed the course Appointees will be welcome at grand rounds, special lectures, and demonstrations given by the schools as a part of their program of postgraduate education. The Hermann M Biggs Memorial Hospital, at Ithaca, is convenient to the medical school at Syracuse The Homer Folks Tuberculosis Hospital, at Oneonta, is convenient to the medical school at Albany The Mount Morris Tuberculosis Hospital, at Mount Morris, is convenient to the medical schools at Buffalo and Rochester Appointees at the New York State Hospital at Ray Brook can participate in the special program at the medical schools of Albany or Syracuse

Through the Council Committee on Public Health and Education of the Medical Society of the State of New York and in collaboration with the county medical societies special lecturers will be supplied as need warrants

The Federal Government, though the United States Public Health Service, has allocated certain moneys to the States Stipends up to a maximum of $250 per month are available if certain qualifications can be met Details are available upon request

Make inquiries of and application to Dr Robert E Plunkett, General Superintendent of tuberculosis hospitals, New York State Department of Health, State Office Building, Albany 1, New York

General Education for Rockland County

POSTGRADUATE instruction has been arranged for the Rockland County Medical Society, it is to be given at the Recreation Pavilion, Summit Park Sanatorium, Pomona, at 4 00 P M on various days On March 29 Dr Gray H Twombly, assistant professor of cancer research, College of Physicians and Surgeons, Columbia University, New York City, will speak on "Recognition and Treatment of Pelvic Cancer" On April 24 a lecture entitled "Common Diseases of the Skin—Illustrated with Color Photography" will be delivered by Dr Leon H Griggs, associate professor of clinical medicine, Syracuse University College of Medicine The lecture to be given on May 24 is "The Clinical Aspects of Glomerulonephritis," by Dr William Goldring, associate professor of medicine, New York University College of Medicine On June 26 Dr Clayton W Greene, professor of medicine, University of Buffalo School of Medicine, will discuss "What Can We Do for Angina Pectoris and Coronary Occlusion?" On September 25 Dr Foster Kennedy, professor of clinical medicine (neurology), Cornell University Medical College, will speak on "Nervous Conditions Associated with Warfare"

This instruction is provided by the Medical Society of the State of New York, except that the lectures by Drs Twombly and Kennedy are presented jointly by the New York State Department of Health and the Medical Society of the State of New York.

[Continued on page 660]

DERMATOPHYTID

SO BOTHERSOME . . .
SO DIFFICULT TO ERADICATE

To the patient, dermatophytid proves more annoying than the original lesions themselves Consisting of deep-seated vesicles which exude a thick clear liquid, dermatophytid is the result of hyperallergization from a distantly located fungus infestation The lesion characteristically gives rise to severe pruritus and, when opened is especially prone to secondary pyogenic infection Through the use of Tarbonis, continuously applied, the surrounding inflammatory reaction rapidly subsides and the primary lesions themselves respond promptly Tarbonis represents a distinct advance in the therapy of dermatophytid over salicylate-benzoic acid unguents and over crude tar preparations, and usually obviates the need for roentgen therapy

Tarbonis is colorless, odorless, greaseless, does not stain linen or skin It contains 5% Liquor Carbonis Detergens extracted from selected tar by a unique process, retaining all beneficial factors of tar and eliminating the irritants. Menthol and lanolin are also incorporated in the vanishing cream base, making for a preparation of unusual pharmaceutical elegance. Specifically indicated whenever the action of tar is required

[Continued from page 658]

The Rockland County Medical Society also met on February 20 at 4 00 PM at the Recreation Pavilion, Summit Park Sanatorium, Pomona, for a lecture entitled "Hypertension and Hypertensive Renal Disease," given by Dr Jules Redish, assistant professor of medicine, New York University College of Medicine, New York City This instruction was provided by the Medical Society of the State of New York.

Cortland County Has Two Lectures on General Medicine

THE Cortland County Medical Society met at 9 00 PM in the Board Room, Y M.C A., Cortland, for two lectures given on February 15 and March 15 The first was "Arteriosclerosis in the Aging," given by Dr Wardner D Ayer, professor of clinical medicine, Syracuse University College of Medicine The second was "The Diagnosis and Treatment of Anemia," by Dr Paul Reznikoff, associate professor of clinical medicine, Cornell University Medical College, New York City

General Medical Series for Madison County

POSTGRADUATE instruction is being given to the Madison County Medical Society on Thursday evenings at 8 30 PM at the Hotel Oneida, Oneida

On February 28 Dr Ezra Bridge, superintendent, Iola Sanatorium, Rochester, and assistant professor of medicine, University of Rochester School of Medicine and Dentistry, spoke on "New Developments in Tuberculosis" On March 7 Dr Edward C Hughes, professor of obstetrics, Syracuse University College of Medicine, discussed "Caudal Anesthesia in Obstetrics" On March 14 the lecture was "New Concepts and Therapy of Hypertension," given by Dr Richard S Gubner, assistant medical director of the Equitable Life Assurance Society of the United States, New York City On March 21 Dr Roscoe D Severance, associate professor of orthopedic surgery, Syracuse University College of Medicine, will speak on "Preventive Orthopedics Common Defects with Good Prognosis Under Medical Care" The lecture for March 28 will be "Carcinoma of the Colon and Rectum," given by Dr Frederick S Wetherell, professor of clinical surgery, Syracuse University College of Medicine

The Madison County Medical Society met at 8 30 PM on February 21 at the Hotel Oneida, Oneida, for a symposium on bacterial endocarditis Dr Orren D Chapman, professor of bacteriology and parasitology, Syracuse University College of Medicine, discussed bacteriology, Dr George H Reifenstein, associate professor of pathology, Syracuse University College of Medicine, spoke on pathology, Dr Edward C Reifenstein, Sr, professor of medicine, Syracuse University College of Medicine, spoke on diagnosis and treatment

This instruction, with the exception of the lecture by Dr Gubner, is provided jointly by the Medical Society of the State of New York and the New York State Department of Health

Jefferson County Studies Hematologic Disorders

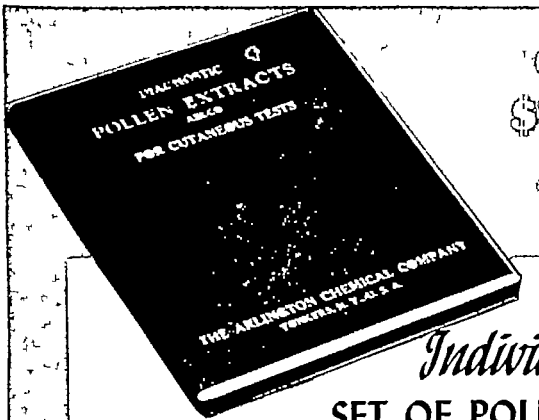
POSTGRADUATE instruction for the Jefferson County Medical Society was given on February 14 at 6 30 PM at the Black River Valley Club, Watertown

Dr Ellery G Allen, associate professor of clinical medicine and assistant professor of clinical pathology, Syracuse University College of Medicine, delivered a lecture entitled "General Résumé of the Hematologic Disorders, Including the Anemias"

Fulton Academy Hears Lecture on the Rh Factor

INSTRUCTION arranged by the Council Committee on public health and education of the Medical Society of the State of New York, with the cooperation of the New York State Department of Health, was given before a meeting of the Fulton Academy of Medicine held on February 16 at 12 30 PM at the Lee Memorial Hospital, Fulton. A lecture entitled "The Rh Factor in Blood Transfusion and Pregnancy" was given by Dr Frederick N Marty

Dr Marty is instructor in clinical medicine, Syracuse University College of Medicine



This instruction is presented as a cooperative endeavor between the New York State Department of Health and the Medical Society of the State of New York

Woman's Auxiliary

To the Medical Society of the State of New York

County News

Albany County The Christmas Seal Sale for the Tuberculosis Fund, under the direction of Mrs William G Richtmyer, during the week of December 10, exceeded its quota by a large amount

The Auxiliary members have been busy spreading information about the medical opinion of the antivivisection bill known as the DiCostanzo-Crews Bill before the State Legislature On January 22, our legislative chairman, Mrs William M Thomson, was on hand to present speakers and material at the Women's Forum of the State Legislature at the hearing in the Capitol

On January 30, the members of the Auxiliary were addressed by Dr John E Heslin, who spoke on medical indemnity insurance, and who asked the women to promote its success by giving out information in all groups of which they were a part We were also addressed by Dr Robert R Hannon, Executive Secretary of the Medical Society of the State of New York, who spoke on the bills pertaining to public health and medicine, now before the state and national legislatures

Our past president, Mrs Alfred L Madden, who is now president-elect of the Woman's Auxiliary to the Medical Society of the State of New York, addressed a meeting of the International Federation of Catholic Alumni, on January 26, speaking against antivivisection On January 28, Mrs John E Gainor addressed the women of the Delmar Progress Club, a branch of the Federation of Women's Clubs of America, on the same subject

Our president, Mrs Emerson Crosby Kelly, has announced that our Auxiliary has purchased and presented seventy-three draw sheets, hemmed and ready for use, to the Hospital of Incurables, as one of our philanthropic projects

The next meeting of the Auxiliary was a luncheon at the University Club, Albany, on February 27, at which Mrs Gerald C Cooney, Legislative Chairman of the Woman's Auxiliary to the Medical Society of the State of New York, spoke

Mrs Kelly and Mrs Madden have been guest speakers at meetings of the Woman's Auxiliaries of adjoining counties and we have enjoyed an interchange of ideas Our membership is increasing, and we look forward to a busy spring season.

Schenectady County On December 27, the Auxiliary had a Christmas tea at the home of Mrs Glen Smith, in Schenectady, with a special effort to get new members to attend There were about forty-five attending

In January the Auxiliary had a dinner meeting at the Hotel Van Curler with Mrs Michael Schultz, program chairman for the state Auxiliary, Miss Yolande Lyon, field representative of the Medical Society of the State of New York, and Mr George Farrell, direction of the Bureau of Medical Care Insurance of the State Medical Society, as guests This meeting was in conjunction with the Schenectady County Medical Society and Dr Harry Reynolds, vice-president, presided at the meeting, which was open to the public The meeting, a forum on health insurance, was very instructive Mrs Alfred Grussner was chairman

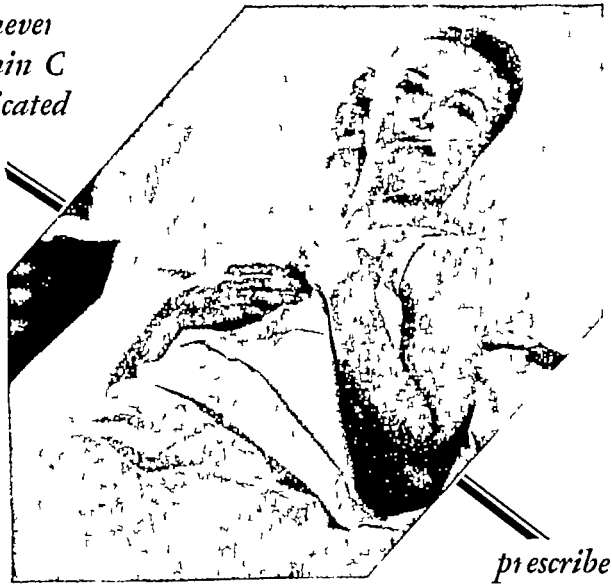
---

WORKING WITH LUNG IRRITANTS CAN CAUSE CHRONIC BRONCHITIS

Chronic bronchitis can be an industrial hazard if workers who come in contact with various irritants to the lungs do not observe proper precautions, according to an article in the current issue of *Hygeia*, health magazine of the American Medical Association

Arthur S Webb, M D , Controller of the DuPage County (Illinois) Tuberculosis Sanatorium Board and Honorary Director of the DuPage County Tuberculosis Association, writes that "if the worker is exposed to dust that has sand particles of small enough size to breathe into his lungs, he can develop a condition known as silicosis, in which particles of sand enter the lung and eventually cause irritation and cough "

The author states that there are many causes for chronic irritation of the bronchial tubes "An irritation may begin with the acute diseases such as measles, whooping cough, influenza, pneumonia, typhoid fever, scarlet fever, malaria, or infected tonsils



Bad teeth or sinus infection may play a part Other conditions which may be uncovered on investigating chronic bronchitis are tuberculosis and bronchiectasis Bronchiectasis is an enlargement and infection of the tubes and air sacs of the lungs "

Continuing, the article says "deformities of the air passageways, such as enlarged tonsils, adenoids, and enlarged turbinates, may contribute to chronic bronchitis Also foreign bodies, such as beans, that children may stick up the nostrils, and polyps, tumors, and various other unusual conditions, may encourage chronic infection of the air passages "

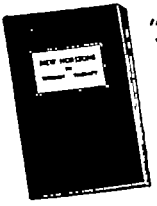
Dr Webb cautions against the passive acceptance of this lung disease He suggests the immediate investigation of the cause of bronchitis and if it is due to "abnormal conditions in the lungs or air passageways, these may be removed and the patient saved from a life of semi-illness which cramps his efficiency and is disturbing to those about him A neglected chronic cough, with its irritation and infection, may cause changes in the lung which may eventually cause a change in the shape of the chest Such people are more or less semi-invalids, being susceptible to cold, fatigue, loss of weight and appetite They may be able to work but do not feel well

"In investigating such a problem, an orderly procedure should be followed beginning with a careful history, with particular attention to past diseases and occupational hazards Questions regarding the aspiration of foreign bodies are important The nose and throat should be examined X-rays of the sinuses and lungs should be taken "

Whenever Vitamin C is indicated

prescribe

SODASCORBATE



n surgery, in convalescence, in pregnancy and lactation, in infectious diseases—in scores of clinical and pathologic states—vitamin C is being prescribed more widely every day

And every day, more and more physicians are avoiding certain of this vitamin's undesired side- and after-effects—gastric irritation, acid shift and laxative action—by prescribing SODASCORBATE, the *improved* vitamin C therapy

SODASCORBATE (sodium ascorbate) corrects vitamin C deficiencies surely, swiftly, safely It has many advantages over ordinary ascorbic acid, particularly where this therapy must be continued over long periods, or where massive doses of vitamin C are required.

The average dose for adults and children over 12 years is one tablet three times daily or as indicated by the condition For children under 12 one-half tablet. This may be dissolved in milk for babies and young children.

Supplied in bottles of 40 and 100 tablets, as well as in hospital size bottle containing 500 tablets. For professional samples and covering literature, sign and mail the coupon.

"NEW HORIZONS IN VITAMIN C THERAPY"

This 32 page monograph contains much interesting and valuable information on vitamin C therapy Brief concise, authoritative. Most comprehensive bibliography Mail the coupon for your copy

REVIEWED

Uncle Sam Convalescing By H Ameroy Hartwell, M D Duodecimo of 79 pa es, illustrated Boston, Bruce Humphries, 1944 Cloth $2 00

This little book of 75 pages, depicting the depression in the United States in the past decade, 1929–1939, is one of the finest modern examples of historic allegory that the writer has had the privilege to read.

It is written by a doctor already renowned as an author of merit The descriptive phrasing is in medico-analytic style, extremely pleasing to the medical mind and easily understood by the layman.

Franklin D Roosevelt, who was the Chief of Staff of the World Hospital in which Uncle Sam is convalescing, wrote the author, Dr H Ameroy Hartwell, praising this allegory about the depression and N R.A.

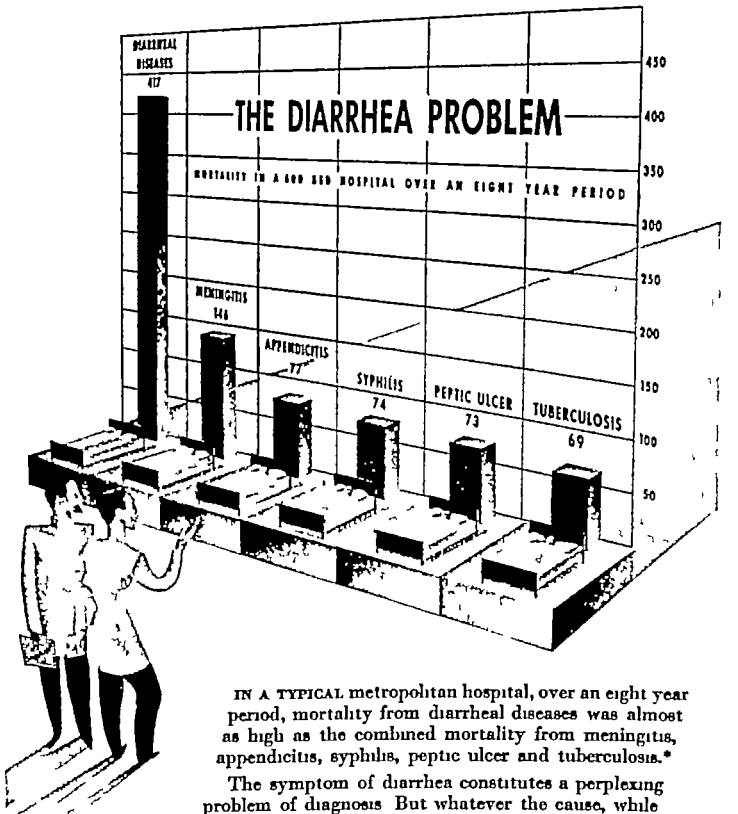
This is a book which everyone interested in the crisis through which this country recently passed should read. The reviewer endorses it highly as a literary gem

THOMAS B WOOD

Clinical Urology By Oswald Swinney Lowsley, M.D , and Thomas Joseph Kirwin, M D Second edition (In two volumes) Octavo of 1,769 pages, illustrated Baltimore, Williams & Wilkins Co , 1944 Cloth, $10 per set

The second edition of this splendid work has been completely revised, rewritten, and brought up to date As always, Mr Didusch's illustrations are beautifully done and explain the subject matter in detail

The addition of a bibliography at the end of each chapter is a valuable contribution to the second edition. The subject matter is clear, concise, and arranged in a most satisfactory fashion, making this an extremely valuable reference work for both the specialist and general practitioner



FEDOR L SENGER

Microbiology and Pathology By Charles F Carter, M D Third edition Octavo of 777 pages, illustrated St Louis, C V Mosby Co , 1944 Cloth, $3 50

This third edition of a standard textbook for nurses maintains the standards set by the previous editions Its division into general principles of microbiology, relation of bacteria to disease, bacteriology of water and milk, special bacteriology, pathology, and laboratory exercises is a satisfactory form of presentation.

The glossary at the end of part four is indeed most helpful to students

[Continued on page 666]

IN A TYPICAL metropolitan hospital, over an eight year period, mortality from diarrheal diseases was almost as high as the combined mortality from meningitis, appendicitis, syphilis, peptic ulcer and tuberculosis.*

The symptom of diarrhea constitutes a perplexing problem of diagnosis But whatever the cause, while specific treatment is being instituted, the diarrhea and resultant dehydration can be controlled by KAOMAGMA

DOSE 2 tablespoonfuls with water, then 1 tablespoonful after each bowel movement.

At times it would seem as if the discussions might be somewhat complicated for student nurses, especially today with lowered admission requirements

In all, the book fills a definite need

ABRAHAM R. KANTROWITZ

Doctors at War Edited by Morris Fishbein, M D Octavo of 418 pages, illustrated New York, E P Dutton & Co , 1945 Cloth, $5 00

If civilization represents the precious amalgam resulting from the commingling of the very finest attributes contributed to it by the art, philosophy, literature, science, and industry of the land, then war has no place in our thinking and in our planning for the future Yet, wars have come and we hope soon will be gone for all time And in war there is destruction and death and hate and fear and courage and sacrifice and devotion to duty and faith in Fate and love of country and ideals and, yes, there is also glory With all due humility and with pardonable pride, medicine seeks top ranking in the honors distributed and implied i sharing the glory so widely earned in this worst of all wars

In sixteen chapters the recital of the story of *Doctors at War* carries on from the job done by Selective Service in choosing the human material necessary for war, through all phases of the participation of the doctor in the Army, the Navy, and the Air, in the Red Cross, the Public Health Service, in industry, both at home and abroad, in convalescence and rehabilitation, to medical research now and tomorrow

No other field of endeavor can begin to compare with, much less equal, the voluntary enlistment of about 60,000 physicians of all ages from colleges, from industry, from civilian practice, from retirement, willingly sacrificing careers and interrupting established practices in order to carry on what medicine has always considered its traditional duty Even those at home gave freely of their limited time, without thought of compensation, to the work of physical examinations under Selective Service

Not only the physician, but every parent, every wife, every individual with any stake in the war, no matter how remote this might be, has a right to be proud of the record presented in *Doctors at War*

BENJAMIN M BERNSTEIN

Microbial Antagonisms and Antibiotic Substances By Selman A Waksman Octavo of 350 pages, illustrated New York, Commonwealth Fund, 1945 Cloth, $3 75

Dr Waksman's timely and scholarly work brings together in one book most of the available information on antibiotic substances Beginning with the microbiology of the soil, the author considers the interrelationship and antagonisms of bacterial and mycotic populations He describes the general methods for isolating antibiotic organisms, the methods of cultivating and testing them, and of measuring their activity The individual antibiotic substances are discussed in detail from the standpoint of their preparation, their chemical structure, their mode of action on bacteria, and their utilization in therapy The bibliography contains over a thousand references, and the index is excellent

This volume is an up-to-date discussion of a live and interesting subject, by a man who has himself made many notable contributions in that field

ARNOLD H EGGERTH

A Textbook of Ophthalmology By Sanford R Gifford, M D Third edition, revised Octavo of 457 pages, illustrated Philadelphia, W B Saunders Co , 1945 Cloth, $4 00

This third edition was completed before Dr Gifford's untimely death and the changes in it are therefore his own There are some new illustrations and a fuller discussion of ptosis, contact glasses, cyclodiathermy, and epidemic keratoconjunctivitis

As in previous editions of this small textbook designed for students and general practitioners, the whole range of ophthalmology is covered in a brief, concise, and eminently readable way The present volume is well indexed and contains over four hundred pages, two hundred and fifteen illustrations, four charts, and thirteen colored plates It also contains a wealth of information for those for whom it was written and makes interesting reading for the ophthalmologist as well

E CLIFFORD PLACE

Shoulder Lesions By H F Moseley, D M , (Oxon) Quarto of 181 pages, illustrated Springfield, Ill , Charles C Thomas, 1945 Cloth, $4 50

Moseley's monograph will be of interest to every medical man, not only to the orthopedist Every physician is called upon to treat pain in shoulders and necks and all will profit from this systematic treatise

Newer concepts (such as cervical disc and scalenus syndromes) are discussed in detail Therapy, including the use of novocaine and x-ray, is treated fully A special word of commendation should be given the section by McNaughton on the neurological aspects of shoulder pain

MILTON PLOTZ

Penicillin and Other Antibiotic Agents By Wallace E Herrell, M D Octavo of 348 pages, illustrated Philadelphia, W B Saunders Co , 1945 Cloth, $5 00

This book is very detailed and complete It brings up to date the present knowledge and uses of penicillin, tyrothricin, streptothricin, and other antibiotic agents Naturally, the largest part is devoted to penicillin The historic section is very well done Methods of preparation, antibacterial activity in vitro and in vivo, physical and chemical properties, and methods of testing are presented in addition to the clinical uses This book will find its main use as a reference for those interested in this field, for it contains the results of trial of these agents on a very large number of diseases and organisms Its appeal to the clinician lies in this large field and detailed consideration of effects and dosage

VICTOR GROVER

Trauma in Internal Diseases With Consideration of Experimental Pathology and Medicolegal Aspects By Rudolf A Stern, M D Octavo of 575 pages, New York, Grune & Stratton, 1945 Cloth, $6 75

Dr Stern has given us a most readable, fascinating treatise on the close correlation between trauma and many of the usual conditions encountered in medical practice

Numerous, thorough case histories have been included, illustrating each disorder and showing the relationship of trauma to the pathology with clinical laboratory, operative, and, frequently, postmortem findings This is supplemented by a careful, com-

[Continued from page 664]

At times it would seem as if the discussions might be somewhat complicated for student nurses, especially today with lowered admission requirements

In all, the book fills a definite need

ABRAHAM R. KANTROWITZ

Doctors at War Edited by Morris Fishbein, M D Octavo of 418 pages, illustrated New York, E P Dutton & Co , 1945 Cloth, $5 00

If civilization represents the precious amalgam resulting from the commingling of the very finest attributes contributed to it by the art, philosophy, literature, science, and industry of the land, then war has no place in our thinking and in our planning for the future Yet, wars have come and we hope soon will be gone for all time. And in war there is destruction and death and hate and fear and courage and sacrifice and devotion to duty and faith in Fate and love of country and ideals and, yes, there is also glory With all due humility and with pardonable pride, medicine seeks top ranking in the honors distributed and implied i sharing the glory so widely earned in this worst of all wars

In sixteen chapters the recital of the story of *Doctors at War* carries on from the job done by Selective Service in choosing the human material necessary for war, through all phases of the participation of the doctor in the Army, the Navy, and the Air, in the Red Cross, the Public Health Service, in industry, both at home and abroad, in convalescence and rehabilitation, to medical research now and tomorrow

No other field of endeavor can begin to compare with, much less equal, the voluntary enlistment of about 60,000 physicians of all ages from colleges, from industry, from civilian practice, from retirement, willingly sacrificing careers and interrupting established practices in order to carry on what medicine has always considered its traditional duty Even those at home gave freely of their limited time, without thought of compensation, to the work of physical examinations under Selective Service.

Not only the physician, but every parent, every wife, every individual with any stake in the war, no matter how remote this might be, has a right to be proud of the record presented in *Doctors at War*

BENJAMIN M BERNSTEIN

Microbial Antagonisms and Antibiotic Substances. By Selman A Waksman Octavo of 350 pages, illustrated New York, Commonwealth Fund, 1945 Cloth, $3 75

Dr Waksman's timely and scholarly work brings together in one book most of the available information on antibiotic substances Beginning with the microbiology of the soil, the author considers the interrelationship and antagonisms of bacterial and mycotic populations He describes the general methods for isolating antibiotic organisms, the methods of cultivating and testing them, and of measuring their activity The individual antibiotic substances are discussed in detail from the standpoint of their preparation, their chemical structure, their mode of action on bacteria, and their utilization in therapy The bibliography contains over a thousand references, and the index is excellent

This volume is an up-to-date discussion of a live and interesting subject, by a man who has himself ibutions in that field

ARNOLD H EGGERTH

A Textbook of Ophthalmology By Sanford R Gifford, M D Third edition, revised Octavo of 457 pages, illustrated Philadelphia, W B Saunders Co , 1945 Cloth, $4.00

This third edition was completed before Dr Gifford's untimely death and the changes in it are therefore his own There are some new illustrations and a fuller discussion of ptosis, contact glasses, cyclodiathermy, and epidemic keratoconjunctivitis

in whooping cough

Elixir Bromaurate

GIVES EXCELLENT RESULTS

Cuts short the period of the illness and relieves the distressing spasmodic cough. Also valuable in Bronchitis and Bronchial Asthma. In four-ounce original bottles. A teaspoonful every 3 to 4 hrs.
(Contains one-half grain Gold Tribromide in one fluidounce. Alcohol 2½% by volume.)

PHARMACAL CO., NEW YORK CITY

[Continued from page 668]

This book supplies the necessary medical information, namely, pathology, symptoms, and treatments of the major orthopedic disabilities There are 181 excellent illustrations, including nursing technics necessary for the nursing care of the orthopedic patient A chapter is included on the use of physiotherapy and surgical appliances, as well as the care of patients in casts A large chapter is devoted to the study of poliomyelitis

This book is recommended highly for nursing schools attached to orthopedic institutions

JOSEPH I NEVINS

Medical Gynecology By James C Janney, M D Octavo of 389 pages, illustrated Philadelphia, W B Saunders Co , 1945 Cloth, $5 00

This very interesting and complete little volume is extremely valuable for both the general practitioner and the specialist in the field, for it has all the newer thoughts as well as a careful evaluation of the older ideas The arrangement of the text and the illustrations are also well done

SANFORD KAMINESTER

The Fundamentals of Electrocardiographic Interpretation By J Bailey Carter, M D Second edition Octavo of 406 pages, illustrated Springfield, Ill , Charles C Thomas, 1945 Cloth, $6 00

This book is essentially an effort to supply the general practitioner with a sound foundation on which to base his interpretation of electrocardiograms, and in this it succeeds admirably The explanations are simple and brief so that they can be easily understood All the conditions discussed are illustrated by typical curves which have been very well reproduced The place of electrocardiography in the study of heart disease is well presented and it is stressed that by merely taking an electrocardiogram the whole diagnosis of heart disease is not settled

A large amount of space is devoted to coronary disease, and this is reviewed in a conservative manner For those who desire to delve further into the subject an excellent bibliography is appended to each chapter

The book adequately fulfills the purpose for which it was written

J HAMILTON CRAWFORD

The Marihuana Problem in the City of New York Sociological, Medical, Psychological and Pharmacological Studies By the Mayor's Committee on Marihuana Octavo of 220 pages, illustrated Lancaster, Jaques Cattell Press, 1944. Cloth, $2 50

This report has already received considerable publicity in the press because of its thoroughness and honesty It is the fact-finding report of a group of individuals appointed by Mayor F H LaGuardia to investigate the various facets of marihuana smoking—the extent to which it is used, the relationship between marihuana smoking and eroticism, crime, juvenile delinquency, etc

Some of the conclusions may come as a surprise to those who are not acquainted with the problem It seems obvious from work of the committee that marihuana is not a narcotic in the sense that it is not habit forming, nor does it lead to a compulsion for the drug As a habit it may not be an admirable one, but as a social problem it is not a disturbing one

The book is well written and should be read by all those who are socially minded

JOSEPH L ABRAMSON

Rypins' Medical Licensure Examinations Topical Summaries, Questions, and Answers Edited by Walter L Bierring, M D With the collaboration of a review panel Fifth edition Philadelphia, J B Lippincott Co , 1945 Cloth, $6 00

The extremely meager and fragmentary text of this volume could be of value only to the medical student reviewing for an examination In spite of the collaboration of an impressive editorial board in the preparation of this edition, one may question whether the possession of this book at an examination would enable the candidate to achieve more than a minimum passing grade However, it is only fair to state that the aim of Dr Rypins was probably only a little more ambitious than this and that the text will probably serve a limited audience satisfactorily

MILTON PLOTZ

The Medical Clinics of North America. Nationwide Number March, 1945 Octavo Philadelphia, W B Saunders Co , 1943 Published bimonthly (six numbers a year) Cloth, $16 net, paper, $12 net

This is an interesting and informative review of recent developments in internal medicine The articles are, in general, clear and concise and deal with many problems including diagnosis, treatment, and pathologic physiology

In general, controversial questions are treated with admirable fairness There are adequate references to the literature and a refreshing absence of authoritarian attitudes

The book can be wholeheartedly recommended to the internist or general practitioner looking for a thorough and understandable review of recent developments in medicine

ARTHUR SHAPIRO

Case Studies in the Psychopathology of Crime A Reference Source for Research in Criminal Material Vol 2 By Ben Karpman, M D Quarto of 738 pages Washington, D C , Medical Science Press, 1944 Cloth, $16

The subject of crime has been holding the attention of all thinking people since the dawn of civilization Yet crime is an ever-distressing subject that has plagued humanity throughout the ages It gained its greatest significance in the war crimes of the Axis nations Naturally, a volume on the subject written by an eminent psychiatrist is of profound significance and importance The present volume is the second in a series on *Case Studies in the Psychopathology of Crime* It deals with cases involving sexual crimes, and many of its cases were treated by the psychoanalytic method. One case is described as it was treated session by session so that the progress of therapy could be followed by the reader Furthermore, the dream material was included as a part of the patient's mental productivity

The book is a rather thorough presentation of the psychologic processes and the motivation of conduct in these unfortunate people It will appeal to all who are interested in the subject of crime, and to all others who are students in abnormal human behavior and its most serious manifestation, that of criminal conduct It is the product of much thought, survey, and scientific speculation and application of the psychoanalytic method It should receive a warm welcome from the serious student of psychiatry, sociology, and criminology It is highly recommended to all intelligent and serious students in any of the many fields of aberrant human behavior

This good milk for babies is also good for expectant mothers

THE adequate inclusion of milk solids in the pre-natal diet is facilitated when Carnation Evaporated Milk is used

As it pours from the can, Carnation is a *concentrated* food Undiluted or only partially diluted, it may be used in many recipes to increase the milk nutrients to a degree not possible with ordinary milk That is a definite advantage where the mother's appetite for milk as a beverage is limited

The same qualities that have won Carnation Milk universal favor as a food for infants are no less valuable in the pre-natal diet. Safety is assured by hermetic sealing and sterilization Heat treatment enhances digestibility And scientific processing conserves essential nutritive values

In addition, Carnation is fortified with 400 U S P units of vitamin D_3 per pint —a level recommended for the protection of the mother's bones and teeth, as well as for proper fetal development

Carnation Milk's universal availability and genuine economy are further factors in its favor *Carnation Company, Milwaukee 2, Wis. and Toronto, Ont.*

ESKADIAZINE

makes oral sulfadiazine therapy easier

ESKADIAZINE—the ideal oral sulfadiazine—
has these three advantages:—

1 **Fluid Form** This new fluid sulfadiazine is the ideal oral dosage form, especially for infants and children, and also for the many adults who object to tablet medication Each 5 cc (1 teaspoonful) contains 0 5 Gm (7.7 gr) of sulfadiazine.

2 **Exceptional Palatability.** Eskadiazine is so surprisingly palatable and pleasant in consistency that it is accepted willingly by all types of patients. Children actually like to take it

3 **More Rapid Absorption.** The findings of a recent clinical study by Flippin and associates (Am J M Sc , Aug 1945) indicate that with Eskadiazine desired serum levels may be far more rapidly attained than with sulfadiazine administered in tablet form

Smith, Kline & French Laboratories, Philadelphia, Pa

S.K.F.'s new, outstandingly palatable fluid sulfadiazine for oral use

"It's a Boy!"

—and his life expectancy is brighter, and longer by 15 years —thanks to medicine's "men in white"

● Cold figures with a warm, wonderful significance. Yes, the figures on increased life expectancy tell as much as a five-foot shelf of volumes on the amazing strides modern medical science has made in protecting and prolonging human life.

Cryptorchidism

Undescended testes are exposed to several hazards —atrophy, sterility, torsion and malignant degeneration. *Even if these unfortunate complications* do not eventuate, the very existence of cryptorchidism may be responsible for or contribute toward psychic disturbances in adolescence.

PRANTURON

Administration of PRANTURON, chorionic gonadotrophin, at an early age often causes the cryptorchid organ to assume its natural position and thereby promotes somatic and emotional readjustment.

PRANTURON is available in two strengths as a stable powder in multiple dose vials to permit flexibility in dosage, each vial containing 5,000 I U or 10 000 I U of dry highly purified hormone of pregnancy urine. When diluted with the sterile diluent provided solutions of 500 I U per cc. or 1,000 I U per cc. are obtained. Packaged in boxes of one vial

IN THE CORRECTION OF HYPOCHROMIC ANEMIA

More than Iron Alone

MAY BE NEEDED

Hypochromic anemia, whether caused by inadequate food intake, increased nutritional requirement, or by blood loss, usually tends to perpetuate itself Anemia engenders anorexia, hypochlorhydria and impaired digestion. This interferes with adequate intake, absorption and utilization of iron and other essential nutrients, thus intensifying the anemic state

For the speedy correction of the anemia syndrome and its associated multiple nutritional deficiencies, iron alone is usually inadequate *All* the lacking essential nutrients must be supplied, by both diet and appropriate medication.

★ **Heptuna**

a **ROERIG** *Preparation*

Heptuna presents a convenient and effective means of treating hypochromic anemia by supplying not only iron, but also other metabolic essentials frequently needed.

EACH CAPSULE CONTAINS:

★ **The Most Readily Available Form of Iron**

Ferrous Sulfate U.S.P	4½ Grains

★ **Natural Fat-Soluble Vitamins**

Vitamin A (Fish Liver Oil)	5,000 U S.P Units
Vitamin D (Tuna Liver Oil)	500 U S.P Units

★ **B-Complex Vitamins**

Vitamin B_1 (Thiamine Hydrochloride)	2 mg
Vitamin B_2 (Riboflavin)	2 mg
Vitamin B_6 (Pyridoxine Hydrochloride)	0 1 mg
Calcium Pantothenate	0.333 mg
Niacinamide	10 mg.

★ **Whole Natural B Complex**

Derived from Liver Concentrate (Vitamin Fraction) and Dried Yeast U S.P

In treating Paranasal Infection

Avoid the Congestive Rebound

of Vasoconstrictors

Help restore normal function

with ARGYROL

This vicious circle of vasoconstriction and compensatory congestion with many vasoconstrictors does *not* lead to restoration of normal function in the nasal passages.

On the other hand, the cleansing demulcent and bacteriostatic actions of ARGYROL aid the natural defense mechanism without disturbing the normal physiology of the mucous membranes.

The Three-Fold Action of ARGYROL:

In contact with the mucous membrane ARGYROL possesses these unique advantages

1. ARGYROL is decongestive without irritation to the membrane and without ciliary injury
2. ARGYROL is definitely bacteriostatic, yet is non toxic to tissue.
3. ARGYROL cleanses, and stimulates secretion, thereby enhancing Nature's own first line of defense

Three-Fold Approach to paranasal therapy:

1. The nasal meatus — by 20 per cent ARGYROL instillations through the nasolacrimal duct.
2. The nasal passages...with 10 per cent ARGYROL solution in drops
3. The nasal cavities...with 10 per cent ARGYROL by nasal tamponage

ARGYROL *the Physiologic Anti-infective with broad, sustained action*

Made only by the **A. C. BARNES COMPANY • NEW BRUNSWICK, N. J.**

ARGYROL is a registered trade mark, the property of A. C. Barnes Company

Announcing Two New

Amino Acid Preparations

NATIONAL'S ANSWER to the rapidly increasing demand for potent palatable amino acid preparations. Alone and in combination with vitamins and minerals suitable preparations containing amino acids are proving themselves in everyday practice. Each of these *new* products fills a need. You'll find them of immediate use in *your* practice.

AMINOVITE provides amino acids, B Complex factors and minerals. Palatable. Indicated as a general dietary supplement.

Contains. Protein Hydrolysate 70% Autolyzed Yeast 10% Hi Ribo 2% Liver Powder (secondary fraction) 2% Lactalbumin, 10% In 4 oz., 8 oz. and 1 lb. packages

AMINONAT supplies in a palatable and concentrated form amino acids required for tissue construction and regeneration. Indicated in hypoproteinemic states.

Contains. Protein Hydrolysate, 94% Sodium Chloride 2% Flavoring Agents, 4% In 4 oz., 8 oz. and 1 lb. packages.

AMIRON

is designed for use as a hematinic and to stimulate appetite.

Contains: (per fluidounce) Protein Hydrolysate 5% Liver Conc. (1 20) 5% Liquid Yeast 5% Carbohydrates, 35% Alcohol 10% Iron and Ammonium Citrates 4 gr. Thiamine Hydrochloride 8 mg. In 4 oz. 8 oz. pt. and gal. bottles

Announcing...

TWO NEW PENICILLIN PRODUCTS

of Schenley Laboratories, Inc.

PENICILLIN TROCHES SCHENLEY—

With a base which dissolves slowly, and thus gradually liberates penicillin at the site of infection, these troches provide an effective means for treatment of mouth and throat infections due to Vincent's organisms Penicillin Troches Schenley retain potency over long periods when kept at recommended temperature.

Penicillin Troches Schenley—1,000 units each Supplied in bottles of 25

PENICILLIN TABLETS SCHENLEY—

Buffered with calcium carbonate, these superior tablets are indicated in treatment of gonorrhea and in continuing therapy of pneumococcic, streptococcic, and staphylococcic infections after acute phase of infection has been controlled. Stability of tablets permits ambulatory patients to carry with them the required daily dose.

Penicillin Tablets Schenley — 25,000 units each Supplied in bottles of 20

A proven aid in preventing rashes

Use of Mennen *Antiseptic* Baby Oil in the home can save you avoidable calls—because it helps to keep baby's skin smooth and healthy, free of many rashes and skin infections. No other oil or lotion can match the Mennen record of excellent results on *millions* of infants over the past 12 years. That is why, in recent surveys, baby specialists said—4 to 1—they prefer Mennen *Antiseptic* Baby Oil over all other oils and lotions. Hospital survey shows that 8 times as many hospitals prefer Mennen Antiseptic Baby Oil as *all other oils combined.*

Effective Convenient Economical

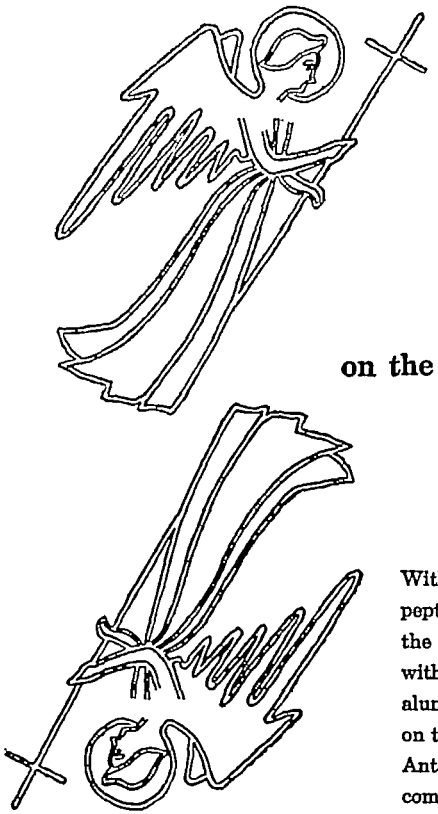
THE effectiveness of Mercurochrome has been demonstrated by more than twenty years of extensive clinical use For professional convenience Mercurochrome is supplied in four forms—Aqueous Solution in Applicator Bottles for the treatment of minor wounds, Surgical Solution for preoperative skin disinfection, Tablets and Powder from which solutions of any desired concentration may readily be prepared

Mercurochrome

(H W & D brand of merbromin, dibromoxymercurifluorescein-sodium)

is economical because stock solutions may be dispensed quickly and at low cost. Stock solutions keep indefinitely

Mercurochrome is antiseptic and relatively non-irritating and non-toxic in wounds



Complete literature will be furnished on request.

For National Rehabilitation

Ice Cream is so Delicious

it's hard to believe

it can be so Nutritious!

But look what it provides:

On top of its welcome deliciousness beyond its tempting, refreshing taste that everyone loves see what bounteous nourishment every helping of ice cream brings

Vitamins Ice Cream is a good source of Vitamin A and Riboflavin (Vitamin G) and contains other vitamins found in milk

Minerals Calcium, necessary for strong bones and teeth, is supplied abundantly by Ice Cream

Proteins Ice Cream provides high-quality proteins those found in milk to promote health and well being

No other single food provides Ice Cream's particular combination of nutritive elements *No wonder* Ice Cream is playing a leading role in national rehabilitation and in lifting everyone's morale

CHLOROPHYLL THERAPY

Proved in the laboratory! Proved in the clinic!
NOW PROVED IN PRACTICE!

Chloresium

REG. U.S. PAT. OFF.

The natural nontoxic healing agent containing the water soluble derivatives of chlorophyll For the treatment of wounds, burns, ulcerative conditions

1 Accelerates healing
2 Stimulates normal cell growth
3 Reduces scar formation
4. Controls infection
5 Is nontoxic—bland and soothing
6 Deodorizes malodorous lesions

During the past five years, exhaustive laboratory and clinical research has shown that the water-soluble derivatives of chlorophyll "a" contained in Chloresium measurably accelerate the healing of wounds, burns, ulcers and similar lesions, especially those of the chronic, indolent and resistant types In addition, Chloresium was shown to promptly eliminate the almost unbearable odors associated with suppurative conditions such as ulcerative carcinoma, chronic osteomyelitis leg ulcers and similar malodorous cases

Now—proved in general practice

The response of the medical profession to Chloresium since its introduction last October has been most gratifying In one recent month over five thousand requests for literature were received A steady volume of re-orders from hospitals and pharmacists is conclusive proof that physicians have found in Chloresium an important new therapy for healing and deodorizing

If you have not used Chloresium, send the coupon The results which it can achieve are the best evidence of what Chloresium can do

Chloresium is ethically promoted
Available at all leading druggists.

CHLORESIUM SOLUTION (PLAIN) 2-oz. and 8-oz. bottles
CHLORESIUM OINTMENT 1-oz tubes and 4-oz jars
CHLORESIUM NASAL SOLUTION ½-oz. dropper bottles and 2-oz. and 8-oz. bottles

Both CHLORESIUM SOLUTION (PLAIN) nd CHLORESIUM OINTMENT contain the purified, therapeutically active *water-soluble* derivati es of chlorophyll "a" ($C_{55}H_{72}O_5N_4Mg$) They are maintained to rigid chemical and physical standards and are pharmaceutically adjusted to a low surface tension to lavore penetrability CHLORESIUM NASAL SOLUTION contains these same *water-soluble* chlorophyll derivatives in an isotonic saline solution suitably buffered for nasal instillation. Indicated for symptomatic relief nd for accelerat ion of healing of acute and chronic inflammatory conditions of the upper respiratory tract.

FREE—mail coupon for literature and sample

Ertron

IS DIFFERENT FROM

ANY OTHER ANTIARTHRITIC

THERAPEUTIC ACTION

Therapeutically, Ertron is different from any other antiarthritic Many patients in large series of clinical studies have experienced restoration of movement in affected joints, relief of pain and measurable evidence of reduced swelling Comprehensive published works are evidence of established therapeutic action

CHEMICAL COMPOSITION

It can now be said that chemically, too, Ertron is unique Ertron differs in chemical composition from the ordinary vitamin D preparations—a fact that undoubtedly accounts for the excellent results obtained with Ertron

Simply stated, Ertron is electrically activated vaporized ergosterol prepared by the Whittier Process Each capsule contains 5 mg of activation products *having a potency of not less than 50,000* U.S P Units of vitamin D

Ertron contains a number of hitherto unrecognized factors which are members of the steroid group The isolation and identification of these substances in pure chemical form further establish the chemical as well as the therapeutic uniqueness of Ertron

ERTRONIZATION THERAPY

Physician control of the arthritic patient is essential for optimum effect To Ertronize employ Ertron in adequate daily dosage over a sufficiently long period to produce beneficial results If signs of overdosage appear, discontinue medication for about ten days—then continue with three capsules per day gradually building up to the patient's level of tolerance.

Ertron is the registered trade-mark of Nutrition Research Laboratories

SUPPLIED IN BOTTLES OF 50, 100 AND 500 CAPSULES

Parenteral for supplementary intramuscular injection

Ethically promoted

NUTRITION RESEARCH LABORATORIES • • • CHICAGO

No Other Infant Foods

OFFER THIS DUAL PROCESSING AND ITS ADVANTAGES

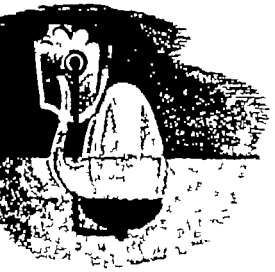
FIRST STRAINED, then HOMOGENIZED—a dual process applied to all Libby Baby Foods—makes these homogenized foods more easily digestible, of a finer texture, and safe for feeding as early as the fifth week of life.

Homogenization, an exclusive Libby process in baby foods, ruptures the food-cell capsules within which the actual nutrients are contained. The largest resultant particles found in Libby's Strained and Homogenized Baby Foods measure 250 microns or less, while in foods which have been merely strained the size reaches 840 microns or more.

Rupture of the cells releases the contained nutriment, disperses it uniformly, and exposes it directly to the action of the digestive juices, making it more easily digestible. At the same time, the inert cellulose fibers of the cell capsules are comminuted to ultraminute fragments which are not irritating to the digestive tract, yet retain their value as "bulk."

Libby's Baby Foods are of such fine, smooth texture that they flow freely through an ordinary-size nipple opening when incorporated in the baby's "formula."

And it has been shown that *homogenization* increases the availability of iron in strained vegetable foods, early feeding of Libby's Baby Foods is a valuable prophylactic measure against the so-called "physiologic" anemia in early infancy.



Libby, McNeill & Libby

Chicago 9, Ill.

NOT MERELY STRAINED *Homogenized too!*

ACCEPTED AMERICAN MEDICAL ASSN. Council on Foods and Nutrition

When the pressure is low—
the circulation slackens

In chronic hypotension or states of circulatory deficiency associated with convalescence mild collapse, and other asthenic states Sympatol provides convenient symptomatic therapy Orally effective Sympatol improves the peripheral circulation by raising systolic and venous pressure and increasing cardiac output. Circulation time is shortened although the pulse rate is frequently slowed

Sympatol

To Improve Peripheral Circulation

THERAPEUTIC APPRAISAL: A synthetic pressor drug—para methylaminoethanolphenol tartrate—for providing safe circulatory stimulation. Sympatol on oral administration increases venous and systolic pressures significantly diastolic pressure only slightly with little or no effect on the central nervous system Repeated doses are consistently and uniformly effective

INDICATED for symptomatic treatment of circulatory atony—to improve peripheral circulation to increase cardiac output and shorten circulation time; to increase cardiac efficiency

DOSAGE: Adults—1 to 3 tablets three times daily or 1 to 2 cc. of solution every four to six hours. Children—5 to 20 minims of solution repeated as required.

SUPPLIED in 100 mg tablets, bottles of 50 10% solution (100 mg per cc.) for oral use bottles of 30 cc.

New, effective treatment for impetigo...

ULCERS	INFECTED WOUNDS
ABRASIONS	INFECTED DERMATITIS
FOLLICULITIS	SYCOSIS VULGARIS
FURUNCULOSIS	INFECTED CYSTS

Tyrothricin's full germ-killing power utilized

● Containing tyrothricin *in true solution*, Bactra Tycin Ointment meets a vital need in the treatment of many common diseases of the skin.

In impetigo, healing proceeds rapidly from first application. Reports from private and clinic practice show that involved areas clear up in a matter of days

The response of surface infections, particularly with staphylococci and streptococci, to Bactra Tycin is prompt and favorable. It is bactericidal on contact, its use also promotes growth of granulation tissue and repair

Each gram of Bactra Tycin contains 1 mg. tyrothricin

This ointment is stable, requires no refrigeration. It is soothing, non toxic, easily applied.

Descriptive literature and sample on request.

YOU CAN'T OVERRATE THE VALUE OF CONTROL

Everyone can see the need for control measures against *obvious* dangers But dramatic and constant campaigning is necessary to win public support in the fight against the unseen menace of cancer. Interest must be awakened and education conducted to enlist the public co-operation requisite to success This challenging work is the responsibility of the Field Army of the American Cancer Society

To give appropriate significance to these efforts and to focus nation-wide attention on this vital problem, Congress has designated April, "Cancer Control Month " And again this Spring, as in each drive spearheading the next year's activities, the Field Army's straightforward appeal to all Americans is "GIVE, to Conquer Cancer."

Once more, over 10,000 Rexall Drug Stores across the country unite in behalf of this cause. Urging Americans to heed the Society's plea, these stores contribute facilities for distribution of literature cautioning "Consult your doctor" at the first moment of cancer's "danger signals."

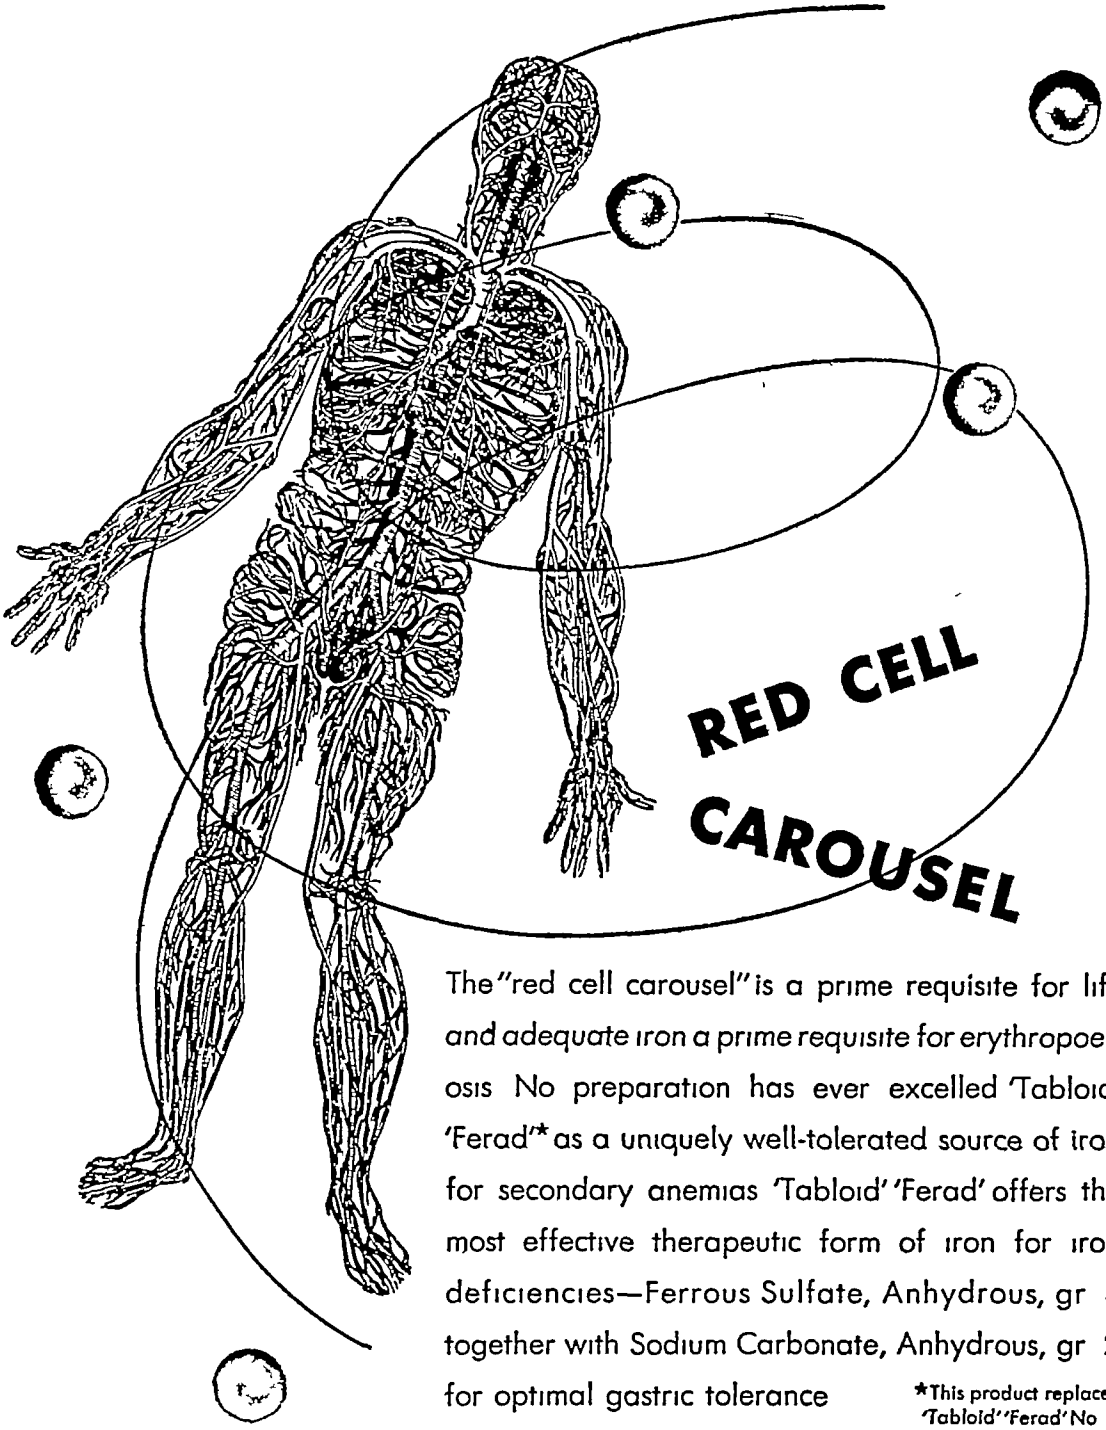
prevention OF SECONDARY POST-TONSILLECTOMY HEMORRHAGE WITH

"A preliminary study of the routine use of sulfathiazole gum after tonsillectomy indicated a reduction in the incidence of secondary hemorrhage. In addition, the gum appeared to exert a favorable effect on the healing of the pharyngeal wound."

—McGovern, F. H.: Arch. Otolaryngology 40:196-197 (Sept.) 1944.

White's SULFATHIAZOLE GUM*

AVAILABLE
In packages of 24 tablets, sanitaped, in slip-sleeve prescription boxes.



IMPORTANT:
Please note that your patient requires your prescription to obtain this product from the pharmacist.

When a single tablet of pleasantly flavored Sulfathiazole Gum is chewed for one-half to one hour it provides a high salivary concentration of *locally active* sulfathiazole averaging 70 mg. per cent. Moreover resultant blood levels of the drug, even with maximal dosage, are so low (rarely reaching 0.5 to 1 mg. per cent) that systemic toxic reactions are virtually obviated.

INDICATIONS:
Local treatment of sulfonamide-susceptible infections of oropharyngeal areas, acute tonsillitis and pharyngitis—septic sore throat—infectious gingivitis and stomatitis—Vincent's infection. Also indicated in the prevention of local infection secondary to oral and pharyngeal surgery.

DOSAGE:
One tablet chewed for one-half to one hour at intervals of one to four hours depending upon the severity of the condition. If preferred, several tablets—rather than a single tablet—may be chewed *successively* during each dosage period *without significantly increasing the amount* of sulfathiazole systemically absorbed.

A PRODUCT OF
WHITE LABORATORIES, INC.
PHARMACEUTICAL MANUFACTURERS NEWARK 7, N. J.

The "red cell carousel" is a prime requisite for life and adequate iron a prime requisite for erythropoiesis No preparation has ever excelled 'Tabloid' 'Ferad'* as a uniquely well-tolerated source of iron for secondary anemias 'Tabloid' 'Ferad' offers the most effective therapeutic form of iron for iron deficiencies—Ferrous Sulfate, Anhydrous, gr 3 together with Sodium Carbonate, Anhydrous, gr 2 for optimal gastric tolerance

*This product replaces 'Tabloid' 'Ferad' No 2

'TABLOID' 'FERAD'.

BURROUGHS WELLCOME & CO (U S A) INC, 9 & 11 EAST 41ST ST, NEW YORK 17, N Y

Now

MILLIGRAM-UNITAGE LABELED

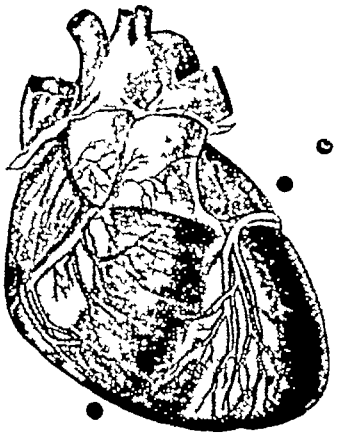
Effective immediately, every vial of Penicillin-C S C will state the potency of the product in units per milligram

The high state of purification achieved in Penicillin-C S C is indicated by this unitage per milligram statement—in no instance will Penicillin C.S C. contain less than 1300 units per milligram.

PENICILLIN-C.S.C.

As the illustration indicates, Penicillin-C.S C. now offers two important advantages

A) Exact milligram unitage labeling enables the physician to know precisely what he is administering so far as purity is concerned



B) Purity above 1300 units per milligram largely avoids the reactions attributed by many investigators to insufficient purification

CSC PHARMACEUTICAL DIVISION

COMMERCIAL SOLVENTS CORPORATION

17 East 42nd St., New York 17 N Y

Penicillin-C.S C. is accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

No different instructions needed for the patient— No difference in therapeutic procedure

Yet All These Advantages

DIGITALINE NATIVELLE—pure crystalline digitoxin—the chief active glycoside of Digitalis purpurea, offers many advantages in the treatment of congestive heart failure, auricular flutter and fibrillation

Its administration is identical with that of whole digitalis leaf preparations, since one tablet of Digitaline Nativelle (0 1 mg) is the therapeutic equivalent of 1 5 gr of standardized whole leaf Hence no different instructions to the patient are necessary, no greater caution need be observed One such tablet of Digitaline Nativelle has been found to be the average maintenance dose, to be increased or decreased if necessary

Because it is pure crystalline digitoxin, the dosage of Digitaline Nativelle is measured by weight, hence unvarying potency is provided Digitaline Nativelle is absorbed in toto, probably directly from the stomach, making for greater tolerability and virtual freedom from nausea and vomiting due to local irritation

ACCEPTED AMERICAN MEDICAL ASSN

COUNCIL ACCEPTED

Digitaline Nativelle also provides the outstanding advantage of rapid, complete digitalization from oral administration The average digitalizing dose is 1 2 mg , given either at one time or in 2 doses of 0 6 mg each at a 3- to 6-hour interval Digitalization is complete in 6 to 10 hours

Physicians are invited to send for samples, literature and bibliography

FASTER HEMOGLOBIN *restoration*

Licuron B facilitates the answer to those nutritional deficiencies which have accumulated in winter The general debility so frequently reflected in the colds and infections of spring responds dramatically in many cases to the bi active antianemic, Licuron B

Licuron B, containing copper iron, restores hemoglobin faster and to a higher level than does iron alone.* The dose of iron required is accordingly less and this avoids side effects such as constipation But Licuron B also assures that, as the hemoglobin level rises, the general nutrition of the patient is improved In addition to copper iron Licuron B provides liver B-vitamins augmented by the crystalline vitamins thiamine, riboflavin and niacinamide. Because it is thus bi active, Licuron B is efficient therapy in debilitated and anemic states Small and easy-to-take, the sugar coated tablet of Licuron B assures patient-cooperation. Lakeside Laboratories, Milwaukee 1, Wisconsin

REHABILITATES

VAGINAL

MUCOSA...

Desquamation of vaginal epithelium, due to inflammatory reaction, is frequently encountered in acute, subacute and chronic vaginitis.

Floraquin allays such inflammatory conditions; destroys pathogenic organisms; provides carbohydrates for the restoration of mucosal glycogen; facilitates regeneration of vaginal epithelium; restores the normal vaginal pH—thus aiding reestablishment of the normal vaginal flora

Floraquin—a product of Searle Research—contains the nontoxic protozoacide, Diodoquin, together with adequate lactose, dextrose and boric acid to adjust and to *maintain the pH at approximately* 4.0 when mixed with vaginal secretions.

Floraquin and Diodoquin are the registered trademarks of G. D. Searle & Co., Chicago 80, Illinois

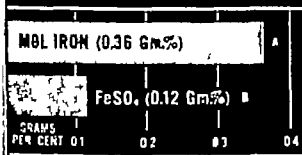
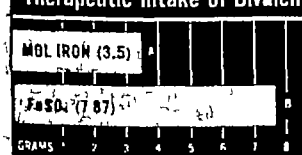
NEW YORK 13, N Y WINDSOR, ONT



Rapidity of Clinical Response

(A) Completely effective therapeutic response (return to normal blood values) was obtained in an average of 13.7 days of Mol-Iron therapy

(B) Ferrous sulfate therapy *failed* to produce normal hemoglobin values after an average of 20.3 days.



Average Daily Hemoglobin Increase

(A) The group treated with Mol-Iron averaged a daily hemoglobin increase of 2.48 per cent (0.36 Gm. per cent).

(B) The group treated with ferrous sulfate showed an average daily gain of hemoglobin of 0 83 per cent (0 12 Gm. per cent)—a response about one-third as effective.

Therapeutic Intake of Bivalent Iron

(A) The Mol-Iron treated group received an average total of 3.528 Gms. of bivalent iron to produce the sought for result (return to normal blood values).

(B) While an average ingestion of 7 871 Gms. of bivalent iron failed to achieve an optimal response in the ferrous sulfate treated group.

The charts summarize the results of a controlled study of comparative therapeutic response in post-hemorrhagic and nutritional hypochromic anemias.

The series includes 49 cases treated with Mol Iron and 21 with exsiccated ferrous sulfate; the results are typical of those observed in treatment of iron-deficiency anemias with White s Mol-Iron.

A DEFINITE ADVANCE IN TREATMENT OF HYPOCHROMIC ANEMIA

White's MOL-IRON TABLETS

As compared with ferrous sulfate given in equivalent dosage—

1 Normal hemoglobin values are found to be restored more rapidly with White's Mol Iron. Daily rate of hemoglobin formation may be *increased as much as 100% or more.*

2 Iron utilization is similarly more complete

3 Gastrointestinal tolerance is notably satisfactory—even where other iron preparations have previously been poorly tolerated.

INDICATIONS: Hypochromic (iron-deficiency) anemias caused by inadequate dietary intake or impaired intestinal absorption of iron, excessive utilization of iron, as in pregnancy and lactation, chronic hemorrhage

DOSAGE: One or two tablets three times daily after meals.

Available in bottles of 100 and 1000 tablets

Ethically promoted—not advertised to the laity

Postgraduate Course in Surgery

May 14, 15, 16, 1946

The diagnosis and management of common surgical disorders will be presented by members of the Lahey Clinic Staff in demonstrations and lectures.

There will be no charge for personnel on active duty in the armed forces. Registration fee will be $25 00 Applications will be limited and accepted in the order in which they are received. Registration fee should be enclosed with application.

Further information will be furnished on request.

PROGRAM

NEW ENGLAND MUTUAL HALL

Tuesday, May 14

MORNING SESSION—9 00 A M

DISEASES OF THE OESOPHAGUS, STOMACH AND SMALL INTESTINE

Introduction	Dr Neil W Swinton, *General Chairman*
Oesophageal Diverticulum	Dr Frank H. Lahey
Perforation of the Oesophagus	Dr Ralph Adams
Indications for Surgery in Peptic Ulcer	Dr Sara M Jordan
Surgical Treatment of Peptic Ulcer	Dr Frank H. Lahey
Cancer of the Stomach	Dr Samuel F Marshall
Experiences with Massive Hemorrhage from the Gastrointestinal Tract	Dr Richard B Cattell

AFTERNOON SESSION—2 00 P.M

DISEASES OF THE BILIARY TRACT

Gastroenterological Investigation in Suspected Biliary Tract Disease	Dr Sara M Jordan
Acute Cholecystitis and Pancreatitis	Dr Samuel F Marshall
Methods of Investigating Jaundice	Dr S. Allen Wilkinson
Surgery of the Gall Bladder and Common Duct	Dr Frank H Lahey
Indications for Splenectomy	Dr Donat P Cyr
Surgical Removal of Cancer of the Pancreas	Dr Richard B Cattell

EVENING SESSION—8 00 P M.

GYNECOLOGY

Abnormal Uterine Bleeding	Dr Neil W Swinton
Problems of Sterility	Dr A. S. Parker Jr
Dysmenorrhea	Dr Bentley P Colcock
Treatment of Varicose Veins	Dr Kenneth W Warren
Treatment of Cancer of Cervix and Uterus	Dr Hugh F Hare
Plastic Procedures on the Pelvic Outlet	Dr Herbert D Adams
Subtotal, Total and Vaginal Hysterectomy	Dr Richard B Cattell

Wednesday, May 15

MORNING SESSION—9 00 A.M

SURGICAL SPECIALTIES

Experience with Brain and Spinal Cord Tumors	Dr. Gilbert Horrax
Surgical Treatment of Hypertension	Dr James L. Poppen
Experience with Nerve Graft and Suture in Facial Nerve Paralysis	Dr Frank D Lathrop
Carcinoma of the Larynx	Dr Walter B Hoover
Surgical Pulmonary Infections of the Chest	Dr Herbert D Adams

AFTERNOON SESSION—2 00 P M

SURGERY OF THE COLON AND RECTUM

Principles in the Treatment of Anorectal Disease	Dr Neil W Swinton
The Etiology and Treatment of Diarrhea	Dr Everett D Klafer
Regional Ileitis	Dr Samuel F Marshall
Ulcerative Colitis	Dr Richard B Cattell
Management of Ileostomy and Colostomy	Dr Bentley P Colcock
Cancer of the Colon and Rectum	Dr Frank H. Lahey

Thursday, May 16

MORNING SESSION—9 00 A M

POSTOPERATIVE TREATMENT

Spinal Anesthesia	Dr Urban H. Eversole
Complications of Anesthesia	Dr Morris J Nicholson
Postoperative Phlebitis and Thrombophlebitis	Dr James A. Evans
Management of Postoperative Urinary Complications	Dr Earl E. Ewert
Management of the Painful Shoulder	Dr G E. Haggart
Pre- and Postoperative Nutritional Problems	Dr F N Allan
The Use of the Miller Abbott Tube	Dr Bentley P Colcock
Diagnosis and Management of Peripheral Vascular Disease	Dr Herbert D Adams
Principles of Radiation Therapy for Malignant Disease	Dr Hugh F Hare

AFTERNOON SESSION—2 00 P M

THYROID SURGERY

Cancer of the Thyroid	Dr Richard B Cattell
Intrathoracic Goiter	Dr Neil W Swinton
Preparation of Patients with Hyperthyroidism for Surgery with Thiouracil and Thiobarbital	Dr Elmer C Bartels
Clinical Aspects of Hyperthyroidism	Dr Lewis M. Hurxthal
Complications of Thyroid Surgery	Dr Frank H. Lahey

"What are the MAGIC WORDS?"

No magic words, no magic wand can improve a cigarette. *Something more tangible is needed.*

PHILIP MORRIS superiority is due to a different method of manufacture, which produces a cigarette *proved* definitely less irritating to the smoker's nose and throat.*

Perhaps you prefer to make your *own* test. Many doctors do. There is no better way to prove to your own satisfaction the superiority of PHILIP MORRIS.

* *Laryngoscope, Feb 1935, Vol XLV, No 2, 149 154*
Laryngoscope, Jan 1937, Vol XLVII, No 1, 58-60

TO PHYSICIANS WHO SMOKE A PIPE We suggest an unusually fine new blend—COUNTRY DOCTOR PIPE MIXTURE Made by the same process as used in the manufacture of Philip Morris Cigarettes.

WHEN *Living Itself* PROVES DIFFICULT

Stamina and strength, essential to a joyous, optimistic outlook, are vitally linked to the nutritional status, and will quickly wane if undernutrition is allowed to develop Zestful living and boundless energy are hardly compatible with nutritional deficiencies

For the below par patient whose inadequate nutritional intake is the responsible factor, Ovaltine as a dietary supplement can make a real contribution toward assuring nutritional balance A good source of high quality protein, readily utilized carbohydrate, well emulsified fat, and essential vitamins and minerals, Ovaltine can prove a significant factor in restoring the desired state of optimal nutrition Three glassfuls daily, made with milk as directed, provide appreciable amounts of essential nutrients as indicated by the table. The low curd tension of Ovaltine assures rapid gastric emptying, hence the appetite for regular meals is not impaired Ovaltine is equally enjoyed with meals and between meals

THE WANDER COMPANY, 360 N MICHIGAN AVE , CHICAGO 1, ILL.

Ovaltine

Three servings daily of Ovaltine each made of ½ oz. of Ovaltine and 8 oz of whole milk,* provide:

CALORIES	669	VITAMIN A	3000 I.U.
PROTEIN	32.1 Gm.	VITAMIN B_1	1.16 mg.
FAT	31.5 Gm.	RIBOFLAVIN	1.50 mg.
CARBOHYDRATE	64.8 Gm.	NIACIN	6.81 mg.
CALCIUM	1.12 Gm.	VITAMIN C	39.6 mg
PHOSPHORUS	0.839 Gm.	VITAMIN D	417 I.U
IRON	12.0 mg.	COPPER	0.50 mg.

*Based on average reported values for milk.

See the improved Hygeia Nursing Unit

- Easy to clean
- Fewer parts to handle — just bottle, nipple, and cap
- *When bottles are filled, only necessary to remove cap at feeding time*
- Sterilized cap makes handy container for baby's other foods

CAP . . . Keeps nipple germ-free for storing or out-of-home feeding Sterilized cap may be used for orange juice, cereals, etc

NIPPLE . . . Famous breast-shaped nipple has a patented airvent to insure steady flow of formula and reduce "wind-sucking" Sanitary tab keeps nipple sterile when applying *Not necessary to touch feeding surfaces of nipple*

BOTTLE . . . Wide mouth—easy to clean—no funnel required for filling Red measuring scale easy to read Tapered shape makes it easier for baby to hold

SAFE, SURE, ADEQUATE SOURCE OF NUTRITION

PURODIGIN now costs no more than preparations of whole digitalis leaf

Facts ON PURODIGIN

REG U S PAT OFF

PURODIGIN contains the highly purified glycoside, digitoxin ($C_{41}H_{64}O_{13}$)—"first in the choice of digitalis materials for general therapeutic use."—Gold et al., J Pharmacol *82* 187, 1944

PURODIGIN is approximately 1000 times as potent in man as digitalis leaf

PURODIGIN is safe. The ratio of therapeutic dose to toxic dose is the same as in the case of digitalis.

PURODIGIN is rapidly and completely absorbed following oral administration.

PURODIGIN is well tolerated. Small dosage and complete absorption minimize gastrointestinal irritation.

PURODIGIN dosage is based on weight, eliminating the confusion of biologic units

Digitalization can be accomplished with 1.2-1 5 mg , in single or divided doses.

Digitalization can be maintained in most patients with a dose of 0 2 mg. per day.

PURODIGIN is the first American-made digitoxin.

Editorial

The Chemistry of the Shock Syndrome

The theory that surgical shock is primarily due to a loss of effective blood volume has been justified by the dramatic results of replacement therapy during the war Nevertheless, the whole story of the shock syndrome is yet to be told Recent experimental work has opened an entirely new approach to the problem

From the very beginning of research on shock the hypothesis that the vasomotor changes causing pooling of the blood and loss of intravascular volume were due to toxic products of tissue damage has received much attention Histamine, callicrein, adenylic acid, acetylcholine, and bacterial toxins are examples Like the obvious suspects in modern murder mysteries, these substances apparently are to be replaced by an entirely new villain

The newer research is based on the work of Chambers, Zweifach, and their associates [1,2] They demonstrated in experimental animals that the shock syndrome consists of two stages, an initial compensatory and a subsequent decompensatory phase In the initial phase the capillaries and metarterioles of the omentum showed increased vasoconstriction activity and response to epinephrine This was favorable to vascular readjustments to reduced blood volume With prolongation of profound hypotension this hyper-reactivity was gradually replaced by a loss of vasoconstriction and an overflow into the vascular bed with progressive venular stagnation Once this hyporeactive stage had fully developed, replacement therapy had only a transient effect The condition became irreversible

That these two reactions are due to two antagonistic substances, one a vasodepressor and one a vasoexcitant, was proved by transference to normal animals, where they produced corresponding effects on the mesenteric vessels

The importance of this discovery was immediately recognized and served as a stimulus to further research What are these vasoexcitor and vasodepressor principles? Where do they originate? What mechanisms cause their formation and destruction? The answer to these questions was the objective of an extensive experimental study by Shorr, Zweifach, and Furchgott [3] The

[1] Zweifach, B W., Lee, R. E., Hyman C., and Chambers R.: Ann. Surg. 120: 232 (1944)
[2] Zweifach, B W Abell R G., Chambers, R., and Clowes, C. H. A. Surg., Gynec. Obst. 80: 593 (1945)
[3] Shorr E. S., Zweifach B. W., and Furchgott R. F.: Science 102 480 (Nov 16) 1945

extensive experimental work carried out by these workers seems to justify the following conclusions

1 The vasodepressor material (abbreviated to VDM) demonstrated by Zweifach, Chambers *et al*, originates in liver and skeletal muscle Its genesis is due to tissue anoxia

In hemorrhagic shock the liver is the major source In traumatic shock the damaged muscle may provide an additional amount of VDM to account for the differences in this two types of shock

2 The vasoexcitor material is produced chiefly in the kidneys under anaerobic conditions, but if shock is prolonged the production ceases and VEM disappears from the blood

3 The VEM is probably identical with the renin-angiotonin system, whose hypertensive action is well established The VDM of hepatic origin is its physiologic antagonist

The therapeutic implications of these studies are of great interest "The immediate problem of freeing the vascular bed from the deleterious influence of VDM can be approached in several ways It might be possible to antagonize its actions by supplying VEM in amounts sufficient to insure the resumption of the compensatory type of vascular reactivity, which in turn would lead to the restoration of an adequate blood flow to the tissues, particularly to liver and kidney The re-establishment of aerobic conditions in the liver should, to judge from in vitro experiments, halt any further production of VDM, thereby limiting the problem to the counteraction of inactivation of the VDM which had been previously released into the circulation In addition to direct antagonism by VEM, the possibility should also be considered of inactivating VDM in the blood stream by appropriate agents Mention has already been made of a cell-free liver extract which has proved capable of inactivating VDM under aerobic conditions in vitro "[3]

Some Thoughts on "Politics"

Not so long ago one of our valued readers criticized the Editors of this JOURNAL for venturing certain comments in their department dealing with local as well as world politics and social upheavals Well, why should not the doctors express themselves on these subjects? They come pretty closely into our professional lives, and not only ours but our patients', for we have to deal with the mishaps that result from them For example, an irresponsible labor leader in the largest city of this State tried to tie up its transport facilities and claims that this "may cause 5,000 deaths", other labor difficulties paralyze harbor traffic and the delivery of essential fuels, in many places, mass picketing defies court injunctions and woe to him who tried to break through the lines, public schools are closed by fear of violence, men and women who want to work are slugged to keep them from working, and the constituted authorities can do little or nothing about it Work stoppages bring on loss of wages and consequent family distress Restraints to production in the factories, to the production of food in the farms, the distribution of subsidies, of grants-in-aid, of unrestrained spending by government and individuals, of centralized control of our lives and activities, all are among the many factors which contribute to this present universal condition of doubt and unrest To say that the doctor has no interest either as a citizen or a professional man in these matters is absurd and nonsensical He has a definite interest and he must express him-

self as an individual and in his organized groups. He seems loath to do either unless he can be roused to do so as an essential obligation For he can be a power in his community if he so desires. Call it politics if you will, but participation need not label the doctor as a politician in a derogatory sense As an individual and as a class, he must recognize how important his influence is in community life, how much responsibility rests upon his shoulders, and how he cannot escape from assuming his part. Legislators make laws, but they receive their directives from the people and among the latter the doctor has a voice as well as his neighbor Let him use it

Safety in Childbirth

Puerperal mortality in this country for many years occupied an unenviable position. The possibility of its prevention or reduction was often doubted Deaths from childbirth were accepted as one of the unavoidable risks to which woman was heir This conception has changed, and in a recent article contained in the *Statistical Bulletin of the Metropolitan Life Insurance Company* (December, 1945) due credit is given to the various groups of interested physicians who combined to make a careful study of individual cases and did not hesitate to make public their findings The original New York Academy of Medicine report was assailed at the time as visionary and unwarranted, but a reduction in the maternal death rate in New York City from 64 per 10,000 in 1933 to 17, or a decrease of 73 per cent, emphasizes the contention that improvement was possible

There are deaths from childbirth which, even with our present knowledge, cannot well be prevented, but even this number is declining year by year as advances in medical research begin to bear fruit One need only point to the introduction and wider employment of the sulfa drugs and penicillin There remain certain factors, probably preventable, which require further efforts before they can be eliminated or their effects reduced, but the medical profession may well be proud of the accomplishments developed through its own effort.

Current Editorial Comment

Public Health Services for Veterans Opportunities and facilities for the health protection of the veteran and his family formed the theme of an address presented recently by Dr V A VanVolkenburgh, assistant commissioner for local health administration, before the training school for Veteran Guidance Counselors, State Division of Veterans Affairs

Emphasizing that every possible health safeguard must be utilized in behalf of the veteran and his dependents, Dr VanVolkenburgh said

"It is not enough to provide medical and surgical skills after illness occurs Every possible preventive skill within the limits of scientific knowledge must and shall be employed to protect against illness and premature death It is the obligation of state and local health departments to provide such protection

"Health department responsibilities are concerned primarily with the practice of community preventive medicine rather than individual curative medicine It is on this basis that the responsibilities of health personnel, the restrictions placed on the public, and the provisions for aid have been formulated. These are set forth in the Public Health Law and the Sanitary Code of the State"

Among the public health services readily available through health departments to veterans as well as to other population groups, Doctor VanVolkenburgh mentioned facilities for the early diagnosis and treat-

ment of cancer, tuberculosis, venereal and other communicable diseases, free advice on sanitation problems, maternity, infancy, and child-hygiene diagnostic and advisory clinic services, medical, nursing, and hospital care for the wives and children of men in certain grades of military service, administered by the State Department of Health under the federal Emergency Maternity and Infant Care Program, medical rehabilitation consisting primarily of care for physically handicapped children and remedial services for adults with abnormalities resulting from poliomyelitis, and health education materials including literature, posters, and motion pictures

. . .

The Onset of Labor What brings on labor? Frankly speaking, we do not know although the effort to solve the question has occupied the attention of many investigators Among the theories which have been advanced is that the full attainment of placental growth has something to do with it, but apparently this is not the case, as discussed in a recent article by Mandel, Graff, and Graff [1]

. It has been assumed that there is a coincidence between the full period of gestation and placental senescence From histologic evidence numerous investigators have concluded that the placenta is a senile organ at term Yet others have shown that the amounts of estrogen and progesterone, presumably produced by the placenta, reach their highest levels at term This high level of functional activity seems inconsistent with the degenerative changes noted by the former group The authors of this study have attacked the problem from another point of view, namely, the status of the NCR The latter is defined as the ratio of the volume of nucleus to the volume of cytoplasm and as this decreases from its period of greatest activity in youth to old age, it is possible to measure the "functional" age of a tissue by measuring its NCR This method has been applied in a study of 186 placentas of varying periods of gestation at the Sloane Hospital with great care and precision It revealed from an estimation of the nucleocytoplasmic ratio that the placenta aged in a uniform and continuous manner all through its existence, that toxemia had no effect on it but that death of the fetus lowered it The writers were impelled to conclude, therefore, that there is no correlation between placental senescence and the onset of labor The problem of what factor terminates pregnancy will remain a matter to be approached from another standpoint

Hotel Reservations for Annual Meeting

Reservations are being made in the following hotels for guests at the Annual Meeting

Hotel Pennsylvania	300 rooms
Governor Clinton Hotel	75 rooms
McAlpin Hotel	50 rooms
Martinique Hotel	20 rooms
Hotel Victoria	10 double rooms
Hotel Times Square	20 double rooms
	445 single rooms and 30 double rooms

It is essential that those desiring to attend the Annual Meeting make reservations as soon as possible

DISORDERS OF THE BLOOD FORMING ORGANS

ELLERY G ALLEN, B S , M D , F A C P , Syracuse, New York

A SPECIALIST is, by Webster's definition, "one who devotes himself to a particular branch of a profession, etc" A specialist in internal medicine is, therefore, one who has, for certain elective reasons or by force of circumstances, become interested in a certain phase of medicine, although he must, in all humility, confess that his knowledge is not all-embracing or that he possesses extraordinary diagnostic or therapeutic acumen not generally possessed by capable internists Medical specialists have been variously described, both sincerely and facetiously, of the latter group, we have heard them defined as "physicians who know more and more about less and less" In a similar vein, another wit has suggested that "a specialist is occasionally a pretty good fellow who is likely to be a hell of a long way from home"

For obvious reasons, then, I do not wish to be regarded as a specialist, rather, I should hope to appear before my medical colleagues as one who has been lured into yet another interesting field of internal medicine, hematology, because of a fortunate association with inspiring teachers and a close partnership with medical students, both students and teacher studying clinical pathology

My purpose in delivering this discourse is twofold first, to discharge an obligation to the members of your Society, who so graciously invited me to address you, helping thus to keep alive my egoism, and second, to present, for mutual discussion, some of the practical problems that we have encountered in dealing with the improperly designated "diseases of the blood"

Whether the blood-forming organs constitute the largest in the body, or the most important, needs little comment, let it suffice that the bone marrow, the reticuloendothelial system, the lymphoid structure, and the peripheral blood constitute, in health, a vast and orderly collection of delicately balanced mechanisms Disorders of one or several of the hematologic constituents result in deviations from the normal that test the skill and ingenuity of the physician, and it is a practical discussion of these disorders that prompts me to present this brief and general résumé.

Only a few years ago we were content, because of our ignorance and complacency, to regard a study of the peripheral blood as sufficient, in the majority of instances, for the accurate appraisal of the so-called "diseases of the blood" The research of Minot and Murphy, now twenty years old, marked an epoch in hematologic interest and stimulated a relentless study of the basic reasons for derangements that produced abnormalities in the peripheral blood These investigations have included, as all of us are aware, many additional pathologic and physiologic studies of all the "blood forming organs," and it would hardly be an exaggeration to assert that progress in this field, during the past years, has indeed been fruitful

I have selected the following three main topics for discussion, earnestly hoping that a mutual exchange of personal experiences may prove of some general interest

1 Anemia and polycythemia
2 Leukocytosis and leukopenia
3 Hemorrhagic diseases

Anemia and Polycythemia

For many years physicians have been content to regard the average red blood count for a woman to be 4,500,000, and to allow men a little more than a 10 per cent increase, or 5,000,000 Many do not recall, however, that these figures are almost a hundred years old, were given by Vierdort as the results of three blood counts he performed in 1852, and have been handed down from generation to generation, hallowed and inviolable Indeed, it is a tribute to the conservatism of our profession that these figures have so stoutly resisted attempts at alteration We must recognize, however, that women in health present erythrocyte counts varying between 3,800,000 and 5,500 000 with an average of approximately 4,800 000, and that the red-cell levels of men vary between 4,600,000 and 6,5000,000, with an average of approximately 5,400,000

As regards the hemoglobin values, it can safely be said that for both men and women, 3 Gm. per million red cells is a correct figure

It is our experience that a healthy woman may have a hemoglobin as low as 11 49 Gm (76 per cent) and a man may present a reading as high as 19 5 Gm. (130 per cent), neither level being abnormal for that particular individual For practical purposes, a hemoglobinometer reading in grams is preferable to one reading in per cent, since various hemoglobinometers have different standards as representing 100 per cent, and I am convinced that nothing has more confused the matter of color-index estimations than this fact

* Presented at the Annual Meeting of the Ulster County Medical Society December 5 1945.

The hematocrit is a valuable instrument for estimating the volume of packed red cells, the volume index, and the mean corpuscular volume of the average individual erythrocyte, and should be employed in all cases of anemia Calculation of the color index gives us an impression as to the hemoglobin content of the average cell, whereas the volume-index estimations indicate their average size Thus anemias may be classified as hyperchromic, normochromic, and hypochromic, on the basis of the color-index studies, and macrocytic, normocytic, and microcytic, on the basis of volume-index calculations Of the two, the volume studies, as obtained by the red count and hematocrit reading, are probably preferable to the color-index figures, since it is possible to read a hematocrit level more accurately than the color in the hemoglobinometer

Anemia

An individual is said to be anemic when the amount of circulating hemoglobin has been reduced below his normal level Although at one time we were prone to regard anemias as "primary" and "secondary," chiefly because it seemed necessary to separate pernicious anemia from other types, we now know that all anemias are "secondary," and that the terms should be abandoned From the laboratory standpoint, anemias are classified on the basis of color or volume-index studies Practical clinical classification, based on etiology, demands that one consider whether the anemia is caused by increased blood loss, increased blood destruction, defective blood formation, or any combination of the three The anemias caused by blood loss are common and are likely to be of the hypochromic or microcytic type. The hemolytic anemias, caused by increased blood destruction, may exhibit any type of color or volume index, whereas the anemias caused by decreased blood formation are likely to be hyperchromic and macrocytic, although such factors as inadequate dietary iron, infection, increased hemolysis, and blood loss may considerably alter this picture

In any case of anemia, the physician should ask himself is the anemia caused by blood loss, is there evidence of increased blood destruction, and are any factors present that could depress the marrow function? Obviously, one must subject the patient to a thorough study in order to decide this matter and unless this be done in every case, one cannot have any rational basis for intelligent treatment A thorough history and physical examination should include attention to the possibility of inadequate diet, infection, abnormal loss of blood, hemorrhagic phenomena, toxic drugs and chemicals, disease of the gastrointestinal tract, hepatic disorders, jaundice, enlarged lymph glands and spleen, a history of exposure to x-ray or radium, and diseases affecting the bone marrow itself Complete laboratory studies, including x-rays of the gastrointestinal tract, gastric analysis, studies of the stools and urine for blood, examinations for evidence of increased hemolysis, lymph-node biopsy, and sternal-marrow biopsy, may be necessary in the cases in which the cause is not obvious, and even when all this has been done, a rare case may defy causative diagnosis

The successful treatment of anemia depends on our ability to remove the cause, and any antianemic therapy is merely treating a symptom unless this is possible One must insist on the removal of agents or physical conditions known to depress the marrow function, increase hemolysis, or cause bleeding, if this be possible Adequate diet, control of infections, and hemorrhage must receive close attention The anemia of primary thrombopenic purpura and congenital hemolytic icterus are best treated by splenectomy Liver extract is specific for pernicious anemia and aids greatly in the management of some of the anemias secondary to deficiency states, especially those in which hyperchromic blood is present Oral iron is valuable in most of the hypochromic anemias, but I am not convinced that liver extract or the addition of copper is of distinct value in this variety Some observers have expressed the opinion that severe hypochromic anemias may occasionally fail to respond to oral iron until one or more transfusions have been given, this has not been my own experience, and I recall that the most severe case of hypochromic anemia I have seen, in a Christian Scientist with chronic blood loss, bilateral hydrothorax, ascites, and anasarca, and boasting a hemoglobin of 2 2 Gm , recovered quickly and completely on oral iron, since she refused, with characteristic emphasis, the benefits that might have been obtained from transfusions

Parenteral iron is never justified, I believe, and any physician who gives "iron injections" must admit that he is either ignorant of the fact that it is not necessary and is probably ineffective, or that he is giving "iron shots" for his own financial gain or possibly practicing some form of psychotherapy Transfusions of blood are usually not indicated in types of anemia known to respond to specific therapy, although it may be necessary occasionally to employ this valuable procedure when the hemoglobin level approximates 4 5 Gm (30 per cent) to prevent circulatory collapse, to control hemorrhage, or to tide the anemic patient over until a definite diagnosis can be made

Considerable discussion has arisen as to the therapeutic effect of various diets in the manage-

ment of anemic patients It is my observation that, except in the deficiency states, when patients are unable to procure, digest, or assimilate a reasonable amount of well-balanced foods, diet plays a very minor role It is also my view that vitamins, either singly or in combination, whether given orally or parenterally, do not exert any specific effect in anemic patients, although the frank deficiency states may be exceptions

Certainly most of us will recall, for one reason or another, the depression following 1929, when great numbers of our civilian population were forced to accept community charity and were allowed about thirty cents a day for food At that time, uncomplicated cases of pernicious anemia and iron-deficiency anemia showed satisfactory responses to specific therapy, and fortunately for both the patient and the public nurse, the indiscriminate use of vitamins had not appeared on the scene As to the value of other drugs in the treatment of anemia, almost nothing need be added The anemia sometimes associated with myxedema usually gradually disappears after proper thyroid medication, but it is doubtful if the drug exerts a direct and specific effect on the maturation of the erythrocytes

Our experience with pernicious anemia has permitted us to draw several conclusions In about ten years, at the University Hospital and the Syracuse Free Dispensary Hematology Clinic, my associates and I administered approximately ten thousand injections of liver extract intramuscularly From our observations, we conclude that liver extract caused clinical remission in every uncomplicated case The average case in relapse received twenty to thirty units of liver extract on the first day of treatment and no more for a week, if a satisfactory reticulocyte response followed Subsequent dosage averaged ten units weekly until the hemoglobin and red-cell levels were normal In occasional cases, the addition of iron was found to be of benefit when the red-cell level had reached approximately 3,500,000, especially if the color index had fallen below 1 0 Following remission, the patients received 10 units once in two to four weeks

Occasionally a case required more frequent injections and a rare patient was controlled by one injection of 10 units every six weeks Those patients exhibiting objective neurologic signs have been treated with 10 units once a week, irrespective of their normal blood levels, and no patient has failed to improve, at least symptomatically No patient with objective neural signs has recovered completely, although a few have been noted to have gained improvement in vibratory sensation and reflexes. Two patients with partial loss of vision caused by optic neuritis have recovered almost completely A rare patient with multiple peripheral neuritis was thought to recover, although it was felt that the addition of parenteral thiamin may have been of distinct aid in hastening recovery

It is important to realize that patients with pernicious anemia may also have other physical defects requiring urgent attention We have seen patients who also had the complication of vascular disease, infection, gastric malignancy, chronic nephritis with nitrogen retention, and myxedema Thus, if one is not constantly aware of such possibilities, therapeutic efforts may prove unavailing

The hemolytic anemias, caused by increased blood destruction, include those caused by toxic agents, such as sulfonamide drugs, lead, the inhalation of arseniureted hydrogen, phenyl hydrazine, benzedrine, potassium chlorate, phosphorus, benzol and its derivatives, and snake venom Hodgkin's disease and infections, such as malaria and severe sepsis, may be causative agents The rare, acute hemolytic anemia of Lederer, usually associated with an infectious process, may respond satisfactorily to blood transfusions The hemolytic anemia of Cooley, seen chiefly in children of Mediterranean stock, does not respond to any type of treatment, nor do satisfactory results follow therapy for sickle-cell anemia Studies of erythroblastosis fetalis, shown to be caused by immunization of an Rh-negative mother by an Rh-positive fetus with the production of agglutinins, which causes hemolysis of the fetal blood cells, have added distinctly to our knowledge of this occasional serious disorder Hemolytic anemia of the newborn may be fatal, or may respond well to intramuscular injections of blood serum or frequent small transfusions

Congenital hemolytic icterus is characterized by varying degrees of anemia, jaundice, and bouts of fever, and is diagnosed on the basis of family history, increased fragility of the erythrocytes, and the presence of spherical microcytes in the peripheral blood In rare cases, the presence of hemolytic icterus with increased erythrocyte fragility may occur late in life, without a family history suggestive of the disorder or previous jaundice or anemia. Such a case, with severe anemia, jaundice, and fever, appearing for the first time in a woman more than 70 years old, was recently seen and will be published in another report. Following fifteen transfusions, the anemia, jaundice, fever, and other symptoms disappeared, although the increased fragility persisted Splenectomy is the treatment of choice, although we have seen at least three patients who appeared to improve temporarily

study and detailed and repeated laboratory observations Even with all the data at hand, it is occasionally impossible to make a correct diagnosis, and treatment, although often successful in certain ailments, is frequently disappointing in others The problems of leukemia, the bone-marrow depressions of unknown cause, and the obscure hemorrhagic disorders offer the greatest challenge to our investigators, but it can confidently be hoped that time and effort will give us a suitable answer in these obscure states, as has been the case in pernicious anemia, some of the purpuras, erythroblastosis fetalis, transfusion reactions, and in the bleeding known to be due to vitamin-K deficiency

WEDNESDAY, MAY 1

THE Annual Banquet of the Medical Society of the State of New York will be held at the Hotel Pennsylvania, 33rd Street and Seventh Avenue, on Wednesday evening, May 1

Why not participate in this first postwar renewal of the only social activity of the Society?

Use the blank below for reservations at Five Dollars

Dr Clarence G Bandler, Chairman, Banquet Committee
Medical Society of the State of New York
292 Madison Avenue
New York 17, New York

Dear Dr Bandler

Please send me —— tickets for the Annual Banquet of the Medical Society of the State of New York, to be held Wednesday evening, May 1, 1946 at the Hotel Pennsylvania Enclosed is my check for $——

My guests will be 1._____

2 _____

3._____

Please seat us with Dr._____

Very truly yours,

AN ANALYSIS OF 200 CASES OF ARTHRITIS ADMITTED TO AN ARMY GENERAL HOSPITAL

KENNETH GOLDSTEIN, Maj ,(MC),AUS,* Thomasville, Georgia

(From the General Medical Section Finney General Hospital)

THIS communication is an analysis of 200 cases of arthritis in the General Medical Section of a Medical Service in an Army General Hospital These cases were observed over a period of one and a half years During this time there were admitted to the Medical Service 5,524 cases, of which arthritis and its allied disorders occurred in 3 6 per cent.

The following classification of joint disease was employed (Steinbocker[1])

Articular Disorders

Joint disease of known cause

1 Specific infectious arthritis gonorrheal, tuberculous, suppurative, etc.
2 Gout
3 Traumatic arthritis
4 Arthritis of serum sickness
5 Neoplasms of joints cyst, sarcoma, xanthoma, hemangioma, synovioma, metastatic carcinoma
6 Neuropathic articular diseases
Tabes, syringomyelia
7 Hemophiliac arthritis
8. Pulmonary osteoarthropathy
9 Aseptic bone necrosis (?) Nonarticular

Joint disease of unknown cause

1 Rheumatoid arthritis
2 Osteoarthritis
3 Rheumatic fever

Nonarticular ("Rheumatic") Disorders (of Known and Unknown Cause)

1 Fibrositis myositis, myofascitis, muscular rheumatism, fasciitis, tendonitis, fibromyositis, neuromyositis, periarthritis, perineuritis
2 Neuritis neuralgia, neuropathy
3 Bursitis
4 Synovitis
5 Tenosynovitis
6 Skeletal anomalies
7 Postural defects static disturbances
8 The "algias" myalgia, arthralgia, neuralgia, psychalgia, vasomotor instability, sympathetic tonia

Every patient admitted with joint symptoms was studied completely A diagnosis of the type of arthritis was made to initiate the proper therapy early Following is the plan of study for every patient admitted having joint symptoms

1 Complete and detailed history
2 Complete and detailed physical examination
3 Complete blood count, including a differential count
4 Urinalysis, Kahn test, sedimentation rate, serum proteins, albumin-globulin ratio, and uric-acid determination
5 X-ray examination of one or more of the affected joints
6 Dental examination for foci of infection
7 Provocative walking test

Additional examinations performed as indicated were as follows

1 Nose and throat consultation for examination of tonsils and sinuses
2 Gonorrheal complement fixation
3 Genitourinary consultation with examination of prostate and prostatic smears for white blood cells
4 Basal metabolic rate If symptoms of hypo- or hyperthyroidism were present
5 Electrocardiogram if there was a question of rheumatic fever

Having established a working classification and plan of study of the arthritic, careful clinical records were kept, enabling us after a period of twenty months to summarize our observations

TABLE I.—NUMBER OF CASES

Type	Number	Per Cent
1 Hypertrophic	80	40
2. Rheumatoid	64	32
3 Fibrositis	35	17 5
4 Mixed	10	5
5. Palindromic rheumatism	5	2 5
6. Gout	3	1 5
7 Psoriatic	2	1
8. Gonorrheal arthritis	1	0 5
Total	200	100 0

As indicated in Table 1 above, the majority were of the osteoarthritic type, while the next most prevalent type was rheumatoid, and third fibrositis Ten were found to have evidences of both infectious arthritis and osteoarthritis. Three were definitely gout, two were of the psoriatic type of arthritis, and five were compatible with the syndrome of palindromic rheumatism as described by Hench and Rosenberg

* Home address, 131 Linwood Avenue Buffalo, New York.

TABLE 2 —Age Incidence

Type	Number
Hypertrophic	
20–25 years	5
25–30 years	17
30–35 years	20
35–40 years	25
40–45 years	8
45–55 years	5
Rheumatoid	
20–25 years	20
25–30 years	14
30–35 years	15
35–40 years	15
40–45 years	1

Osteoarthritis appeared mainly in the age group between 25 and 40, with the majority occurring between the ages of 35 and 40 In the rheumatoid group they were evenly distributed between the ages of 20 and 40, with the majority occurring in the younger age group between 20 and 25

Predisposing or Contributory Factors —1 Climate Exactly how climate affects the origin and course of rheumatoid arthritis is not yet clearly understood The disease definitely predominates in temperate zones and northern countries where cold and dampness exist Although the condition may develop in any climate or at any time, it is more frequent and more subject to relapse during the changeable weather of Spring and Fall As indicated in Table 5, the greater number had the onset of their joint signs and symptoms when they were exposed to these conditions Among the osteoarthritics the most important causative factors were trauma, postural defects, and articular abnormalities In osteoarthritis of the knees and ankles 73 per cent gave a history of previous trauma, 16 per cent of the patients with osteoarthritis of the spine demonstrated some postural defect, either scoliosis, lordosis, or kyphosis, or had evidence of juvenile epiphysitis, 5 per cent gave a previous history of trauma to the spine

TABLE 3 —Hypertrophic Arthritis with History of Trauma

	No of Cases
Knees and ankles	22
Spine, associated with skeletal deformities	13
Spine, associated with trauma	4

Our criteria for the diagnosis of the various arthritides are worthy of mention It is an easy error to make the diagnosis of rheumatoid arthritis merely because the patient has subjective complaints referable to his joints It is to be remembered, however, that rheumatoid arthritis is a systemic disease with many systemic symptoms and signs One of the important factors is the presence of constitutional symptoms such as anorexia, weight loss, and loss of appetite Some of the patients with early rheumatoid arthritis presented these symptoms plus a migratory aching and stiffness with little or no puffiness of the small joints Frequently these subjective symptoms and an elevated sedimentation rate were the only clinical findings present The greater number, as will be shown later, demonstrated constitutional symptoms, slight joint swelling, pain, and tenderness of the proximal interphalangeal joints, and involvement of some of the larger joints, namely the knees In some of our early cases in which the sedimentation rates were not particularly elevated, we applied provocative exercise tests which proved helpful in the diagnosis of early rheumatoid arthritis It is generally accepted that the sedimentation rate becomes rapid in the presence of tissue damage or severe trauma With this principle in mind we subjected our patients with early rheumatoid arthritis to a 4–5 mile hike, taking sedimentation rates before and after the hikes and daily sedimentation rates for four days In those who had true rheumatoid arthritis, subjectively and objectively, symptoms and signs were considerably aggravated following the hike The sedimentation rate was found to be considerably elevated at the end of one hour on the days following the hike We conducted controls and found no elevation of sedimentation rate following this exercise test It gave us also an index to the amount of the relative severity of the infection and the activity of the arthritis

Our diagnosis of osteoarthritis was made on (1) history, (2) objective findings, and (3) roentgenologic findings It is interesting to note that the mere presence of articular lipping, in either the knee joints or spine, was not an essential prerequisite for the diagnosis The presence of symptoms, objective findings, and the absence of positive x-ray findings were sufficient evidence for a diagnosis of osteoarthritis It is a frequent error to attribute low-back pain to osteoarthritis merely because there are hypertrophic changes in the lumbar spine It has been stated by Comroe that 50 per cent of all patients with architectural weakness of the spine have no symptoms whatever resulting from such a disturbance [2 3].

TABLE 4 —Racial Incidence

Type	Number of Cases	
	Colored	White
Hypertrophic	15	65
Rheumatoid	8	56

As indicated in Table 4, most of the arthritics were white and in proportion to the number of colored and white admissions

The syndrome of fibrositis has become a rather common finding in the Army, mainly because the average soldier is subject to a considerable amount of exposure and chilling We have employed a causative classification of fibrositis, namely, a primary type which was independent of any other recognized disease and a secondary type due to toxic infection The diagnosis was made on the clinical symptomatology of pain, stiffness, aching and soreness appearing abruptly in any area of muscles or around joints, more pronounced on awakening or after periods of prolonged inactivity, relieved by exercise and the application of heat

TABLE 5.—THEATER OF OPERATIONS—NUMBER OF CASES

	China India	Alaska	Europe	S.W. Pacific
Rheumatoid	3	4	22	15
Hypertrophic	6	2	38	11
Fibrositis			19	4

As shown in Table 5, the greater number of patients with rheumatoid arthritis came from the European Theater of Operations, where exposure to wet, damp, and cold weather may have been an important precipitating factor Most of the patients with hypertrophic arthritis and fibrositis were evacuated from the European Theater

TABLE 6.—DURATION OF SYMPTOMS

	Number of Cases					
Months	Hypertrophic	Rheumatoid	Fibrositis	Psoriatic	Gout	Palindromic
6-12	12	32	15			3
Years						
1-2	14	12	4	1		3
2-3	18	4	5	1	1	1

5-6	2	1				
6-7	2	1				
7-8	10	5				
9-10	7					

Of the 80 patients with hypertrophic arthritis, 57 had symptoms of four years' duration The majority of the patients with rheumatoid arthritis had symptoms of relatively short duration—six months to two years In our group of fibrositis, 15 patients had symptoms of six to twelve months' duration

As indicated in Table 7, rheumatoid arthritis affected the lumbar and lumbosacral spine in 11 patients and the sacroiliac joints in 18 patients There was generalized joint involvement in 5 patients. In 12 of the patients the knees were solely involved, in 4 the feet, and in 20 the proximal interphalangeal joints In 9 cases the hand, and wrists were involved in 8 the knees and ankles, and in 9 the ankles alone In 1 case the temporomandibular joint alone was affected and the other sternoclavicular associated with an

ankylosing spondylitis of the Marie-Strumpell type In short, rheumatoid arthritis involved principally the small joints of the hands, second the wrists, and third the knees and ankles

Sixteen of the soldiers had evidence of infectious arthritis of the sacroiliac joints, 11 of these were associated with involvement of the articular facets In only 2 of the 11 were we able to demonstrate calcification in the paravertebral and interspinous ligaments Among the group of spondylitis, restriction of spinal mobility was a constant objective finding Among the patients with fibrositis the lumbar muscles were affected in most of the cases In the 2 cases of palindromic rheumatism the hands and wrists were involved The patients with hypertrophic arthritis, for the most part, had involvement of the dorsal and lumbar spine, knees, and sacroiliac joints The stress and strain of military service probably hastened the development of osteoarthritic changes in these weight-bearing bones

Symptoms worse in wet and damp	21
Symptoms worse by lifting and bending	12

Of the 64 patients with rheumatoid arthritis, 26 had constitutional symptoms, consisting of anorexia, malaise, weight loss, and easy fatigue Most of the patients with hypertrophic arthritis had dull pain referable to the involved joints The remainder had some symptoms of stiffness and soreness which were worse in wet and damp weather and aggravated by lifting and bending

TABLE 9 —Physical Signs

Rheumatoid	Number of Cases
Swelling of proximal interphalangeal joints	22
Swelling of toe joints	1
Swelling, redness, elevated skin temperature of knees	14
Swelling, redness, elevated skin temperature of wrists	4
Ankles	9
Ankylosis	4
Muscle spasm of lumbar muscles—limited forward flexion	18
Ulnar deviation of wrists and fingers	2
Atrophy of muscles	5
Pain on manipulation of joints	14
Hypertrophic	**Number of Cases**
Limited forward flexion in lumbar spine	40
Crepitus elicited—knee	17
Muscle spasm	12
Pain and tenderness over lumbar spine	28
Pain of manipulation and limited motion	11

As outlined in the above table, 34 per cent of the patients with rheumatoid arthritis had swelling of the proximal interphalangeal joints and 62 per cent had redness and elevated skin temperature All of the patients suffering from rheumatoid spondylitis had muscle spasm of the lumbar muscles and limitation of forward flexion Only four soldiers, at the time of admission, demonstrated ankylosis and fixation of the involved joints, five demonstrated atrophy of the muscles of the hands All of the patients who had hypertrophic arthritis with involvement of the knee joints had objective findings, namely, crepitation on manipulation Fifty per cent of the patients with hypertrophic arthritis with spine involvement had limitation of forward flexion with some localized pain and tenderness over the lumbar spine, 14 per cent had pain on manipulation of the involved joints, and muscle spasm was demonstrated in 15 per cent of the patients with hypertrophic arthritis

As indicated in Table 10, 53 per cent of the patients with rheumatoid arthritis showed an elevated sedimentation rate of 15 to 35 mm at the end of one hour, 30 per cent—35 to 55 mm at the end of one hour Ninety-three per cent of the entire group of patients who had rheumatoid arthritis showed an elevated sedimentation rate The table shows, as has been stated in the literature, that the erythrocyte sedimentation rate is increased in over 90 per cent of patients with active rheumatoid arthritis It has been our experience that both the leukocytes and sedimentation rate parallel the severity of the arthritic process Both of these become decreased after the clinical signs of activity have subsided Seventy per cent of the patients with rheumatoid arthritis had leukocytosis of 8,000 to 12,000, 15 per cent had leukocytosis of 12,000 to 15,000, and 7 per cent had leukocytosis of 15,000 to 20,000 Twenty-three per cent showed a red blood count of 2,5000,000 to 3,5000,000, 39 per cent, 4,000,000 to 4,500,000, and 20 per cent, 4,5000,000 to 5,000,000 Thirty-one per cent revealed a hemoglobin of 55 per cent to 70 per cent, 13 per cent showed values of 70 per cent to 80 per cent and 15 per cent showed 80 per cent to 90 per cent

Treatment

In the management of our patients with rheumatoid arthritis we followed a more or less conservative program of therapy which varied with each patient, depending on the peculiarity of that case. Only presently recognized measures of therapy were used All patients with rheumatoid arthritis were required to have at least ten to fifteen hours of rest daily Physical therapy in the form of diathermy with short-wave therapy and hydrotherapy was carried out All acutely inflamed joints were properly splinted to avoid ankylosis The joints were placed in position so that if ankylosis occurred they would be in a position most useful to the patient The splints were removed daily and affected joints were put through at least several painless motions to prevent formation of dense adhesions within the joints Joints that were acutely inflamed were manipulated as little as possible and kept at rest All patients with rheumatoid arthritis were given high-caloric high-vitamin diets If the patient was underweight, a 4,000-calorie diet was administered Obviously infected foci, such as tonsils, were either treated or removed as recommended by the Nose and Throat Department Chronic sinus infection and prostatitis were treated in the appropriate departments In addition to these measures, sodium salicylate and sodium bicarbonate, brewer's yeast, and multiple vitamins were also supplied If, despite this regimen, the patient's disease continued to show progression as evidenced by inflamed swollen joints and elevated sedimentation rate, he was given a course of typhoid vaccine intravenously The first injection consisted usually, of 10,000,000 organisms of triple typhoid, subsequent injections consisted of doubling the previous injection unless the previous reaction was too severe. The course was composed usually of six injections, given twice weekly If no benefit was derived from the course of typhoid vaccine, the patient was usually transferred to the Arthritis Center, Hot Springs, Arkansas, for further therapy The patients with osteoarthritis were treated mainly with physiotherapy in the form of diathermy massage analgesics, and multiple vitamins In the management of fibrositis we employed analgesics and physiotherapy, with the larger percentage of patients showing improvement of their symptoms

Case Reports

Case 1.—Hypertrophic arthritis (Left Knee)—A 25-year-old white man was admitted to Finney General Hospital on February 7 1945 from the Hawaiian Islands with an admission diagnosis of hypertrophic arthritis of the left knee joint.

Onset followed an injury to his left knee during desert maneuvers in California about one and a half years previously Since then the patient had continuous dull aching pain and occasional redness and swelling of the knee joint Walking, cold and damp weather aggravated these symptoms This condition became progressively worse and was aggravated by hiking, excessive walking, or activity Following jungle maneuvers in the Maui Islands his knee became very painful and swollen and he was admitted to the Tripler General Hospital on November 21, 1944 Examination showed the patient walked with a marked limp and with considerable tenderness and swelling about the left knee joint. Range of motion was normal but movement elicited considerable discomfort. X-rays revealed moderately advanced hypertrophic changes.

Physical examination at Finney General Hospital disclosed a moderate amount of pain and tenderness on manipulation of the left knee joint. There was no limitation of motion. A considerable amount of crepitation and grating was elicited on manipulation. Laboratory work, including blood count, sedimentation rate, and stool examination, was essentially normal X-rays of the left knee joint revealed severe osteoarthritic changes with spur formation and hyperostosis.

Case 2.—Hypertrophic arthritis (Lumbar Spine)—The patient was a 36-year-old white man who since about November, 1942 had had dull aching pains, stiffness, and soreness in both shoulders, hip joints, and the lower part of the back. This was usually worse in wet damp weather and also in the morning on awakening and after prolonged inactivity The patient had been repeatedly hospitalized for a total period of almost one year Because his complaints became more severe while in the European Theater of Operations he was hospitalized on October 26 1944 at the 217th General Hospital. Examination there revealed considerable limitation of motion of the lumbar spine with some localized pain and tenderness over the lumbar and lumbosacral spine. X-rays of the lumbosacral spine showed hypertrophic changes of the fourth lumbar vertebral body and roughening of the inferior border of both the right and left rami of the pubis and ischium Both

shoulders were normal on x-ray Because of these findings he was evacuated back to the Zone of Interior with a diagnosis of hypertrophic arthritis of the lumbar and lumbosacral spine and of the ischium

Complete physical examination here revealed some crepitation on manipulation of both knee joints with some pain on extreme flexion and extension There was also some localized pain and tenderness over the paravertebral muscles of the lumbar and lumbosacral spine with some spasm of these muscles There were about 20 to 35 degrees limitation of forward bending of the lumbar spine and a considerable amount of pain and tenderness localized over both sacroiliac joints The remainder of the physical examination was negative Laboratory work was essentially normal

Case 3—Rheumatoid arthritis—In September, 1944 a patient, while on duty overseas, noticed that he was losing weight gradually, had lost his appetite, and felt generally tired Within the next three weeks he developed an acute migratory polyarthritis with acute joint swelling, redness, pain, and tenderness of the left ankle, right ankle, and knees Following this, both wrists, finger joints of both hands, and later both elbows became affected All of the above-mentioned joints became extremely swollen, reddened, hot, and very tender A diagnosis of acute infectious polyarthritis was made Because of the acute swelling of both knee joints, an aspiration of the left knee was done on November 1, 1944 and two weeks later he had an aspiration of the right knee Each time 30 cc of fluid was removed Since this attack, the swelling gradually subsided but stiffness and limitation of motion of the knees and wrists persisted Examination of stools, agglutination tests, x-rays, and sigmoidoscopic examination were all essentially normal

At the time of admission to this hospital the patient complained of swelling, pain, and soreness of both knee joints, wrists, ankles, feet, hands, and both hip joints Physical examination revealed some fusiform swelling with spindling at the proximal interphalangeal joints of both hands, particularly on the right There were also some swelling of both wrist joints with some elevated skin temperature There were about 10 to 15 degrees limitation of flexion and extension and also some limitation of abduction and adduction in both wrist joints There was a considerable amount of muscular atrophy, particularly of the small muscles in the dorsum of both hands Examination of both knees revealed swelling of both joints with loss of topography, elevated skin temperature, but no definite fluid could be demonstrated in the knee joints by examination There were about 20 to 25 degrees limitation of flexion and about 5 to 10 degrees in extension of both knee joints There were atrophy of the muscles in the calves and thighs of both lower extremities and also of the muscles of the right arm and forearm. Genitourinary examination revealed the patient to have a prostatovesiculitis, nonsuppurative, nonvenereal, the cause of which was undetermined. Serum proteins, albumin-globulin ratio, serology, malarial smear, urinalysis, and blood count were normal. The sedimentation rate was elevated to 70 mm at the end of one hour

The patient was placed on a 4,000-calorie diet with five units of insulin before meals, analgesics, multiple vitamins, physiotherapy, and a course of typhoid vaccine At the end of three weeks the patient had gained six pounds, the acute joint signs and symptoms had subsided, and he was in better general condition to be transferred to an Arthritis Center

Case 4—Gout—The patient had his first attack of severe pain in his right big-toe joint following an operation for a strangulated hernia six years before admission The attacks awoke him in the early hours of morning, the right big-toe joint became swollen, reddened, and very painful This lasted for approximately three weeks and the condition was diagnosed as gouty arthritis at that time He had one other attack similar to this just before his entrance into the Army, with the onset also in the early hours of the morning, which lasted three or four weeks

Since then, until the recent attack, he has had dull continual pain in the right big-toe joint On September 20, 1944, while overseas, the patient awoke about 4 00 A.M. with severe pain in his right great toe, which became swollen, reddened, and very painful, so that he couldn't get his shoes on. Physical examination after admission to the hospital revealed a purplish-red, exquisitely tender swelling of the right great toe joint in the region of the first metatarsal phalangeal joint with no evidence of tophi about the joints or ears Laboratory studies revealed a blood uric acid of 10 mg per 100 cc which gradually receded to 6 8 mg per 100 cc On October 20, 1944 the uric-acid level was $2^1/_2$ mg per 100 cc and the sedimentation rate varied between 39 mm per hour and 25 mm. per hour X-ray of the right foot revealed mild hypertrophic changes at the first metatarsal phalangeal joint with no areas of rarefaction seen The patient was subsequently evacuated to the Zone of Interior Since his original attack overseas the patient has had a continual dull pain in his right great-toe joint

Physical examination here was essentially negative except for the right great toe, which showed some purplish-bluish discoloration with pain and tenderness on manipulation Blood uric acid was 3 8 X-ray of the right foot showed hypertrophic changes of the first metatarsal phalangeal joint of the right foot No areas of rarefaction were seen.

Case 5—Palindromic rheumatism—About two years before admission the patient had migratory polyarthritis involving all the joints, starting in the right knee He was in bed approximately four months and was told he had rheumatic fever All the joints at the time of involvement were red and swollen, with no residual damage or changes of joints following his recovery Since February, 1944 the patient has had periodic episodes of swelling affecting the wrists, finger joints of the right hand, and both feet and toes These attacks occurred about every two to three weeks, and lasted for one to two days There was no history of hay fever or asthma in the family Previous x-rays of the bones and joints involving the right hand were negative. All previous sedimentation rates were normal. Swelling of the right hand, metacarpal-phalangeal joints, were noted at previous hospitals These

joints were reddened, swollen, and quite painful There has never been any swelling in the left hand.

At the time of admission to Finney General Hospital physical examination was negative. While in the hospital the patient had seven to eight episodes of sudden onset of swelling of all the proximal interphalangeal joints of the right hand, the dorsum of the right wrist, and some soft tissue swelling of the right forearm The overlying skin was reddened with somewhat increased temperature These episodes of swelling usually lasted forty-eight to seventy-two hours and then completely subsided with no residual symptoms. All x-rays of the bones and joints of the wrist and hand revealed no abnormalities. Blood counts and sedimentation rates were repeatedly normal Serum proteins and the albumin-globulin ratio were normal The eosinophile count ranged from 5 to 6 per cent with a platelet count of 184,000 Nose and throat examination revealed the presence of chronic, suppurative, ethmoidal sinusitis and chronic, bilateral, follicular tonsillitis, and on February 15, 1945 tonsillectomy was performed.

It was our opinion that, in view of the sudden onset of swelling of the joints of the right hand and the soft-tissue swelling of the right forearm and its sudden disappearance with no residual symptoms and the normal sedimentation rate, this patient was suffering from a so-called palindromic rheumatism, as described by Hench.

Case 6.—Fibrositis—The patient was a 22-year old white man who stated that his present illness had had its onset about four months before admission, with dull aching pain, stiffness, and soreness in the lower part of his back and in both knees, more severe in the left knee He described his symptoms as being a dull aching pain associated with stiffness and soreness which was more pronounced on awakening in the morning or after periods of prolonged activity It was relieved by mild exercise aspirin, and heat. His symptoms became worse after considerable exposure to wet and damp weather at Camp Gordon Johnston, Florida. Because of these symptoms he was admitted to the Station Hospital, Camp Gordon Johnston, Florida, on March 14, 1945 Physical examination at that hospital was essentially negative. Nose and throat examination revealed the presence of a deviation of the nasal septum to the right and some clouding of both right and left antra. X-rays of the sinuses revealed marked clouding of the left antrum and thickening of the lining membranes, slight clouding of the right ethmoids and right frontal sinus. All laboratory work, including sedimentation rate, was essentially negative. He received physiotherapy and salicylates with subjective improvement, and was subsequently transferred to Finney General Hospital on March 30, 1945

Physical examination at Finney General Hospital was essentially negative except for the bones and joints. There was localized pain and tenderness over the lumbar muscles and over the lumbar and lumbosacral regions. There was no muscle spasm. There was about 15 to 20 degrees limitation of forward bending of the lumbar spine. There was slight limitation of lateral motion. The sedimentation rate was 6 mm. at the end of one hour It was thought that this patient's clinical history and findings were quite characteristic of fibrositis involving the lumbar muscles.

Case 7.—Rheumatoid spondylitis—The patient's present illness goes back to 1932, when in civilian life he was told he had rheumatism At that time he had pains, aches, and stiffness in the lower part of his back and hips, with difficulty in walking. Since that time, until six or seven weeks, before examination the soldier had periodic attacks of low back pain, stiffness, and soreness over the lower back and hips usually worse in the morning and after prolonged inactivity, but somewhat relieved by exercise and application of heat. In April, 1945 he noticed the onset of another attack of stiffness and soreness in his lower back, but this time it progressed up the lumbar spine to his neck and shoulders and left him completely stiff and he was unable to bend his neck. Because of this he was admitted to a Station Hospital on April 6 1945

Physical examination at Finney General Hospital was essentially negative except for the bones and joints. Examination of the back revealed a considerable amount of spasm of the muscles overlying the entire spine and limitation of motion in both shoulder regions particularly in abduction. The patient was able to raise both arms only to about the level of the shoulder regions. There was a considerable amount of limitation of forward bending of both the cervical and dorsal lumbar regions. He was able to bend his spine in these regions only about 25 to 30 degrees. There were localized pain and tenderness over the entire cervical, dorsal, lumbar and both sacroiliac joints. Chest expansion was limited to 1/2 inch. Laboratory work revealed hemoglobin of 80 per cent, red blood count, 4,280,000, white blood count, 14 150, normal differential, sedimentation rate on two occasions of 52 mm. at the end of one hour Serum proteins were 7 1 Gm. per cent, albumin, 4 5 Gm per cent, and globulin, 2 6 Gm per cent. Urinalysis was essentially normal. X rays showed moderate scoliosis of the dorsal spine with convexity of curvature toward the right, with ossification of the anterior spinal ligaments in several areas, and bone bridging anteriorly between the tenth, eleventh, and twelfth dorsal bodies. There were no definite arthritic changes demonstrable in the articular facets. There were arthritic changes present in both sacroiliac joints, consisting of sclerosis and obliteration of joint margins. It was the impression of the roentgenologist that the patient had ankylosing spondylitis of the lower dorsal region.

Summary and Conclusions

1 Two hundred patients with arthritis have been admitted to this hospital during the interval of September, 1943 to May, 1945

2 All of these cases were classified and careful observations made during their hospital stays as to predisposing causes, symptomatology, physical signs, laboratory and x-ray findings

3 A provocative walking test employing the

sedimentation rate has been described to aid in the early diagnosis of rheumatoid arthritis

4 Osteoarthritis was the most prevalent of the arthritic diseases, with rheumatoid arthritis and fibrositis following in that order

5 Climate and adverse influence of service manifestly have been strong factors in precipitating signs and symptoms in osteoarthritis, rheumatoid arthritis, and fibrositis

6 Most of the patients with osteoarthritis had involvement of the spine Those who had rheumatoid arthritis were affected principally in the small joints of the hands, second the wrists, and third the knees and ankles

7 Seventy-one per cent of our cases of rheumatoid arthritis had constitutional symptoms and 93 per cent showed an elevated sedimentation rate

8 Seventy-six per cent of the patients with osteoarthritis had symptoms, all of them demonstrated positive objective findings

9 Conservative management with recognized measures of therapy resulted in improvement in the greater number of our patients with arthritis Those showing progression were transferred to an Arthritis Center

INOCULATION OF VALUE IN PREVENTING TUBERCULOSIS

Results of a ten-year study in Chicago to prove the value of inoculating children against tuberculosis and results of a similar program in New York City reaching back sixteen years were reported on November 7, 1945 at Cornell University Medical College

The papers were presented at the thirty-fifth clinical session on chronic pulmonary diseases of the Tuberculosis Sanatorium Conference of Metropolitan New York in cooperation with the New York Tuberculosis and Health Association

Records were presented by the Chicago experimenters to show that vaccination with BCG in the first seven years of life is of value in preventing tuberculosis The New York doctor declared that routine vaccination with BCG of children from tuberculous homes is less advantageous than removal of tuberculous subjects from such homes

BCG is the product resulting from a method of treating live tubercle bacilli to make them less virulent, developed by the French scientists Calmette and Guerin

The report of the New York investigation was made by Dr Milton I Levine, assistant professor of pediatrics, Cornell University Medical College His study was confined to the first five years of life of 2,084 children of tuberculous families, of which 1,011 were vaccinated and 1,073 were held as controls The children were followed for varying periods, according to the date of their birth, some as long as sixteen years previous to January 1, 1944, when the study ended

All children studied were from tuberculous families, and with rare exceptions were placed under observation before they were 12 months old Although the method of selecting those to be held as controls and those to be vaccinated was changed part way through the study, results were essentially similar, the mortality of the controls was more than four times that of the vaccinated group The possible effect of various factors on the comparative results, such as parental cooperation, economic condition, racial distribution, and exposure to infection was assessed in the conclusions

"From a public-health standpoint," Dr Levine concluded, "the efficacy of BCG must be judged by its ability to reduce the tuberculosis mortality of children vaccinated in their homes in the midst of a tuberculous environment As a public health measure, therefore, the routine vaccination with BCG of children from tuberculous homes is less advantageous than removal of the tuberculous subject from the home "

Results of the Chicago study were presented by Dr Sol Roy Rosenthal, of the Chicago Municipal Tuberculosis Sanatorium and the University of Illinois School of Medicine

"BCG has been found to be entirely innocuous both locally and generally in animal studies over a period of ten years, and infant studies over a period of seven years," said Dr Rosenthal "In 1,204 vaccinated children, where no known source of contact with tuberculosis was known, 3 cases of tuberculosis developed and one death from the disease In 1,213 controls there were 23 cases of tuberculosis and four deaths from the disease

"In 98 vaccinated newborn, who were in contact with tuberculosis following vaccination, there was 1 case of tuberculosis and no deaths, whereas in 63 controls there were 4 cases of tuberculosis and three deaths Considering the contact and noncontact group as a whole, there were 27 cases of tuberculosis in the control group against four cases in the vaccinated There were seven deaths from tuberculosis in the control group and one in the vaccinated

"From these results it may be concluded that in the first seven years of life, BCG vaccination is of definite value in the prevention of tuberculosis "

PENICILLIN IN THE TREATMENT OF VINCENT'S ANGINA

LEWIS H BRONSTEIN, CAPT ,(MC), New York City*
(*From the Regional Hospital Fort G G Meade, Maryland*)

SINCE September, 1944, penicillin has been used at this installation for the treatment of ulceration of the tonsils due to the Vincent's organisms During this period, 105 patients have been treated by intramuscular injection of this antibiotic Adequate evaluation of the results obtained from this treatment called for a comparable control group because of the great variability in individual response to this infection

Such a control group was found consisting of 32 patients These patients were treated with peroxide and perborate gargles, rigid dental attention to the gums where indicated, and high doses of cevitamic acid, nicotinic acid, and thiamin chloride as recommended by the Dental Service These unselected cases were so treated because they were admitted to wards other than the Communicable Disease Section and were started on the above treatment Others were admitted to this section and were inadvertently started on the oxidizing and vitamin routine by new personnel All these patients were allowed to continue on this type of medication They were admitted throughout the period during which the penicillin treated patients were admitted It is, therefore, felt that the general bacterial flora was the same in both groups Unfortunately, it was not possible to burden the Laboratory with additional bacteriological material at that time However, in many instances culture of the exudate was done in both groups of cases and similar organisms were recovered

It is realized that this is not a perfect control group It is however, a better group than one composed of patients who had been treated in previous years or in different seasons of the same year The factors of secondary infection which undoubtedly play a role in the clinical course of the disease are, therefore, more nearly comparable

In all cases the diagnosis was based on the usual criteria of Vincent's infection a foul-smelling ulcerative tonsillar lesion with pseudomembrane and a smear showing numerous spirochetes and fusiform bacilli Most of the patients had severe pain

Previously, in a much smaller group, it had been decided to treat the lesion locally with penicillin in bentonite, a diatomaceous earth This material had sufficient body so that it remained on the lesion for some time The concentration was 500 units per Gm The nurse spread this medication on the ulcerative lesion every three hours and the patient was given the material to apply to his gums It was found that this method did not give better results than were being obtained with the usual methods of treatment employed at that time

It was therefore decided to try the effects of intramuscular penicillin therapy The dosage was 20,000 units used every three hours for either eight or sixteen doses, depending on the appearance of the lesion on admission We did not study the rate of disappearance of the organisms as carefully as others have [1] We made routine smears at the end of the course of penicillin and in every case found that there were no spirochetes to be seen The number of fusiform bacilli was also markedly decreased so that the laboratory reports read "few" to "none" Smears were repeated at two-day intervals until the patient was discharged, and in all cases, neither spirochetes nor fusiform bacilli were subsequently seen. Thus, in a larger series of cases than has been previously reported,[1-3] we have been able to confirm the rapidity and thoroughness of the disappearance of the organisms under the influence of penicillin In the control group, it was found that the organisms usually disappeared in about five days with the spirochetes going first The time for this occurrence was quite variable and not as prompt as with penicillin

The relief of pain is as remarkable as the rapid disappearance of organisms Under no other therapy that has been attempted have the patient's symptoms disappeared as rapidly Within twelve to fourteen hours practically all pain was gone and the patient was able to take food by mouth This relief was dramatic in every case

An analysis of the length of time it took to give the tonsil a normal appearance, without ulceration or inflammation, shows that the results are not as spectacular as would be implied from the reports in the literature We measured the length of time from the start of treatment to the day that the tonsil looked normal, at which time there were also no Vincent's organisms. In the penicillin-treated group of 105 cases, the average was 6.2 days with a standard deviation to 2 55 In the group of 32 cases treated with oxidizers the average length of time was 8 1 days with a

* Home address, 235 W 102 Street, New York City

standard deviation of 2 89 This large standard deviation shows that there was a wide spread in the number of days it took to clear these lesions with either form of therapy This may very well be due to the factor of secondary infection—a point which requires further study for proper evaluation If one attempts to apply statistical criteria to these averages, it is found that the standard error of the difference between these means is 0 56, whereas the difference itself is 1 9 Such calculations show that the possibility of chance itself resulting in this difference is less than one in four hundred It would, therefore, seem that the difference is probably due to the action of the drug

The nature of the work done at this camp made it impossible to study the recurrence rate This will have to be done at an installation with a more permanent population

Patients with gingival involvement should have dental attention for the removal of debris at the bases of the teeth and the treatment of gingival flaps This should be done in conjunction with the penicillin injections We did not attempt to treat patients with gingivitis alone unless they were hospitalized for other conditions There are not enough of these cases to report In those cases in which smears were made from the gingivae, it was found that the organisms disappeared from these areas under intramuscular penicillin therapy more slowly than from the tonsillar areas The dental department has been using penicillin in bentonite in addition to their other measures for gingivitis They have found rapid clinical improvement, particularly of pain, but no bacteriologic studies were done

Conclusion

Penicillin is a very useful agent in the treatment of Vincent's infection of the tonsil, but should be used in conjunction with dental measures where the gums are also involved It results in

1 Rapid bacteriologic clearing of the tonsillar lesions, as evidenced by disappearance of the spirochetes and fusiform bacilli

2 Rapid disappearance of pain

3 Somewhat quicker clinical cure of the lesions than with oxidizers

RELAPSING FEVER, LUNG ABSCESS BEING CONQUERED BY PENICILLIN

Two more diseases—relapsing fever and abscess of the lungs—are on the way to being conquered by penicillin, according to reports appearing in the December 8 issue of the *Journal of the American Medical Association*

Although relapsing fever is not common in the United States, 11 cases were treated at an army hospital in Texas by Capt William C Taft and Capt John B Pike, Army Medical Corps

They wrote that by giving sixty injections of penicillin into the muscles, a total dosage of 2,400,000 units, they effectively checked the disease

Relapsing fever is an acute infectious disease, caused in this instance by a tick common in Texas The disease is characterized by intermittent periods of fever It usually begins within seven days of infection.

The onset is sudden with fever, chills, headache, pains in the back and limbs, loss of appetite, nausea, vomiting, sometimes abdominal pain and tenderness, and constipation Within a few days red spots, the size of a dime or quarter, may appear

"Penicillin reduces the length of disability from the disease to a minimum," the authors wrote The patients treated with penicillin recovered within two weeks after treatment began

Previously, treatment consisted of arsenical injections, with or without bismuth, into the veins The results were very unsatisfactory, no patient was hospitalized for less than one month.

The treatment with penicillin, given every three hours day and night, produced a rapid subsidence of symptoms and signs, prevented subsequent relapses and eliminated the long convalescence characteristic of patients otherwise treated, the authors stated

Two other investigators, Charley J Smyth, M D , and Thomas H Billingslea, M D , reported success with penicillin in the treatment of four patients suffering with abscess of the lungs at the Wayne County General Hospital, Eloise, Michigan

The patients received long and continued treatment with penicillin which was injected into the muscles every three hours, day and night The total dosage varied from 6,000,000 to 14,000,000 units per patient The authors stated that long-continued treatment was necessary in order to control the surrounding infection adequately

The condition may be caused by the draining of infective material from the upper respiratory tract or it may result from the wedging of a foreign body in a large bronchus or from wounds on the chest The abscess cavity usually contains blood, bacteria, and pus which often has a foul odor

The authors stated in conclusion that "if lung abscesses are recognized early and vigorously treated by long continued penicillin administration there will be an appreciable reduction in the morbidity and mortality from this disease"

THE CLINICAL DIAGNOSIS OF CORONARY ARTERY SCLEROSIS

A STUART FERGUSON, M.D., Newburgh, New York

CORONARY artery sclerosis is a disease entity with which every physician is thoroughly familiar. It is a pathologic condition characterized by chronic, progressive, obstructive narrowing of the lumen of the coronary arteries. It may be a part of a general arteriosclerotic disease of the body or it may be a selective disease of the coronary system alone.

Symptoms of this disease may occur at any age from the second decade on. They occasionally occur in the late thirties, frequently in the forties, and most often in the so-called dangerous fifties. The symptoms occur about three times as frequently in men as in women. The latter, as a group, are apt to develop symptoms after middle life.

If there is any one disease which strikes terror to the mind of the average patient, it is "heart disease." This may be due in part to the *frequent experience of patients who have witnessed* the sudden and unexpected death of a relative or friend. Following such an experience, it is not unusual for patients to consult their physician for reassurance concerning some anxiety that may develop relative to their heart.

It is the general practitioner who most frequently observes the earliest manifestations of coronary disease. A discussion of the symptom complex and approach to some of the problems of clinical diagnosis is the purpose of this paper.

For a moment, let us consider the dynamics of the heart. It is normally a well regulated pump engine. Its principal fuel is oxygen, which is furnished by the intricate coronary arterial system. The mechanical efficiency of the stroke output is directly dependent on energy liberation, as a result of complete oxidation through patent coronary arteries. Any departure from this normal supply of fuel to the pump engine through narrowing of the coronary arteries is what we understand as chronic progressive coronary arteriosclerosis, which results in so-called coronary insufficiency.

When portions of the myocardium are deprived of blood, such heart muscle unquestionably fails by virtue of decreased and, ultimately, absence of energy liberation. As this condition progresses, the pump engine becomes overloaded during unusual exertion and the first subjective clinical symptom, fatigue, appears. The fatigue syndrome may continue for many months or even years before a noticeable breathlessness for grade or stair climbing appears.

Gastrointestinal symptoms begin to appear, such as belching and abdominal bloating after a good meal, especially the evening meal. Eventually the anginal syndrome appears either abruptly with a definite precordial or substernal distress following exertion or emotional stress but promptly relieved by rest, or by an indefinite ache in the chest which is so slight and transient that the patient is not too much disturbed by it but rather puzzled because it is promptly relieved by a belch of gas or a dose of baking soda and may not appear again for some days.

When coronary insufficiency is ushered in by the abrupt, definite chest pain which may radiate to the precordium or down one or both arms, causing the victim to stop at once for relief, it *may reasonably be concluded that closure of a* coronary vessel will probably take place in from a couple of weeks to two or three months. There are exceptions, of course, to this general observation.

Most patients with early cardiac complaints are seen in the office. The usual complaint that brings them to the physician in suspected coronary heart disease is pain in the chest, precordial region, left shoulder, or left arm. A careful history with leading questions is helpful in evaluating the symptoms.

How long has the patient had this distress? Just where does it occur? Does the pain spread in any direction? Does he wake up with it in the morning? Does it last all day? Does it occur only when he is at rest? If so, is it relieved by walking or working? What relieves this pain when it occurs? Can he walk up two flights of stairs without difficulty? Can he walk up a hill? What else does he complain of? The location of distress may be a clue. Anginal distress most often is parasternal or substernal across the upper part of the chest. Next in order is over the precordial region. A pain described below and to the left of the nipple is least likely to be of cardiac origin.

A clear-cut chest or precordial distress described as an oppression, constriction, or ache, definitely associated with exertion or following excitement or anger, which may or may not radiate down the left arm or both arms and is relieved in a few minutes by rest, should be considered anginal in character until it is proved otherwise.

Presented at a clinical conference, St. Luke's Hospital, Newburgh, New York, December 5, 1945.

standard deviation of 2 89 This large standard deviation shows that there was a wide spread in the number of days it took to clear these lesions with either form of therapy This may very well be due to the factor of secondary infection—a point which requires further study for proper evaluation If one attempts to apply statistical criteria to these averages, it is found that the standard error of the difference between these means is 0 56, whereas the difference itself is 1 9 Such calculations show that the possibility of chance itself resulting in this difference is less than one in four hundred It would, therefore, seem that the difference is probably due to the action of the drug

The nature of the work done at this camp made it impossible to study the recurrence rate This will have to be done at an installation with a more permanent population

Patients with gingival involvement should have dental attention for the removal of debris at the bases of the teeth and the treatment of gingival flaps This should be done in conjunction with the penicillin injections We did not attempt to treat patients with gingivitis alone unless they were hospitalized for other conditions There are not enough of these cases to report In those cases in which smears were made from the gingivae, it was found that the organisms disappeared from these areas under intramuscular penicillin therapy more slowly than from the tonsillar areas The dental department has been using penicillin in bentonite in addition to their other measures for gingivitis They have found rapid clinical improvement, particularly of pain, but no bacteriologic studies were done

Conclusion

Penicillin is a very useful agent in the treatment of Vincent's infection of the tonsil, but should be used in conjunction with dental measures where the gums are also involved It results in

1 Rapid bacteriologic clearing of the tonsillar lesions, as evidenced by disappearance of the spirochetes and fusiform bacilli

2 Rapid disappearance of pain

3 Somewhat quicker clinical cure of the lesions than with oxidizers

RELAPSING FEVER, LUNG ABSCESS BEING CONQUERED BY PENICILLIN

Two more diseases—relapsing fever and abscess of the lungs—are on the way to being conquered by penicillin, according to reports appearing in the December 8 issue of the *Journal of the American Medical Association*

Although relapsing fever is not common in the United States, 11 cases were treated at an army hospital in Texas by Capt William C Taft and Capt John B Pike, Army Medical Corps

They wrote that by giving sixty injections of penicillin into the muscles, a total dosage of 2,400,000 units, they effectively checked the disease

Relapsing fever is an acute infectious disease, caused in this instance by a tick common in Texas The disease is characterized by intermittent periods of fever It usually begins within seven days of infection.

The onset is sudden with fever, chills, headache, pains in the back and limbs, loss of appetite, nausea, vomiting, sometimes abdominal pain and tenderness, and constipation. Within a few days red spots, the size of a dime or quarter, may appear

"Penicillin reduces the length of disability from the disease to a minimum," the authors wrote The patients treated with penicillin recovered within two weeks after treatment began

Previously, treatment consisted of arsenical injections, with or without bismuth, into the veins The results were very unsatisfactory no patient was hospitalized for less than one month

The treatment with penicillin, given every three hours day and night, produced a rapid subsidence of symptoms and signs, prevented subsequent relapses and eliminated the long convalescence characteristic of patients otherwise treated, the authors stated

Two other investigators, Charley J Smyth, M D , and Thomas H Billingslea, M D , reported success with penicillin in the treatment of four patients suffering with abscess of the lungs at the Wayne County General Hospital, Eloise, Michigan

The patients received long and continued treatment with penicillin which was injected into the muscles every three hours, day and night The total dosage varied from 6,000,000 to 14,000,000 units per patient The authors stated that long-continued treatment was necessary in order to control the surrounding infection adequately

The condition may be caused by the draining of infective material from the upper respiratory tract or it may result from the wedging of a foreign body in a large bronchus or from wounds on the chest The abscess cavity usually contains blood, bacteria, and pus which often has a foul odor

The authors stated in conclusion that "if lung abscesses are recognized early and vigorously treated by long continued penicillin administration there will be an appreciable reduction in the morbidity and mortality from this disease"

COARCTATION OF THE AORTA

A Report of Five Cases

ROBERT SCHWARTZ, Maj ,(MC),AUS*

(From the Veterans Administration Facility, Aspinwall Pennsylvania)

COARCTATION of the aorta is a far more prevalent disease than is commonly believed. Its frequency was strikingly illustrated to us at the Aspinwall Facility by observing 5 cases in the brief period from December, 1943 to May, 1944

The findings in coarctation are quite typical and diagnosis should not be difficult once it is considered In any young adult with hypertension one's first thoughts should be to examine the arterial pulsations in the lower extremities and determine the blood pressure in the popliteal spaces [1] Two factors determine the clinical picture in any given case (1) the degree of obstruction, and (2) the collateral circulation There may be narrowing, stenosis or complete atresia of the aorta.[2,3] From 1 to 3 inches of the vessel is involved, usually in the arch at the site of the obliterated ductus arteriosus or beyond the origin of the subclavian artery Collateral circulation takes place through the subclavian arteries (first and second intercostals), internal mammary arteries (third to eleventh intercostals), and the superior epigastric arteries, which anastamose with the inferior epigastrics and external iliacs. An atypical form of coarctation has been described recently [4] in which the orifice of the left subclavian artery is obstructed and there is no obstruction to the blood flow in the thoracic aorta. In these cases the diagnosis can only be proved by angiocardiographic studies

In a classic example of aortic coarctation, hypertension will be elicited in the upper extremities while the popliteal blood pressure is lower Pulsations of the aorta and femoral arteries are diminished, signs and symptoms of arterial insufficiency may be present in the lower extremities. The patient may be well developed above and underdeveloped below the waist. Pulsating internal mammary arteries or cutaneous arteries over the scapulae may be visible The heart is apt to be enlarged and a basal systolic murmur is usually present this is transmitted to the neck and posterior part of the chest, and may or may not be accompanied by a diastolic murmur A systolic thrill may be felt in the neck vessels X ray usually reveals a prominent ascending aorta with a small or absent knob, a notched, scalloped appearance is often produced in the lower margins of the posterior ribs by the dilated intercostal arteries.

The pathogenesis of coarctation is uncertain. Some feel that it results from a thrombus in the ductus arteriosus with subsequent narrowing of the aorta due to cicatricial contraction [4] Another theory favors an abnormal embryonic development at the junction of the left fourth, fifth, and sixth aortic arches For some time the hypertension was thought to be mechanical in origin. However, Friedman Selzer, and Rosenblum[5] have demonstrated an appreciable decrease in renal blood flow in such cases, and postulate that the hypertension is due to primary renal ischemia with secondary arteriolar spasm Steele reviewed 217 cases[1] and found the diastolic pressure usually elevated above 100 mm in the femoral as well as the brachial arteries, indicating a general distribution of increased peripheral resistance

The prognosis in these cases is variable. Patients often survive to adult life. On the other hand, they are subject to rupture of the aorta, bacterial endocarditis, and all the complications of hypertension (myocardial insufficiency, renal failure, arteriosclerosis, and cerebral hemorrhage) Treatment is purely symptomatic and can only be directed at any of the above complications However a recent experimental study, with a report of two human patients suggests that operative correction of coarctation may become feasible [6] The procedure consists of completely dividing the narrowed upper thoracic aorta, or excising a segment of it, and reconstructing the vessel by end to-end anastomosis.

Case Reports

Case 1.—H W D was seen on December 7, 1943 during an outpatient examination. He was a 28-year-old white man who had been discharged from service on May 18, 1943 for coarctation of the aorta and chronic prostatitis." Since discharge he had been employed as a furnace installer

The veteran had no knowledge of rheumatic fever scarlet fever, or venereal disease in the past There was a history of "inflamed left kidney' dating back to 1938. The family history was negative

In 1941, while undergoing kidney studies at a hospital in Pittsburgh, Pennsylvania, the veteran was discovered to have hypertension and told that he had a form of congenital heart disease. When inducted into the Army on May 23 1942, his blood pressure was 130/80 and heart examination was negative. He apparently carried out his military duties fairly well until November 28, 1942, when he was hospitalized because of urinary symptoms A history of dizziness, headaches, and tinnitus was then elicited dating back several years. In addition, the patient admitted having precordial pain and cold sensations in the legs and feet for some months. With the findings of elevated blood pressure (160/104) diminished femoral pulsations, a systolic aortic murmur transmitted to the neck and posterior chest, and notching of the lower borders of many ribs, a diagnosis of coarctation was made. Left nephrectomy for calculus hydronephrosis in 1941

After discharge, the veteran experienced fairly constant

Published with permission of the Medical Director Veterans Administration who assumes no responsibility for the opinions expressed or conclusions drawn by the author

* Formerly cardiologist at present Chief of the Medical Service Veterans Administration Facility Aspinwall Pennsylvania.

region about the operative site He also complained of dyspnea after climbing two flights of stairs and pains over the precordium which came on both at rest and after exertion, lasting five to ten minutes There was no history of ankle edema, palpitation, nocturnal dyspnea, orthopnea hemoptysis, or nosebleeds Other symptoms were headaches, nocturia (two to three times), and nocturnal cough

Examination revealed a fairly well-developed and well-nourished white man, not appearing acutely or chronically ill There was no orthopnea, edema, cyanosis, or clubbing Exercise test caused mild dyspnea which subsided gradually The heart was not enlarged to percussion or palpation, the point of maximal impulse was felt in the fifth left interspace within the midclavicular line A systolic thrill was felt over the aortic valve area, transmitted along the right carotid artery No abnormal pulsations were noted over the chest Heart sounds were of good quality, the aortic second sound not being accentuated A loud systolic murmur was heard at the apex and base of the heart, a similar murmur was audible over the upper two thirds of the posterior chest No arrhythmia, gallop, or rub was present There were no neck-vein distention, basal rales, or hepatic enlargement The retinal arteries were tortuous, brachial vessels were a bit thickened, femoral pulsations were markedly diminished, the popliteal, posterior tibial, and dorsalis pedis arteries were not palpable Blood pressure readings in mm of mercury were as follows right arm, 158/104, left arm, 166/94, popliteal areas, 100/82

Electrocardiogram showed left axis deviation and was suggestive of myocardial damage X-ray showed no cardiac enlargement, a wavy contour was noted on the inferior borders of the posterior portions of the left fifth to eighth ribs and right fourth and fifth ribs Blood Wassermann and Kahn tests were negative, urinalysis normal

The diagnoses were coarctation of aorta, hypertensive heart disease, and retinal and peripheral arteriosclerosis

Case 2—R J C, a 31-year-old white man, a machinist by occupation, entered the Veterans Facility in Aspinwall on December 13, 1943 for treatment of "hypertension" The patient stated he had always been in good health prior to Army induction There was no history of rheumatic fever, nephritis, heart disease, or syphilis The family history was negative

In July, 1943, while undergoing a routine physical examination for Officer Candidate School, the patient was discovered to have high blood pressure He was discharged from service on October 5, 1943 From that time on, he noticed a constant tired feeling, fatigability, and nervousness, going uphill or climbing stairs caused shortness of breath Aside from occasional spells of dizziness, there were no other symptoms referable to the cardiovascular system

Examination revealed a well-developed and well-nourished adult man, not appearing acutely or chronically ill There was no dyspnea, orthopnea, cyanosis, edema, or clubbing of the fingers The heart was not enlarged, no thrills or abnormal pulsations were noted Heart sounds were of good quality, with the aortic second sound louder than the pulmonic second sound, the rhythm was regular At the base of the heart a rough, systolic murmur was heard, which was loudest in the recumbent position This murmur was transmitted to the right side of the neck In addition, a soft systolic murmur was audible medial to the right scapula There were no signs of congestive heart failure Exercise tolerance was normal Blood-pressure readings were as follows 176/120 (left arm), 166/120 (right arm), 146/116 (right popliteal), and 150/116 (left popliteal) There was some diminution of the femoral pulsations, the dorsalis pedis vessels could not be felt although the posterior tibials were palpable No cutaneous pulsations were noted over the parasternal or scapular areas The retinal arteries were tortuous, narrowed, and spastic, with some arteriovenous nicking

Electrocardiogram showed left axis deviation X-ray revealed a small aortic knob with slight widening of the ascending aorta, the heart was not enlarged, the inferior borders of the ribs were smoothly outlined Urinalysis, blood count, and blood nonprotein nitrogen were normal The Wassermann and Kahn tests were negative

The diagnoses were coarctation of aorta, hypertension, and retinal arteriosclerosis

*Case 3**—J S M, a 20-year-old white man, a student, entered the Veterans Facility in Aspinwall on March 3, 1944 for treatment of "pulmonary stenosis and mitral heart disease"

The past history was negative except for measles, mumps, and pneumonia during childhood The patient had no knowledge of rheumatic fever, nephritis, or syphilis In the family history it was noted that a brother had heart disease and his mother had asthma

The patient had always been in good health, indulging in such strenuous exercise as football without any symptoms In June, 1943, while in military service, he began to experience headaches and dizziness Some time later, an examination revealed the presence of hypertension (200 mm Hg systolic pressure) After a period of hospitalization, he was discharged from service on December 2, 1943 The patient continued to experience headaches and dizziness and also complained of occasional ankle edema after long walks He was able to climb two flights of stairs without dyspnea, slept comfortably on one pillow, and experienced no precordial or retrosternal pain There were no urinary symptoms

Examination revealed a well-developed and well-nourished man of asthenic habitus, not appearing acutely or chronically ill There was no dyspnea, orthopnea, cyanosis, clubbing, or edema Retinal arteries were tortuous and showed acute branching There was no thyroid enlargement or venous distention in the neck Faint pulsations could be felt in the suprasternal notch A harsh systolic bruit was heard in the left supraclavicular fossa.

The apex of the heart was felt in the fifth left interspace, 8 cm from the midsternal line, within the midclavicular line Percussion revealed no cardiac enlargement The sounds were normal, with the aortic and pulmonic second sounds of equal intensity A harsh systolic murmur was audible at the base of the heart A similar murmur was heard posteriorly over the upper thoracic spin No thrills, gallop, or arrhythmia were noted Exercise tolerance was normal Brachial and radial arteries were soft Femoral, popliteal, posterior tibial, and dorsalis pedis pulsations were absent Blood pressure readings were as follows Brachial—160/80 (right), 142/82 (left) Popliteal—112/104 (right), 120/92 (left)

No dilated arteries were visible over the chest or back The liver and spleen were not enlarged Pulsations of the abdominal aorta could not be felt, despite a scaphoid abdomen

X-ray revealed a small aortic knob and a rounded

* Case of Maj A. S Glushien, (MC)

left ventricle which was not definitely enlarged There was no notching of the ribs Electrocardiogram was normal Urinalyses and blood count were normal Blood Wassermann and Kahn tests were negative.

The diagnoses were coarctation of aorta, hypertension, and retinal arteriosclerosis.

Case 4—R W was examined as an outpatient on March 6, 1944 He was a 21-year-old white man who had been discharged from service on December 21, 1943 for a "congenital anomaly of the heart (coarctation of the aorta) and paroxysmal tachycardia." Since his discharge he had been employed as a machine operator

There was no past history of nephritis or venereal disease The veteran stated he had had "growing pains in the knees" at the age of 9, at which time he was found to have a "leaking valve in the heart" The family history was negative.

At the age of 9 years, the patient also had his first episode of tachycardia. A physician was called who diagnosed the "leaking heart valve" From then on, attacks of rapid heart action recurred at intervals varying from once a week to once in six months and lasting ten seconds to three hours at a time. They were usually brought on by severe exercise These episodes ceased entirely for a period of two years, up until July, 1943 when the veteran contracted malaria, following this illness, symptoms recurred. He would also experience an aching sensation over the precordium for one to two hours after these attacks which could be relieved somewhat by massaging the chest He could often stop the palpitation by lying flat with the legs elevated or holding his breath for a few seconds. During the six months prior to examination, some exertional dyspnea had been noticed climbing two to three flights of stairs caused shortness of breath. On one occasion, following a long railroad trip during which his feet hung down all the time there was mild swelling of the ankles. The veteran's only other symptoms were frequent headaches and "nervousness", he did not complain of nocturnal dyspnea, orthopnea cough, dizziness, nocturia, or nosebleeds. He was under the care of a local physician, taking "pills for his nerves.

Examination revealed a fairly well-developed and well-nourished white man who did not appear acutely or chronically ill There was no orthopnea, cyanosis, clubbing, or edema. Exercise tolerance was fairly good The point of maximal impulse of the heart was felt in the fifth left interspace 8 cm from the midsternal line and within the midclavicular line. Percussion revealed no cardiac enlargement No thrills were felt No abnormal pulsations were seen over the chest or back Heart sounds were of good quality the aortic second sound being louder than the pulmonic second sound There was no arrhythmia. A loud, rough systolic murmur was heard at the base of the heart transmitted to the left axilla and along the neck vessels. A systolic murmur was also heard over the posterior chest between the scapulae No gallop or pericardial rub was audible There was no neck-vein distention, basal pulmonary congestion, or hepatic enlargement

The retinal vessels appeared normal the brachial arteries were soft and compressible. Pulsations in the feet and ankles were practically absent. Blood pressure readings in mm of mercury were as follows left arm, 140/98 right arm, 150/90, left popliteal, 100/? right popliteal, 100/80 The feet were cold and paled on elevation.

Chest x-ray showed a small aortic knob with wavy irregularity of the lower margins of the fifth and sixth ribs posteriorly Electrocardiogram was suggestive of myocardial damage. Blood Wassermann and Kahn tests were negative, urinalysis normal

The diagnoses were coarctation of the aorta, and hypertensive heart disease

Case 5—J L. G was seen on May 2, 1944 during an outpatient examination He was a 22 year-old white man who had been discharged from service on June 24, 1943, for "hypertension." Since discharge he had worked steadily as an electroplater

During childhood the veteran had a tonsillectomy scarlet fever measles, chickenpox, and a ten-day illness which was thought to have been rheumatic fever, although he remembered none of the symptoms There was no history of chorea subcutaneous nodules, growing pains nephritis or venereal disease The family history was negative.

In 1941, the veteran first learned that he had hypertension. This was discovered when he was refused employment because of a "blood pressure of 150" In 1942, he was told by a physician that he had a heart murmur During that time, he felt well except for occasional headaches and dizziness When inducted into the Army on October 24, 1943 the blood pressure was 132/80 and examination of the heart was reported as negative In May, 1943 while undergoing a routine physical examination for air cadet, hypertension was found to be present and the patient was hospitalized, during which time his blood pressure varied between 150/100 and 190/130 Hypertension persisted despite treatment with potassium thiocyanate, aminophylline and sedatives

Following his discharge, the veteran had no symptoms until November, 1943 at which time he began to experience frequent dizzy sensations and fullness in the head, particularly when he became overheated during exertion He also noticed mild dyspnea after climbing two or three flights of stairs. He did not complain of precordial pain, palpitation, orthopnea, nocturnal dyspnea, cough, or nocturia. There was no history of ankle edema, hemoptysis, or nosebleeds. The veteran was under the care of a local physician, being treated for "high blood pressure.

Examination revealed a well-developed and well-nourished white man, not appearing acutely or chronically ill. There was no orthopnea, cyanosis clubbing, or edema. Exercise tolerance was normal. The heart was not enlarged to percussion or palpation the point of maximal impulse was felt in the fifth left interspace 9 cm from the midsternal line and inside the midclavicular line. No thrills were felt. The neck vessels pulsated vigorously In addition prominent pulsations were noted along either side of the sternum Heart sounds were of good quality, the aortic second sound was not accentuated. A rough systolic murmur was heard at the apex and base transmitted along the carotid arteries, where it was most intense. A systolic murmur was also audible over the posterior chest medial to the left scapula. There was no arrhythmia gallop or rub The retinal arteries showed narrowing, tortuosity and increased light reflex. The brachial arteries were thickened. Femoral pulsations were barely palpable posterior tibials and dorsalis pedis pulsations were absent Blood pressure readings in mm of mercury were as follows right arm, 202/114, left arm 204/126, right popliteal, 120/?, left popliteal 110/? There were no neck vein distention, basal rales, or hepatic enlargement.

TABLE 1.—Clinical Findings in 5 Male Patients with Coarctation of the Aorta

Name Age	H. W. D. 28	R. J. C. 31	J. S. M. 20	R. W. 21	J. L. G. 22
Past history	Hypertension and congenital heart disease—1941	Hypertension—1943	Hypertension—1943	"Leaking valve in heart" and paroxysmal tachycardia—1932	Hypertension—1941 Heart murmur—1942
Symptoms	Precordial pains, coldness in legs, exertional dyspnea, dizziness, headaches, tinnitus	Fatigue, nervousness, exertional dyspnea, dizziness	Headaches, dizziness, ankle edema	Palpitation, precordial pain, exertional dyspnea, headaches, nervousness	Headaches, dizziness, exertional dyspnea
Blood pressure					
Brachial	162/100	172/120	152/80	148/94	204/120
Popliteal	100/82	148/116	116/98	100/86	118/?
Heart					
Size	Normal	Normal	Normal	Normal	Normal
Murmur	Base of heart and posterior chest	Base of heart and medial to right scapula	Base of heart and over upper dorsal spine	Base of heart and between scapulae	Base of heart and medial to left scapula
Thrill	Present	Absent	Absent	Absent	Absent
Peripheral pulsations	Femorals diminished Popliteal, post-tibial dorsalis pedis absent	Femorals diminished Dorsalis pedis absent	Femorals, popliteals post-tibials and dorsalis pedis absent	Post-tibials and dorsalis pedis very feeble	Femorals barely felt. Post-tibials and dorsalis pedis absent
Cutaneous pulsations	Absent	Absent	Absent	Absent	Present
X-ray	Wavy contour of inferior border of posterior ribs	Small aortic knob Widened ascending aorta	Small aortic knob	Small aortic knob Wavy irregularity posterior ribs	Small aortic knob Wavy lower borders of posterior ribs
Electrocardiogram	Left axis deviation suggestive of myocardial damage	Left axis deviation	Normal	Suggestive of myocardial damage	Normal
Cardiac decompensation	Absent	Absent	Absent	Absent	Absent
Renal function	Good	Good	Good	Good	Good

Electrocardiogram was normal. X-ray showed no cardiac enlargement, the aortic knob was small, and several ribs showed wavy, irregular lower borders in their posterior halves. Urinalysis was normal. Blood Wassermann and Kahn tests were negative.

The *diagnoses* were coarctation of the aorta, hypertension, and retinal and peripheral arteriosclerosis.

Summary

Five cases diagnosed as coarctation of the aorta are presented, with a tabular analysis of the clinical data. The increased frequency of this condition reflects the younger age group of World War II veterans who are being hospitalized and examined for rating purposes. The ease of diagnosis is stressed, provided one considers coarctation in every young adult with hypertension.

PREGNANCY FOLLOWING TREATMENT WITH MALE SEX HORMONE IN STERILITY DUE TO FUNCTIONAL BLEEDING

ARTHUR F SIMON, M.D., New York City

FOR a number of years male sex hormones have been used in patients with meno- and metorrhagia due to functional disturbances. As such a condition is not infrequently the cause of sterility, I was surprised that I could not find any case in the medical literature in which treatment with male sex hormones in patients suffering from such ailments resulted in pregnancy. As I had the opportunity to see such a case it may be worth while to report it.

Mrs. P. E., aged 37, a housewife was referred to me in November, 1943. Thirteen years before this the right adnexa had been removed for an ectopic pregnancy, the convalescence was complicated by an embolism of the lung. Five years later she had a normal delivery. There were no more pregnancies afterwards. Three weeks prior to her visit her child was accidently killed. Due to the fact that she had had that embolism and because two other physicians had told her that she had a fibroid tumor and had warned her not to have another pregnancy she wanted to have my advice concerning this question.

The patient was very depressed because of the loss of her child. As long as her child was living she had avoided another pregnancy, but now all her thoughts were concentrated on the idea of having another one if possible. She was very obese, weighing 225 pounds, her height was 5 feet 4 inches. There were some varicosities of her legs, besides that she was suffering from chronic cholecystitis. The uterus was slightly enlarged and hard but no fibroma could be detected.

The right ovary was slightly enlarged, otherwise no other pathology was present. Her periods were regular, every twenty-eight days, of normal strength, and lasted from three and a half to four days. Due to the fact that five years after that embolism she had had a normal delivery and that organically she was essentially normal, she was encouraged to try to have another baby.

I saw her again on May 14, 1944. Her menstrual periods had become slightly more profuse than formerly. Her last period had started just four days previously and was almost finished, when suddenly a severe hemorrhage occurred. On examination the uterus was found as before, the vagina and the applied towels were covered with clots and fluid blood. Under bed rest and administration of styptics, the bleeding subsided within one and a half to two days. From that time on her periods became progressively more profuse and prolonged. Neither several courses of progestin and frenosil (mammary luteinic extract) administered during the secretory phase of the cycle nor styptics given during the bleeding had any visible effect. Gonadotropin seemed to aggravate the condition. Her menstrual period meanwhile had increased in duration to ten to twelve days, and the bleeding was so profuse that she developed anemia with about 65 per cent hemoglobin.

I therefore decided to make a trial with male sex hormone. On March 24, 1945 I started a series of eight injections of 25 mg. each, given every other day. The following period lasted only four days, and was of normal volume, except that on the second day there was a heavier flow. In order to normalize this still more I gave another series, beginning April 19. The type of the following period was the same. There was one more similar period, but the period that she had expected on July 4 did not come, and further examinations and tests proved her to be pregnant. At the time of writing the patient was in her seventh month of pregnancy.

Summary and Discussion

A case of functional bleeding connected with sterility has been presented, in which the patient, after unsuccessful treatments with other medicaments which are usually given for such conditions, was cured by male sex hormone and subsequently became pregnant.

For various reasons an endometrial biopsy could not be done but there cannot be any doubt that the male sex hormone counteracting an excess of estrogen caused the involution of the hypertrophic endometrium and made the embedding of the ovum possible. Between November, 1943 and May, 1944 the periods had become slightly stronger until from that time on the changes became more marked. During these one and a half years the patient did not conceive. However, after the regulating of the periods by male hormone, pregnancy occurred very soon.

It may be suggested to give male hormone in those cases of sterility where hypermenorrhagia seems to be its cause.

124 East 84th Street

CORRECTION NOTICE

The Post-Graduate Courses announced by the University of Buffalo School of Medicine, as being held the week of March 18, 1946, have been rescheduled to be held the week of April 22 through April 27.

PENICILLIN IN ACUTE CHOLECYSTITIS

RANDOLPH ROSENTHAL, M D , New York City

(From the Bronx Hospital)

THE paucity of reports dealing with the use of penicillin in acute cholecystitis is somewhat surprising in view of the fact that organisms known to be penicillin sensitive (as well as those known to be penicillin insensitive) are among those incriminated as causative agents [1] From a practical standpoint, it is rarely possible, in spite of Lyon-Meltzer drainage and bacteriologic study of duodenal aspirate, to determine the nature of the offending bacterium involved in a case not submitted to operation Since it is known that penicillin is recoverable in the bile[2 3] in concentration sufficient to be effective against penicillin-sensitive organisms, the rationale for the use of penicillin in those cases of acute cholecystitis not subjected to operation, for whatever reason, is apparent [3]

The case presented in this paper is in a patient who was hospitalized because of a recent diagnosis of Addison's disease During the course of hospitalization, which was originally prescribed for purposes of confirming the diagnosis and establishing adequate dosage levels for desoxycorticosterone acetate and adrenal cortex extract,[4] the patient developed an attack of acute cholecystitis which precipitated an Addisonian crisis The patient's condition became critical Medical and surgical consultants agreed that the underlying Addison's disease militated against operative interference. Penicillin was administered

Report

(Hospital #157357) A 50-year-old white woman was first seen at home complaining of severe weakness and an oppressive sensation in the chest Physical examination revealed heart sounds of poor quality and a blood pressure of 94/60 Pigmentation of the arms was erroneously thought to be a souvenir from Florida, where the patient had spent the winter Urine and blood count were essentially normal and an electrocardiogram showed nothing to suggest myocardial damage The past history threw no light on the present illness Recurrent attacks of gallbladder colic had occurred at rare intervals during the past ten years A history of oophorectomy and salpingectomy which revealed tuberculosis of the organs involved twenty years prior to the present illness could not be confirmed by the surgeon when contacted as far as cause was concerned

Under observation, the pigmentation of the skin became deeper and more generalized, involving the buccal mucosa as well as the forearms and anterior and posterior aspects of the chest and legs Asthenia grew more profound, and the diagnosis of Addison's disease was made when the patient was hospitalized for confirmation of diagnosis and therapeutic control of the Addison's disease

Work-up in the hospital confirmed the diagnosis with a report of blood chlorides of 410 mg per cent (525–600 normal), and nonprotein nitrogen of 59 4 mg per cent Fasting blood sugar was 93 The brilliant response of the patient's asthenia and hypotension to desoxycorticosterone acetate further confirmed the diagnosis After therapy was established, blood chemistry showed normal blood chlorides, 536 mg per cent, nonprotein nitrogen 27 9 mg per cent, blood sugar, 95 The patient developed the not unusual diarrhea that so often accompanies Addison's disease, as well as "sinking spells" These symptoms responded only to adrenal cortex extract

Incidental complications of therapy included transitory development of fluid in the left side of the chest on the nineteenth hospital day This promptly responded within forty-eight hours to an adjustment in therapy Hypertension reaching 180 systolic required further readjustment on one occasion The control of the Addison's disease appeared to be within reach of desoxycorticosterone acetate—5 mg every forty-eight hours—and adrenal cortex extract—10 cc daily in divided doses—until the patient developed attacks of biliary colic These were not new to her

On the sixth day after the onset of symptoms ascribed to her gallbladder, the symptoms became more acute, associated with a rise in temperature to 102 2 F The patient's abdomen at this time was rigid in the right upper quadrant, showing marked rebound tenderness in this area Clinical diagnosis of acute cholecystitis was made Two other members of the medical service concurred in the diagnosis, as did the surgical consultant, who agreed that operation was contraindicated because of the patient's underlying Addison's disease Her condition became critical the following day and penicillin therapy was begun in desperation Though the typical temperature curve of acute cholecystitis was not markedly affected by the penicillin given intravenously in infusions, the patient felt subjectively much better three hours after penicillin therapy was begun The patient received 150,000 units of penicillin by continuous infusion on the first day of therapy, when the temperature reached 103 6 F Another 150,000 units was given the second day, when the temperature reached 103 4 F , and 100,000 units a day for the next three days as the temperature dropped from the peak of 103 6 F to 101 0 F after she had received a total of 600,000 units of penicillin At this point, there was only slight tenderness in the right upper quadrant, no rigidity, and no rebound tenderness Temperature continued to drop to the previous level and the patient was once more easily controlled on desoxycorticosterone acetate and adrenal cortex extract

Additional Laboratory Data The admission urine analysis showed a faint trace of albumin, the specific gravity was 1 010 The blood count on admission showed the following hemoglobin, 94 per cent, red blood cells, 4,830,000, white blood count, 8,350, of which neutrophils equal 69, stabs equal 3, the eosinophils equal 2, lymphocytes equal 24, and monocytes equal 2 Wassermann and Kahn tests on admission were negative Chest x-ray on July 6, 1944 showed no abnormality of the lungs, the left cardiac contour suggested left ventricular hypertrophy Gallbladder series on August 15, 1944 showed the gallbladder to be filled faintly with priodex. This was indicative of a pathologic condition Electrocardiogram on June 22, 1944

showed left-axis deviation—otherwise it was negative. The barium enema and gastrointestinal series subsequently done at another hospital were entirely negative.

The patient was discharged in ambulatory condition on maintenance dosage of desoxycorticosterone acetate—5 mg every forty-eight hours—and adrenal cortex extract—10 cc daily in divided doses—on August 21, 1944

Comment

There is every reason to anticipate that acute cholecystitis would respond to penicillin when the causative agent is a penicillin sensitive bacterium The significant findings of Rammelkamp and Helm[2] in 1943 that penicillin could be recovered in the bile in concentrations sufficient to be effective against penicillin-sensitive organisms support the idea. Priest[3] in 1945 suggested that penicillin be tried in certain biliary tract infection and based his contention on the findings of Rammelkamp and Helm Since it is rarely possible to determine preoperatively the nature of the offending organism in acute cholecystitis the contention that penicillin-insensitive organisms frequently are the causative factor in no way argues for withholding what may be a lifesaving drug.

The assertion that penicillin's antibiotic properties turned the tide in this case may be challenged. The fact remains however, that the patient was decidedly better subjectively within three hours after the onset of penicillin therapy, and her response to adrenal cortex extract and desoxycorticosterone acetate was more favorable. It must be borne in mind that a serious underlying Addison's disease precipitated a critical condition which resisted specific therapy until penicillin was administered. It might be contended that the potent chemicals used in the treatment of the Addison's disease turned the critical tide, and that penicillin did not significantly alter the course of the acute gallbladder condition. It may be asked then, why these same drugs failed before penicillin was given. The author is of the opinion that penicillin was the factor that turned the tide for a patient who was hopelessly ill prior to its administration and who in all probability was doomed to succumb[4] if surgical relief were attempted

Conclusion

The author is of the opinion that in acute cholecystitis whenever operation is delayed or contraindicated the patient should be given the benefit of penicillin therapy to lessen the risks of nonoperative management. The only theoretic exception to this rule would apply to cases in which the causative agent is definitely known to be a penicillin resistant bacterium.

"DOCTOR JONES" SAYS—

Using fancy words where simple ones'll do—I was just reading, here, some extracts from an article—this fellow's criticizing social workers for what he calls "robing the simplest thoughts in cabalistic phrases." ("Cabalistic —I take it what he means there is something mysterious—not easily understood.)

And he goes on to illustrate how, as he claims they tend to dress up their ideas in language so involved and technical that it takes an expert to interpret it into anything an ordinary person could understand Those aren't his words but that's the general idea

Well from what I've read of things social workers have written, I can't say't I ever noticed that particularly About the worst offenders I'd say, are the doctors—with engineers a close second. They use a technical language—a good many of 'em do—that's largely made up of 'ten-dollar' words and then they wonder why their ideas don't seem to register with ordinary folks.

These word tests like the magazines have been running—I got quite a letdown when I started trying 'em You know they give you a list of more or less unusual words and you're supposed to check the meaning you think is right and then look over the page to see what your rating is. Well, sir, I've been looking up words in the dictionary ever since I was a kid and I started out expecting to get a rating of "Excellent" to say the least. About the best I've ever been able to do was "Fair," Not wanting to admit that I was dumb I concluded that simple words had answered my purpose so well I hadn't had occasion to use the fancy ones.

Of course improving our vocabulary—it ought to be encouraged. And using words they have to look up in the dictionary—I s pose it makes a good impression sometimes. But what we've got to say—if it's important for ordinary folks to understand it, it's sort of necessary to speak a language that they don t have to have an interpreter translate it for em I figure the less words we use the more people they re liable to reach. Yes, words are like some clothes it's remarkable how few you can get along with and still get by —*Paul B Brooks, M.D in Health News, Dec. 17 1945*

SAFETY SWITCH FOR SHORT-WAVE MACHINE

I KLEIN, M D , New York City

SHORT-WAVE machines are not usually equipped with safety switches and I have not found any in the many institutions and private offices visited However, there is a definite need for a safety switch on a short-wave machine

In a compensation office where more than one patient was treated at once, there were complaints of excess heat and occasional burns In our own office we made a safety switch to be placed in the hand of the patient so that in an emergency the switch can be turned off by the patient

The switch is a circuit by-pass switch in the main circuit which leads to the short-wave machine This switch is of the simple *on* and *off* type It is manipulated by pressing a button The switch is held in the hand of the patient

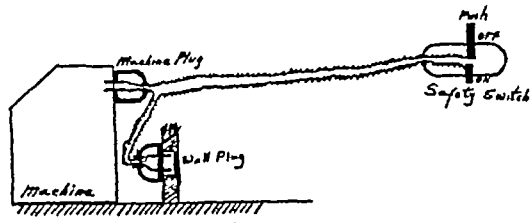

FIG 1

The patient can turn off the circuit when he feels excessive heat We have had this type of switch installed in our office for the last six years and have been very well satisfied with the way it functions

100 Central Park South

BLOOD PRESSURE CHEMICAL

Patients with essential hypertension may in future be taking regular doses of a new medicine to keep the blood pressure at safe levels just as diabetics today take regular doses of insulin to stay healthy

This blood-pressure-lowering chemical is not yet ready for general use, but steps leading to its development have been taken by Drs Arthur Grollman and Tinsley R Harrison, of the Southwestern Medical College in Dallas, Texas

The increatory substance, as Dr Brollman terms it, was first discovered in the kidneys Medical men long ago believed the kidneys played a part in the development of high blood pressure, but the idea that these organs which act primarily as filters and waste handlers produce a chemical essential for maintaining normal blood pressure is relatively new High blood pressure results, Dr Grollman believes, when these organs are damaged so that they cannot produce this essential substance

Annual Reports

Medical Society of the State of New York

1945-1946

Report of the President

To the House of Delegates, Gentlemen

The last meeting of the House of Delegates was held at Buffalo on October 8, 1945, five months after the date originally scheduled I had occupied the office of President since the preceding May, therefore it was possible to make a brief report of the activities of our Society for the five months intervening In that report, mention was made of the very loyal and able work of the men serving on the various committees which enabled us to carry on the routine work of the association with very little, if any loss of effectiveness. There had been no meeting of the House of Delegates during the latter part of April, therefore, we were compelled to proceed without the advice or instruction usually received at the Annual Meeting It seemed to be the part of wisdom not to appoint new committees, many members of which would be without experience but rather to ask the present members to continue because of their familiarity with the work. Being aware of the additional sacrifice necessary on their part and somewhat skeptical about their accepting these assignments for the next twelve months, I was pleasantly surprised to find that practically the entire membership agreed to serve, despite the fact that they were already doing much more than their normal amount of professional work, due to the shortage of physicians caused by the war The report contained a word of appreciation for the work of all the committees and with the additional experience of the last six months, I feel even more strongly impelled to repeat that expression of appreciation and gratitude for the fine cooperation and very valuable assistance they have rendered during this past year

Prior to the last Annual Meeting we were engaged in four activities, namely

1 A plea for an accelerated separation of our military medical officers

2. The initiation and continued prosecution of the campaign against the antivivisection bill, which is annually introduced into the legislature of the State

3 The continued opposition to the Wagner-Murray Dingell Bill with a discussion of the reasons for opposing all forms of compulsory insurance plans

4. Endeavoring to accelerate the better distribution and correlation of the various voluntary medical insurance plans operating in the state

The report rendered previously was necessarily incomplete as these were continuing programs, some of which have not yet been completed. However it might be well to devote a word to these four objectives

The first-mentioned plea for the more rapid discharge of medical military officers received favorable notice in the public press. The need for men at home was over present The veteran medical officers were anxious to return re-establish themselves, and regain their practice on a peacetime basis We thought it wise to arouse the interest of the members of the national legislature to the plight of these officers remaining in service, though no longer needed It is impossible to determine whether any good whatsoever resulted from our efforts as it is very difficult to influence the military officers in time of war or immediately thereafter However, the medical men have been discharged at a somewhat faster rate during the last six months with the result that we were confronted with another problem, that of trying to assist the veteran officer to find a location, an office and living quarters for wife or family The housing shortage has made it practically impossible to meet these demands We were more fortunate with the younger officers who desired *additional intern work or residencies, for it was possible* to provide many of them with either residencies or assistant residencies.

These conditions effecting the discharged veteran have given us much concern. A special committee has been appointed and is now working to give these men better information and assistance. It can only be done by loyal cooperation of the different county societies with the veterans' committee. Much of the work must be done at the county level, if we are to succeed in removing the troubles now confronting the discharged medical officer Methods that have been suggested, such as referring emergency work or employing them as assistants, anesthetists, etc, would do much to meet the situation. County societies can also render valuable service in this direction if they will send forth information that may be useful to the central committee.

The second activity, that of opposition to the antivivisection bill, was begun in August of 1945, due to the farsightedness of the Committee on Medical Publicity Dr Floyd S Winslow had full responsibility for this work and together with Mr Dwight Anderson and his staff, developed the most vigorous campaign ever organized against those who would prevent animal experimentation

During the Fall of 1945, the pamphlets were written, carefully rechecked and the contents referred to many reliable authorities to insure absolute correctness. This material together with other pieces of publicity, was then distributed, where it would be most effective. The actual campaign was opened by your President at the Fifth District Branch meeting in Oneida on September 17 and the same message was carried to every District Branch meeting in the state County societies were requested to form committees whose duty it was to assist in this campaign. A Council Committee was appointed to take charge of the work and afterwards it became active in the formation

1 By the Medical Society of the State of New York which would necessitate the formation of a service corporation

2. By medical-care plans now established

3 By direct negotiation between the Veterans Administration and individual doctors

The first of the above-mentioned methods has been recommended by the committee and a sufficient amount of money to cover the legal requirements of such an organization with an additional small amount to be used for initiating the service has been requested from the Board of Trustees The special committee is now formulating a fee schedule for both in-hospital and ambulatory patients. This question will be the only subject considered at a special meeting of the Council to be held March 28, 1946.

I must not close this report without expressing my great satisfaction with the cooperation and assistance extended by all members of the office staff Mr George P Farrell the Director of the Bureau of Medical Care Insurance, has impressed me with his knowledge of voluntary insurance plans and his advice at all times has been sound reliable, and willingly offered. His work coordinating the different plans is meeting with considerable success and promises much for the future. I have already mentioned the part Mr Dwight Anderson played in carrying on the antivivisection campaign which is but a small part of the very valuable and important work carried on by the Medical Publicity Committee This is one of our most important and effectual activities. Dr Walter P Anderton who assumed the office of Secretary following the death of our late lamented friend Dr Peter Irving has proved a very efficient officer of our Society His work is so quietly performed and his manner so modest it is a pleasure for me to call attention to his value to the Society in his present position. He is a gentleman, scholar, and a physician whom we are very fortunate in having to carry on all communications and contacts with the members of our Society and profession. Miss Doris K. Dougherty continues to display efficiency and courtesy in her work as Administrative Assistant. Although sufficient office space is sadly lacking, due to the excellent spirit of the entire office personnel it has not seriously interfered with the business of our organization. The work of our Publication Committee under the guidance of the Managing Editor, Dr George W Kosmak, deserves considerable commendation for the manner in which they published our JOURNAL, despite the many unusual difficulties confronting them The great paper shortage still existing together with the tremendous handicap in arranging for the actual printing, due to insufficient manpower, presented an almost impossible task However, the JOURNAL continues to prosper and reflect great credit upon its editors. They are to be congratulated not only for the publication, but also for the quality of the articles presented and the excellence of its editorials.

After serving as your President and visiting different parts of the State to attend various medical meetings, I have been deeply impressed with the great eagerness for postgraduate instruction in the newer developments of medicine by the members of our profession There was ample evidence of their scientific attainments, their professional usefulness, and an exhibition of their exalted character in their desire to give all possible service and protection to the public I was also very much pleased to find an awareness of the value to be received from a study of the present social and economic trends of our country These with the realization that the obligations of medicine and medical practice to the general public are never allowed to be forgotten, gives me a very high opinion of the physicians of New York State. I believe the unity of the medical profession is better than ever before and it is fortunate, for it is only possible to withstand the many dangers confronting the practice of medicine with a profession that is of one accord in the manner of preserving its high ethical and professional standards in seeking newer and loftier ideals.

EDWARD J CUNNIFFE, M.D, *President*

Report of the Secretary

To the House of Delegates Gentlemen

Due to the postponement of the 1945 meeting of the House of Delegates, this report is mainly for the past five months

Membership —Elected in 1945 were 648 new members, 151 were reinstated. The net increase for the year, as shown below, was 293

Membership—December 31, 1944	18,941	
New members—1945	648	
Reinstated members—1945	151	19 740
Deaths	238	
Resignations	96	
Licenses revoked	4	
Licenses suspended	3	341
		19,399
Dropped for nonpayment of dues as of December 31 1945		165
Total Membership as of December 31, 1945		19 234

3,755 members are in the service of our country

Honor counties (none of whose members failed of their dues in 1945) include Allegany, Broome, Cattaraugus Cayuga, Chautauqua, Chenango Clinton Columbia, Cortland, Dutchess, Erie, Essex, Franklin, Fulton, Lewis Madison, Ontario, Orange, Orleans Oswego Rockland, Saratoga, Schoharie Schuyler, Seneca Steuben, Sullivan, Tioga, Tompkins, Washington, and Wyoming

Comparative totals of members since 1935 follows

1935	14 084	1941 — 17,781
1936	14 662	1942 — 15,313
1937	15 529	1943 — 13 637
1938	16 177	1944 — 15 941
1939	16,785	1945 —
1940	17,409	

The membership had increased to 1 1946

Directory —Early in tion of information *Medical Directory* *ical* was ing, and

to the printer early in the Fall It is likely that the new directory will be in the hands of the membership early in 1947

Council—The Council has met regularly the second Thursday of each month, and directly after the adjournment of the last meeting of the House of Delegates The Council has carried out the directions of the House as reported elsewhere

Dr Clarence O Cheney, of White Plains, was appointed by the Council to membership on the New York State Board of Psychiatric Examiners in accordance with the law, replacing Dr Israel Strauss, who had served the State diligently ever since the creation of this Board

In addition to the twenty-three committees of the Council which functioned last year, in accordance with a resolution of your House, President Cunniffe, with the approval of the Council, appointed a Veterans' Affairs Committee, consisting of Dr Dan Mellen, Rome (Chairman), Dr William F MacFee, New York, and Dr James F Rooney, Albany The Council also empowered President Cunniffe to appoint the following committee, which called upon Colonel Harding in Washington for conference regarding medical care of veterans with service-connected disabilities under the U S Veterans Administration Drs Herbert H Bauckus, William Hale, Laurance D Redway, President Cunniffe, Secretary Anderton, and Mr George P Farrell, Director of the Bureau of Medical Care Insurance As a result of this conference, the Council instituted the following Committee of Liaison with the U S Veterans Administration Drs William Hale (Chairman), Herbert H Bauckus, Laurance D Redway, J Stanley Kenney, Dan Mellen, President Cunniffe, Secretary Anderton, and Mr George P Farrell This committee has been working on a plan for practicing physicians to care for veterans with service-connected disabilities under authorization from the U S Veterans Administration

A Council Committee on the contract with the Medical Society of the County of Kings was appointed The members are Drs William Hale, Chairman, F Leslie Sullivan, and James R Reuling, Jr This contract deals with journals which exchange with the NEW YORK STATE JOURNAL OF MEDICINE and with book reviews

The Special Committees ordered by the House of Delegates, National Casualty and Indemnity Insurance Committee, Planning Committee for Medical Policies, Prize Essays Committee, and Committee on Revising Principles of Professional Conduct have also been active during the past months

Delegates to the American Medical Association attended the meeting in Chicago in December, and carried out the instructions which you gave them

Comments—In addition to the usual correspondence, your Secretary has helped with that of the erstwhile War Participation Committee, and with that of its successor, the Veterans' Affairs Committee I have attended the meetings of each of the eight District Branches, the New York State Conference of County Society Secretaries and Editors in Albany, the meeting of the American Medical Association House of Delegates, and the Conference of State Society Secretaries and Editors in Chicago, the meeting of County Society Legislative Committee Chairmen in Albany, and many meetings of the various committees of our Society, as well as the Annual Meeting of the Medical Society of the County of Monroe

Details of the actions of the Council in implementing certain resolutions passed by your House are described in the Résumé of Instructions of the 1945 House of Delegates and Actions Thereon of the Council, Board of Trustees and Officers

It gives me great pleasure to take this opportunity to express my personal appreciation for the honor you have paid me in allowing me to be your Secretary, and to thank my fellow officers, the councillors, trustees, and the staff of the offices of the Medical Society of the State of New York for their unfailing consideration, courtesy, and cooperation

Respectfully submitted,
W P ANDERTON, M D, *Secretary*

March 7, 1946

(The Report of the Treasurer will appear in the April 15 issue)

Report of the Board of Trustees

To the House of Delegates, Gentlemen

During the current year your Board of Trustees held regular meetings following those of the Council, with the exception of the month of February At the meeting held May 10, 1945, Dr Brennan retired as Chairman but agreed to continue as a member of the Board pending the election of a successor by the House of Delegates The latter selected Dr John J Masterson, of Brooklyn, at its October meeting and he entered upon his duties on that date

In order to present to the Society a record of the deliberations of its Board of Trustees, attention is directed to the following items, aside from routine matters, discussed at its various meetings at which there were present, likewise as ex officio members, the Secretary, Treasurer, and their assistants, as well as the Counsel of the Society

Finances—The regular monthly reports of the Treasurer were considered, various supplementary expenditures approved and changes and additions made in the investment account as recommended by the investment committee of the Board The details of the Society's holdings in securities, etc, will be found in the Treasurer's Report

Your Board has been concerned with the reduction in the income of the Society from dues of members who entered military service, but thus far it has been possible to meet the necessary expenditures within the limitations imposed

The Budget Committee of the Council made its report at the December meeting of the latter This accounted for a six months' period ending on June 30, 1946, and was approved by the Board

Contracts.—Annual contracts for services to be performed by Drs David J Kaliski and Robert R Hannon, as well as Mr George P Farrell, as directors of their respective bureaus, were drawn and executed in accordance with the provisions in the Constitution and Bylaws The matter of the contract with Mr Dwight Anderson as Director of the Public Relations Bureau and other activities will be dealt with in a supplementary report.

Increased Office Facilities.—In view of the expansion of the business and other activities of your Society during recent years the need for more space has been given careful study by the Office Administration Committee It is advisable that the present location be retained and fortunately larger quarters are available in the building which we now occupy It is hoped that as soon as the Chemical Warfare Service vacates its present premises we can take over the seventh floor within a short time The unavoidable crowding to which our office forces are now subjected will then be eliminated. Naturally the expenditures for rent and other necessities will be almost doubled but your Board feels that this is warranted by the greater ease and facility with which the Society s business can be conducted

Reserve Funds.—Your Board has sanctioned the establishment of such funds for the NEW YORK STATE JOURNAL OF MEDICINE and the annual meetings to provide for possible future reductions in the income from these sources The advertising revenues from the JOURNAL as well as from the commercial exhibits have shown in recent years a surplus over expenditures However in the event of contingencies it appears desirable to have a fund available to meet possible later deficiencies in the conduct of these activities The costs of publication of the JOURNAL already have increased and the outlays for a new *Directory* are somewhat problematical The ability to resort to such funds will avoid a burden to the Society The reserve fund for publication activities has been limited by your Trustees to the sum of $65 000 Efficient administration in publication policies has resulted in noteworthy economies during the past few years since their conduct has resided entirely in the Society s offices and further improvements in the physical appearance and contents of the JOURNAL will be possible when wartime and other restrictions have been eliminated.

Beneficiary Fund.—In past years employees of your Society, incapacitated by illness age or disaster have received beneficiary payments through appropriations made in each individual case In an effort to replace this method the Office Management Committee during a previous year made a careful survey of various retirement and insurance plans developed in similar organizations by commercial insurance companies The costs to the Society for the operation of these plans would have amounted with employee participation, to from $16,000 to $20 000 annually From time to time during the progress of these studies reports were made to the Council which finally decided to refer the matter to a special committee of the Board of Trustees This committee consisting of Drs William H Ross, Thomas M Brennan, and George W Kosmak, continued the study and submitted for consideration a nonparticipating beneficiary plan applicable to the clerical employees excluding all those under contracts, and omitting the retirement features previously included. The necessary funds were to be derived from an initial appropriation of $100 000 to be made from the general funds of the Society to be invested in Federal Government bonds bearing 2½ per cent interest and additional annual appropriations for a ten-year period until the fund reached a total of $200 000 This income, increasing from $2 500 to $5,000 annually, was considered sufficient for a total of only $26,000 had been paid out during a period of twenty previous years under the previous system However, in view of the enlarged staff, recourse to benefit payments might be more frequent in the future

Following a further discussion of the subject it was finally decided by the Board that the previously observed custom of caring for cases of hardship, illness, and other contingencies arising among employees of the Society be continued as in the past and that there be incorporated in the Report to the House of Delegates a summary of a study of the various plans considered for the information of the House The essential features of the plan which was finally developed are outlined in an earlier paragraph but the special committee of the Board which studied the question will be prepared to furnish the Reference Committee with the other necessary details developed by their studies The Board felt moreover that this innovation was a policy making feature which should be decided by the House of Delegates.

Matters Referred to the Board of Trustees.—Among these was a proposal to set up a fund to be devoted to the education of the children of medical officers, members of the State Society who died while in service during World War II. This was a mandate from the House of Delegates After extended discussion this proposition was referred back to the Council and the Finance Committee of the latter now has the matter under consideration

Conclusion.—In presenting their annual report the Trustees desire to acknowledge the efficient cooperation of the secretarial and financial staffs of your Society and particularly to its Treasurer for his faithful conduct and supervision of the monetary affairs of the organization.

Respectfully submitted,
JAMES F ROONEY, M.D
ALBERT A GARTNER, M.D
WILLIAM H. ROSS, M D
JOHN J MASTERSON, M D
GEORGE W KOSMAK, M.D *Chairman*

Note A supplementary report will be presented

Report of the Council

To the House of Delegates, Gentlemen

Your Council has the honor to report on the executive and administrative affairs of the Society in the period following your last meeting on October 8 and 9, 1945 The various matters that came before it, actions thereon and recommendations, are here presented in successive "Parts" of this report

PART I

Postgraduate Education

The Council Committee on Public Health and Education has the following membership

O W H Mitchell, M D , *Chairman* Syracuse
George Baehr, M D New York
Charles D Post, M D Syracuse

ADVISERS

Edward S Godfrey, Jr , M D , Commissioner, State Department of Health, Albany
Edward S Rogers, M D , Assistant Commissioner for Medical Administration, State Department of Health, Albany

The Council Committee on Public Health and Education arranges for instruction in a wide variety of subjects for meetings of county medical societies, hospital staffs, and other medical groups The program is made available through the combined efforts of the faculties of the nine medical schools in New York State, the New York State Department of Health, the Dental Society of the State of New York, the Division of Industrial Hygiene of the New York State Department of Labor, the Medical Society of the State of New York, and several other organizations and associations

A considerable part of the activities of the Committee is presented in cooperation with the New York State Department of Health The Medical Society of the State of New York pays the traveling expenses of the speakers from inside the State and the honoraria for all speakers are paid by the Medical Society of the State of New York or the New York State Department of Health, depending upon the subject presented Instruction may be arranged as a single lecture, a series of lectures, or a teaching day which is a combination of clinics, demonstrations, and lectures for an afternoon and evening

The Committee prepares and distributes the *Course Outline Book* which lists subjects and speakers available The *Course Outline Book* is revised annually The 1945–1946 *Course Outline Book* contains sixty announcements including courses of lectures, teaching day programs, and single lectures on special subjects Appearing in the 1945–1946 *Course Outline Book* for the first time are additional announcements of instruction available in dermatology, general medicine, obstetrics, otolaryngology, and surgery.

Copies of the 1945–1946 *Course Outline Book* have been distributed to the presidents, secretaries, and chairmen of Public Health and Program Committees of county medical societies, officers of the Medical Society of the State of New York, members of the Council Committee on Public Health and Education and the Subcommittees, the Regional Chairmen in Obstetrics and Pediatrics, the State Commissioner of Health, Assistant Commissioners and Directors of Divisions of the New York State Department of Health, District State Health Officers, City and County Health Commissioners, physicians who arranged courses in the *Course Outline Book*, deans of the medical schools in the United States, the presidents of the universities in New York State, librarians of the medical schools in New York State, secretaries of state medical societies in the United States, executive health officers of the various states, secretaries of the national medical societies, members of the New York State Board of Regents, the New York State Commissioner of Education, and directors of several Divisions of the New York State Education Department, officers of the American Medical Association and the Council on Medical Education and Hospitals, the Chairman of the Council on Medical Service and Public Relations, the Chairman of the Council on Industrial Health, Director of the Bureau of Health Education, members of the Section of Preventive and Industrial Medicine of the American Medical Association, representatives of the New York State Health Preparedness Commission, Secretary and Executive Secretary of the State Charities Aid Association, Surgeon General of the United States Public Health Service, New York State Commissioner of Mental Hygiene, Commissioner of the New York State Department of Social Welfare, and representatives of the Metropolitan Life Insurance Company and the National Foundation for Infantile Paralysis

Since September, 1945, arrangements for postgraduate instruction, presented as a series of lectures or as single lectures were made for twenty-five county medical societies The following county medical societies have had this instruction

County	Instruction	No Lectures
Broome	General Medicine	1
Cayuga	Obstetrics	1
Cortland	General Medicine	2
	Syphilis	1
Franklin	Sulfonamide and Penicillin Therapy	1
(Saranac Lake Medical Society)	Cancer	1

Regional Meetings and Teaching Days.—For a regional meeting invitations are sent to the memberships of the county medical societies adjacent to that in which the meeting is held The Committee arranges for the speakers and for printing and distribution of programs to county medical societies, medical schools, hospitals the NEW YORK STATE JOURNAL OF MEDICINE the *Journal of the American Medical Association* and other publications. The following Regional Meetings or Teaching Days have been held this year

	Instruction	No. Lectures
County—Chautauqua Region—Erie, Chautauqua, Cattaraugus	*Cancer	2
County—Onondaga Region—Cayuga, Cortland, Jefferson Madison, Oneida Onondaga Oswego	*Cancer	4
County—Chemung (Not Regional)	General Medicine	2
County—St. Lawrence Region—Clinton Essex Franklin, Jefferson, Lewis, St. Lawrence	*Cancer	4

The Committee arranged for postgraduate instruction to be presented in twenty-seven counties, with a total of eighty-four lectures

Public Health matters receiving particular emphasis from the New York State Department of Health and the Medical Society of the State of New York since September have been bacterial endocarditis, cancer, gynecology, obstetrics, orthopedics, pediatrics, penicillin therapy, plasma therapy, pulmonary diseases, rheumatic fever—rheumatic heart disease, sulfonamide therapy, surgery, syphilis and tuberculosis.

Pulmonary Diseases and Tuberculosis.—The Council Committee on Public Health and Education, with the approval of the Council of the Medical Society of the State of New York, assisted in the preparation printing and distribution of the announcement regarding a 'Course of Instruction in Pulmonary Diseases and Tuberculosis" given by the Division of Tuberculosis of the New York State Department of Health. This instruction is given at any of the following New York State Department of Health Tuberculosis Hospitals

Hermann M Biggs Memorial Hospital Ithaca, New York
Homer Folks Tuberculosis Hospital, Oneonta New York
Mount Morris Tuberculosis Hospital Mount Morris, New York
New York State Hospital Ray Brook, New York

This course of instruction is endorsed by the following medical schools, and appointees are welcome at grand rounds, special lectures and demonstrations given by the schools as a part of their program of postgraduate education

Albany Medical College
University of Buffalo, School of Medicine
University of Rochester School of Medicine and Dentistry
Syracuse University College of Medicine

This course of instruction is intended primarily for medical officers returning from service with the armed forces but others may apply if they possess the necessary qualifications

Each State tuberculosis hospital can accommodate four residents who will reside at the hospital More can be accommodated if applicants reside in the adjacent community

The minimum period of instruction will be for three months, but may extend up to twelve months maximum, as each applicant may desire

This announcement was given wide distribution to hospitals medical schools, separation centers of the Army and Navy, health officials, and secretaries of county medical societies

The details regarding this instruction appear in the report to the House of Delegates at its meeting in October, 1945

On February 9 1946 a communication was received by the chairman of the Council Committee on Public Health and Education from Robert E Plunkett, M D , General Superintendent, Tuberculosis Hospitals, Division of Tuberculosis, State Department of Health, in which the following paragraph appeared

'May I take this opportunity of personally thanking you for your extremely valuable guidance and assistance in the preparation of this course of instruction And through you, may I extend the appreciation of this department to the State Medical Society '

PART II

Maternal and Child Welfare

Maternal Welfare.—The Subcommittee on Maternal Welfare has the following membership Charles A Gordon, M D , *Chairman*, Brooklyn, Edward C Hughes, M D , Syracuse, Alexander T Martin, M.D , New York James K Quigley, M.D Rochester

Regional Chairmen in Obstetrics

1 New York, Richmond, Bronx Counties
George W Kosmak, M.D , 23 East 93 Street New York 28
2 Kings Queens Nassau, Suffolk Counties
Harvey B Mathews, M.D , 643 St. Marks Avenue Brooklyn 16
3 Westchester Rockland, Dutchess, Putnam, Orange Counties
Julian Hawthorne, M.D , Highland Hall Apartment, 131 Purchase Street, Rye
4 Schenectady Fulton, Montgomery, Schoharie Greene, Ulster Counties
William M Mallis, M.D , 1364 Union Street, Schenectady 8
5 Albany Washington, Saratoga, Columbia, Warren Rensselaer Counties
Joseph O C Kiernan, M.D , 496 Madison Avenue, Albany 3

* The traveling expenses and honoraria of speakers and printing of programs provided by the New York State Department of Health.

October, eleven lectures on cancer have been given in six counties, including three Regional Teaching Days For a report of these activities, see the report on Postgraduate Education These lectures, presented by the Medical Society of the State of New York and the State Department of Health, have been well attended and received.

Hard of Hearing and the Deaf —The Subcommittee on Hard of Hearing and the Deaf has the following membership

Gordon D Hoople, M D , *Chairman,* Syracuse 2
C Stewart Nash, M D , Vice-Chairman, Rochester 7
Ralph Almour, M D , New York 21
John F Fairbairn, M D , Buffalo 9
Edmund Prince Fowler, M.D , New York 22
Marvin F Jones, M D , New York 22
Harry K Tebbutt, M D , Albany 6

Meetings of the Subcommittee on Hard of Hearing and the Deaf were held on January 8 and February 13, 1946 Present at these conferences, in addition to the Subcommittee members, were members of the Council Committee on Public Health and Education, officers of the Medical Society of the State of New York, the chairmen of the Subcommittees on Maternal and Child Welfare, and representatives of the New York State Departments of Health, Education, and Social Welfare

The Council of the Medical Society of the State of New York at its meeting on January 10, 1946 approved the recommendation of the Council Committee on Public Health and Education "that the Subcommittee on Hard of Hearing and the Deaf, in cooperation with the New York State Departments of Health and Education prepare and submit as soon as possible a program for the State of New York for the following purposes (*a*) the prevention of hard of hearing and deafness, and (*b*) the detection and treatment of these conditions"

These conferences of the Subcommittee on the Hard of Hearing and the Deaf were held for a discussion of the establishment of hearing conservation centers throughout New York State and their estimated cost At the meeting on February 13, 1946 data was submitted by members of the Subcommittees and others, concerning these centers Future meetings will be held to continue these discussions before recommendations are submitted

Child Health —Recently a request has come to the Council Committee on Public Health and Education to cooperate in the study of child health services which is being developed by the American Academy of Pediatrics The Academy considers it advisable to establish this study as a cooperative project with the United States Public Health Service and the Children's Bureau of the Federal Department of Labor

At a meeting of the Council on February 14, 1946 a request for the cooperation of the Medical Society of the State of New York was presented and your Chairman advised that the matter be referred to the Council Committee on Public Health and Education with power We have studied this very extensive program and believe that the Medical Society, through appropriate committees, should cooperate and assist For the actual operation of the inquiry, there is no financial obligation on the part of the Medical Society of the State of New York.

Administration of Gamma Globulin by Public Health Nurses —In January, 1946 a communication was received by the Chairman of the Council Committee on Public Health and Education from the Onondaga County Medical Society asking for an opinion regarding the administration of gamma globulin by public health nurses to prevent and modify measles It was the unanimous opinion of the Council Committee on Public Health and Education and representatives of the New York State Department of Health, at a meeting on January 8, 1946, that "gamma globulin may be administered by public health nurses if physicians order it to be given and assume responsibility for such treatment"

At the meeting of the Council on January 10, 1946 the above recommendation was approved and the Onondaga County Medical Society so notified

Standing Orders for Public Health Nurses of the New York State Department of Health —Representatives of the New York State Department of Health, at a meeting with the Council Committee on Public Health and Education on January 8, 1946, requested the cooperation of the Medical Society of the State of New York in revising the Department's "Standing Orders for Public Health Nurses" These Orders have not been revised or approved by the Medical Society of the State of New York since 1935 Many new procedures and practices have been developed and a revision is urgent It was the unanimous opinion of the Council Committee on Public Health and Education and representatives of the New York State Department of Health that such a revision should be made as soon as possible

The above report was approved at the meeting of the Council of the Medical Society of the State of New York on January 10, 1946

Proposed Changes in New York State Narcotic Law —On November 7, 1945 a meeting of the Council Committee on Public Health and Education was held to consider proposed changes in the New York State Narcotic Law regarding the dispensing of barbiturates Present at this conference, in addition to the Committee members, were officers of the Medical Society of the State of New York, representatives of the New York State Department of Health and the City of New York Department of Health, the supervisor of the New York State Narcotic Control Bureau, and the secretary of the State Board of Pharmacy

Other conferences will be held with the Committee, representatives of government agencies, and the Executive Officer of the Medical Society of the State of New York who will give special attention to the matter

Discontinuance of Drafting of Professional Students —The following resolution was not approved by the House of Delegates at its meeting on October 8 and 9, 1945, but was referred to the Council for consideration and action

> "That the Medical Society of the State of New York represented at this duly convened meeting of its House of Delegates goes on record as strongly favoring the immediate discontinuance of the drafting of all persons engaged in studies preparatory to the practice of any of the recognized professions or engagement in any scientific occupations, that the War and Navy Departments and Selective Service System be, and they are hereby urged and petitioned to remove this menace to professional education and professional standards by ceasing the drafting of all such students"

The Council at its meeting on December 13, 1945 voted to refer the above resolution to the Council Committee on Public Health and Education.

The Chairman of the Council Committee on Public Health and Education reported at the meeting of the Council on January 10, 1946 that "considerable thought had been given to the proposal and it was his opinion that it should be sent to the proper individuals in the American Medical Association for consideration in their dealings with the Federal government." It was voted that this be done.

PART V

Rehabilitation

The Subcommittee on Rehabilitation has the following membership

O W H Mitchell, M D *Chairman*, Syracuse 10
Charles M Allaben, M D., Binghamton
Gustave Aufricht M D, New York 28
Conrad Berens, M D New York 21
Ralph T B Todd, M.D., Tarrytown

Meetings of the Subcommittee on Rehabilitation were held on December 11, 1945 and February 13, 1946 Present at these meetings, in addition to the Subcommittee members, were members of the Council Committee on Public Health and Education, officers of the Medical Society of the State of New York, the Director of the Bureau of Workmen's Compensation of the Medical Society of the State of New York and representatives of the New York State Departments of Health, Education, and Social Welfare

Considerable attention has been given to the fee schedules for surgical procedures used by the Bureau of Medical Rehabilitation of the New York State Department of Health and the Division of Vocational Rehabilitation of the New York State Education Department.

As in previous conferences there was splendid cooperation between the representatives of all agencies concerned

Rural Medical Service

The Council Committee on Rural Medical Service was formulated in November of 1945 Dr Dan Mellen was named Chairman of the Committee and also appointed to serve were Dr Homer J Knickerbocker, of Geneva New York, and Dr Edward P Flood, of the Bronx, New York. The Committee is available for conference with the American Farm Bureau Federation and all other farm organizations since all planning for improvements in rural health must have the benefit of the experience and advice of the organized medical profession.

PART VI

Public Relations and Economics

The Council Committee on Public Relations and Economics has the following membership

Carlton E. Wertz, M.D., *Chairman*	Buffalo
Harry Arnow M D	Bronx
Charles M Allaben, M.D	Binghamton

The Committee submits the following report

Public Medical Care

The Subcommittee on Public Medical Care has the following membership

Ralph T B Todd, M.D., *Chairman*	Tarrytown
Joseph C O'Gorman, M.D	Buffalo
Charles F Rourke, M D	Schenectady
David W Beard, M D	Cobleskill

In 1940 the Medical Welfare Committee of the State Society (now the Public Medical Care Committee), under the chairmanship of Dr L. C Wood, set forth seven fundamental principles which they believed would make it possible for full cooperation between the Welfare Department and the practicing physician serving the welfare client. Five of the principles were immediately accepted by the Welfare Department of the State. A joint report of these facts was printed in the JOURNAL on March 15, 1941, under "Reports" to the House of Delegates

Five years have passed, and therefore it seems timely to review and appraise the work done and the advances made, as well as the work still to be accomplished.

Your Committee and the Welfare Department have taken the seven principles as headings of this report and have made notes under each heading so that at a glance, the progress made can be noted.

It must be remembered that prior to these stated principles both groups were doing a job, but both groups were going their "merry way" without due consideration to the problems faced by the other, and more often with conflicting opinions than with understanding.

Fortunately, the first principle acknowledged to be a "must," was that "the medical aspects of medical relief should be supervised by the medical profession" This principle made it necessary to form medical plans in the various welfare districts. These medical plans gave impetus to carrying out the other principles and whenever and wherever these plans have been established, there has been a definite improvement in the medical care of the welfare client not to mention the happier relationship between welfare officer and practicing physician.

In submitting the Joint Statement to you we would like to thank Commissioner Robert Lansdale for his sympathetic cooperation and support in this endeavor Deputy Commissioner Lee Dowling, and Harry O Page, Dr Peter I Birkel, and Miss Marion Rickert, of the Welfare Department, for their patience, time and complete understanding which this work has required.

Analysis of Joint Statement on Medical Relief*

(Prepared by the New York State Department of Social Welfare and Public Medical Care Committee of the Medical Society of the State of New York as it relates to the present status of medical-care planning carried on jointly by the Department and the State Society)

1 The Medical Aspects of Medical Relief Should Be Supervised by the Medical Profession

One of the State Department of Social Welfare mandatory requirements for the approval of a local medical-care plan is

(1) A full or part-time physician to serve as Medical Director or Consultant. With three exceptions these physicians are on a salary basis. In three welfare districts the physicians serving as Medical Consultants are on a voluntary basis only because the county medical society believes such service should be on a voluntary basis (See Appendix C for list of Medical Plans and Appendix D for

*Joint Statement on Medical Relief published in NEW YORK STATE JOURNAL OF MEDICINE, Vol. 41 No. 6 March 15 1941.

October, eleven lectures on cancer have been given in six counties, including three Regional Teaching Days For a report of these activities, see the report on Postgraduate Education These lectures, presented by the Medical Society of the State of New York and the State Department of Health, have been well attended and received

Hard of Hearing and the Deaf—The Subcommittee on Hard of Hearing and the Deaf has the following membership

Gordon D Hoople, M D , *Chairman*, Syracuse 2
C Stewart Nash, M D , Vice-Chairman, Rochester 7
Ralph Almour, M D , New York 21
John F Fairbairn, M D , Buffalo 9
Edmund Prince Fowler, M D , New York 22
Marvin F Jones, M D , New York 22
Harry K Tebbutt, M D , Albany 6

Meetings of the Subcommittee on Hard of Hearing and the Deaf were held on January 8 and February 13, 1946 Present at these conferences, in addition to the Subcommittee members, were members of the Council Committee on Public Health and Education, officers of the Medical Society of the State of New York, the chairmen of the Subcommittees on Maternal and Child Welfare, and representatives of the New York State Departments of Health, Education, and Social Welfare

The Council of the Medical Society of the State of New York at its meeting on January 10, 1946 approved the recommendation of the Council Committee on Public Health and Education "that the Subcommittee on Hard of Hearing and the Deaf, in cooperation with the New York State Departments of Health and Education prepare and submit as soon as possible a program for the State of New York for the following purposes (*a*) the prevention of hard of hearing and deafness, and (*b*) the detection and treatment of these conditions"

These conferences of the Subcommittee on the Hard of Hearing and the Deaf were held for a discussion of the establishment of hearing conservation centers throughout New York State and their estimated cost At the meeting on February 13, 1946 data was submitted by members of the Subcommittees and others, concerning these centers Future meetings will be held to continue these discussions before recommendations are submitted

Child Health—Recently a request has come to the Council Committee on Public Health and Education to cooperate in the study of child health services which is being developed by the American Academy of Pediatrics The Academy considers it advisable to establish this study as a cooperative project with the United States Public Health Service and the Children's Bureau of the Federal Department of Labor

At a meeting of the Council on February 14, 1946 a request for the cooperation of the Medical Society of the State of New York was presented and your Chairman advised that the matter be referred to the Council Committee on Public Health and Education with power We have studied this very extensive program and believe that the Medical Society, through appropriate committees, should cooperate and assist For the actual operation of the inquiry, there is no financial obligation on the part of the Medical Society of the State of New York.

Administration of Gamma Globulin by Public Health Nurses.—In January, 1946 a communication was received by the Chairman of the Council Committee on Public Health and Education from the Onondaga County Medical Society asking for an opinion regarding the administration of gamma globulin by public health nurses to prevent and modify measles It was the unanimous opinion of the Council Committee on Public Health and Education and representatives of the New York State Department of Health, at a meeting on January 8, 1946, that "gamma globulin may be administered by public health nurses if physicians order it to be given and assume responsibility for such treatment"

At the meeting of the Council on January 10, 1946 the above recommendation was approved and the Onondaga County Medical Society so notified

Standing Orders for Public Health Nurses of the New York State Department of Health—Representatives of the New York State Department of Health, at a meeting with the Council Committee on Public Health and Education on January 8, 1946, requested the cooperation of the Medical Society of the State of New York in revising the Department's "Standing Orders for Public Health Nurses" These Orders have not been revised or approved by the Medical Society of the State of New York since 1935 Many new procedures and practices have been developed and a revision is urgent It was the unanimous opinion of the Council Committee on Public Health and Education and representatives of the New York State Department of Health that such a revision should be made as soon as possible

The above report was approved at the meeting of the Council of the Medical Society of the State of New York on January 10, 1946

Proposed Changes in New York State Narcotic Law—On November 7, 1945 a meeting of the Council Committee on Public Health and Education was held to consider proposed changes in the New York State Narcotic Law regarding the dispensing of barbiturates Present at this conference, in addition to the Committee members, were officers of the Medical Society of the State of New York, representatives of the New York State Department of Health and the City of New York Department of Health, the supervisor of the New York State Narcotic Control Bureau, and the secretary of the State Board of Pharmacy

Other conferences will be held with the Committee, representatives of government agencies, and the Executive Officer of the Medical Society of the State of New York who will give special attention to the matter

Discontinuance of Drafting of Professional Students—The following resolution was not approved by the House of Delegates at its meeting on October 8 and 9, 1945, but was referred to the Council for consideration and action

> "That the Medical Society of the State of New York represented at this duly convened meeting of its House of Delegates goes on record as strongly favoring the immediate discontinuance of the drafting of all persons engaged in studies preparatory to the practice of any of the recognized professions or engagement in any scientific occupations, that the War and Navy Departments and Selective Service System be, and they are hereby urged and petitioned to remove this menace to professional education and professional standards by ceasing the drafting of all such students"

City of Lockport	Monroe County
City of Jamestown	Onondaga County
City of Binghamton	

(See Appendix A)

6 Clinics Should Not Be Exploited to Avoid Payment of Fees for Service They Should Be Used When Medically Desirable

A basic requirement for approval of a local medical plan is that the Welfare Department use already existing medical resources Clinics are considered to be such a resource and therefore the Department has no choice but to insist that available clinics be used to the fullest, reasonable extent There are two major kinds of clinic resources namely, those operated by voluntary or municipal hospitals and those either operated by or subsidized by another State department There are still in existence a few clinics operated by welfare departments In Lockport, for example such a clinic is in existence but its use is not mandatory and fewer and fewer patients attend it. In Binghamton City, there had been a long tradition of the use of clinics run by the Welfare Department and staffed by a salaried physician. The recent "Medical Review" of the local medical plan resulted not only in the abolishment of the salaried physician system but also of the clinics

The City of Rochester sends all ambulatory patients to the general medical and surgical clinics of the voluntary hospitals with no provision for care in the offices of the salaried physicians In contrast, Monroe County has worked out with Strong Memorial Hospital Rochester a plan whereby ambulatory patients are treated in the offices of the salaried physicians. Upon referral by the attending physician patients may be sent to Strong Memorial Hospital for the services both diagnostic and treatment, of consultants and specialists They do not attend the general medical or surgical clinics

Clinics are used to the greatest extent in the large cities where there are teaching hospitals affiliated with medical schools

(See Appendix B, page 780, for Copy of the Strong Memorial Hospital Clinic Agreement)

7 Provisions Should Be Made to Enable Needed Medical Care to Be Furnished for Indigent and Near Indigent Families Not Otherwise Eligible for Relief

The term "medical indigency' has not been defined by the State Department of Social Welfare Each local welfare district sets its own standards and makes its individual case by case decision as to eligibility for medical care The local Social Service staff determines financial need and the physician medical need

At the present time the Department is making a final clearance on a chapter for the Social Service Manual entitled "The Determination of Flexibility for Medical Care" The chapter will cover the following points

(*a*) Legal medical and social aspects
(*b*) The essentials of adequate medical care
(*c*) The budgetary process in the determination of medical care
(*d*) Use of existing medical services
(*e*) Case recording

There are many conspicuous examples of the advantages of having medical advice in deciding whether to accept or reject applications for medical care only However, much more consideration needs to be given to an attempt to define "medical indigent" and more education is needed to encourage local welfare officials to liberalize their policies relating to this group

PART VII

Medical Care Insurance

The Bureau was established February 1, 1945 and *Mr George P Farrell was engaged as fulltime* director

In addition to the following voluntary prepaid medical care plans United Medical Service, Inc., New York City, Western New York Medical Plan, *Inc Buffalo, Medical and Surgical Care Inc., Utica*, and the Central New York Plan, Inc., Syracuse in operation February 1, 1945, the Genesee Valley Medical Care Inc Rochester, offering a surgical indemnity contract, and Northeastern Medical *Service Plan, Inc, Albany, offering an in-hospital*, medical-surgical contract on a service basis, have been formed The Genesee Valley Medical Care Plan covers the counties of Monroe, Wayne, Livingston, Seneca, Ontario, and Yates and the Northeastern Medical Service Plan, the counties of Albany Rensselaer, Schoharie, Montgomery, Fulton, Saratoga, Schenectady Warren, Washington Essex, and Clinton Both plans expect to be offering service to the public in the very near future.

The only two counties not covered by a medical care plan are Jefferson and Chautauqua At the present time Jefferson County is considering an affiliation with Medical and Surgical Care, Inc. Utica and Chautauqua County is seriously considering an affiliation with Western New York Medical Plan Inc., Buffalo or forming a plan of their own.

The three plans which have been in operation for one year or more prior to January 1 1945 show an increase in enrollment for 1945 of 117,587 members or eighty per cent. The total membership (subscriber and dependents) of the three plans on December 31, 1945 was 263 748 Central New York Medical Plan in operation less than a year had a membership on December 31 1945 of 4,500 The high percentage of increase in enrollment is indicative of the acceptance by the public of the prepaid voluntary insurance principle However, in comparison with the enrollment in the Blue Cross Hospital plans it is relatively small varying from *approximately eight to forty per cent of Blue Cross* enrollment in respective plans.

The future success of voluntary medical-care plans will depend to a large degree upon the cooperation and support of the individual doctor and the efforts made by the Blue Cross *organizations* which promote and administer medical-care plans Plans sponsored by the medical profession should receive complete support and cooperation from all practicing doctors in order to fight compulsory governmental regimentation of medical care With such support it is reasonable to expect that with all the plans in operation enrollment should increase to over 500,000 members during 1946

To stimulate interest in the promotion of medical-care insurance plans the Director has appeared before many county medical societies. In addition, the Woman's Auxiliary of the Medical Society of the State of New York, with the cooperation of Miss Yolande Lyon, has made it possible to arrange speaking appointments for the Director before their

per cent of public assistance caseload covered by medical-care plans, page 782)

(2) All but routine medical care must be approved by the Medical Consultant This applies also to special services such as use of specialists, nursing home care, visiting nurse service, etc

(3) In most welfare districts operating under an approved local medical plan, there is a Medical Advisory Committee Some are more active than others

In most instances these committees participate directly in the development of medical plans This participation includes a minimum activity in the following matters

(a) Determination of medical policies
(b) Participation in the establishment of fee schedules
(c) Opportunity to simplify medical procedures, forms, etc
(d) Interpretation to the county medical societies of the problems of welfare administration
(e) Presentation to the county medical society for acceptance the professional medical aspects of the local medical plan in the writing of which they have assisted
(f) Action as a Board of Arbitration in cases where there is a difference of opinion between the Medical Consultant and attending physician

(4) The local Medical Advisory Committee has no supervisory or administrative responsibility for the welfare district medical program However, such a committee can directly influence the program in all its aspects provided either the local Commissioner or the Advisory Committee, or both, takes the initiative and recognizes that the medical program requires constant vigilance, study, and improvement if it is to function at its greatest potentialities

(5) The State Department of Social Welfare has strongly advocated the use of medical advisory committees, the value of which has been demonstrated repeatedly

(6) *Not accomplished* Document to be prepared jointly by the Department and Medical Society of the State of New York outlining the exact manner in which the medical advisory committees will function

2 All Physicians Should Be Encouraged to Participate in the Service

Within the limits set by the State Department of Social Welfare the detailed fee schedules are determined locally Strong encouragement is given in every instance to the development of fee schedules by the cooperative efforts of the welfare officials and the county medical society

Each local Medical Consultant determines the extent to which consultants and specialists are to be used

Much time and thought has gone into study of ways in which red tape can be reduced and already a great deal has been accomplished The Department is continuing its efforts in this direction and is encouraging local experimentation in the development and use of forms and reported procedures

As a general rule, Commissioners of Public Welfare have delegated full authority and responsibility for the operation of the medical program to the Medical Consultant The interchange of ideas between the Welfare Officials, Medical Consultant, and Medical Advisory Committee gives each a better understanding of the problems faced by the other, the end result of which is wiser decisions being made by all

3 Utmost Decentralization of Control in Medical Matters

When a local medical plan is approved, the complete responsibility for all professional medical decisions is vested in the Medical Consultant Each Medical Manual carries a statement to the effect that the Medical Consultant has full authority to approve any medical item not otherwise covered in the Manual The State Department of Social Welfare honors this approval for purposes of reimbursement to the local welfare district The Medical Consultant refers to the State Department in Albany only those matters on which he wishes advice, requests for changes in the local Medical Manual fees, policies, etc , but no questions relating to the individual patient

By a study process known as a "Medical Review," the State Department of Social Welfare examines the medical records of the local welfare districts to determine whether or not the agency is adhering to the conditions established by themselves in their own medical plans To date not a single dollar has been listed for deduction because of local failure to carry out the terms of a medical plan These medical reviews have demonstrated the high level of performance and integrity of local staff operating the medical programs

The State Department has removed its restrictions as to the use of proprietary drugs and has also lifted the mandatory price schedule The drug regulations now are

(a) No expenditures for drugs are reimbursable except on physician's prescription
(b) Approved sera, vaccines, and biologicals distributed free by the State Department of Health are not reimbursable Also, drugs distributed by the State Department of Health are not reimbursable
(c) Reimbursable drugs are those in the *United States Pharmacopoeia*, the *National Formulary*, and generally accepted *New and Nonofficial Remedies* Translated into practice, this means that any medication prescribed in writing by a patient's attending physician is accepted for reimbursement
(d) The "Formula for Computing Charges for Drugs and Other Therapeutic Agents Dispensed" has become suggestive and not mandatory and reimbursement is given on the prices charged locally

4 Free Choice of Physician Should Be Guaranteed Subject to Protective Limitations

Each local welfare district has the power under the Social Welfare Law to administer medical care under a free choice, fee for service system, or under a salaried system The trend is definitely toward the free choice system It is interesting to note that four major cities, Buffalo, Rochester, Syracuse, and Albany, continue to provide medical care in whole or in part under a salaried system

(*See Appendix A, page 779, for Such Limitations as Apply Under the Free Choice System*)

5 Contract Practice for Medical Relief Should Be Disapproved

The Department maintains the same position as set forth in the Joint Statement published March 15, 1941 However, three salaried systems have been abandoned by local action and two new ones added These are

surgical care insurance plans with supplemental coverage to be contracted for only in cases where local plans are not available and be it

Further Resolved That the special committee of three be empowered to take all necessary action subject, however, to the approval of the Council of the Medical Society of the State of New York and that the Council, if it approves, request that the Board of Trustees invest such funds for the setting up of the proposed corporation as in their opinion is required or desirable

The Committee has several times discussed this problem with other Council Committees and has reported and elicited discussion at meetings of the Council, and has held a meeting with representatives of the Blue Cross Plans Commission to discuss the possibilities of forming a national casualty insurance company No definite action was taken at this meeting.

That portion of the resolution relating to a national company has been studied in its relationship to the resolution adopted by the American Medical Association. It was felt that the Committee should await the action of the Council on Medical Service and Public Relations of the A M A. before proceeding further However the Council is engaged in a thorough study of the subject.

In considering a national plan, many problems are involved the wishes of state medical societies the effect on present medical-care plans, and the extension of new plans to areas where none now exist, the financial and legal aspects in relation to the requirements of various states, and a study of the relationship of medical and hospital plans Further developments on the part of the American Medical Association in this matter will be submitted in a supplementary report at the House of Delegates meeting in New York City

The Committee also made an extended study of the organization and formation of a New York State plan. This study was made possible by the report of Mr George P Farrell Director of the Bureau of Medical Care Insurance which has been previously presented to the Council The report follows

"In considering the above problem there are three different methods of approach

"1 Amalgamation of all the present plans in New York State to offer a uniform contract

"2 Establishment of a new organization by the Medical Society of the State of New York to offer a uniform contract on a state-wide basis.

"3 Consideration to be given to a uniform contract with minimum benefits to include in-hospital surgical-medical care by all present existing plans

'The primary consideration in offering a contract on a state-wide basis would be whether it should be indemnity or service At the present time the following contracts are being offered

"*Western New York Medical Plan, Inc. Buffalo* — Surgical contract including obstetrics, on an indemnity basis. (Medical rider providing house office and hospital calls discontinued as of November 1 1945)

Central New York Medical Plan Syracuse — Medical-surgical contract including obstetrics, providing for house office and hospital calls for medical care, on an indemnity basis

"*Medical and Surgical Care, Inc. Utica* —Surgical care including obstetrics, on an indemnity basis Dependents receive one-half benefits for surgical procedures. Limited medical expense benefits (20 8 per cent are enrolled under this contract.)

"*United Medical Service Inc, New York City* — Two classes of contracts—indemnity and service Indemnity provides for surgical care including obstetrics while hospitalized The service contract provides (1) In hospital surgical (2) In hospital surgical and medical (3) General medical expense, including surgical and obstetrics general medical care in the home hospital or physician's office As of November 30 1945, 90 per cent of all contracts issued were of the indemnity class

'*Genesee Valley Medical Care, Inc., Rochester* — Surgical contract including obstetrics, on an indemnity basis

'The plan proposed for the *Capital District, Albany*, is a service plan providing in-hospital surgical-medical care.

"*Jefferson County Medical Society* has tentatively arranged to affiliate with Medical and Surgical Care, Inc., of Utica

"*The Chautauqua County Medical Society* is considering the possibilities of affiliating with Western New York Medical Plan Inc If however, they should form their own plan it is proposed that it be an in-hospital surgical medical care plan.

'In reference to the amalgamation of all the present plans in New York State to offer a uniform contract, the foregoing résumé indicates that many changes would have to be made regarding present types of contracts and benefits offered by each plan Due to the length of time and experience of each individual plan now in existence, consideration would also have to be given to their present financial setups There is a wide variation in surplus of individual plans ranging from about $2.25 per member to zero In other words the surplus of some plans is equivalent to the average cost of about seven months of medical care, while others vary to zero

"It would be necessary to have complete agreement among all existing boards of directors of each individual plan, regarding the adjustment of surplus in relation to membership The consent and cooperation of all participating doctors would have to be obtained, because of their underwriting responsibility to each individual plan

' In reference to method two the following problems would have to be considered

"1 Necessary change in the present Insurance Law (Article IX-c) to permit organization of a plan on a state-wide basis

"2 Establishment of a proper administrative setup to make a state-wide plan function This could be accomplished independently or in cooperation with present existing medical plans. If administered independently, it would require substantial capital and a large personnel and in practice would be functioning as an independent insurance company

"In reference to method three—consideration of a uniform contract which could be offered by existing plans within the state—it is the opinion of Mr George P Farrell that the past experience of plans in the state and also in other states should be gathered and analyzed After such an analysis has been made it would then be possible to offer a plan which would be financially sound and meet the average costs of catastrophic illness Mr Farrell suggests that the Bureau of Medical Care Insurance obtain this information from present plans within the state and from other sources where it is available. After a study of this information is tabulated,

a uniform contract with minimum benefits (including in-hospital surgical-medical care) can be recommended at the earliest possible date

"It is further suggested to study the possibilities of liberalizing enrollment procedures which will give every person the opportunity of enrolling who does not qualify according to some of the present standards set up by the plans

"It is also suggested that greater interest and cooperation be shown by the doctors in supporting present prepaid voluntary medical-care plans operating in their respective areas, also, steps should be taken to get the cooperation of all county medical societies which are not supporting their respective plans

In some areas doctors are supporting the operations of mutual benefit associations which tend to retard the progress of voluntary plans It is Mr Farrell's understanding that these associations do not come under the supervision of the State Department of Insurance Where a mutual benefit association does not provide at least a minimum of protection, as provided by the local medical-care plan in that area, he feels that whatever steps are necessary to discourage the participation in such a program by the doctors should be considered

"Mr Farrell discussed the problem of a statewide plan with the presidents of the four operating plans in New York State, and it is their feeling that present plans should be left to operate in their respective areas, because the rates and benefits offered by each plan apply to the particular needs of the people in that area

Indemnity schedules are established to conform with the average charges for services rendered by doctors in areas served by individual plans Community interest would be lost in a statewide plan.

"They feel, however, that a contract offering minimum uniform benefits might be practical and the rates and fee schedule could be adjusted according to area It is the consensus of opinion also that the plan can be administered more economically and effectively through present methods It can be noted here that the Blue Cross Plans, for the past several years, have been attempting to establish a uniform contract throughout the state but have been unable to do so for the reasons outlined in this report relative to medical care"

A better understanding of voluntary prepaid medical-care plans can be gained from this report

The Committee is highly appreciative of the work of the Medical Care Insurance Bureau's director, and other reports to the House will indicate the magnitude of the work assigned to this Bureau It is indeed felt that the Medical Society of the State of New York has acted wisely in establishing a Medical Care Insurance Bureau to take care of the many problems which have arisen during the past few years in regard to medical and hospital care

PART VIII

Veterans' Postwar Affairs

A Committee on Veterans' Postwar Affairs is now in the state of organization Members of this Committee are Dr William F MacFee, of New York City, Dr James F Rooney, of Albany, New York, and Dr Dan Mellen, of Rome, New York, the latter being chairman of the Committee A Subcommittee is to be appointed to assist in carrying out the duties of the Committee The purpose of the Committee on Veterans' Postwar Affairs will be to help find vacancies for interns, positions for employment, residencies, housing, and to assist in solving many other problems which may confront the discharged medical officer Considerable correspondence has already been carried on, and many veterans have been assisted by interviews at the office of the Medical Society of the State of New York. It will be necessary to have every county society participate in this work by cooperating with the Committee We hope to have more information regarding the Committee's activities soon

PART IX

Legislation

The Council Committee, charged with the duty of studying legislation and putting forth the positions taken by the Society, consists of the following members

Harry Aranow, M D, *Chairman*	Bronx
Walter W Mott, M D	White Plains
Leo F Simpson, M D	Rochester

REPORT

The Council Committee on Legislation respectfully submits the following report

This report is a preliminary report in so far as the Legislature is still in session and will not adjourn until the latter part of the month Very few of the bills in which we have been interested have received final action up to the date of this report

This has been a very busy year for members of the Legislative Committee, members of the county societies and legislative committees in the county societies, as well as for the Public Relations Bureau, and the Executive Officer of the Society It was appreciated early last spring that this legislative session would be a busy time for members of the State Society who are interested in and responsible for the State Society's activities along these lines It is to be remembered that last year we had an unpleasant threat in the form of antivivisection legislation which was passed by a large majority in the Senate and was held in the Committee on Rules in the Assembly only after strong representation had been made against this bill It appeared that there would be an even stronger effort to pass such a bill this year Your Legislative Committee, in conjunction with the Public Relations Bureau, started preparing early last spring for this threat Due to the very excellent work of the Public Relations Bureau, its committee, and Mr Dwight Anderson, its director, material was prepared in advance that could be used in opposition to such legislation this year It was due to such foresight and preparation on the part of the Public Relations Bureau that we had the pamphlet, *Dogs, Drugs and Doctors*, and the leaflet, *His Future Is Brighter*, with the other inserts, postal cards, etc, ready when we needed them this year It was also due to the activities of the Public Relations Bureau that the movement was carried on with the Academy of Medicine in New York City to establish the organization known as "Friends of Medical Research", also the services of a very excellent man, Mr Ralph P Wentworth, were secured for the purpose of acting as executive secretary of this organization Mr Wentworth has been a great aid in organizing local branches of the Friends of Medical Research and in enlisting the aid of various organizations throughout the State for opposition to legislation against vivisection

The threat that we anticipated developed early in the session in the form of the bill known as the DiCostanzo-Crews Bill This bill was sponsored by a well-known newspaper organization and supported with very strong articles in all papers of this organization throughout the State. This organization also had a very large number of field workers whose business it was to obtain signatures to petitions urging the passage of this bill It is understood that about 400,000 signatures have been obtained on these petitions These matters are mentioned to show the strong effort that was made to obtain the passage of this bill

Later another bill was introduced which is known as the DiCostanzo-Van Duzer Bill, which does not prohibit vivisection on living dogs as the DiCostanzo-Crews Bill does, but which would require licensing of all laboratories doing such investigative work on living dogs and the licensure to be $1 000 annually with a $5,000 bond There are also other clauses in this bill which are of a strong nuisance value and which could hinder proper medical research to such an extent as to make it difficult to be carried out properly The Legislative Committee and the Council have indicated that they would not be opposed to the general principles of this last bill if the licensure fees and bonds were not so prohibitive for medical schools and research laboratories which do not have the funds to pay such fees and if the nuisance clauses were eliminated The Legislative Committee was of the opinion that rather than attempt to have this bill amended, it would be better to oppose the bill in its present form Opposition has been registered against this bill, as well as against the DiCostanzo-Crews Bill.

The opposition that was registered by members of the State Society, friends and members of other organizations that are interested in public health and welfare of the State has been very gratifying The Department of Health the State Charities Aid Association, the organizations interested in tuberculosis cancer, communicable diseases the medical schools and their students nurse associations drug manufacturers, wholesalers and retailers are among the many organizations that joined with us in opposition to the passage of these bills Both of these bills were rejected in the Senate Committee on Codes. Action has not been taken on these bills by the Assembly Judiciary Committee. It is still possible for them to be reported out of committee in the Assembly and, if passed they would go to the Senate for its action. If passed in both houses it would then depend on the Governor's action whether the amendments in either one or both of these bills became law It does not seem likely that favorable action will be taken on these bills in the Assembly or by the Governor but we cannot be sure at this time. The action taken in the Senate Committee and apparently the hesitation of reporting these bills out of committee in the Assembly would appear to be due to the large number of letters telegrams and postal cards which have been sent to members of the committees in both houses and to the legislators of both houses. The widespread interest in opposition to these bills that has been registered by these groups has indicated to the legislators the strong opposition against favorable action on these bills and no doubt has been responsible for the attitude by the committees in both houses.

The educational campaign in opposing these bills would appear to be of great value both to the public and the medical profession and should be continued as much as possible in the future It is only by such an educational campaign that we can hope to have the public informed of the value of many of the procedures which are of great importance in testing drugs and developing new methods of curing or preventing disease and new operative procedures which are necessary in preserving or restoring health It would seem important, therefore, not only to keep up an educational program but to keep the organization known as "Friends of Medical Research" alive and active to accomplish these purposes The campaign in opposition to the above bills could only have been carried out with the aid of the Public Relations Bureau, the pamphlets and leaflets and other material furnished by them which could be used by members of the State Society, the county societies the Woman's Auxiliary, and organizations that were interested in opposing these bills This is mentioned because so much credit is due to the Public Relations Bureau in its cooperation with the Legislative Committee in opposition to the above bills

Last year we had a strong campaign against the passage of a bill which would license chiropractors in New York State There was evidence that there was a great likelihood that this bill would be passed last year It was defeated by better than a two to one majority in the Assembly and did not come to vote in the Senate We have been uncertain as to whether we would have to oppose similar legislation this year consequently we have watched for the introduction of a bill for the licensure of chiropractors in the present session Such a bill did not appear until February 27 when it was introduced in the Assembly by Assemblyman Hollinger, of Niagara County Up to the time of writing this report a concurrent bill has not been introduced in the Senate With the introduction of this bill it means that we will have to register our opposition The bill is similar to that of last year and would grant licensure to a large number of chiropractors by waiver Licensure by the State would be an indication or stamp of approval by the department of the State granting such licensure. We object to the licensure of chiropractors or any other cult or school of practice whereby they would have the privilege of making diagnosis and giving treatment, or in other words, the practice of medicine until it can be shown that they have had the proper scientific training in accepted scientific subjects and have passed an examination of sufficiently high standards to indicate that they have the knowledge and training whereby they would not be a danger to the public in carrying out such procedures

It was anticipated this year, also, that bills would be introduced in one form or another bringing compulsory medical insurance under the State law We were apprehensive because of the reports that we had had from hearings under the Governor's commission for the study of medical care and in view of a bill that had been introduced last year which would have extended medical-care insurance to all those covered by State unemployment insurance. The Corcoran Farbstein Bill was introduced which would establish in the State compulsory health insurance similar to that proposed under the Federal Wagner Murray Dingell Bill No action has been taken on this bill so far and there does not seem to be great likelihood of it succeeding. On February 15 the Governor's commission made its report whereby the majority report was opposed to the establishment of compulsory medical-care insurance at this time So far no bills have been introduced under the auspices of this commission. The Governor is

to give a further message along these lines, but so far the message has not been presented

Bills have been introduced to extend sickness benefits to those under unemployment insurance These bills would enable workers under unemployment insurance to receive State aid when unemployed because of illness which cannot be given under the present unemployment insurance or the Workmen's Compensation Law As this extension of sickness benefits does not pertain to medical care or compulsory medical insurance, but would furnish income to those who would be in need of such income due to illness, we are not opposed to such legislation but have indicated that we favor such relief

There has been an extremely large number of bills introduced in the present session of the Legislature modifying the Workmen's Compensation Law So far no final action has been taken on any of these bills Many of them we are not directly interested in, others we are in favor of, some we oppose A few of these bills have been sponsored by the Society itself As there has been such little action taken on these bills so far, and the number is so large, further report on these matters will have to be made in a supplementary report

A similar statement can be made in regard to amendments to the Public Health Law, a few bills involving the Education Law, and a long bill that covers the reorganization of the Social Welfare Department This bill is the result of a study sponsored by the Governor and the introduction of the bill is through the interest of the Governor in this matter

This has been a very busy legislative session The number of bills introduced up to March 1 has been 1,924 in the Senate and 2,231 in the Assembly The time limit for introducing bills has been set for March 7 There is some talk, however, that this may be extended Even with this time limit there is a probability that there will be a considerable number of additional bills introduced this year

The date of adjournment of the Legislature has not been fixed up to the time of writing this report It has been suggested that the Legislature will probably adjourn on March 23 We cannot say definitely at this time the date for adjournment of the Legislature for the 1946 session There is a busy time to be anticipated during the month of March and until final action is taken on the large number of bills in which we are interested It will be necessary, then, to give further information on the final actions in the supplementary report

PART X

Workmen's Compensation

The Council Committee on Workmen's Compensation, consisting of Dr Maurice J Dattelbaum, *Chairman*, Dr Joseph P Henry, and Dr Dan Mellen, has submitted the following report

REPORT

The following report concerns the activities of the Workmen's Compensation Committee and the Bureau of Workmen's Compensation for the period extending from October, 1945 to March 1, 1946 Much of this activity was initiated in previous years but is still being carried on The routine work of the Bureau continues to be very heavy

Difficulty in travelling has made it impossible to spend as much time as was considered necessary in visiting various parts of the State to confer with officials of the county medical societies in respect to matters under our jurisdiction. There has been, however, an active correspondence with these officials, and frequently, long-distance telephone calls were necessary

There has been an increasing cooperation between the compensation committees and the Bureau, and the Bureau has served the local county medical societies whenever called upon to do so

Recently the Council has authorized the Bureau to serve as the central point in a state-wide Industrial Placement Bureau in connection with the recommendation of the Council on Industrial Health of the American Medical Association It is the purpose of the American Medical Association to put placement of personnel for industrial medical service on a better basis The impact of the returning medical officers and of other physicians involved in the reconversion of American industry strongly suggests that some additional attention be paid to placement problems and that, wherever possible, the resources of medical organizations be used in these directions We are awaiting further instructions from the Secretary of the Council on Industrial Health before proceeding actively with this project

The Director of your Bureau attended hearings before the Workmen's Compensation Board of the Department of Labor on the proposed revision of the rules and procedure of said Board, participated in the discussions, and made recommendations on the New Motion Calendar procedure proposed by the Board

He participated in plans for a testimonial dinner given to Miss Mary Donlon, chairman of the Workmen's Compensation Board on December 12, 1945 at the Hotel Commodore More than one hundred and fifty physicians attended the dinner which was also attended by nearly 1,000 representatives of labor, industry, insurance companies, and others interested in Workmen's Compensation

Your Chairman and Director participated in hearings before the Ives Legislative Commission held in New York City in January, 1946

A number of bulletins were issued throughout the year concerning (1) arbitration of medical bills, (2) advising medical societies of the reorganization of the Department of Labor and the setting up of the Workmen's Compensation Board under Chapter 74 of the laws of 1945, with Miss Mary Donlon, an appointee of the Governor, as chairman of the Board, (3) difficulties in obtaining necessary forms for reporting compensation cases, and on a change in procedure inaugurated by the Workmen's Compensation Board in connection with the reporting to said Board of Compensation ratings and revision of ratings by workmen's compensation committees of the county medical societies

Numerous conferences were held with the insurance carriers organization and with the vice-president of the Associated Industries of New York State, Mr Mark Daly, on the fee schedule Conferences were also held with representatives of the New York State Federation of Labor

Your Director also participated in a number of meetings of the Committee on Public Health and Education, of which Dr O W H Mitchell is chairman

Your Director aided the Workmen's Compensation Committee of the Nassau County Medical Society in trying thirty-one physicians accused of violations of Section 13-d of the Workmen's Compensation Law as a result of the Moreland investiga-

tion. Three hearings were held and recommendations sent to the Chairman of the Workmen's Compensation Board

A very successful round table discussion on workmen's compensation was held in Rochester in October, 1945, in which Miss Mary Donlon, chairman of the Workmen s Compensation Board and your Director participated. Similar round table discussions have been recommended for other county medical societies and are being arranged.

This Bureau is making a survey of all the county medical societies in the State to determine the number of lay and professional personnel engaged in the administration of the Workmen's Compensation Law, the amount of time spent in this work, the amount of money spent by each county society, and other matters relative to the administration of the workmen's compensation law by the various county medical societies.

These and other routine matters have engaged our interest in an effort to coordinate the work of the county medical societies throughout the State with one another and with the Department of Labor and other interested organizations and groups to aid in the proper administration of the Workmen's Compensation Law, as it devolves upon the medical profession.

Special reference will now be made to a number of important matters that have come up during recent months.

Dr Maurice J Dattelbaum of Brooklyn, was elected a member of the Council at the Annual Meeting held on October 8, 1945, and in November was appointed Chairman of the Workmen's Compensation Committee to succeed Dr Harry Aranow Dr Dan Mellen, of Rome and Dr Joseph P Henry, of Rochester, were reappointed as members of this Committee

Bureau for Adjustment of Medical Bills, etc.—By authority of the Council, your Director issued a communication on February 9, 1945 addressed to the county medical societies informing them of the creation of a Bureau for adjustment and collection of medical bills and inviting their cooperation. The Bureau has been utilized generally and increasingly throughout the State by physicians and the secretaries of the county medical societies and by chairmen of workmen's compensation committees. In the smaller counties where facilities are not available for direct action, many matters have been referred to the Bureau concerning not only medical bills but also disputes and differences between physicians and employers or insurance carriers, department of labor, etc. The Bureau is receiving an increasing number of matters. For example, during the month of December one hundred and sixty-three matters were referred for attention.

Arbitrations.—During the past year six arbitration sessions were held in Albany, Newburgh, Binghamton, Syracuse, Rochester, Buffalo, and Mineola. In all, thirty cases were arbitrated, twenty-four were settled at the time of arbitration, and eight were adjourned In all, medical bills amounted to $7,174.50, of which $5,661 00 was in dispute and total awards of $3,029 00 were made.

Radiology Examinations.—Your Committee has recommended and the Council has approved the setting up of Radiology Examining Committees in the larger cities of the State to pass upon the applications of physicians requesting qualification in diagnostic roentgenology and radiation therapy A committee was set up in Buffalo for Erie and adjacent counties, consisting of Dr Jacob W Bayliss, Dr G Newton Scatchard, and Dr J M Barnes. In Rochester, Dr Sol C Davidson, Dr James M Flynn, Dr Sidney Larson, and Dr Joseph H Green constitute the examining committee for this area. In Syracuse, Dr Donald S Childs, Dr Lucas S Henry, and Dr Carlton F Potter serve as the examining committee. In the metropolitan area, the examining committee consists of Dr Charles Wadsworth Schwartz, *Chairman* Dr Henry K Taylor, Dr Marcy L. Sussman, Dr Charles Gottheb, Dr Raymond Lewis, Dr John J Masterson, and Dr E. F Merrill.

During the past year (1945), five examinations were held in the metropolitan area for forty applicants The examination is a practical and oral one and candidates are required to obtain a passing mark of 75 per cent Experience has taught us that the standards of qualification for radiologists should be closely adhered to The symbol 'SD-1" represents diagnostic roentgenology, "SD-2," radiation therapy, and 'SD," both ratings Unless an applicant has obtained the diploma of the American Board or is generally qualified and acceptable as a result of hospital and other professional associations, he should be required by the local workmen s compensation committee to take the examination. Up to the present time, a considerable number of the candidates have failed to pass what is deemed to be a fair examination, thus showing the necessity of carefully scrutinizing the qualifications of physicians before recommending them for either an "X" or 'S rating in radiology Both 'XD' and "SD" practitioners may accept referred patients

Assistant's Fee at Hernia Operations.—On July 3, 1945 we addressed a communication to the Chairman of the Workmen s Compensation Board of the Department of Labor, requesting modification of items 375, 376, 380 and 381 of the minimum medical fee schedule in which the operative fees for hernia include the assistant s fee, whereas, for all other operations, a fee of $15 (item 58) for assistance, is allowed in hospitals where no intern or resident is available It was drawn to the attention of the Chairman that many hospitals throughout the State have no interns available for private or compensation operations owing to the scarcity of interns It was also pointed out that the attending surgeons were not only required to perform operations but to make many additional calls to the hospital because of the scarcity of interns. It was suggested, pending a hearing on the general fee schedule, that Miss Donlon consider modifying the above-mentioned items to delete the term 'Including assistant's fee' Under date of July 17, 1945, Miss Donlon answered that there were so many problems in connection with the modification of the minimum medical fee schedule that she deemed it wise to add the items in our request to a list of matters for review at a conference to be called in the fall of 1945 Such a conference has not been called by her

We are pleased to report that through the offices of Mr Henry D Sayer General Manager of the Compensation Insurance Rating Board, and the Medical and Claims Committee of this organization, all insurance carriers, with the exception of the State Insurance Fund, have agreed to pay an assistant s fee in hernia operations.

Increasing Costs.—In 1943 the president of the Medical Society of the State of New York informed the then Industrial Commissioner, Miss Frieda S.

an appointee of the Governor, the Chairman of the Workmen's Compensation Board, in her sole discretion, to make appointments of physicians who have had at least ten years of practice in the specialty They will be paid for each case on a per diem or case basis as determined by the Chairman These appointees shall be civil service exempt, serve part time and be restricted from accepting a fee from any insurance carrier authorized to write workmen's compensation insurance in this state or from any self-insurer

If this bill is enacted, the appointment of impartial specialists to be used by the Workmen's Compensation Board will no longer require the Chairman of said Board to obtain an approved list of qualified specialists from the medical societies as heretofore Miss Donlon would probably call upon the Medical Society for advice as to the qualifications of appointees, but what about future chairmen, who may be politically-minded?

In a supplementary report we will deal with a number of bills now pending before the Legislature

New York State Hospital Association, Joint Council Committee of Radiologists, Pathologists, Anesthesiologists, and Physical Therapy Physicians —During the past year, many meetings have been held with these organizations and the Council Committee, in which your Chairman and Director participated Eventually an accord was reached on the question of the relationship between physicians and hospitals, and the functions of hospitals in so far as certain specialty practices are concerned The following resolution was finally adopted and approved by the State Medical Society on the recommendation of the Committee appointed by our Council, with Dr Carlton E Wertz as Chairman, to meet with the State Hospital Association

Resolution.—As a means of promoting closer relationships among doctors and hospitals and thus further adding to their value to the community, it is suggested to the Medical Society of the State of New York and the Hospital Association of the State of New York that there be appointed a Joint Council consisting of five doctors representing the various specialties and five hospital administrators, or as many as necessary to represent various sections of the State.

This Council will meet as required, not less than twice each year, for the purpose of considering physician-hospital relationships in general, and also to consider individual differences or misunderstandings as they may relate to any matters concerning arrangements between doctors and hospitals

It is understood that such Council cannot have judicial or peremptory powers, nor assume any prerogatives of the House of Delegates, Trustees, or other groups in either Association Its purpose shall be that of a hearing, arbitration or conciliation body, to attempt to settle the many problems which arise locally, as well as statewide, to provide a means whereby individuals, as well as groups of physicians and hospitals, may better understand their problems and assist in their solution

In view of the complete accord reached by the representatives of the State Medical Society, the State Hospital Association, and the Joint Council of Radiologists, Pathologists, Anesthesiologists, and Physical Therapy physicians on the question of the four specialties, (roentgenology, pathology, anesthesiology, and physical therapy) as the practice of medicine, such a committee or council could serve as a voluntary arbitration committee to implement the proposed amendments to the Workmen's Compensation Law and Education Law to be introduced at this session of the Legislature

The President of the State Medical Society was authorized by the Council to appoint a subcommittee in accordance with these recommendations and Drs Carlton Wertz, J Stanley Kenney, and Walter Mott, the members of the committee, were reappointed with additional representatives of the four specialties to be appointed shortly The above action is deemed a step forward in the relationships between the medical profession and hospitals As a result of these meetings, your Director assisted in the drawing up of bills, which were presented to the Legislature to implement the agreement reached concerning the four specialties and to permit reasonable and equitable contractual relationships between physicians and voluntary hospitals Furthermore, a means is provided for arbitration of disputes over the terms of contracts

Reporting of Compensation Cases —The Chairman of the Workmen's Compensation Board has been greatly concerned and, properly so, about the failure of physicians promptly to report compensation cases as required by law It must be conceded that for the average physician, who only occasionally sees a compensation patient, the making out of reports and the notarization of some of them is irksome and sometimes difficult Your Committee has been concerned with this problem for a number of years and by every means available to it, has admonished physicians to report cases promptly and otherwise comply with certain provisions of the law requiring a physician to obtain authorization for certain procedures The NEW YORK STATE JOURNAL OF MEDICINE, the local county society bulletins, the forums of the county medical societies, the district branch meetings, have all been utilized, from time to time, without full success While the exigencies of medical practice are occasionally responsible for delay, there are a few physicians who have persistently violated both the spirit and letter of the Workmen's Compensation Law in regard to reporting Such physicians should be admonished by their medical societies and, if they persist in their wilful practices, should be recommended for discipline by the workmen's compensation committees The Workmen's Compensation Board is now inclined to be less lenient with offenders and is sending in the names of such offenders to the medical societies for proper action.

On the other hand, it is the opinion of this Bureau that certain steps can be taken to facilitate prompter and easier reporting We have suggested to the Medical and Claims Committee of the insurance carriers and self-insurers, a number of procedures whereby forms may be simplified and reporting made less burdensome In past years we have sat with committees of the Department of Labor to simplify the forms and to make the physicians duties less onerous We have recommended the doing away with the notarization of the C-4 form and it seems that the latter suggestion bids fair to be adopted this year Our studies along these lines will continue so that we may obtain the support of the Department for the adoption of a more simple C-104 report to enable prompt reporting within forty-eight hours

In the meantime, we again recommend that

medical societies do everything in their power to encourage physicians to comply with the law promptly so that the patient's claim for compensation may be promptly determined Delay in reporting often deprives the injured worker of prompt compensation payments

Hernia Cases and the Orthopedic Surgeon — During the past year, a communication was received from the Monroe County Medical Society, disapproving the inclusion of hernia cases within the scope of the orthopedic surgeon and requesting opinion on this point. The Committee on Workmen's Compensation gave full consideration to this matter, obtained the opinion of many orthopedists throughout the State and has recommended that (1) hernia repair does not fall within the scope of the orthopedic surgeon, and (2) the orthopedic surgeon, unless fully qualified in general surgery in accordance with the standards set up for this specialty, should not be given a rating in surgery in order to perform herniotomies.

Authority of the Chairman of the Workmen's Compensation Board to Review Special Ratings.— On October 15, 1945 the Attorney General rendered an opinion to the Chairman of the Workmen's Compensation Board reading as follows

"The chairman of the Workmen's Compensation Board does not have any authority to re-examine, reduce, or revoke special ratings granted to physicians authorized to render medical care under the Workmen s Compensation Law, apart from the physician's general authority to practice under that Statute. Such special ratings are regarded as rights equal to the primary authorization to render medical care and may not be revoked or modified except for one of the causes specified in *Section 13-d* of the Workmen's Compensation Law, warranting removal from the list of authorized physicians."

Recently a physician was denied a major surgical rating after a number of examinations into his qualifications by special surgical examining committees At the outset of the 1935 law he had been given a long list of symbols including an "A" rating The following year his rating, and that of hundreds of others, was amplified to depict his actual qualifications based upon standards then set up No-body but this one physician objected. He made repeated applications for the return of his "A" rating Finally, he appealed to the Medical Appeals Unit of the Industrial Council. The case was heard and a decision rendered, based upon the Attorney General's opinion of October, 1945, but not upon his qualifications, which the Appeals Unit did not consider in the verdict. This was upheld by the Chairman of the Workmen's Compensation Board and the doctor's "A" rating was restored

As the matter now stands, once a physician is given a certain rating, after recommendation by the Medical Society or the Medical Practice Committee, said rating is permanent It may not be removed or altered (except to add to it by the presentation of evidence of further qualification) unless and until a hearing is held under the provisions of *Section 13-d*

Your Chairman and Director again wish to pay a word of tribute to the office staff who have served throughout the year with loyalty and devotion and without whose cooperation the bureau could not have been run efficiently

PART XI

Publications

The Publication Committee met monthly, usually on the day preceding the meeting of the Council and regularly presented to the latter a report on its activities. By resolution this Committee is made up of a member of the Board of Trustees, the Secretary, the Treasurer, the Business Manager of the JOURNAL, the Managing and Literary Editors and, therefore, included Dr George W Kosmak (Chairman, representing the Trustees), Drs. Walter P Anderton and Kirby Dwight, Mr Dwight Anderson, and Dr Laurance Redway Dr John Joseph Masterson, as Chairman of the Office Management Committee, likewise attended the meetings by invitation

The Committee considered at its meetings publication details of the JOURNAL and *Directory*, passed upon editorials, censored advertising material, and discussed the acceptability of various articles submitted for inclusion in the JOURNAL.

Directory —Preparations have been made for publishing a *Directory* during the current year and the compiling staff has been partly assembled The preparation of the contents is now under way in the hope that the material will be ready for bringing out a new issue early in 1947 This will depend, however, on the ability to secure a satisfactory supply of paper

The assembling of the material for any definite date will prove tedious and difficult because of the numerous changes in residence and telephone numbers (especially of returning servicemen), changes in hospital staffs, and the addition of many new members In this connection, note must be taken of the fact that no *Directory* has been issued since 1941 Moreover, the lack of adequate space in our present quarters has also contributed to our difficulties.

Journal.—Numerous changes have been made in the composition of the JOURNAL. The editorial

section has been expanded to six pages for each issue Since the close of the war more scientific articles are being submitted and we have been favored by papers from New York men in service dealing with experiences in military hospitals Medicolegal developments have been contributed by the Society's counsel and the activities of the Woman's Auxiliary have been noted when available New departments dealing with Workmen's Compensation matters and with voluntary insurance plans have been added under the immediate conduct of Dr David J Kalisk and Mr George P Farrell. The news coverage dealing with county societies was generally unsatisfactory because, perhaps, of wartime responsibilities of local county society secretaries Therefore, this department of the JOURNAL has depended largely for its material on a clipping bureau Further efforts will be made to enlist local cooperation in extending the value of this department More complete necrologies of deceased members are now being published Prompt attention is given to all papers submitted for publication, authors notified as soon as possible of the acceptability of their contributions, and a new manuscript filing system has been introduced

In view of the demands on space and the continued restrictions on printing it has been found necessary to limit the acceptance of scientific papers to those emanating from within the limits of the State, to those written by members of the Society, and to those read by invitation by guests at official meetings

The American Medical Association annual conference of State Society secretaries and editors, held in Chicago on February 8 and 9 of this year, was attended by Dr Anderton and Dr Kosmak.

The editorship of the JOURNAL has been continued by Dr Kosmak as Managing Editor and Dr Redway as Literary Editor, who were assisted in the writing of editorials by Drs Norman Moore and George Cottis on special assignments It appears desirable to extend this list of contributing and associate editors so as to interest other fields of medical activity, including the State Department of Health, the medical schools, etc It is hoped to develop this phase during the coming year

The business conduct of the JOURNAL has been ably carried on by Mr Dwight Anderson, who also supervises the work of the advertising solicitors, Mr Gordon Marshall and Mr Charles L Baldwin, Jr All commercial announcements are carefully scrutinized by the Editor before acceptance and advertisers urged to insert in their "copy" the ingredients and dosage of their special preparations This suggestion has been found acceptable in practically every instance and should prove informative to the users of the product

Delays in the distribution of the JOURNAL [illegible] are regrettable, but such delays have been unavoidable It is hoped that more favorable conditions in the paper and printing situation will tend to improve this situation in the future

The statistical details of the JOURNAL's contents in 1945, are as follows

Total number of pages in the 24 issues and	2716
Total number of pages of text	1491
Total number of pages of scientific articles	778
Total number of pages of nonscientific text	713
Total number of pages of advertising (72 of these are cover pages)	1291
Total number of scientific manuscripts received in 1945	222
Number accepted	148
Number rejected	74
Total number of scientific papers published.	200
Average number of scientific articles per issue	8
Total number of pages of scientific text	778
Average number of pages of scientific text per issue	32
Therapeutic Conferences (Cornell University Medical College)	12
Diagnostic Conferences (Bellevue Hospital)	4
Editorials	
Total number of editorials published	70
Total number of pages of editorials	117
Proceedings of the State Society	
Annual Reports (April 1, April 15, May 1, May 15, June 1, October 15 issues)	76
Minutes of the House of Delegates (December 1, December 15 issues)	82
Total	158

General Features

The remainder of 438 pages was devoted to Medical News, Hospital News, Postgraduate Medical Education, Health News, Medical Care Insurance, Medical Legislation, Correspondence, Book Reviews, Honor Roll, Semiannual Index, Woman's Auxiliary, Workmen's Compensation, State and County Society Officers, Suggestions to Authors, and Miscellaneous

Illustrations	
Total number of illustrations published	152
Fillers	
Total number published	301

The Publication Committee has given continued consideration to the possibility of improving the general appearance and format of the JOURNAL and it is needless to repeat why this could not be done at the present time The editors are constantly striving to make the JOURNAL an informative periodical for our members and to develop its various features to attract their interest and attention For this the cooperation of the county societies as well as individual members is essential as already stated Comment and criticism of its contents, therefore, are invited and will be given prompt attention Infallibility of our editorial staff is not to be assumed and we welcome suggestions for improvement from whatever source they may come

FINANCIAL REPORT

Directory.—The Publication Committee has decided not to sell advertising space on the covers of the next issue of the *Directory* It is felt that past editions gave an impression that it was an advertising medium rather than a work of reference This decision was made easier because of the setup arranged for selling advertising space in the new volume Formerly, for many years past, this was handled through an outside agency It was decided to use the same administrative staff on the *Directory* that we have been using for the advertising of the JOURNAL for the past three years Mr Dwight Anderson will be in charge as director of advertising, Mr Gordon Marshall will act as sales manager, and Mr Charles L Baldwin, Jr, space salesman It is expected to reduce the cost of the next issue of the *Directory* by a considerable amount due to this arrangement

Journal.—Again improvement is noted in

financial situation of the JOURNAL. The surplus in 1945 was $37 020 41 The surplus in 1944 was $30,-441 67 In 1943, the surplus was $6,579 78 In previous years the JOURNAL was conducted with an annual deficit running between $8 000 and $25,000 over the course of the last twenty years

Exhibit space at the annual meetings is handled by the Publication Committee with the same administrative setup as the JOURNAL. Exhibit space allocated to the 1946 meeting will produce revenue of $22 940, an increase of $2 070 The annual meeting sales in 1944, at the Pennsylvania Hotel, totalled $20 870 00

In conclusion, your committee desires to express its appreciation of the cooperation extended by the various members of the office staff concerned with publication activities, and recommends that the House of Delegates continue this Special Committee, working under supervision and reporting to the Council, and that the House give the following directive as to continuance of its personnel

The Publication Committee shall consist of the Secretary, the Treasurer, the Business Manager of the JOURNAL and *Directory* the Managing and Literary Editors and one member of the Board of Trustees to be appointed by the President of the Society after consultation with the Chairman of the Board of Trustees

edical Publicity

o Committee presents the following report.

eases.—The routine work of providing pub- material on the various aspects of the Society's m has continued as usual. The press of the and metropolitan New York was given in sion on the Annual Meeting of the Society, strict branch meetings held throughout the and the postgraduate meetings conducted the auspices of the Committee on Public and Education. In addition, publicity was for other events such as the addition of ficers and staff members the development new Bureau of Medical Care Insurance and nation of Friends of Medical Research

ations.—The following new club-talk bullo- repared and distributed to our regular "Bulletin 67—Rehabilitation of the and "Bulletin 68—Diabetes in Old Several of our bulletins had to be re- of the numerous requests for them. made its initial appearance in has been published subsequently ed It is designed to inform the ciety who are most active in its nd for it has been so great that close to 500

Public Relations Bureau rt R. Hannon to help defeat n known as the DiCostanzo-

ng the summer of 1945 on pieces of printed matter tors," and "His Future Is was intended for use with up leaders the latter was for general distribution A printing of 30,000 of "Dogs, Drugs and Doctors," and 1,000,000 of "His Future Is Brighter" was required to meet the demand before the campaign was finished.

Other printed matter in connection with the most active antivivisection fight in recent years included an insert bearing the names of legislators and a request to the recipient to write to his own Senator and Assemblyman. Other printed pieces were 50,000 copies of "The Case for Vivisection," which originally appeared in the magazine *Pageant* and 600,000 copies of post cards headed "Voter's Ballot" for mailing to legislators

It would be difficult to estimate the actual amount of publicity received in connection with this campaign. Editorials, articles, and letters have appeared not only in the great metropolitan dailies, but also in the leading newspapers of other cities throughout the state Just as active in providing educational material to the public have been the small but influential newspapers in the smaller towns of New York State

A special exhibit was installed at the American Museum of Natural History entitled "*Really* Man's Best Friend." On the occasion of the opening of this exhibit to public view, February 6 1946, the first annual "Whipple Prize" for dogs' services to humanity was awarded to "Josie" and "Trixie" of the University of Rochester School of Medicine and Dentistry These dogs are the descendants of the dogs used by Dr George H. Whipple, Nobel Prize winner, in his original work on pernicious anemia which led to the development of liver therapy Maj Gen Norman T Kirk, Surgeon General of the U.S Army, made the presentation. The photographs were most effective and found their way into the pages of newspapers from coast to coast.

An essay contest in the public schools was conducted in connection with the exhibit, which will still be in progress at the time of the publication of this report The prize to be given is a spaniel puppy which will go to the junior high school student writing the best essay on '*Really* Man's Best Friend." The Museum originally planned to display the exhibit for five weeks from the opening February 6, but such was the interest in the presentation, that the Museum authorities offered to retain it until just before the annual meeting of the Society It will be found at our meeting at the Pennsylvania Hotel, among the scientific exhibits

The interest engendered among medical school groups by this legislative campaign has been striking Faculty and students alike have joined to make the fight against the proposed law to exempt dogs from use in medical research an effective educational effort. Noted scientists including Army and Navy Surgeons General and Nobel Prize winners in medicine and science cooperated

A word should be said with relation to the clerical staff engaged in the intensely active work of getting out the printed material bulletins, and correspondence during the heat of the campaign. At a time when extra stenographic workers were unobtainable our staff worked every night until 10:00 or 11:00 o'clock and sometimes until midnight. The difficulties of obtaining printed matter seemed almost insurmountable, and during the entire progress of the campaign the Western Union strike made the sending or receiving of telegrams impossible

At the present writing the antivivisection bills have been killed in the Senate Committee and there is reason to hope that they will also be killed in the Assembly Committee

Friends of Medical Research —On December 12, 1945, under the auspices of the New York Academy of Medicine and the Medical Society of the State of New York, a meeting was held at the Academy building, attended by seventy-six representatives of civic, welfare, nursing, and voluntary public health groups and organizations The subject of the discussion was the danger to the welfare of the people of the State of New York in the possible enactment of a bill expected to be introduced in the 1946 Legislature to prohibit research work with dogs Intense interest was shown in the subject, due in large part to the fact that such a bill passed the State Senate in 1945 by a vote of 33 to 9 Dr James Alexander Miller presided at this meeting The speakers were Dr Simon Flexner, president emeritus, Rockefeller Institute for Medical Research, Dr Anton J Carlson, chairman of the executive committee, American Association for the Advancement of Science, and Mr Dwight Anderson, Director of Public Relations, Medical Society of the State of New York A resolution was passed at this meeting to organize a group to be composed largely of outstanding laymen, to be known as "Friends of Medical Progress," or to bear some similar name

On January 14, 1946 public announcement was made of the formation of this organization by Dr George Baehr, president of the New York Academy of Medicine, at a meeting of the Society of Medical Jurisprudence At this meeting the following addresses were made Gilbert Dalldorf, M D , director of the New York State Department of Health Laboratories and Research, Albany, who presented the subject from the public health and preventive medicine standpoint, Maurice L Tainter, M D , of the Research Department, Winthrop Chemical Company, formerly professor of pharmacology, Stanford University School of Medicine, who considered the pharmacologic aspects, and Dwight Anderson, LL B , Director of Public Relations, Medical Society of the State of New York, who spoke on the topic, "Friends of Medical Research"

A considerable amount of newspaper publicity was generated by this announcement, occurring a few days after the introduction of the expected anti-vivisection bill in the Senate Dr Simon Flexner consented to act as honorary president of the organization, and among the members of the Sponsoring Committee at the outset were Nicholas Murray Butler, president emeritus, Columbia University, Gerard Swope, president, General Electric Company, Fiorello LaGuardia, former mayor of New York City, Clifton Fadiman, author and critic, John W Davis, former ambassador to Great Britain, Vice-Admiral Ross T McIntire, Surgeon General, U S Navy, Homer Folks, secretary, State Charities Aid Association, Dr Anton J Carlson, chairman of the Executive Committee, American Association for the Advancement of Science, Saul Mills, secretary of the C I O , New York City These sponsors were secured through the efforts of Dr Baehr

It was decided that the task of mobilizing public opinion and focusing expression of that opinion directly upon members of the Legislature was to be performed within the setup of the Public Relations Bureau of the State Society Throughout the state, local committees of Friends of Medical Research were organized, and the dissemination of printed matter accomplished through them, and the execution of other techniques for informing and stimulating the public was reposed in the staff of the Public Relations Bureau of the State Society

In all, eighteen committees of Friends of Medical Research were organized in the following counties Albany, Broome, Cattaraugus, Chautauqua, Chemung, Clinton, Dutchess, Erie, Jefferson, Livingston, Monroe, Niagara, Oneida, Onondaga, Oswego, Schenectady, Tompkins, and Yates

The Public Relations staff was more than doubled In addition to Mr Dwight Anderson, who directed the campaign, Miss Yolande Lyon, who assisted him, and Mr Gordon Marshall who was drafted from the advertising staff of the JOURNAL to assist in layouts and production problems of the printed matter, the staff was augmented by Mr Ralph P Wentworth, employed in November to assist in organization work throughout the state, forming local committees of Friends of Medical Research Mr Alex Kahn was employed for three months handling special assignments in connection with the exhibit, and radio contacts, and Mr Horace Foster, for special publicity assignments Four clerical persons were added to the staff for the three months' peak of the campaign, and five of our regular staff of clerical persons devoted their exclusive attention to it during this period

Senator DiCostanzo introduced the measure in the Senate, as had been expected, promptly on the opening day of the session, but Assemblyman Davidson delayed doing the same thing in the Assembly and finally announced his abandonment of the measure It was several weeks before another Assemblyman could be found willing to sponsor the bill, but at last Mr Crews, of Brooklyn, advanced toward the glare of the footlights to take a bow from the "humanitarians and dog lovers seeking to stop the cruel cutting up of dogs" The next decisive moment in the intensive campaign, which had been stepped up rapidly to increased tempo, occurred when Senator DiCostanzo repudiated the bill on the pretext that it was impossible to pass the measure This happened February 7, the day after the award of the Whipple Prize to "Josie" and "Trixie," which has been previously described Another—and a potent—service performed for humanity by these glamorous Dalmatians!

The forces working to defeat this measure owe a deep debt of appreciation to Dr George H Whipple, of the University of Rochester School of Medicine and Dentistry, who permitted his dogs to be sent to New York to receive a prize-award bearing his distinguished name Dr Whipple, unable to be present, sent a message of greeting to be read at the ceremonies

Dr George Berry, assistant dean of the Rochester School, was of invaluable aid to Mr Anderson in checking scientific material and supplying information which was of great help in giving to the details of the proceedings scientific and historic background fitting to an award bestowed in the name of a Nobel Prize winner A great part of the success of the dramatization of the dogs' services to humanity made before a battery of photographers and radio men and in the presence of distinguished medical and scientific men was due to the presence of Dr Frieda S Robbins, Dr Whipple's assistant, who spoke at the ceremonies and lent to them the great charm of her personality A striking part of the proceedings was the importance attached to them by Surgeon General Kirk's participation The persuasive power of the presence of Dr William Hagen, dean of the Veterinary College of Cornell University was compelling when he explained that research work with dogs had helped dogs as well as human beings

It would have been impossible for the Public Rela-

tions Bureau to have functioned in this campaign without the continuous aid and advice of Dr Floyd S. Winslow Chairman of the Council Committee on Medical Publicity He was ready at all times to lend his aid in emergency situations, and was able to conduct successfully the relations with the Rochester School of Medicine and Dentistry which played such a significant part in the success of the enterprise.

An executive committee was set up for the Friends of Medical Research, comprising Dr I Ogden Woodruff, Chairman, Dr George Baehr, Dr Kirby Dwight, Dr George W Kosmak, Dr Floyd S Winslow, and Dr E H L. Corwin, Secretary This committee is now engaged in effecting a permanent organization on a national level on a full time all year round basis.

Woman's Auxiliary.—Cooperative work with the Woman s Auxiliary continued throughout the year "Publicity Pointers," a document written especially for auxiliary publicity chairmen, was prepared and sent out early in the fall.

The State Auxiliary assisted materially in the promotion of voluntary medical insurance as the main activity of the official auxiliary program for 1945–1946. As a result, each county auxiliary pledged itself to hold a meeting on the subject of voluntary medical insurance to which representatives of community organizations would be invited. Mr George P Farrell, Director of the Society's Bureau of Medical Care Insurance, was secured as the chief speaker for most of these meetings. A panel exhibit on medical insurance has been the chief display Printed material of the Public Relations Bureau and the local medical insurance plans was distributed at these sessions.

In the work of effecting the plans of the Woman's Auxiliary, Miss Yolande Lyon, field representative of the Public Relations Bureau, assisted Mrs Edwin A Griffin, President of the Auxiliary and Mrs Michael Schultz program chairman.

Public Service.—Cooperation with other departments of the Society and with outside groups has been an important part of the public relations work. Requests for information, printed matter on a variety of subjects, talks on voluntary and compulsory health insurance and animal experimentation have been filled in large numbers. Miss Lyon, field representative, gave talks before nineteen organizations. Some of these were on socialized medicine, others were on antivivisection legislation.

Assistance was given on numerous occasions to magazine writers preparing articles on subjects concerned with the work of the Society The Public Relations Bureau cooperated in helping to inform the public on the launching of United Medical Service.

Mr Anderson assisted officers of the New Jersey Medical Society in planning a Public Relations program Assistance was given to research people of the New York Trust Company in obtaining material for what proved to be a most exhaustive article on the many phases of socialized medicine. This appeared in "The Index," a banking publication, which itself has a large circulation, and we ourselves have had numerous occasions for distribution of this piece of material. Mr Anderson and Miss Lyon attended all district branch meetings, the A.M.A. conference on public relations, and the A.M.A. annual meeting

PART XIII

Miscellaneous

Medical Licensure.—The Council Committee on Medical Licensure was continued with the same personnel

F Leslie Sullivan, M D , *Chairman*	Scotia
Howard Fox, M D	New York
David A Haller, M D	Rochester

REPORT

The Supplemental Report by the Committee on Medical Licensure as printed for the House of Delegates at Buffalo, New York on October 8, 1945, gave the complete statistical data and comments as available for 1945 It will not be reviewed in this report as it is on file and at the disposition of the Committee (See NEW YORK STATE JOURNAL OF MEDICINE, December 1 and 15 *Sections 15 and 67*, Minutes of the Annual Meeting.)

At the present time due to various political and emotional trends the Legislative Committee is proceeding deliberately and cautiously in relation to forcing controversial legislation which might in itself be amended in such a way as to be a detriment to membership

Dr James F Rooney, of Albany, expressed satisfactorily and clearly the opinion of your chairman in his comment on the Reference Committee report (NEW YORK STATE JOURNAL OF MEDICINE, Dec. 15, page 2675) "In relation to these two affairs I think the word 'may' is of necessity embodied in this recommendation because the Medical Society of the State of New York cannot dictate to either the Legislature or the Board of Regents, and particularly to the Board of Regents. It will have to be qualified because if we try to put in the word 'shall' or 'must, immediately this authority which controls education in the State of New York might react backward. Therefore, it is wise to have 'may' there.

"One thing further in relation to this California law which I think you asked about, Dr Frey We have had to dodge this question of citizenship in the State of New York repeatedly for the last twenty eight years We got it into the law shortly after 1921 it remained in the law until 1924, and then the Legislature felt that we were not quite as universal as we should be, so they did not require citizenship California had a similar situation confronting them in their legislature so they very quietly killed the dog without cutting his tail off because there is not a single country outside of the United States of America that recognizes an American license or allows United States citizens to practice in that country—not a single one.

"I attempted to have the law amended in a similar manner several times, in 1916 and then after the last war was over in 1921, 1922, 1923, 1924, and 1925, providing that we would reciprocate if the standards of these various countries were equivalent to those required by our educational authorities and if they would admit under the same conditions our men to practice medicine in these countries that they requested we should do for their graduates. Not even England will license a physician of the United States unless he completes or supplements his medical education in an English School

"I admit that this is rather devious, but it is a very good way of getting around this question of citizenship which I fear for some years will still be a very difficult provision to get through our Legislature as it is at present constituted."

During the Legislative session of 1945, an "act to provide for licensing of persons to practice Medicine from unapproved schools" passed both Houses of the Legislature and only the veto by Governor Dewey, on April 22, 1945, prevented it being enacted into law (Report of Council, 1944–1945, page 23) There was one bill introduced in the Senate and two in the Assembly that would have set aside the requirements of four year courses of eight months each in registered medical schools of this country and graduation from a registered medical school for admission to the medical licensing examination of the State, and would have required that the Department of Education issue licenses to successful candidates These bills were introduced to provide for licensure for certain individuals who had attended and graduated from unrecognized medical schools It was distinctly class legislation or legislation favorable for a very small group of persons at the expense and to the danger of the public These bills were introduced under the guise of acute shortage of physicians during the present war emergency The two Assembly bills passed the Assembly without opposition

The Senate bill was then stricken from the calendar as the Assembly bills were sent to the Senate for its action In the Senate both of these bills were passed with a vote of 34 to 15 The result of such a change in the New York law would have opened the doors of the medical licensing examination not only to a few recent graduates of unrecognized schools but to graduates of all extinct medical schools, diploma mills, whose standing had been so low that their graduates had been excluded from licensure in New York State as not meeting the requirements of the Education Law for admission to the practice of medicine in the State It is to be realized that these standards are the minimum standards that are considered to be adequate protection to the public It is also to be realized that an extremely high percentage of the candidates in the New York medical licensing examination greatly exceed the minimum requirements set by law, as these minimum requirements are not as extensive as a vast majority of the medical students desire in their preparation for their practice of medicine On the passage of these bills in both houses strong representation was made by those interested in the protection of the public along these lines to the Governor, requesting that he veto these bills The Department of Education, the Department of Health and other professions and organizations interested along these lines made strong representation to the Governor urging his disapproval of these bills No doubt you saw in your paper on April 22, 1945, that the Governor did veto these bills It is thought that it would have been nothing short of a tragedy had they become a law At the time of his disapproval of these bills the Governor issued the following memorandum

"Memorandum filed with the following bills

Assembly Bill Introductory Number 2186, Printed Number 2438, entitled 'An act to provide the licensing of persons to practice medicine and declaring an emergency'

Assembly Bill Introductory Number 2197, Printed Number 2463, entitled 'An act to amend the education law, in relation to admission to examination for practice of medicine'

"Not Approved

"Each of these bills would grant permission to the graduates of certain unapproved medical schools to take licensing examinations in the State of New York One bill extends this privilege merely for one year, the other would do it permanently

"The Department of Education, which is charged with responsibility for medical educational standards, has approved a large number of schools and has declared that certain others are substandard These bills would overrule the chosen agent of the people of the State, the Department of Education, and make admissible to the practice of medicine, men whom the Department declares may not be trusted with the privilege and responsibility

"The lives and health of the people of the State are a sacred charge They cannot and must not be exposed to the danger of bad medical treatment The Department of Education certifies that such would be the result of these bills and I am compelled, therefore, to disapprove them

"The Bills are disapproved

THOMAS E DEWEY"

On October 20, 1945, a new set of regulations pertaining to examination of certain graduates of unapproved schools was issued by the Commissioner listing the action of the Board of Regents on September 21, 1945, and comment of the Associate Commissioner, J Hillis Miller, is as follows

Memorandum from J Hillis Miller, Associate Commissioner of the State Education Department, explaining the action of the Board of Regents on September 21, 1945, as follows

"*Policy of the Board of Regents on Admission to Professional Licensing Examinations*

"On September 21, 1945, the Board of Regents established a set of conditions under which it would admit to professional licensing examinations applicants otherwise not qualified, pursuant to their discretionary power to determine equivalency as defined by paragraph 2 of Section 51 of the Education Law These conditions are as follows

"1 Applicants must have been residents of New York State when they began their professional training

"2 Applicants must have been entitled to a qualifying certificate when they entered professional study

"3 Applicants must have completed a full course of study leading to the appropriate professional degree

"4. Applicants must present evidence of moral character and fitness for admission to their profession

"5 Applicants who are veterans shall be required to present a certificate of discharge which was other than dishonorable

"6 Applicants submitting internship in a hospital as the equivalent clinical experience must have had such experience for a period of two years and applicants from the armed forces will be required to show evidence that they have had at least one year's professional experience while a member of the armed forces

"7 Applicants will be required to submit a certified copy of confidential record of service while in the armed forces including professional experience, or a certified report of internship in an approved hospital

"8 Applicants must take advantage of these special provisions within two years after discharge from the armed forces or within two years after the required internship in approved hospitals

"Paragraph 2, Section 51 of the Education Law reads as follows '2 The regents may by rule or order accept evidence of preliminary and professional education, and where practice is a prerequisite to licensure may receive evidence of such practice in whatever state or country the same may have been obtained or engaged in, for licensing a candidate to practice any such profession in lieu of that prescribed by the laws relating to such profession, provided it shall appear to the satisfaction of the regents that such candidate has substantially met the requirements of such laws.'

"The reasons which prompted the Regents to take this action are as follows

"A number of residents from New York State who have met all requirements for admission to professional licensing examinations except graduation from an approved school, have practiced their profession in the armed forces and the public health service of the United States during the war emergency These persons are returning as veterans and the Regents policy is intended to give recognition in worthy cases to professional training and experience while serving their country

"Another group under the same circumstances have been admitted to internships in approved hospitals and have thereby contributed to the health needs of the people during the national emergency The opportunity for such internships was made possible by action of the New York State Legislature Chapter 761 of the Laws of 1940 amended subsection 1 of section 1202 of article 48 of the Education Law, forbidding interns from schools not maintaining at the time a standard satisfactory to the Department from practicing in any legally incorporated hospital, or in any state hospital, or in a hospital in any other political subdivision of the State, or other state institutions in which medical service is furnished. This law was to have gone into effect July 1, 1942

"Because of the war emergency the effective date was set at July 1, 1943, by chapter 902 of the Laws of 1942 and by chapter 103 of the Laws of 1943 to be effective July 1, 1944, and by the Laws of 1944 to be effective July 1, 1945 and by the Laws of 1945 to be effective July 1 1946 In other words, the effect of the Law of 1940 has been postponed by an act of Legislature year by year Pursuant to these acts of the Legislature legally incorporated hospitals have been given the privilege of permitting interns from unregistered medical schools to serve internships in approved hospitals.

"In establishing the policy referred to above, the Board of Regents has made it possible for deserving veterans and a limited number of civilians to gain admission to the licensing examination who would otherwise have been denied the privilege of taking the examination. In this connection it should be recalled that laws were passed by both houses of the Legislature in 1945 mandating the Department to admit indiscriminately all candidates from unapproved schools. These laws were finally vetoed by the Governor There is every reason to believe if the Regents had not taken the initiative in this matter that similar acts of the Legislature would become law in 1946 It is the hope of the Regents that by means of this procedure they can take care of worthy cases particularly veterans and at the same time protect the basic professional laws and the educational standards which have placed New York State in the forefront of other states as regards professional licensure"

October 20, 1945

Dr Laurance D Redway, past-president of the Medical Society of the County of Westchester, in his address as retiring president to members of that Society in December, 1945, said

"Note that this action stems gratuitously from the Regents. The Law has not been changed. Thus no less honorable a body than the Regents has put itself on record as favoring a lowered standard of medical education in the State Why they chose to do this is not apparent But the effect of their action is significant and far-reaching

"On October 31, 1945, the *New York Times* carried the statement on page 25 that the Congress of Industrial Organizations plans a campaign to force a reorganization of the Board of Regents ' The immediate goal is said to be 'the election of two labor representatives to vacancies occurring on the Board next year' The C I O complains that the group is now dominated by age conservatives. Thus in the State the growing revolt of the masses is manifested by an attack on the allegedly senile conservatism of the Regents who have already gratuitously compromised the State standards of medical education The practice of medicine is thus under attack at the national level and medical educational standards are being undermined at the state level, in advance, be it noted, of any participation of labor representatives in the affairs of the Regents. These few instances will outline for us some of the major trends above the county level"

There are no figures available as yet from the State Education Department as to the number of applicants for examination under this new ruling, the number of permissions granted or the percentage of licentiates or failures. It is understood, however, that the Department is using this regulation with caution and deliberation.

Convention.—The Council Committee on Convention consists of the following personnel

Harry Aranow, M D, *Chairman*	Bronx
W P Anderton, M D	New York City
Dwight Anderson, Esq	New York City

The Convention Committee with subcommittees, met at the Hotel Pennsylvania New York City, on December 1, 1945, when preliminary plans and arrangements were discussed. Several of the meeting rooms were inspected.

Since then the various subcommittees have worked well. Dr Edward P Flood, Chairman of the *Subcommittee on Arrangements*, Dr Duncan W Clark, Chairman of the Subcommittee on the Scientific Program, and Dr J G Fred Hiss, Chairman of the Subcommittee on Scientific Exhibits deserve thanks and commendation for their arduous and efficient accomplishments The cooperation of the Woman's Auxiliary has also been much appreciated. The space for commercial exhibits has been enlarged. The scientific programs of the various sections and sessions are attractive

We have every expectation that the 1946 convention will be a great success. It gives me pleasure to extend my appreciation to the members of our various committees and the staff of the office of the Society for their generous and helpful cooperation.

Nursing Education.—The Council Committee on Nursing Education has consisted of Dr W P

Anderton, *Chairman*, Dr Clayton W Greene, and Dr Norman S Moore Although many nurses have been released from the armed forces, the discharge of nurses seems to have been less rapid than the discharge of medical officers. There continues an insufficient supply of registered nurses in many parts of the State.

In spite of the accelerated cost of nurse training during the war, the standards of nursing education have been well maintained The Cadet Nursing Corps is being discontinued and the Federal payment for education of nurses is being stopped

The Chairman has attended meetings of the New York Visiting Nurse Association, the Nurse Councilng and Placement Office Advisory Committee, and the New York State Nursing Council for War Service This last named body is being superseded by the New York State Council on Nursing Its work in recruiting nurses during the war deserves the highest commendation, and the Directory of New York State Nursing Schools and supplementary table of student expenses in the various schools has been a pioneer compilation

It seems likely that the general increase in cost of living, including increase in nurses' fees, will tend to enlarge the demand for practical nurses both in private and hospital practice It is hoped that the facilities for training practical nurses in New York State will be increased.

Office Administration and Policies —This special committee of the Society, consisting of Dr John J Masterson, *Chairman*, and Drs W P Anderton, Kirby Dwight, George W Kosmak, Laurance D Redway, and Mr Dwight Anderson, reports as follows

REPORT

Your committee has met monthly In keeping with economic trends of the times, it has been necessary to increase most of the salaries of the clerical staff of the Society Each case has been studied individually by your committee We have a loyal and industrious staff with a comparative small turnover, and as professional men, our Society believes in fair remuneration for good work.

Arrangements have been made with the owners of 292 Madison Avenue, where we are at present located on the twenty-first floor, to move as soon as possible, probably about May 1, 1946, to the seventh floor where sufficient space will be available for our now overcrowded staff A new lease has been signed by the Board of Trustees authorizing this removal

It has been recommended that the House of Delegates continue this Special Committee, working under supervision of and reporting to the Council, and that the House give the following directive as to continuance of its personnel

"The Committee on Office Administration and Policies shall consist of the Secretary, the Business Manager of the JOURNAL and *Directory*, the Literary and Managing Editors, the Treasurer, and one member of the Board of Trustees, to be appointed by the President of the Society, after consultation with the Chairman of the Board of Trustees"

The Woman's Auxiliary —The Council Committee on Woman's Auxiliary consists of the following personnel

Edwin A. Griffin, M D, *Chairman*	Brooklyn
F Leslie Sullivan, M D	Scotia
Nathan B Van Etten, M D	New York City

The Woman's Auxiliary to the Medical Society of the State of New York has had a busy year, and much of its work has been carried on by mail.

The midwinter Board meeting had to be canceled because postwar conditions did not permit of space in any New York hotel for their meeting

However, with great effort it accomplished all the tasks assigned to it using the telephone and mails as its agent

Meetings with lay groups were arranged to acquaint Mr and Mrs Q Public with the physicians' plan of Voluntary Health Insurance Mr George P Farrell, the medical-care insurance representative of the Medical Society of the State of New York, has been the guest speaker whenever possible These meetings have been held all over the state from Buffalo to Long Island

Legislation has been a matter of real concern to the Auxiliary which through its legislation chairmen, Mrs Alfred L Madden and Mrs Gerald C Cooney, have jumped into action at a moment's notice They have contacted State and National Houses of Legislation on such topics as the Wagner-Murray-Dingell Bill, the Animal Experimentation Bill, and have also contacted lay groups to educate them on matters dealing with health

The Physicians' Home has a very special appeal to the Auxiliary It has worked all year raising funds to aid this worthy cause

One of the sincere objects of this organization is the furthering of friendships among physicians' families, and the results of this has made the state one large family

In the entertaining of out-of-town guests at medical meetings they have put forth their best efforts

Always remember a doctor's wife is surely a helpmate in every sense of the word

APPENDIX A.—SEE PART VI PUBLIC RELATIONS AND ECONOMICS, PAGE 750

MEDICAL PLAN		PHYSICIANS' SERVICES
Allegany County	Fee basis—free choice	Any physician licensed and registered in New York State practicing in Allegany and adjoining counties: if he submits prescribed request form, it is assumed he accepts rules and regulations.
Binghamton City	Fee basis—free choice	Effective March 1 1945 previously salaried system. All physicians licensed to practice in New York State. Commissioner may eliminate those who do not comply with rules and regulations.
Broome County	Fee basis—free choice	All physicians licensed in New York State and registered in Broome County who agree to abide by the regulations are eligible to participate. The department will not ordinarily pay for services by physicians residing outside Broome County except with approval of Commissioner
Cattaraugus County	Fee basis—free choice	All physicians licensed in New York State. Commissioner may eliminate those who violate rules and regulations
Chautauqua County	Fee basis—free choice	Except for Town of Ripley—salaried physicians for HR—(L.S.) All physicians licensed in New York State.
Chenango County	Fee basis—free choice	Any physician licensed and registered in New York State and practicing in Chenango County who indicates he wishes to provide service under the program
Clinton County	Fee basis—free choice	Patients are expected to call nearest physician; all physicians licensed in New York State eligible. Commissioner may eliminate for violation of rules and regulations
Jamestown City	Fee basis—free choice	Fee basis effective January 1 1945 Any physician licensed in New York State and agreeing to conform to rules and regulations.
Herkimer County	Fee basis—free choice	Same as Broome.
Fulton County	Fee basis—free choice	(Preferably the nearest physician.) Any physician licensed in New York State. Commissioner may eliminate those who violate rules and regulations.
Franklin County	Fee basis—free choice	Except in Town of Malone and St. Regis Reservation. Preferably the patient shall select the nearest physician If the physician he selects is outside the free zone in which he resides the further physician, if he chooses to make the visit, shall receive the same fee as the nearest physician.
Essex County	Fee basis—free choice	Except in towns of Moriah, Keene, Schroon and Newcomb Same limitation as above for Franklin.
Erie County	Fee basis—free choice Salaried system	For OAA–AD–CWS and all cases outside Buffalo. E. J Meyer Memorial Hospital, home call service for HR in Buffalo and ADC in Buffalo.
Dutchess County	Fee basis—free choice	Any physician who is licensed in New York State who has applied in writing to the Department of Public Welfare and has been approved and appointed by the Professional Advisory Committee and the Director of Public Assistance is eligible; where needs warrant, the Medical Committee will use physicians outside the Welfare District to cover the particular need.
Monroe County	Salaried system Fee basis—free choice	For OAA ADC and HR (N–S) in Rochester When salaried physician not available to above groups; specialists are utilized on fee basis when hospital outpatient department service is not available or where patient is not ambulatory
Oneida County	Fee basis—free choice	Patients have free choice of physicians "as far as possible."
New York City	Fee basis—for home calls choice is from panel	Recipients have the right to designate the physician they wish to have assigned; in so far as possible calls will be divided equally among the physicians on the panel of the proper Welfare Center Requirements for physicians 1 Any physician licensed in New York State, registered in the State for the current year and who has a narcotic permit may apply to treat recipients in his borough. 2. Application is reviewed by the Medical Director and the Medical Advisory Committee whose decision to accept or reject is final. 3 Violation of the rules and regulations may result in suspension or revocation of the privilege of treating recipients. Such action is taken by the Medical Director with the advice of the Advisory Committee.
	Clinics are utilized for ambulatory patients	
New Rochelle (City)	Salaried system	Salaried physicians are assigned in rotation for home calls. Ambulatory patients receive care in the Welfare Department licensed dispensary or some other clinic to which they have been referred.
Nassau County	Fee basis—free choice from panel in the patient's community	Any physician licensed to practice medicine and surgery in New York State, who has practiced in Nassau County one or more years, who has applied in writing to the Division of Medical Care and who has been appointed by the Commissioner is eligible to participate. Physicians practicing in adjacent Suffolk County and New York City who meet the residence requirements in their respective communities, and other out-of-county physicians who have been especially approved by the Medical Director shall also be considered for approval to participate in the Medical Care Program.
Lockport City	Fee basis—free choice	The City Physician will be assigned to treat recipients who do not specify a particular physician when requesting care in the home; ambulatory patients who do not specify a particular physician may be treated by him at clinic; any physician who has agreed to conform to rules and regulations may participate. Except with approval of the Advisory Committee, no physician shall receive more than $1,500 for services during the fiscal year nor more than $50 per person for services other than major surgery; nor more than $200 for any one month in welfare fees.
Livingston County	Fee basis—free choice	In so far as possible the physician chosen should be the nearest one to the patient's home. All physicians licensed in New York State are eligible to participate if service is given in accordance with manual regulati—

Medical Plan		Physicians' Services
Rochester City	Salaried system for home calls Clinics are utilized for ambulatory patients	When salaried physicians services are "unsuitable" or "unavailable," fee basis service may be arranged with the approval of the Medical Director
Rensselaer County	Fee basis—free choice	Except for N S and S C cases living in and nearby Troy and HR cases in the Town of Hoosick Falls The patient shall be expected to call the nearest physician If a more distant physician is called, he shall be paid the same fee as the nearest physician. Any physician licensed in New York State may participate, Commissioner may exclude for violations of rules and regulations
Putnam County	Fee basis—free choice	Any physician licensed in New York State, and in some instances in the State of Connecticut, is eligible to participate within the scope and under the regulations herein established
Otsego County	Fee basis—free choice	Any physician licensed to practice in New York State may participate if service is given in accordance with the rules and regulations
Orleans County	Fee basis—free choice	Except for HR cases in Towns of Shelby and Ridgeway—all physicians licensed to practice in New York State are eligible to participate in this program, but the department will not ordinarily pay for the services of physicians residing outside the County except with the approval of the welfare official
Orange County	Fee basis—free choice	In so far as possible the physician chosen shall be within a reasonable zoning distance from the patient's home All physicians licensed in New York State are eligible to participate
Onondaga County	Salaried system for home calls clinics are utilized for ambulatory patients	Each salaried physician is assigned to a specified district
Suffolk County	Fee basis—free choice	Any physician licensed in New York State may participate. Physicians' services authorized by the Department shall not exceed $1,500 by any one physician in any twelve months' period This amount is exclusive of major surgery and obstetric care.
Warren County	Fee basis—free choice	Except that patients should preferably choose the nearest physician. If he chooses one further away, he will be paid the same fee as the nearest physician Any physician licensed in New York State may participate
Ulster County	Fee basis—free choice	In so far as possible, the physician chosen by the patient shall be the nearest one or within reasonable distance of the patient's home Any physician licensed in New York State is eligible to participate
Troy City	Salaried system for home calls to HR recipients ambulatory patients attend Department dispensary Fee basis—free choice for OAA recipients	Physicians are assigned to specific districts
Steuben County	Fee basis—free choice	In so far as possible the physician should be the nearest one to the patient's home. Any physician licensed in New York State is eligible to participate if service is given in accordance with manual regulations
Steuben County (Towns)	Fee basis—free choice	Except in Town of Erwin, any physician licensed in New York State is eligible to participate.
Schuyler County	Fee basis—free choice	Free choice when practicable. Any physician licensed in New York State is eligible to participate
Schenectady County	Fee basis—free choice	Preferably the physician nearest the patient's home. Any physician licensed in New York State is eligible to participate
Saratoga County	Fee basis—free choice	In so far as possible the physician chosen shall be the nearest one or within reasonable distance of the patient's home. Any physician licensed in New York State is eligible to participate
Wyoming County	Fee basis—free choice	All physicians licensed to practice in New York State eligible to participate, Commissioner may eliminate because of violations of rules and regulations. In no instance will a greater fee for a home call be paid a physician than would be paid the Wyoming County physician living nearest the case
Wayne County	Fee basis—free choice	No requirements for physicians who wish to participate It is understood that participating physicians agree to comply with provisions of the Social Welfare law and rules of the County of Wayne
Washington County	Fee basis—free choice	In so far as possible the physician chosen by the patient shall be within a reasonable distance of the patient's home All physicians licensed in New York State are eligible to participate in this program Commissioner may eliminate for violation of rules and regulations after consultation with Advisory Committee.
Westchester County	Fee basis—free choice	In so far as possible the physician chosen shall be within a reasonable distance of the patient's home, any physician licensed to practice in New York State may participate Commissioner may eliminate, after consultation with Public Relations Committee of Medical Society, any physician who fails to serve the best interests of the patient or who violates the principles of the medical program as provided in the Manual.
Yates County	Fee basis—free choice	Any physician licensed and registered in New York State and practicing in Yates County is eligible If the physician submits to the Department form M–1 requesting authorization for the care of relief recipients, it is assumed by the Department that the physician wishes to participate under the rules and regulations of the plan. It is understood, however, that such participation shall not be construed as binding upon the physician to changes in the plan in the future unless a physician participates after reasonable notice is given to him of such changes.

APPENDIX B.—CLINIC PROGRAM, OUTPATIENT DEPARTMENT STRONG MEMORIAL HOSPITAL, JANUARY 1 1943

I. Policy

(1) *Definition.* Clinic care shall be considered to include professional care, i.e. ordinary dressings, treatments necessary drugs for immediate use in the clinic, laboratory service operating room, minor operations plaster casts, physiotherapy allergy treatments, dental care—extractions only psychiatric care, and drugs for use at home

(2) *Type of Service Rendered.* Strong Memorial Hospital Outpatient Department at the present time is operating the following clinics

Allergy (children-adults)
Basal Metabolism
Cardiac (children-adult)
Chiropodist (diabetic only)
Dental (extractions only)
Diabetic
Diathermy
Ear
Electrocardiogram
Endocrine (adult only)
Eye (refraction and treatment)
Fracture
Gastrointestinal (medical only)
Genitourinary (adult)
Gynecologic
Laboratory (general)
Hay Fever and Asthma
Luetic
Medical
Nephritic
Neurologic (medical)
Nose and Throat
Orthopedic
Pediatric
Physiotherapy
Plastic Surgery
Prenatal Instruction
Prenatal
Postnatal
Proctology
Psychiatric
Radium Therapy
Skin (adult)
Skin (children—Seen in Pediatric)
Surgical
Tumor Breast
Tumor (gynecologic tumor)
Tumor (general)
Varicose Veins
Well Baby
X Ray Diagnosis and Therapy

Patients with eye complaints should be referred to *Eye Clinic* for treatments of their complaint and not solely for refractions. It is understood that patients are not to be sent for *Laboratory Tests* only The hospital Outpatient Department is not to be regarded as laboratories to which patients are sent for tests, but rather as diagnostic clinics that will provide all services necessary in the course of diagnosis and treatment. Patients referred to *Psychiatric Clinic* should either have been referred to the Medical Clinic or a report of a satisfactory medical examination should accompany the patient. A social history from the County Department of Public Welfare should also accompany the patient whenever possible.

(3) *Selection of Outpatient Department.* A patient may have free choice of outpatient department keeping in mind that patient should return to outpatient department where he has had previous care, either the outpatient department or hospital. If patient refuses to return or if patient a physician and patient prefer another outpatient department, an adjustment will be considered, providing the outpatient department will accept patient.

(4) *Method of Referral.*

(a) Patients active in the outpatient department at Strong Memorial Hospital since January 1, 1942 are to continue as the outpatient department patients regardless of their category However the status of each of those patients is to be reviewed by the Medical Consultant and the hospital at periodic intervals and referred back to the patient's physician by the Medical Consultant whenever they do not require continued Specialist Services.

(b) All new patients are to be referred by the County Department of Public Welfare. Telephone approval should be obtained for emergencies whenever possible. Emergencies after hours or on holidays are to be cared for without authorization and reported to the County Department of Public Welfare within forty-eight hours of rendering service.

(c) Patients should not be referred by Strong Memorial Hospital to another outpatient department without prior approval of the Medical Consultant.

(d) Patients referred to Clinic following hospitalization at Strong Memorial Hospital or Rochester Municipal Hospital, or having been seen in the Strong Memorial Emergency Division may be seen once before obtaining authorization of the Medical Consultant for further care. If patient has been receiving outpatient department care at a hospital other than Strong Memorial the Medical Consultant will designate the out patient department to render further care after an initial visit to Strong Memorial Outpatient Department.

(e) If patient is attending more than one outpatient department, the Medical Consultant and the outpatient departments involved shall decide which outpatient department is to be responsible for rendering clinic care.

(5) *Method of Authorization—Approval of Medical Consultant.*

(a) New patients are to be referred to Strong Memorial Hospital Outpatient Department by means of a Referral Letter or Form signed by the Medical Consultant. This letter or form will indicate the diagnosis and the information or service desired

(b) The referral letter or form will be considered authorization for all future follow-up visits and treatments considered necessary in the special clinic to which the patient has been referred. At intervals of three months, the Medical Consultant will review each clinic case.

(c) Physiotherapy and Diathermy shall be limited to five visits in one calendar year without prior approval of the Medical Consultant. All subsequent Physiotherapy and Diathermy treatments shall have the written approval of the Medical Consultant prior to being rendered.

(d) Authorization for x ray and Radium Therapy will be approved by the Medical Consultant based upon a statement from the roentgenologist at Strong Memorial Hospital. The statement shall include the diagnosis, number of x-ray therapy treatments and course.

(e) Approval of continued clinic care may be withdrawn by the Medical Consultant after review of the individual case with the hospital.

(6) *Regulations—Outpatient Department, Emergency Division.*

(a) Patients admitted to the Emergency Division should be classified in one of two classes

1. Those patients that are officially admitted to the hospital shall have charges made in the usual manner for hospital cases.
2. Those patients that are not admitted to the hospital shall have charges made in the regular manner for clinic cases and billed through the outpatient department.

(b) Patients seen in the Emergency Division and going to a clinic the same day or vice versa, should be charged one visit only

(c) Patients visiting two clinics in the same day are to be charged for two separate visits.

(d) Patients seen in a clinic one day and given a return appointment for an Electrocardiogram, Basal Metabolism Report, X ray Diagnosis or Laboratory Service are not to be charged for those services, since service is included in the flat clinic rate and might have been rendered the day patient attended clinic.

(e) Patients having Physiotherapy Diathermy X ray, or Radium Therapy will be charged the flat clinic rate each time the service is rendered.

(f) The dispensing of all drugs necessary for treatment shall be included in the flat clinic rate.

(g) If patient returns for drug refill and it is not necessary for the patient to be seen in the clinic, no clinic charge or drug charge is to be made.

(h) At the end of each month, the cashier of the Outpatient Department will send to the County Department of Public Welfare, a notification form for each clinic visit during that month. This form will indicate the name and address of the patient, the date of service rendered the diagnosis and the cost, which in the majority of cases will be $1.00 for the visit.

II Fee Schedule

(1) A flat rate of $1.00 per clinic visit to include all services and drugs except the following

Crutches canes, arch bandages trusses shoe alterations, corsets, plaster pylons, surgical orthopedic, and prosthetic appliances and their repairs. These items are to be paid for as extras and are not to be considered as part of clinic care.

Resume of Instructions of the 1945 House of Delegates and Actions Thereon of the Council, Board of Trustees, and Officers

Early Release of Doctors from Armed Services (Section 104) **and Restoration of Prewar Medical Educational and Intern System** (Section 80) —As directed by the House of Delegates, the Secretary sent to President Harry S Truman, Rear Admiral Ross T McIntire, Maj Gen Norman T Kirk, and Maj Gen. Lewis B Hershey copies of resolutions pertaining to these subjects.

Actions by Governing Boards of United Medical Service, Inc., and the Affiliated Associated Hospital Service of New York (Section 77) —Copies of this resolution were sent to Mr Louis H Pink, president of Associated Hospital Service of New York, Mr John F McCormack, president of the New York State Hospital Association, Mr Robert F Dineen, superintendent of insurance, and to the Secretary of each of the seventeen county medical societies within the territory of the United Medical Service, Inc., also to physician members of the Board of Directors of United Medical Service, Inc., and Associated Hospital Service of New York. The resolution stated "that no member of this Society shall continue to serve on a Board of Directors which fails to recognize and abide by the explicit terms of the laws relating to the practice of medicine, the administration of nonprofit hospital service and medical expense insurance, and the official definition of the Medical Society of the State of New York relating to the distinction between hospital service and the practice of medicine."

Remission of Veterans' Dues (Section 105) — Copies of the resolution providing for the remission of dues of veteran members of the Medical Society of the State of New York for one year from the date of cessation of service, plus the remainder of the succeeding fiscal year, were sent to the Secretary of each county medical society Furthermore, the subsequent interpretation of the Council, that this resolution was intended to apply to all veteran members regardless of the date of discharge, was sent to each county society secretary

Medical Care of Veterans (Section 51) —In accordance with a resolution of the House of Delegates suggesting that 'conference be sought with appropriate officials of the Veterans' Bureau in order to bring about a liberalization of the rules and regulations of the Veterans Administration, in order to permit veterans to obtain medical care through their own physicians" President Cunniffe, President-Elect Hale Past-President Bauckus, Secretary Anderton, Dr Laurance D Redway, and Mr George P Farrell conferred with Col. J C Harding on February 1, 1946 at the Veterans Administration, Washington, D C As a result of vote by the Council Dr Cunniffe appointed the following Liaison Committee with the United States Veterans Administration Dr William Hale, *Chairman*, Mr George P Farrell, secretary Dr Herbert H Bauckus Dr Laurance D Redway, Dr Dan Mellen Dr J Stanley Kenney with himself and Secretary Anderton, ex officio An established policy of the Veterans Administration is to have veterans with service-connected disabilities examined and treated by local physicians under authorization from the Veterans Administration. A fee schedule and plan of cooperation between the Medical Society of the State of New York and the United States Veterans Administration is in the process of development.

War Participation (Section 58) —The Council Committee on Veterans Affairs Dr Dan Mellen, *Chairman*, Dr William F MacFee, and Dr James F Rooney were appointed the Council Committee on Veterans' Affairs, and a subcommittee with wide representation through the State has also been appointed The activities of this Committee are reported elsewhere.

Liberalization of E.M I C Policies and Requirements in Relation to Applications for Specialist Status in Obstetrics (Section 75) —The following resolution was referred by the House of Delegates to the Council for discussion with the State Department of Health

> *"Resolved*, that the Medical Society of the State of New York, represented in this duly convened meeting of its House of Delegates, registers its professional interest in those individual physicians whose applications for specialist status in obstetrics under the E M.I C program have met with rejection, and hereby requests the E.M I.C Bureaus of the State Department of Health and the Children's Bureau of the U.S Department of Labor, overall administrative agency which approved the New York State Plan, to interpret officially the present requirements and policies in New York State with respect to certification of specialists in obstetrics under E M.I.C and to revise the same, if necessary, to insure a broader more liberal, fairer set of provisions under which discrimination cannot occur and the objects and aims of the program can be accomplished with facility and satisfaction."

The Committee on Public Health and Education, its subcommittee on Maternal and Child Welfare, and several officers of the Society met with representatives of the State Department of Health on November 7, 1945 and considered this problem from every angle The conclusion reported to the Council was to the effect that the Committee felt that the existing requirements were 'fair and satisfactory"

Workmen's Compensation Law (Section 83) — The House of Delegates voted that legislation be pressed to return to the medical societies in counties of a population of over a million the powers formerly existing under Chapter 258, Laws of 1935, and requested "the proper officials of this society to take such action as may be advisable to secure for the county medical societies in counties of less than one million population adequate reimbursement for the expenses incurred by them in carrying out the law" An effort was made to have the former purpose accomplished through legislation, and the Workmen's Compensation Bureau has made a study of the latter situation.

cians during the reporting period, some of which have been withdrawn after conference, or settled before suit, and some of which may eventually lead to litigation. A large amount of preventative work is done by your Counsel and his office staff We are in frequent consultation with claimants and their attorneys and have convinced many patients that they have no meritorious claim and that the physician involved should not be blamed simply for an untoward result

Table 1 shows that during the present reporting period we have disposed of 97 cases Forty-nine of these cases were settled and 47 resulted in verdicts in favor of the defendant doctor There was one judgment for the plaintiff against a physician. It may also be noted from Table 1 that there are pending as of January 31, 1945, 384 cases.

Counsel Work.—During the period of this report, your Counsel and Mr Clearwater, the attorney for the State Society, have attended the Annual Meeting of the Society and the regular meetings of the Council and Board of Trustees of your Society, and have conferred with members of committees on numerous legal problems which have presented themselves. In the urgency of a great number of postwar problems facing the Society, this work has been particularly heavy this year Among other matters which your Counsel conferred upon with the Council and Board of Trustees was the preparation and execution of the contracts entered into between the Society and Dr David J Kalish, Director of the Bureau of Workmen's Compensation, and between the Society and Dr Robert R Hannon, Executive Officer of the Society, and between the Society, and Mr George P Farrell, Director of the Medical Expense Bureau of the Society

Your Counsel, acting with the Committee on Bylaws, has examined various proposed amendments to the Constitution and Bylaws, both of your Society and of a number of component county medical societies and has rendered advice and made suggestions in connection therewith.

There have been a number of conferences during the year with relation to various proposed State and National plans for [illegible] and surgical insurance. Your Counsel and Mr Clearwater have attended these meetings and rendered legal opinions in connection therewith. We have also frequently consulted with Dr Anderton, Dr Kalish, and Dr Hannon relative to legal phases of problems which have been presented in their particular fields

There have also been conferences relative to the preparation and signing of leases for the Society's proposed new quarters Mr Clearwater attended the arbitration proceedings to fix the proposed rentals

Your Counsel receives frequent requests, both oral and in writing, on legal problems which it would be prolix to refer to in any other way than by listing just some of the subjects involved the circumstances under which a physician may operate and treat minors, the legality of various problems involving sterilization, artificial insemination, therapeutic abortions, the propriety of advertising matter concerning medicolegal publications, contracts between physicians and corporate employers, disclosure of confidential information to other than patients, the right of a physician to retain x-ray plates taken by him of a patient, what physicians may testify to in different types of legal actions, the extent to which interns and other nonlicensed personnel may render medical care and treatment in institutions, problems concerning leases of office and residential space by doctors coming out of service, occupation of premises leased while doctor lessors were in service, and the various problems of commitment for insanity

Your Counsel's office is at the service of all members of the Society and it is a daily occurrence for us to answer problems arising out of emergency situations which members of the profession face and which cannot be adequately handled by correspondence. We make every effort to render guidance in these situations They involve a considerable amount of time and work.

Legislative Advice and Activities —During the past year your Counsel and Mr Clearwater have conferred with numerous persons representing varying points of view in connection with proposed changes to the law which effect the practice of medicine and the problems of the medical profession. These problems are discussed at length with the appropriate committees of the Society and with Dr Hannon, the Executive Officer of the Society We are also in frequent consultation with Mr Dwight Anderson and the members of the Publication Committee regarding legal phases of their work. For the information of the membership of the Society, we have during the past year written on the following subjects in the NEW YORK STATE JOURNAL OF MEDICINE disciplinary proceedings—splitting of fees, the statute regarding confidential communications, the problem of rents for physicians' offices under the OPA, recovery for mental anguish, and hospitals' liability for acts of nurses

Conclusion.—Your Counsel, in closing, wishes to express his deep appreciation of the invaluable assistance rendered throughout the State of New York by the many members of the Society who have given of their time and effort to aid us with our problems, particularly those of a technical, medical, and surgical nature Without their help our work would be indeed arduous. I am grateful to the Officers of the Society, to the Council, and to the Board of Trustees for their help and assistance in our work. All of these things are factors that make for the results shown in this report

Respectfully submitted,
WILLIAM F. MARTIN, *Counsel*

Amendments to Constitution and Bylaws

In accordance with Article XIII of the Constitution and Bylaws, the following proposed amendments are published for the information of the House of Delegates and will be considered at its next meeting.

1 Introduced by the Committee on Reorganization

A. In Chapter VII, Section 6 of the Bylaws, delete the second and third sentences, which read as follows "These minutes shall be copied from a stenographer's notes with such deletion only as will not modify, alter, or becloud the history of the actions of the said bodies. The stenographer's typewritten copy shall be preserved until ordered destroyed by the House of Delegates."

Insert the following language in place of the deletion "He shall perform such other duties as may be prescribed from time to time by the House of Delegates or the Council," amending said section so as to read as follows

"Section 6 The Secretary shall attend all meetings of the Society, the House of Delegates, the Council, the Board of Trustees, and the Board of Censors, and shall keep minutes of their respective proceedings He shall perform such other duties as may be prescribed from time to time by the House of Delegates or the Council."

B In Chapter VII, Section 7 of the Bylaws, delete the following words from the first sentence thereof "be responsible for and have general charge of the Society's offices and the employees therein. He shall be "

Insert in place of said deletion, the following language "countersign all checks issued by the Treasurer on funds of the Society, he shall be "

"Section 7 The Secretary shall countersign all checks issued by the Treasurer on funds of the Society, he shall be the custodian of the seal of the Society, and of all books of records and papers belonging to the Society, except such as properly belong to the Treasurer, and shall keep an account of and promptly turn over to the Treasurer all funds of the Society which come into his hands He shall provide for the registration of the members at all sessions of the Society With the aid and cooperation of the secretaries of the county societies, he shall keep a proper register of all the registered physicians of the State by counties He shall aid the officers of the District Branches in the organization and improvement of the county societies and the extension of the power and influence of the Society He shall conduct the official correspondence notifying the members of meetings, officers, councillors, trustees, and Board members of their election, and committees of their appointment and duties He shall affix the seal of the Society to all credentials issued to members of the Society elected by the House of Delegates and to such other papers and documents as may require the same He shall make an annual report to the House of Delegates He shall supply each county society with the necessary blanks for making their annual reports to this Society Acting in cooperation with the Council, he shall prepare and issue all programs He shall be a member of the Council. He shall be ex officio a member of all boards and committees without vote He shall record the name and date of admission of each member of the Society"

C Repeal entire Chapter VIII of the Bylaws entitled "Direction of Activities."

D In Chapter XVIII, Section 2, delete the following "given at a previous annual meeting of the House of Delegates, and before the same can be acted upon it shall be published once before the annual meeting in the ," and insert in place of said deletion the following "published one month before the annual meeting in the ," so that said Section 2 of Chapter XVIII shall read as follows

"Section 2 Notice of the proposed amendment shall be published one month before the annual meeting in the official bulletin or journal of the Society"

2 Introduced by Dr James F Rooney, Trustee, Individually —Article IV of the Constitution

Amend Article IV, Council, by adding the words "Second Vice-President" after the word "President-Elect," and adding the words, "Assistant Secretary" after the word "Secretary", the words "Assistant Treasurer" after the word "Treasurer", and the word "Vice-Speaker" after the word "Speaker," and "the President of each district branch of this Society for the term to which he was elected." The article would then read

"There shall be a Council composed of the President, the President-Elect, the Second Vice-President, the immediate Past-President, the Secretary, the Assistant Secretary, the Treasurer the Assistant Treasurer, the Speaker, the Vice-Speaker, the Chairman of the Board of Trustees, nine other members elected by the House of Delegates, and the President of each district branch for the term to which he was elected."

3 Introduced by Dr James R. Reuling, Jr, Individually —Chapter II, Section 1, of the Bylaws

Amend Chapter II, Section 1 of the Bylaws, by inserting after the sentence "Each component county society shall be entitled to elect as many delegates as there shall be State Assembly Districts in such county at the time of election, but each county medical society shall be entitled to elect at least one delegate," the following sentence

"Any component county medical society which, according to the rolls of the State Society, on May 1 of the previous calendar year shall have had 125 or more members, shall be entitled to elect not less than two delegates any Society with 250 or more members, not less than three delegates, any Society with 375 or more members, not less than four delegates, any Society with 500 or more members, not less than five delegates, any Society with 1,000 or more members shall be entitled to elect not less than one delegate for each 250 members and fraction of that number"

4 Introduced by Dr James M Flynn, for the Committee on Malpractice Defense and Insurance —Notice of Amendment to Bylaws Reconstituting Present Committee of Malpractice Defense and Insurance

"WHEREAS, the Group Plan of Malpractice Insurance and Defense was organized by the Medical Society of the State of New York to stabilize and perfect this type of protection for the members, and

"WHEREAS, in accomplishing that purpose, the Group Plan has grown to the size of a corporate enterprise large enough to require the supervision of a board of directors, and

"WHEREAS, the direction of an undertaking of the size and character of the Group Plan requires continuity of supervision by a committee or board whose members remain in office long enough to become thoroughly familiar with the many business and professional problems involved in the successful operation of it, and

"WHEREAS, the present Council Committee on Malpractice Defense and Insurance, after a careful study, has recommended that its functions be transferred to a permanently organized special committee or board, now, therefore, be it

"Resolved, that the Constitution and Bylaws of the Medical Society of the State of New York be, and they are hereby amended as follows

"Sections 2 and 3 of Chapter XII of the Bylaws entitled 'Special Committees' are renumbered 3 and 4, respectively

"A new Section 2 is added as follows *'A Special Committee, to be known as the Malpractice Insurance and Defense Board, consisting of five members, including a chairman, shall be appointed by the President with the approval of the Council. Five members of the committee shall be appointed in 1946 for one, two, three, four, and five years, respectively, and thereafter one new member shall be appointed each year to serve five years Vacancies for any cause shall be filled for the unexpired term by appointment by the President with the approval of the Council The Secretary, Treasurer, Legal Counsel, and Indemnity Representative shall be ex officio members of the committee with voice but without vote It shall be the duty of the committee to study and supervise, on behalf of the Society, all matters having to do with malpractice insurance and defense'"*

5. Introduced by Dr Louis H Bauer, Individually

Chapter II, Section 3 of the Bylaws, is amended by inserting after "The annual meeting of the House of Delegates shall be held," the words, "at the call of the Speaker, at least one and not more than two days" The words, "on the day," shall be eliminated. The first sentence of the amended Bylaw will then read

"Section 3 The annual meeting of the House of Delegates shall be held at the call of the Speaker, at least one and not more than two days before the annual meeting of the Society"

The balance of the section is to remain unchanged

Reports of the District Branches

First District Branch

To the House of Delegates Gentlemen.

The activities of the First District Branch have this year been confined strictly to the conduct of its regular meeting The officers of the component Medical Societies met at the Hotel Roosevelt on September 13 1945 to plan for this.

The meeting was well attended by representatives of each society, by the Officers of the Branch, Dr Robert R. Hannon, Mr Dwight Anderson, and by Dr Edward R. Cunniffe who spoke on the trends and plans of medicine in this state for this year

It was decided to abandon the large clinical type of meeting held in a hospital, because no hospital felt it had the personnel to properly care for such a meeting, and to substitute a didactic lecture meeting.

An innovation of having one session begin in the late afternoon and, following a dinner an evening session was suggested and tried out with very satisfactory results.

This meeting, held in White Plains on October 30 1945, was featured by four splendid papers and by the address of our President, Dr Cunniffe, on "Policies and Opportunities for Constructive Action of the State Society"

Dr Clarence O Cheney was host to this meeting at the Westchester Division of the New York Hospital in White Plains, and entertained the Branch most royally, even providing refreshments at the end of the evening session.

The hall at the hospital was eminently well fitted for such a meeting and every sort of facility was present for lantern slides or moving pictures. Dr Cheney was present throughout and aided very materially in the success of the meeting. The attendance was more than 160 which is large for such a meeting

The program for each session was as follows A medical movie—"The Life Cycle of the Rocky Mountain Tick", two lectures—"A Review of the Various Methods Used in the Treatment of Thrombophlebitis of the Extremities" by Frederic W Bancroft, M D New York City, associate clinical professor of surgery, Columbia University College of Physicians and Surgeons, and Attending Surgeon, Metropolitan Hospital, and "Infectious Jaundice and Hepatitis" by Franklin M Hanger M.D , New York City, associate professor of medicine, Columbia University College of Physicians and Surgeons, and associate physician, Presbyterian Hospital

Dinner was served at 6 00 P.M. at the Roger Smith Hotel during which an address was given by Edward R. Cunniffe, M.D., Bronx, President of the Medical Society of the State of New York.

The evening session began at 7 30 P.M. and included a medical movie—"The Physiology of Swimming" and two lectures—"Headache" by Harold G Wolff, M.D , New York City associate professor of medicine, Cornell University Medical College, and associate physician, New York Hospital and "Management of the Failing Heart" by Harry Gold, M.D., New York City, assistant professor of pharmacology, Cornell University Medical College

Respectfully submitted,

SCOTT LORD SMITH, M.D , *President*

March 4, 1946

Second District Branch

To the House of Delegates Gentlemen.

The thirty ninth annual meeting of the Second District Branch of the Medical Society of the State of New York, consisting of morning and afternoon sessions and luncheon, was held on October 24, 1945, at the United States Naval Hospital, St. Albans. The papers of the morning session were presented by the members of the Naval Hospital. All were of a high order of excellence. The program was as follows

"The Etiologic Importance of Allergic Rhinitis in Gastrointestinal Complaints" by Comdr James R. Barnard (MC) USNR, "The Diagnosis of Infestation with the Sacroptes Scabiei Var Hominis" by Lt. Eugene A Hand, (MC) USNR, "Electroencephalographic Findings in Naval Personnel' by Lt. Russell A. Anthony, (MC) USNR, "Repair of Total and Subtotal Loss of Skin and Soft Tissue on the Sole of the Foot' by Capt. William G Hamm, (MC) USNR, "The Management of Acute Arterial Occlusion" by Lt. Comdr Gerald H Pratt, (MC) USNR, and "Sympathetic Surgery in the Treatment of Causalgia" by Capt. James A. White, (MC) USNR.

At luncheon the President introduced Capt. E. D McMorries, the new commandant of St Albans Hospital, who made a brief address of welcome.

The afternoon session opened with a stimulating address by Edward R. Cunniffe M.D Bronx, President of the Medical Society of the State of New York, on social and economic aspects of the practice of medicine.

The concluding paper of the day was delivered by Dr Walsh McDermott of the staff of Bellevue and New York hospitals, on the subject of "Clinical and Pharmacologic Studies of the Administration of Penicillin." It was an authoritative presentation of the latest work in this important field.

The Woman's Auxiliaries of the four counties attended the meeting.

The net receipts from the luncheon after payment of all expenses amounted to $97 75, which was sent to the American Red Cross, U.S. Naval Hospital, St. Albans Chapter

Respectfully submitted,

EVERETT C JESSUP, M.D., *President*

March 1, 1946

Third District Branch

To the House of Delegates, Gentlemen

On Wednesday, May 2, 1945 a meeting of the Executive Committee was held at the DeWitt Clinton Hotel, Albany, New York. After a well-served luncheon a round table discussion, with Dr Robert R Hannon, Executive Officer, as Chairman, was held.

The Third District Branch meeting date was set as September 20, 1945, and at this time members of the committee were detailed to various assignments to make the meeting a success

The thirty-ninth annual meeting of the Third District Branch of the Medical Society of the State of New York was held on September 30, 1945, at the Aurania Club, Albany Preceding the scientific session, sound movies on "Air Warfare Over Europe," and "Evacuation and First Aid in Naval Warfare of the Pacific," and moving x-rays were shown. The first paper was presented by Dr Maurice L Tainter, Albany, Director of Research, Winthrop Chemical Company, who spoke on "The Problem of Sulfa and Penicillin Fastness" Following Dr Tainter's address, luncheon was served in the club and was well attended The afternoon session was opened by an address by Dr Edward R. Cunniffe, President of the Medical Society of the State of New York.

His timely talk was very interesting and instructive as to our position in socialized medicine The next speaker was Dr George C Shattuck, of Boston, Massachusetts, clinical professor of tropical medicine, Harvard Medical School, who discussed "The Problems of Tropical Diseases in Returned Military Personnel," which has already been reprinted in the NEW YORK STATE JOURNAL OF MEDICINE

The third speaker of the afternoon was Dr Albert F R. Andresen, Brooklyn, professor of clinical medicine, Long Island College of Medicine, who spoke on "Early Diagnosis of Malignant Diseases of the Stomach" The last speaker of the afternoon was Dr David K Miller, Buffalo, professor of medicine, University of Buffalo, School of Medicine, whose subject was "Management of Virus or Atypical Pneumonia." Several of the papers were augmented with lantern slides The day was clear, the food was exceptionally good and the papers were so interesting that none dared leave the assembly for fear of losing the thread of instruction The attendance was 66 and the meeting was adjourned at 5 30 P M.

Respectfully submitted,

JOHN L EDWARDS, M D, *President*

March 1, 1946

Fourth District Branch

To the House of Delegates, Gentlemen.

The thirty-ninth annual meeting of the Fourth District Branch of the Medical Society of the State of New York was held on Friday, September 21, 1945, in the Queensbury Hotel, Glens Falls, New York.

An interesting program was presented in the afternoon. Maj Norman A. Levy, (MC), USA, read a paper on "Postwar Neuroses" Then Dr Robert F Korns, associate director, Division of Communicable Diseases, New York State Department of Health, addressed the meeting on "Tropical Diseases Brought to Us by Returning Veterans"

The last paper was by Dr J G Fred Hiss, of Syracuse, profesor of clinical medicine, Syracuse University College of Medicine, on "Rheumatic Fever"

A dinner in the evening was attended by members of the District Branches, many accompanied by their wives

Dr Edward R Cunniffe, President of the Medical Society of the State of New York, spoke after dinner on "Medical and Economic Matters of Interest" He also told several entertaining stories in his inimitable way

Respectfully submitted,

FRANK F FINNEY, M D, *President*

Fifth District Branch

To the House of Delegates, Gentlemen

On June 8, 1945 a dinner meeting of the Executive Committee of the Fifth District Branch was held at the Rome Club, Rome

There were present Drs Dan Mellen, president, J E McAskill, secretary, H G Farmer, president of the Medical Society of the County of Jefferson, A. F Gaffney, president of the Medical Society of the County of Oneida, P K Menzies, president of the Medical Society of the County of Onondaga, Fred C Sabin, secretary of the Medical Society of the County of Herkimer, William Hale, President-Elect of the Medical Society of the State of New York, and Robert R. Hannon, Executive Officer of the Medical Society of the State New York. Arrangements for the Annual Meeting of the Fifth District Branch were discussed

The 1945 meeting of the Fifth District Branch of the Medical Society of the State of New York was held at the Elks Club, Oneida, on September 18, 1945

Afternoon and evening sessions were held, and between these, dinner was served at the Oneida Hotel.

At the afternoon session, following motion pictures on medical subjects, Dr Harold W Brown, professor of parasitology, DeLamar Institute of Public Health, College of Physicians and Surgeons, Columbia University, New York City, discussed "Tropical Diseases with Special Reference to Filariasis"

This lecture was followed by "Diagnosis and Treatment of Dysenteries" by Dr Frank Myers, associate in medicine and assistant professor of pharmacology and therapeutics, University of Buffalo, School of Medicine "Medical Care Insurance" was presented by Mr George P Farrell, Director of the Bureau of Medical Care Insurance, Medical Society of the State of New York.

After the Scientific Session, a business meeting was held, and the following officers were elected for the ensuing year president, Dr Sherman M. Burns, Oswego first vice-president, Dr H Dan Vickers, Little Falls second vice-president, Dr James E. McAskill, Watertown, secretary, Dr O D Chapman, Syracuse, and treasurer, Dr H. D MacFarland, Utica.

Dr Edward R. Cunniffe, President of the Medical Society of the State of New York, delivered an interesting and scholarly address at the close of our dinner

The evening session was filled by the following program

"The Neuroses Related to the Manic-Depressive Constitution" by Dr Foster Kennedy, professor of clinical medicine (neurology), Cornell University Medical College, New York City, "The Blood Derivatives Program in New York State" by Dr Edward S Rogers, assistant commissioner for medical administration, New York State Department of Health, Albany

In spite of inclement weather, the meeting was well attended, and much interest was shown in our program.

Respectfully submitted,

DAN MELLEN, M.D, *President*

March 5, 1946

Sixth District Branch

To the House of Delegates, Gentlemen.

On Wednesday, September 26, 1945 the thirty-ninth annual meeting of the Sixth District Branch of the Medical Society of the State of New York was held at the Cortland Country Club, Cortland, New York, and was well attended. An afternoon and evening session were held and dinner was served between them

In the afternoon a lecture on the subject "Thrombophlebitis" was presented by Dr Lawrence L. Hobler, of Elmira This talk was followed by Dr William Kaufmann, of Albany, with a discussion on "Diagnosis and Management of Certain Tropical Diseases in Returning Veterans."

The last item on the program, "Medical Indemnity Insurance," was an address by Dr Edward R. Cunniffe, President of the Medical Society of the State of New York.

A delicious dinner was enjoyed by the members

Dr Frank H. Lahey of Boston, Massachusetts, addressed the evening session on "Lesions of the Terminal Ileum, Colon, and Rectum," with illustrative lantern slides.

The following officers were elected president, Ivan N Peterson, M D, Owego first vice-president, Charles L. Pope, M.D., Binghamton, second vice-president, Norman C Lyster, M.D., Norwich, secretary, Elton R. Dickson, M.D, Binghamton, and treasurer, William A. Moulton, M.D, Candor

Respectfully submitted,

CLIFFORD F LEET, M.D., *President*

Seventh District Branch

To the House of Delegates, Gentlemen.

The thirty ninth annual meeting of the Seventh District Branch was held on Thursday, September 27, 1945, at the Clifton Springs Sanitarium, Clifton Springs, New York.

The Clifton Springs Sanitarium and staff were our hosts There was a large attendance from the entire district, almost filling the spacious auditorium.

The morning session consisted of a dry clinic. A number of interesting cases was presented by the staff of the Clifton Springs Sanitarium and Clinic. There were interesting discussions.

The members of the Seventh District Branch and officers of the Medical Society of the State of New York were guests of the Clifton Springs Sanitarium at a delicious luncheon served upon the enclosed porch of the sanitrium

Immediately after this repast, Dr Edward R. Cunniffe, President of the Medical Society of the State of New York, made an interesting speech upon medical economic subjects.

The following officers were elected for the ensuing year president, Dr Lloyd F Allen, Pittsford, first vice-president, Dr Kenneth T Rowe, Dansville, second vice-president, Dr George H. Gage, Rochester, secretary, Dr James I Yanick, Hornell; and treasurer, Dr Glenn C Hatch, Penn Yan.

In the afternoon Dr E. Carlton Foster, Penn Yan, read an interesting paper, entitled "Group Practice Advantages Disadvantages, Organization and Costs."

Mr George P Farrell, Director of the Bureau of Medical Care Insurance of the Medical Society of the State of New York, read an essay upon "Prepaid Medical Care Insurance," concerning plans now in operation, what the State Society has done and hopes to accomplish for a state-wide coverage Dr Albert M Crance, Geneva, presented an interesting essay entitled "Modern Trends in Urology and Their Application to General Practice." Dr Earle B Mahoney, assistant professor of surgery, University of Rochester, School of Medicine and Dentistry, presented an authoritative exposition on "Burns New and Improved Treatments."

It gives me pleasure again to express the appreciation of the Seventh District Branch to the Clifton Springs Sanitarium for their delightful hospitality

Respectfully submitted,

H. J KNICKERBOCKER, M.D, *President*

March 6, 1946

Eighth District Branch

To the House of Delegates, Gentlemen.

The fortieth annual meeting of the Eighth District Branch was held on Thursday, October 4, 1945 at the Hotel Statler Buffalo. There were 216 members present, the largest attendance ever recorded in the Eighth District.

The morning session began at 10 00 A M , with an address by Dr Stuart L Vaughan, Buffalo, assistant professor of medicine and associate in bacteriology, University of Buffalo, School of Medicine, on "Blood Dyscrasias"

The second paper was given jointly by Dr Robert Schwartz, instructor in pediatrics, and Dr Raymond J Pieri, professor of clinical obstetrics, both of Syracuse University, College of Medicine The topic was "Rh Factor in Obstetrics and Isohemolytic Disease"

The meeting was adjourned for luncheon. Following the luncheon, there was an address by Dr Edward R. Cunniffe, Bronx, President of the Medical Society of the State of New York.

Following Dr Cunniffe's address, there was election of officers and the following were duly elected president, Dr William J Orr, Buffalo, first vice-president, Dr Robert C Peale, Olean, second vice-president, Dr John C Kinzly, North Tonawanda, secretary, Dr Henry S Martin, Warsaw, treasurer, Dr Ralph M. Bruckheimer, Cassadaga

The afternoon session began at 2 00 P M., with a talk by Dr Henry H. Ritter, New York City, professor of clinical surgery, New York Post-Graduate Medical School, Columbia University Dr Ritter's talk was on "Treatment of Common Fractures and Wounds"

The second paper was given by Dr Richard B Cattell, Lahey Clinic, Boston, Massachusetts, on "Management of Benign and Malignant Lesions of the Biliary Tract"

The aforementioned papers and talks were well received. They were all instructive and interesting The interest that they aroused was attested to by the record attendance

The format of the program was planned at an executive committee meeting held in June, 1945, at the Hotel Statler in Buffalo The executive committee was composed of the officers of the Eighth District and the presidents of the component county medical societies of the district Valuable aid was given to the committee by Dr Robert R Hannon, Executive Officer, who arranged the executive committee meeting in June

Respectfully submitted,

PETER J DI NATALE, M D , *President*

March 6, 1946

1946 Annual Meeting

Medical Society of the State of New York

April 29, 30, May 1, 2, 3—The Hotel Pennsylvania, New York City

House of Delegates

The regular annual meeting of the House of Delegates of the Medical Society of the State of New York will be called to order at 10 00 A.M on Monday, April 29, 1946 in the Keystone Room, Balcony Floor of the Hotel Pennsylvania, New York City

In accordance with Chapter II, Section 3, of the revised Bylaws, the House will assemble according to the following schedule

Monday, April 29, 1946, 10 00 A.M.
Tuesday, April 30, 1946, 9 00 A.M and 2 00 P.M.
Wednesday, May 1, 1946, 9 00 A.M.

At the last adjourned session (9 00 A.M, Wednesday, May 1) the election of officers, councilors, trustees, and delegates will occur in accordance with Chapter III, Section 1 of the revised Bylaws

It will be noted that the House will meet this year on three days instead of two, to permit more time for the Reference Committees to work and make it unnecessary for the members of the Committees to be absent during the sessions of the House. To avoid further conflict, the section meetings will not start until Wednesday morning, instead of Tuesday morning as heretofore and the Annual Dinner will be held Wednesday evening

LOUIS H BAUER, M D, *Speaker*
W P ANDERTON, M D, *Secretary*

Annual Meeting

The Annual Meeting of the Medical Society of the State of New York will be held on Wednesday, May 1, at 7 00 P M, on the "Penn Top"

EDWARD R. CUNNIFFE, M D, *President*
WALTER P ANDERTON, M.D, *Secretary*

Registration

Registration will be held in the hotel for delegates on Monday, April 29 after 9 00 A M, for members on Monday, Tuesday, Wednesday, Thursday, and Friday, April 29, 30, May 1, 2, 3, from 9 A.M to 6 P M

Exhibits

The Woman s Auxiliary

See page 824 for the program.

Scientific Program

The Committee:

Duncan W Clark, M D , Chairman, Brooklyn
and
Chairmen of Sections and Sessions

GENERAL SESSIONS

(Dr Clark presiding)

The presentations at these Sessions will consist of one-half hour lectures, without discussion The meetings will start promptly at the hour specified Members are requested to be in their seats at least five minutes in advance of the meeting time •

Wednesday, May 1—2 30 P M.
Hotel Pennsylvania, Keystone Room

1 "Penicillin Aerosol with Special Reference to Its Use with Intermittent Pressure in the Treatment of Sinusitis"
Alvan L Barach, M D , Associate Professor of Clinical Medicine, College of Physicians and Surgeons, Columbia University, New York
Bettina Garthwaite, M D , Assistant in Medicine, College of Physicians and Surgeons, Columbia University, New York
Colter Rule, M D , Assistant in Medicine, College of Physicians and Surgeons, Columbia University, New York

2 "Primary Atypical Pneumonia"
Frank L Horsfall, Jr., Comdr , (MC) USNR, Hospital of the Rockefeller Institute for Medical Research, New York
(The A. Walter Suter Lectureship This will be the seventh lecture to be delivered under this lectureship fund)

3 "Clinical Comparison of the Cardiac Glycosides"
Arthur C de Graff, M D , Professor of Therapeutics, New York University College of Medicine, New York

4. "Present Status of the Medical Treatment of Hypertension"
William Goldring, MD , Associate Professor of Medicine, New York University College of Medicine, New York

Friday, May 3—2 00 P M
Hotel Pennsylvania, Keystone Room

1 "The Analysis of Surgical Failures and Fatalities Following Thoracolumbar Sympathectomy for Essential Hypertension"
J William Hinton, M D , Associate Clinical Professor of Surgery, New York Post-Graduate Medical School, Columbia University, New York

2 "The Surgical Treatment of Congenital Pulmonary Stenosis"
Alfred Blalock, M.D , Professor of Surgery, Johns Hopkins University School of Medicine, Baltimore, Maryland (By invitation)

3 "Conservative Treatment of Thrombophlebitis, Including the Use of the Anticoagulants"
Irving S Wright, M D , Associate Professor of Clinical Medicine, Cornell University Medical College, New York

4. "Surgical Management of Thrombosis and Thrombophlebitis with Discussion of Vein Resection"
Gerald H Pratt, M D , Assistant Professor of Clinical Surgery, New York Post-Graduate Medical School, Columbia University, New York

SECTIONS

All papers read before the Society by members become the property of the Society The *original* copy of each paper shall be left with the secretary of the Section

Discussers should have their remarks typed, double-spaced, and should hand them to the secretary

Time limits Twenty minutes for each paper, five minutes for individual discussion

Section meetings shall begin promptly at the hour specified

Section on ANESTHESIOLOGY

Chairman Milton C Peterson, M.D , New York
Vice-Chairman
Robert B Hammond, M D , White Plains
Secretary Rose M Lenahan, M.D., Buffalo

Wednesday, May 1—10 00 A.M
Hotel Pennsylvania, Conference Room 2

1 "Preoperative Evaluation of Patients with Cardiac Disease'
David Scherf, M.D , New York
2 'Pentothal Time Quotient, an Instructional Aid'
Richard N Terry, M.D., Buffalo
3 'Factors Involved in the Choice of Preanesthetic Medication"
Rose M Lenahan, M.D , Buffalo

Thursday, May 2—2 00 P.M
Hotel Pennsylvania, Conference Room 2

1 "Curare in the Poor Anesthetic Risk Patient'
I. M Pallin, M.D , Brooklyn
2. "Anesthesia for Surgery on the Sympathetic Nervous System'
M Phelps, M D., New York
D Burdick, M.D., New York
M C. Peterson, M D., New York
3 "Aids in Thoracic Surgery"
E. A. Rovenstine, M D , New York
Charles Burstein, M.D , New York

Section on DERMATOLOGY AND SYPHILOLOGY

Chairman Clarence H Peachey, M.D , Rochester
Secretary L. William Abramowitz, M D., New York

Thursday, May 2—10 00 A.M
Hotel Pennsylvania, Salle Moderne

1 "Penicillin Ointment in the Treatment of Diseases of the Skin"
Joseph J Hallett, M.D., Rochester
Earl D Osborne, M.D., Buffalo
James W Jordon, M.D., Buffalo
Discussion George C Andrews, M D , New York
2. "Resistant Dermatophytosis and Its Treatment'
Royal M Montgomery, M.D., New York
Esther A. Casper, B.S., New York (By invitation)
Discussion George M. Lewis, M D., New York
3 "Occupational Neurodermatitis'
Oscar L. Levin, M.D , New York
Howard T Behrman, M.D., New York
Discussion Louis Tulipan, M.D , New York
4 "The Route of Percutaneously Applied Antigen Transported Through the Body by Electrophoresis'
Abraham Walzer, M D , Brooklyn
Harry G Golan, M.D , Richmond Hill
Discussion Marion L. Sulzberger, M D , New York

Friday, May 3—10 00 A.M
Hotel Pennsylvania, Salle Moderne

1 "Treatment of Experimental Syphilis with Penicillin"
Charles M Carpenter, M D., Rochester
Ruth A. Boak, M D., Rochester
Discussion A. Benson Cannon, M.D., New York
2 "Syphilis in Army Separatees"
Theodore Rosenthal, M.D., New York
Nathan Sobel, M.D., New York
Discussion Frank C Combes, M.D , New York
3 "The Use of Ozonized Oils in Clinical Dermatology"
Herman Sharlit, M.D , New York
Discussion Eugene F Traub, M D , New York
4. "Pigmentary Changes in Diseases of the Skin in the Negro'
Gerald A. Spencer, M.D , New York
Discussion Samuel M Peck, M D , New York

Section on GASTROENTEROLOGY AND PROCTOLOGY

Chairman Stockton Kimball, M.D , Buffalo
Vice-Chairman
Dascum C. McKenney, M D., Buffalo
Secretary Harry E. Reynolds, M.D Schenectady

Wednesday, May 1—10 00 A.M
Hotel Pennsylvania, Parlor 1

1 "Appendicostomy in the Treatment of Chronic Ulcerative Colitis"
Frank C. Yeomans, M D , New York
2 "Benign Tumors of the Colon"
Frank G Runyeon, M.D , Reading, Pennsylvania (By invitation)

3 "Carcinoma of the Colon, Resection, and Immediate Primary Anastomosis"
John C M Brust, M D, Syracuse

4 "Diagnosis and Treatment of Complications of Amebic Dysentery"
Z T Bercovitz, M.D, New York

Thursday, May 2—2 00 P M
Hotel Pennsylvania, Parlor 1

1 "Clinical Aspects of Infectious Hepatitis"
Harry Murphy, M D, Buffalo

2 "The Management of Uncomplicated Peptic Ulcer"
J Edward Berk, M D, Philadelphia, Pennsylvania (By invitation)
Discussion Asher Winkelstein, M D, New York, and Frank Meyers, M D, Buffalo

3 "Action of Drugs and Various Chemical Agents on Gastric Mucosa and Gastric Function"
Stewart Wolf, M D, New York (By invitation)
Harold G Wolff, M D, New York
Discussion Franklin Hollander, Ph.D, New York (By invitation)

4 "The Management of Ambulatory Peptic Ulcer Patients with Protein Hydrolysates"
W F Ruggiero, M D, New York
Frank CoTui, M D, New York (By invitation)
Anthony A Bianco, M D, New York

Section on INDUSTRIAL MEDICINE AND SURGERY

Chairman Russell C Kimball, M D, Brooklyn
Secretary Philip L Forster, M D, Albany

Wednesday, May 1—10 00 A M
Hotel Pennsylvania, Parlor 2

1 "A Program for the Industrial Physician for the Control of Malaria"
Fred H Shullito, M D, New York
Discussion N E Eckelberry, M D, New York, and S Spitz, M D, Brooklyn

2 "The Effect of Effort and Injury on the Normal Heart and the Diseased Heart"
Arthur M Master, M D, New York
Discussion B Vance, M D, New York, and C A Poindexter, M D, New York

3 "Clinical Experiences with Chemical Hazards in Industry"
G H Gehrman, M D, Wilmington, Delaware (By invitation)
Discussion Leonard Greenburg, M D, New York, and Irving Gray, M D, Brooklyn

Thursday, May 2—2 00 P M.
Hotel Pennsylvania, Parlor 2

1 "Surgical Treatment of Painful Phantom Limb"
E Jefferson Browder, M D, Brooklyn
Discussion Byron Stookey, M D, New York, and O C Perkins, M D, Brooklyn

2 "The Traumatic Abdomen"
Robert F Barber, M D, Brooklyn
Discussion W P Eckes, M D, New York, and B Cissell, M D, Brooklyn

3 "The Estimation of Functional End Results and Disability"
Frank Leder, M D, New York (By invitation)
Discussion H V N Spaulding, M D, New York

Section on MEDICINE

Chairman Frederick W Williams, M D, Bronx
Vice-Chairman Harold F R. Brown, M D, Buffalo
Secretary George E Anderson, M D, Brooklyn

Thursday, May 2—10 00 A M
Hotel Pennsylvania, Keystone Room

Joint Meeting with the Section on Surgery
(See Section on Surgery)

Friday, May 3—10 00 A M
Hotel Pennsylvania, Penn Top North

1 "The Dietary Treatment of Laennec's Cirrhosis"
Arthur J Patek, Jr, M D, New York
Discussion Abraham H. Aaron, M D, Buffalo, and Elaine P Ralli, M D, New York

2 "What Contributions Has Thiouracil Made to the Management of Graves' Disease?"
Rulon W Rawson, M D, Boston, Massachusetts (By invitation)
Discussion Thomas H. McGavack, M D, New York

3 "The Advantages of Venous True Blood Sugar Values for Glucose Tolerance Tests"
Herman O Mosenthal, M D, New York
Discussion Edward Tolstoi, M D, New York, and Maurice Bruger, M D, New York

Section on NEUROLOGY AND PSYCHIATRY

Chairman E Jefferson Browder, M D, Brooklyn
Secretary Burton M Shinners, M D, Buffalo

Thursday, May 2—10 00 A.M
Hotel Pennsylvania, Parlor 1

1 "Recent Advances in the Treatment of Epilepsy"
H Houston Merritt, M D, Bronx (By invitation)
Discussion Tracy J Putnam, M D, New York

2 "Considerations Concerning Contraindications to, and Complications of Electroshock Therapy in Mental Disorders"
S Eugene Barrera, M D, Albany
Discussion Hubert S Howe, M D, New York, and Lothar Kalinowsky, M D, New York

3 "The Postconcussional State"
Gilbert M Beck, M D, Buffalo
Discussion John H Scharf, M D, New York

Friday, May 3—10 00 A M
Hotel Pennsylvania, Parlor 1

1 "Exacerbations and Remissions of Symptoms in Posterior Fossa Tumor in Children"
Harold Merwarth, M D, Brooklyn
Discussion Lewis D Stevenson, M D, New York

2 "The Effects of Combined Insulin (Subcoma Doses) and Electroshock Therapy in the Treatment of Schizophrenic Ambulatory Patients"
Philip Polatin, M D, New York
Hyman Spotnitz, M D, New York
Discussion Richard M Brickner, M.D, New York

3 "Posterior Fossa Meningiomas"
Eldridge Campbell, M D, Albany
R. D Whitfield, M.D, Albany
Discussion Bronson S Ray, M D, New York

Section on OBSTETRICS AND GYNECOLOGY

Chairman Charles J Marshall, M D., Binghamton
Secretary Charles A. Gordon, M.D., Brooklyn

Wednesday, May 1—10 00 A.M
Hotel Pennsylvania, Salle Moderne

1 "The Treatment of Amenorrhea and Sterility with X ray"
Ira I. Kaplan, M.D , New York
Discussion Howard C Taylor, Jr , M D , New York, and Samuel A. Wolfe, M D Brooklyn
2. "Female Endocrine Factors in Sterility"
L C Rubin, M.D., New York
Discussion Edward C Hughes, M D , Syracuse, and Charles L. Buxton, M.D , New York
3. "Local Anesthesia for Cesarean Section"
Frank P Light, M.D , Brooklyn
Discussion Claude Heaton, M D New York, and James P Marr, M.D , New York

Thursday, May 2—2 00 P M
Hotel Pennsylvania, Salle Moderne

1 "Studied Effects of Demerol in Obstetrics"
William M Mallis, M.D , Schenectady
Discussion Charles Poemer, M.D., New York, and H I Johnston, M D , Binghamton
2 "The Surgical Treatment of Dysmenorrhea"
Christopher J Duncan, M.D , Brookline Massachusetts (By invitation)
Discussion R. G Douglas, M.D , New York, F S. Wetherell, M.D , Syracuse, and Edward G Waters, M.D., Jersey City, New Jersey (By invitation)
3 "Pathogenesis of Erythroblastoma"
A S Wiener, M D , Brooklyn

Section on OPHTHALMOLOGY AND OTOLARYNGOLOGY

Chairman Harold H Joy, M.D., Syracuse
Secretary Maxwell D Ryan, M D , New York

Thursday, May 2—9 00 A.M
Hotel Pennsylvania, Penn Top South

1 "Experiences in Emergency Ophthalmic Surgery"
Daniel B Kirby, M.D , New York
Discussion James G Fowler, M.D Buffalo, and James F Cahill, M D , Syracuse
2. "Eye Changes in Intracranial Lesions"
Albert D Ruedemann, M.D , Cleveland Ohio (By invitation)
Discussion Arthur J Bedell M D , Albany, and Thomas H. Johnson, M.D., New York
3 "Ocular Changes in Hyperthyroidism"
Alan C. Woods, M.D , Baltimore Maryland (By invitation)
Discussion Conrad Berens, M D , New York, and Albert C Snell, Jr., M D., Rochester
4. "Divergence Insufficiency and Paralysis
James W White, M.D , New York
Discussion Maynard C. Wheeler M.D , New York, and Franklin R. Webster, M.D , Syracuse

Friday, May 3—10 00 A M
Hotel Pennsylvania, Penn Top South

1 "Clinical Use of Penicillin in Otolaryngology"
J Winston Fowlkes, M.D , New York
Discussion A Reginald Everett, M D., New York
2. "Psychologic Implications of Laryngectomy—Observations of 100 Cases"
J S Greene, M D., New York
Discussion Hayes L. Martin, M D , New York
3 "A Comprehensive Study of Vasomotor Rhinitis—Etiology, Classification, and Treatment"
F Howard Westcott, M.D , New York
Discussion Darrell Voorhees M D , New York

Section on ORTHOPEDIC SURGERY

Chairman Robert M Cleary, M D , Buffalo
Secretary Joseph Buchman M D , New York

Thursday, May 2—10 00 A.M
Hotel Pennsylvania, Manhattan Room

(Program to Be Announced at a Later Date)

Friday, May 3—10 00 A.M
Hotel Pennsylvania, Manhattan Room

Joint Meeting with the Section of Orthopedic Surgery of the New York Academy of Medicine

Chairman Leon Lantzounis, M D , New York
Secretary Frederick R. Thompson, M D , New York

The scientific meeting will be preceded by executive sessions for the election of officers of

1 The Section on Orthopedic Surgery of the Medical Society of the State of New York.
2. The Section of Orthopedic Surgery of the New York Academy of Medicine

(Presentation of Cases)

Section on PATHOLOGY AND CLINICAL PATHOLOGY

Chairman Fred W Stewart M D , New York
Vice-Chairman Ellis Kellert, M D , Schenectady
Secretary M J Fein, M.D , New York

Wednesday, May 1—10 00 A.M
Hotel Pennsylvania, Parlor B

1 "Osteoid-Osteoma of Bone"
Henry L. Jaffe, M.D , New York (By invitation)
2 "Comparative Studies with Some Newer Tests for Hepatic Dysfunction, Thymol Turbidity, Cephalin-Cholesterol Flocculation and Colloidal Gold Reaction
H. K. Linder, M D., New York (By invitation)
M Bruger, M.D , New York
Carl H Greene, M.D , New York
Discussion Robert E. Shank, M.D , New York (By invitation)
3 "The Results of Treatment of Lymphosarcoma"
A. Purdy Stout, M.D , New York
Discussion Claude E Forkner, M D , New York

3 "Carcinoma of the Colon, Resection, and Immediate Primary Anastomosis"
John C M Brust, M D, Syracuse

4. "Diagnosis and Treatment of Complications of Amebic Dysentery"
Z T Bercovitz, M D, New York

Thursday, May 2—2 00 P M.
Hotel Pennsylvania, Parlor 1

1 "Clinical Aspects of Infectious Hepatitis"
Harry Murphy, M D, Buffalo

4. "Evaluation of the Transdiaphragmatic Approach for Upper Abdominal Surgery"
   John D Stewart, M.D , Buffalo

Section on UROLOGY

Chairman George E Slotkin, M D , Buffalo
Vice-Chairman John L. deVries, M D , New York
Secretary Archie L. Dean, Jr., M D , New York

Wednesday, May 1—10 00 A.M
Hotel Pennsylvania, Penn Top North

Symposium
CARCINOMA OF THE PROSTATE

1 "The Clinical Problem"
   Reed M Nesbit, M.D., Ann Arbor, Michigan (By invitation)
2. "Laboratory Procedures of Diagnostic and Prognostic Value"
   Helen Q Woodard, Ph.D , New York (By invitation)
3 "A Consideration of the Effect of Androgen Control Treatment"
   Charles C. Herger, M D , Buffalo
   Hans R. Sauer, M.D , Buffalo
   Discussion of Papers Ernest M Watson, M.D , Buffalo, and Archie L. Dean, M.D , New York

Thursday, May 2—2 00 P M
Hotel Pennsylvania, Penn Top North

1 "Prevention of Complications Following Surgery of the Urinary Tract"
   George E. Slotkin, M.D , Buffalo
2 "Calculus Disease of the Kidneys"
   Charles C Higgins, M.D , Cleveland, Ohio (By invitation)
3 "Treatment of the Urologic Problems Following War Injuries of the Spinal Cord"
   George C. Prather, M.D , Boston, Massachusetts (By invitation)

SESSIONS

Session on CHEST DISEASES

Chairman Nelson W Strohm, M D , Buffalo
Secretary Grant Thorburn, M.D New York

Thursday, May 2—2 00 P.M
Hotel Pennsylvania, Keystone Room
(Program to Be Announced at a Later Date)

Session on HISTORY OF MEDICINE

Chairman T Wood Clarke, M D Utica
Vice-Chairman
Judson B Gilbert, M D , Schenectady
Secretary Claude E. Heaton M D , New York

Thursday, May 2—8 00 P.M
Hotel Pennsylvania, Keystone Room

1 "Medicine Among the Iroquois'
   Arthur C. Parker, D Sc., Rochester (By invitation)
2. "Medicine in New York Folklore"
   Harold W Thompson, Ph.D , Ithaca (By invitation)

Evening meeting—open to public.

Session on PHYSICAL MEDICINE

Chairman.
Walter S McClellan, M.D Saratoga Springs
Secretary Albert R. Hatfield, Jr , M D Utica

Wednesday, May 1—10 00 A M
Hotel Pennsylvania, Manhattan Room

Symposium

PHYSICAL MEDICINE IN "HUMAN RECONVERSION'

1 "Physical Medicine in Traumatic Injuries"
   George G Deaver, M.D , New York
2 "Physical Medicine in the Treatment of Arthritis and Allied Conditions"
   L. Maxwell Lockie, M.D , Buffalo
   Earnscliffe Musgrove, A.R.P.T.I., Buffalo (By invitation)
3 'Physical Medicine in Neuromuscular Conditions'
   Benjamin Simon, M D., Bridgeport, Connecticut (By invitation)

Discussion of Symposium [illegible] M D , New York, Duncan [illegible] M D , Brooklyn, John W Ghormley M.D., Albany, and Howard A. Rush, M D [illegible]

4 "A Case of Gargoylism"
Lotte Strauss, M D , New York (By invitation)
Discussion Paul Klemperer, M D , New Rochelle

5 "Peculiar Postmortem Lesions Following the Use of Ertron in Rheumatoid Arthritis"
Margaret Bevans, M D , New York
Discussion Sigmund Wilens, M D , New York (By invitation)

Thursday, May 2—2 00 P M
Hotel Pennsylvania, Manhattan Room

Joint Meeting with the Section on Public Health, Hygiene and Sanitation

1 "The Pathogenesis of Salmonella Infection in the Interpretation of the Morbid Anatomy"
Alfred Angrist, M D , Jamaica
Mollie Mollov, M S , Jamaica (By invitation)
Discussion Marion B Coleman (By invitation)

2 "Serology Findings in Patients Treated with Penicillin for Early Syphilis"
J F Mahoney, M D , Stapleton, S I (By invitation)
Discussion Evan W Thomas, M D , New York

3 "Plan for State-Wide Distribution of Blood and Blood Derivatives"
Organization—I J Brightman, M D , Albany
Technical Aspects—David R. Climenko, M D , Albany (By invitation)
Discussion Edward S Rogers, M D , Albany

4 "On Air Sterilization by Means of Ultra-Violet Radiation"
L J Buttolph, Ph D , Cleveland, Ohio (By invitation)

Section on PEDIATRICS

Chairman Carl H Laws, M D , Brooklyn
Vice-Chairman Albert G Davis, M D , Utica
Secretary George R Murphy, M D , Elmira

Thursday, May 2—10 00 A M
Hotel Pennsylvania, Parlor 2

(Program to Be Announced at a Later Date)

Friday, May 3—10 00 A M
Hotel Pennsylvania, Parlor 2

(Program to Be Announced at a Later Date)

Section on PUBLIC HEALTH, HYGIENE, AND SANITATION

Chairman Joseph P Garen, M D , Saranac Lake
Vice-Chairman Henry B Doust, M D , Syracuse
Secretary Frank E Coughlin, M D , Albany

Tuesday, May 1—10 00 A M
Hotel Pennsylvania, Penn Top South

1 "Surgical Limb"

Discussion Hollis S Ingraham, M D , Albany

4 "The Practice of Medicine and Public Health—A Mutual Relationship"
E H L Corwin, Ph D , New York (By invitation)
Discussion O W H Mitchell, M D , Syracuse

Thursday, May 2—2 00 P M
Hotel Pennsylvania, Manhattan Room

Joint Meeting with the Section on Pathology and Clinical Pathology

(See Section on Pathology and Clinical Pathology)

Section on RADIOLOGY

Chairman Alfred L L Bell, M D , Brooklyn
Vice-Chairman Lee A Hadley, M D , Syracuse
Secretary Raymond W Lewis, M D , New York

Thursday, May 2—9 30 A M
Hotel Pennsylvania, Conference Room 2

Round-Table Discussion

Interesting proved cases will be presented for discussion Discussion leaders are
Ross Golden, M D , New York, *Chairman*
Merrill C Sosman, M D , Boston, Massachusetts (By invitation)
Sussman, Marcy Lee, M.D , New York

Friday, May 3—10 00 A M
Hotel Pennsylvania, Conference Room 2

1 "Radiology in the Navy"
E Forrest Merrill, M D , New York
Discussion Eric Ryan, M D , New York

2 "Army Radiology in World War II"
Edward K Reid, M D , New York

3 "Atomic Energy and Radiology"
Edith H Quimby, Ph D , New York (By invitation)
Discussion Maurice Lenz, M D , New York

Section on SURGERY

Chairman Beverly C Smith, M D , New York
Secretary Stanley E Alderson, M D , Albany

Thursday, May 2—10 00 A M
Hotel Pennsylvania, Keystone Room

Joint Meeting with the Section on Medicine

Symposium

THE MAINTENANCE OF NITROGEN BALANCE IN SURGICAL PATIENTS

1 "The Blood Proteins and Nitrogen Balance"
Sidney C Madden, M D , Atlanta, Georgia (By invitation)

2 "The Use of a Mixture of Pure Amino Acids in Surgical Nutrition" or "Parenteral Nitrogen Therapy in Surgical Nutrition"
Sidney C Werner, M D , New York

3 "Protein Metabolism in Surgical Diseases"

Diagnostic Advantages of Multiple Precordial Leads

Cases are presented in which a single precordial lead is normal, but in which multiple such leads demonstrate definite pathologic myocardial processes. Among these abnormalities are septal and lateral infarcts and lesions shown by various ST and T changes. Charts and diagrams illustrate the technic recommended and examples of normal multiple precordial leads are included

The Distribution of Atabrine in the Blood, the Skin and Its Appendices

Simple methods will be demonstrated to determine atabrine blood levels during the therapeutic or suppressive treatment of malaria. They can be used in advanced field stations. The most promising dosage scheme for treatment will be demonstrated in charts. Atabrine is deposited in the skin and the nails during its therapeutic suppressive use. The skin values can be measured by the Dermofluorometer The deposition in the nails can be demonstrated under long wave ultraviolet light Such a deposition takes place only as long as the drug is given. The nails, therefore mirror exactly the periods during which atabrine was taken or omitted.

The instrument with which these tests are being done will be demonstrated.

SURGICAL TREATMENT OF RECTAL CANCER AND MANAGEMENT OF ASSOCIATED VESICLE DYSFUNCTION

A. A series of moulage models discloses various premalignant and malignant lesions. Based on a series of 460 cases of rectal and sigmoidal cancer pre- and postoperative management is presented technic of surgical removal and eliminating the abdominal colostomy, and means of preserving the sphincter musculature are shown. In spite of the high rate of resectability (81 3 per cent), the mortal ity is low (0.2 per cent), the period of hospitaliza tion is short (18 7 days), return to work is early, the sphincter function is definitely good, the sur vival rate as to three-year cure is 58.6 per cent and the five-year cure is 50 per cent.

B Kodachrome transparencies show normal distribution of nerve supply to bladder the surgical distribution of the hypogastric plexus during proctosigmoidectomy Another series of drawings depicts cystometric readings prior to, immediately following the surgical procedure, and following return to normal. A series of moulage models shows various bladder lesions in association with rectal malignancy as viewed through the cystoscope

Resection of the Knee Joint for Suppurative Arthritis

The exhibit, based on five cases, shows that resection can be done during an active phase of suppuration without stimulating a flare-up in the inflammatory process. It is contended that this procedure removes tissues of low vitality and se cures adequate drainage and saves the patient time. In some instances it saves limb and life. Its use is reserved for that stage of suppuration, when a pain less functioning joint can no longer be attained The final result is a fusion of the knee.

Medical Society of the State of New York
FRIENDS OF MEDICAL RESEARCH

"Really Man's Best Friend," located on the Mezzanine, just outside the entrance to the ballroom floor, will present, pictorially, man's progress in medical research with the aid of the dog The Medical Society of the State of New York, working with Friends of Medical Research, developed this exhibit as an aid to the dissemination of facts about research work with animals *"Really* Man's Best Friend" was first shown at the American Museum of Natural History, where the Whipple Prize dogs received their award in recognition "for outstanding services to humanity" The American Medical Association has accepted this exhibit for inclusion in its Scientific Exhibit Section at the Annual Meeting in July at San Francisco Following this, the Friends of Medical Research plan to keep the exhibit circulating for display purposes, continuing the work of educating the public on the benefits to both man and animal made possible by the use of animals, especially dogs, in medical research.

A recorded transcription of the ceremonies at which Norman T Kirk, Surgeon General of the U S Army, made the Whipple Prize Award will be available for replaying to interested groups

The record also includes an interview with Dr Freida S Robbins, of the University of Rochester School of Medicine and Dentistry, Rochester, New York, who has worked as an associate with Dr George H Whipple in the fundamental research which led to the development of liver therapy for pernicious anemia, and more recently in the technic of blood transfusion.

New York

SPECIAL EXHIBIT OF RHEUMATIC FEVER PRESENTED BY SEVERAL INDIVIDUALS AND ORGANIZATIONS INTERESTED IN THIS DISEASE

The New York State Medical Society s Subcommittee on Child Health under the chairmanship of Dr Alexander T Martin, and the New York Heart Association are sponsoring, with the aid of organizations and clinicians who are especially informed about rheumatic fever and rheumatic heart disease, a series of clinical conferences and an exhibit on rheumatic fever at the Annual Meeting of the Medical Society of the State of New York, April 29–May 3, at the Hotel Pennsylvania, New York City

The clinical conferences will take place four times daily for one hour each, at 10 00 A.M , 12 NOON, 2 00 P.M. and 4 00 P M Each conference will be lead by an authority on rheumatic fever The sessions will be informal and provide full opportu nity for group discussion.

Among the clinicians who will lead a group discussion are Dr Arthur M Master, New York Heart Association, Dr Clarence E De la Chapelle, professor of clinical medicine, New York University College of Medicine, Dr Robert F Watson, Rockefeller Institute, Dr Leo Taran, medical director St. Francis Sanatorium, Roslyn, Long Island, Dr Charles R. Messeloff, cardiovascular disease specialist, New York, Dr David Rutstein, deputy commissioner, New York City Health Department, Dr Alfred Langman, Babies Hospital, New York, Dr Charles A Poindexter, New York University College of Medicine, Dr Arthur De Graff, New York University, College of Medicine, Dr Charles A. R. Connor, formerly of AAF Rheumatic Fever Control Program, Dr Currier McEwen, dean, New York University, College of Medicine, Dr Albert D Kaiser, Commissioner of Health, Rochester, Dr Ann Kuttner, Irvington House, Irvington Dr J G Fred Hiss, Rheumatic Fever Foundation of Onondaga County, Syracuse, Dr Alexander T Martin, New York University, College of Medicine, and Dr George M. Wheatley, Metropolitan Life Insurance Company, New York.

The following organizations are cooperating in providing exhibit material

American Heart Association
Children s Bureau
Metropolitan Life Insurance Company
Rheumatic Fever Foundation of Onondaga County
St. Francis Sanatorium

There will be a demonstration of sedimentation test methods by the New York Post-Graduate Hospital laboratory under the direction of Dr Ward J MacNeal.

Officers of the various sections are especially invited to study this exhibit and suggest topics (subjects) for similar treatment at future conventions

THE TECHNICAL EXHIBITS

WHAT'S NEW

IN

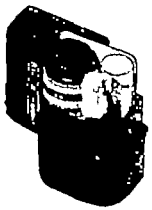
Surgical Instruments

Medical Books

Pharmaceutical Specialties

X-Ray Equipment

Other Products and Services



LAST YEAR, physicians could not avail themselves of the opportunities presented by the technical exhibits because the Society had to cancel the Convention following O D T ruling Appropriately, therefore, to meet the heightened interest, this year's Meeting will contain the largest number of technical exhibits in the history of the Medical Society

Physicians just returned from Service will especially appreciate this opportunity The latest in products, equipment, medical books and services will be spread in a vast array

Of particular aid will be the specific, well-referenced literature available at almost every exhibit bringing up-to-the-minute the clinical background supporting the application of pharmaceutical specialties to medical practice The following pages contain brief descriptions of each Technical Exhibit

Abbott Laboratories, North Chicago (Booth 63), E. L. Shattuck, H. C. Harris, and other Abbott-trained representatives will be glad to discuss with you the war-born and newer products on display here. Amethone, the new antispasmodic for the urinary tract, thiouracil (Abbott), of value in reducing to normal the basal metabolic rate in the preoperative preparation of thyrotoxic patients, the Abbott disposable syringe and other new products all merit your particular attention.

The Alkalol Company, Taunton, Massachusetts (Booth 20), is this year, completing fifty years of service to the medical profession. The company manufactures two well known preparations. (1) Alkalol—a scientifically balanced alkaline, saline solution containing no glycerin and barely a trace of alcohol. It is hypotonic and a mucous solvent. (2) Irrigol—an alkaline saline douche powder which makes a nontoxic, slightly astringent solution—is useful as a vaginal douche, rectal enema, and for colonic irrigations.

The Ames Company, Inc., Elkhart, Indiana (Booths 98 and 99), demonstrating new technics for qualitative detection of urine-sugar and albumin. The *Clinitest* tablet method for detection of urine-sugar is a simple, reliable test for use by the diabetic patient and in the laboratory—the tablet reagent develops its own heat inside the test tube, eliminating the need for burners or other equipment. The new *Ames Albuminteat* tablet for urine-albumin gives the physician, technician, and public health worker a reliable, nonpoisonous, noncorrosive reagent tablet and does not require the use of heat.

The Arlington Chemical Company, Yonkers, New York (Booth 39), will serve their protein hydrolysate product, Amunoids, to allow physicians to evaluate the palatability of this protein hydrolysate when administered orally. They will also show their line of allergenic extracts for diagnosis and hypersensitization.

The Armour Laboratories, Chicago (Booth 65) invite members of The Medical Society of the State of New York, to visit its display. The new Armour Atlas of Hematology is available to physicians on request.

Associated Concentrates, Inc., Elmhurst, New York (Booth 24) will show various medicinal products distributed by them. Informative booklets will be available. Our products are used for the treatment of various skin diseases, especially psoriasis and other conditions related to the disturbance of the lipid-metabolism.

Ayerst, McKenna & Harrison, Ltd., New York (Booth 41), will feature Premarin, a highly potent, naturally occurring complex of conjugated estrogens. "Premarin constitutes a recent advance in endocrine research, resulting from the collaboration of Dr. J. B. Collip, Director of the Research Institute of Endocrinology, McGill University, with our laboratories, and is accepted by the Council on Pharmacy and Chemistry of the American Medical Association. We shall display also two new pertussis preparations, one for prophylaxis and the other for treatment of the active stages of whooping cough. These are based on the principle that the endotoxin of the H. pertussis organism is important in the etiology of the disease.

W. A. Baum Co., Inc., New York (Booth 42). All of the well known Lifetime Baumanometer models are again available in all their prewar perfection and will be on display. An invitation is extended to the doctors in attendance to bring their Baumanometers for checking, minor repairs, and replacements.

Becton, Dickinson & Co., Rutherford, New Jersey (Booth 17). In addition to our usual line of syringes and needles, we will show several new outfits designed for various types of anesthesia. A full line of Vacutainer equipment will be displayed, and our representatives will be prepared to give demonstrations of this new method of taking blood specimens for all purposes.

The Best Foods, Inc., New York (Booth 5) is exhibiting Nucoa, the wholesome, nutritious vegetable margarine, which contains 15,000 units of vitamin A to the pound. Also on exhibit will be the famous Best Foods. Miss Elsie Stark, Director of Consumer Education, will be in charge of the booth and will welcome questions about the products.

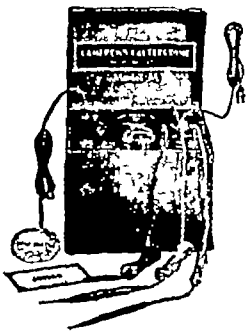
Bilhuber-Knoll Corp., Orange, New Jersey (Booth 2). Among the fine prescription chemicals displayed are such dependable products as the sedative Bromural in nervous indigestion, Tannalbin—intestinal astringent, Dilaudid—analgesic, Octin—antispasmodic, Metrazol—antitoxoxant. These medicinal chemicals are prescribed alone or in combination with other drugs as the needs of the individual patient may demand.

Ernst Bischoff Company, Inc, Ivoryton, Connecticut (Booth 109) Aminet Suppositories effective, prolonged relief in bronchial and cardiac asthma. Diatussin the safe, effective, non-narcotic antitussive Sas-Par effective oral treatment of psoriasis Lobelin-Bischoff respiratory stimulant Aquinone-Aquakay high potency vitamin K therapy Anayodin effective nontoxic amebacide

The Borden Company, New York (Booth 91) Spend a few minutes with us refresh your memory on our Prescription Products Meet the new concentrated Biolac, new Improved Dryco with its formula flexibility, Mull-Soy for your milk allergic patients, powdered whole milk, Klim, the improved milk sugar, Beta Lactose, and the Merrell-Soule Protein and Lactic-Acid Milks. Borden men are pleasant men.

Brewer & Company, Inc., Worcester, Massachusetts (Booth 94) The exhibit will emphasize their specialties, with special reference to Luasmin in the treatment of asthma and Thesodate in the treatment of angina pectoris. Their ampules and vitamin preparations will also be displayed as well as other items of special interest from their complete line of pharmaceuticals

Bristol Laboratories, Inc., Syracuse, New York (Booth 70) The keynote of the display will be a series of illuminated color photographs of cases which have been under treatment with penicillin Other parenteral products manufactured by Bristol Laboratories will also be displayed.



The Burdick Corporation, Milton, Wisconsin and New York City (Booth 68), will exhibit their line of physical therapy equipment This includes ultraviolet and infrared lamps, short wave diathermy and the rhythmic constrictor for the treatment of peripheral vascular conditions

Burroughs Wellcome & Co, Inc., New York (Booth 56), cordially invite physicians to their exhibit of a representative group of fine pharmaceuticals and chemicals. Of particular interest are Globin Insulin, a new advance in diabetic control, Digoxin, a pure, stable, crystalline glycoside of digitalis lanata combining constant, uniform potency with rapidity of action, "Dexin" High Dextrin Carbohydrate, the milk modifier in which the nonfermentable portion predominates, and "Lubafax" Brand Surgical Lubricant, our newest preparation.

Cambridge Instrument Company, Inc., New York (Booths 71 and 72), will exhibit cardiac diagnostic instruments including the well-known Cambridge "Simplı-Trol" portable electrocardiograph which operates from the electric light supply current, also Cambridge stethographs and pulse recording instruments.

Camel Cigarettes, New York (Booths 30 and 31), will exhibit large detailed photographs of equipment used in comparative tests of the five largest-selling brands of cigarettes Representatives will be available to discuss research. Trans-Lux News will be supplied throughout the meeting

The Cameron Heartometer Co, Chicago and New York (Booth 69), is showing the improved Heartometer, a scientific precision instrument for accurately recording diastolic and systolic blood pressures It also furnishes a permanent graphic record of the pulse rate, the nervous functioning of the heart, the myocardial response, as well as the functioning of the valves The Heartometer reveals heart disturbances in both early and advanced stages, and is of great value in checking the progress of medication and treatments

Cameron Surgical Specialty Company, Chicago and New York (Booth 107), is showing the first all-stainless steel, boilable, and electrically operated bronchoscopic outfit The Deluxe Omniangle Gastroscope is also on display Cauterdynes (the genuine radio knives), in both office and hospital sizes, are being demonstrated The newest and finest in electrically lighted diagnostic and operating instruments may be seen at this interesting exhibit

S H Camp & Company, Jackson, Michigan (Booth 114), will display a complete line of Camp Anatomical Supports for prenatal, postnatal, orthopedic, visceroptosis, sacro-iliac, hernia, and other specific conditions Experts from the Camp Staff will be in attendance to answer questions pertaining to the scientific application of these supports, and to advise regarding the availability of them in authorized service departments of stores throughout the country

Canadian Radium And Uranium Corp, New York (Booth 82) High-purity radium is available to the medical profession in any form and any type of container A special exhibit is devoted to Alpha-Ray Therapy by the utilization of Radon in ointment For further interesting details, call at Booth 82

Carnation Company, Milwaukee, Wisconsin (Booth 117) You will see an attractive display presenting some interesting information on the various uses of Carnation Vitamin D Evaporated Milk for infant feeding, child feeding, and general diet purposes The method by which Carnation Milk is generously fortified with vitamin D—400 U S P Units per reconstituted quart, will be explained Valuable literature will also be available for distribution

Ciba Pharmaceutical Products, Inc, Summit, New Jersey (Booths 102 and 103), invites you to visit its exhibit Products displayed will include Privine, a potent, prolonged-acting nasal vasoconstrictor, Metandren Linguets, the most potent androgen for oral use, Trasentine, a well-tolerated antispasmodic and Trasentine-Phenobarbital Representatives in attendance will be ready to answer any questions you may have

The Coca-Cola Company, Atlanta, Georgia (Booth 78) Coca-Cola will be served through the joint courtesy of The Coca-Cola Bottling Co of New York, Inc, and The Coca-Cola Company

[Continued on page 810]

When Vitamins Are Not Enough

In malnutrition, convalescence, anorexia and old age, more than vitamins are often indicated Besides vitamins there are maltose, dextrose and dextrins and other food elements present in Maltine with Vitamin Concentrates

Some of the food elements in Maltine with Vitamin Concentrates— approximate content per 30 cc. (2 tablespoonfuls)

VITAMIN A	10,000 U S P units
VITAMIN D	1,000 U.S P units
THIAMINE HYDROCHLORIDE	3 mg
RIBOFLAVIN	4 mg
NICOTINAMIDE	40 mg
+ MALTOSE	9 6 gm
+ DEXTROSE	4.2 gm
+ DEXTRINS	10.2 gm
+ PHOSPHORUS	279 mg
+ CALCIUM	303 mg
+ CHOLINE*	36 mg
+ INOSITOL*	44 mg
+ FOLIC ACID*	22 mcg

*These constituents are members of the natural B Complex. Their need in human nutrition has not been established.

Two tablespoonfuls supply at least twice the minimum daily requirements of the above vitamins and supplementation of other easily digested food elements. The Maltine Company, New York 22.

MALTINE WITH VITAMIN CONCENTRATES

MORE THAN A CAPSULE COULD HOLD

[Continued from page 808]

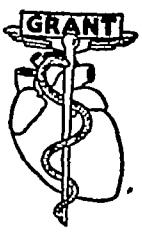
Cutter Laboratories, Berkeley, Chicago, New York (Booth 15) Biologicals, human blood fractions, blood plasma, penicillin, intravenous solutions, blood transfusion, and plasma preparation equipment

The Denver Chemical Mfg Co, Inc, New York (Booth 34) Galatest, dry reagent for instantaneous detection of urine sugar, now used routinely by many hospitals, industrial medical departments, Army induction and separation centers, and ever-increasing numbers of private practitioners Acetone Test (Denco), dry reagent for rapid detection of acetone in urine, has been enthusiastically received by hospitals and physicians

Doak Company, Inc, Cleveland, Ohio (Booth 40), demonstrates colloidal sulfur, iron, calcium, and bismuth diasporal and also the well-known line of dermatologic preparations

The Doho Chemical Corporation, New York (Booth 118), makers of Auralgan, are introducing a new sulfa drug for treatment and control of chronic suppurating ears, Otosmosan Colored lantern slides and moulage models depicting acute and pathologic conditions of the ear, with strict scientific accuracy, so as to be highly constructive and interesting to all physicians, will be displayed at this exhibit

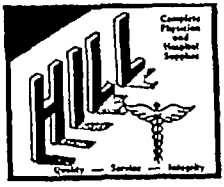
The Drug Products Co, Inc, Long Island City, New York (Booth 85) Myopone—an entirely new approach in the treatment of myopathies—myositis, fibrositis, and fibromyositis—will feature our exhibit There will also be displayed other therapeutic agents (Hyposols, Pulvoids, etc) of special interest to physicians You are cordially invited to attend and our representatives will be pleased to give you full information



Eaton Laboratories, Inc, New York (Booths 100 and 101), will exhibit ethical, pharmaceutical specialties of interest to the medical profession Several of these are new and improved advances in therapy

Endo Products, Inc., Richmond Hill, New York (Booth 10) Endo professional service representatives will be on hand to give information on Endo specialties Some of these are Pendil (an emulsifier for prolonging the action of penicillin), Mesopin (selective, gastrointestinal antispasmodic), Endoglobin-C (liver, iron, B vitamins, *plus* Vitamin C), Hycodan Bitartrate (selective antitussive), Endoglobin (liver, iron, B vitamins), Estronome (natural mixed estrogens)

C B Fleet Co, Inc, Lynchburg, Virginia (Booth 7) Phospho-Soda (Fleet) has been an ethical product over half a century It is a highly concentrated, purified, aqueous solution of the two U S P phosphates in stable form It is nontoxic, rapid, but mild in action, without irritation of the gastric or intestinal mucosa



Otis E Glidden & Co, Evanston, Illinois (Booth 35) You are cordially invited to visit us and obtain latest information on Zymenol (Brewer's Yeast Emulsion) for constipation, colitis and diarrhea Avoids catharsis, colloid bulkage, mineral oil leakage, and avitaminosis

Grant Chemical Company, Inc, New York (Booth 90), makers of specialties for diseases of the heart and blood vessels, presents a highly interesting display on Diurbital. Diurbital provides a three-way approach to effecting a gradual, steady substantial decrease in blood pressure in essential hypertension This is accomplished by direct relaxation of the blood vessels At the same time, diuresis removes excessive fluid from the oppressed heart, and gentle sedation allays such symptoms as nervousness, headache, and vertigo Thus, Diurbital aids in making life more comfortable for patients with hypertension, angina pectoris, myocarditis, dropsy, and arteriosclerosis with edema.

Hanovia Chemical And Manufacturing Company, Newark, New Jersey (Booth 8) A complete line of self-lighting ultraviolet quartz lamps will be on display for general body and orificial application Don't fail to witness a demonstration of Hanovia Safe-T-Aire Lamps that have a wide field of application in the destruction of airborne bacteria Courteous and competent representatives will be at your disposal

H J Heinz Company, Pittsburgh, Pa (Booth 81), is displaying and sampling from their glass containers of Strained Foods for infants and Junior Foods, especially designed for intermediate feeding Their representatives would appreciate your recommendations regarding these foods Register for *The Nutritive Value of Vegetables,* eleventh edition, *Nutritional Charts, Nutritional Observatory, Special Dietary Foods Book,* and *Your Baby's Diary and Calendar*

Hill Surgical Supply Co, Syracuse, New York (Booth 28) Representatives of the Hill Surgical Co will be on hand to tell you about the many new products from leading surgical and equipment manufacturers throughout the United States. Of special interest to you, undoubtedly, will be the new hospital furniture and surgical instruments. Be sure to stop

Hoffman La Roche, Inc., Nutley, New Jersey (Booth 52) Pharmaceutical prescription specialties of rare quality produced at Roche Park, where vitamins are made by the ton, will be exhibited. The medical profession's interest in Per-Os-Cillin, the new stable oral penicillin, the versatile parasympathetic stimulant Prostigmin, and other scientific accomplishments will be satisfied by Hoffman-La Roche representatives who will be in attendance to discuss clinical problems.

The Hygeia Nursing Bottle Co, Buffalo New York (Booth 9) Doctor you are invited to stop at Booth No 9 to learn the advantages of the improved Hygeia Nursing Bottle Unit Prescribing Hygeia Nursing Bottles will help mothers overcome feeding problems and will indirectly help you. Come and see a six minute motion picture, giving you the story in a "nutshell."

Holland-Rantos Company, Inc., New York (Booth 37) You are cordially invited to visit the Holland-Rantos booth where on display will be the well-known Koromex contraceptive specialties. Besides the new Koromex Set Complete, which is a package combining the necessary items for complete contraceptive technic, will be the new Nylmerate Jelly introduced only a short time ago and received enthusiastically, for the treatment of trichomoniasis and vaginal discharges of a nonspecific origin. Representatives of the company will be on hand to answer all questions. Professional samples of Nylmerate Jelly and Koromex Jelly will be available as will copies of the Dickinson-Freret Chart.

International Vitamin Corporation, New York (Booth 22) In the rear of the booth is a graphic demonstration of the manufacture of vitamin A concentrate from the crude fish livers to the finished vitamin concentrate, illustrating each step in its production. In the foreground of the exhibit is a series of lighted photographs illustrating different plant and laboratory operations.

Kelley-Koett X-Ray Co., Covington, Kentucky (Booth 124) Featured at the Kelsket booth this year is the completely modern Kelsket KY Mobile Unit. Physicians have long recognized the KY as a versatile complement to larger apparatus, and, in cases where space is limited or other equipment unavailable as an effective all-purpose unit offering complete radiographic coverage. Its easy mobility allows it to be used with any professional table in the office or hospital. Come in and see us at any time during the Exhibit. We will be glad to demonstrate this fine unit to you.

Kellogg Company, Battle Creek Michigan (Booth 23) Kellogg's ready to-eat cereals have an important place in normal and restricted diets. All of these cereals contain valuable whole grain nutrients, either natural or restored Pep is fortified with extra thiamin (B_1) and with vitamin D All Bran is one of the best sources of iron, one serving furnishing about one third the daily minimum requirement. A new Diet Manual and the Nutritive Value Charts are available at the Kellogg booth.

Kidde Mfg Co., Bloomfield, New Jersey (Booth 73) The Kidde exhibit consists of the plastic CO_2 Snow Maker, plastic applicators for applying the Snow and CO_2 refill cartridges for the apparatus. The Kidde Dry Ice Apparatus makes Cryotherapy safe simple, and easy to apply, thus eliminating former objections to the use of this long recognized therapy

H. W Kinney & Sons, Inc., Columbus, Indiana (Booth 16)

Lakeside Laboratories, Milwaukee, Wisconsin (Booth 29) are exhibiting and offering literature on three products (1) Leuron-B, a tablet of iron, copper and vitamin B-complex for the treatment of hypochromic anemia, (2) Menacyl, a tablet of aspirin with vitamins K and C for use in the treatment of rheumatic fever etc., and (3) Mercuhydrin, a mercurial diuretic

Lanteen Medical Laboratories, Inc., Chicago, Illinois (Booth 12), presents a new product Vi-Teens Homogenized Vitamins. Vi Teens Homogenized Vitamins is a palatable multiple vitamin emulsion containing vitamins A, B_1 B_2, C, D, and Niacinamide, it is miscible in milk, formula, juices or water, and easily mixed with cereal For infants and children, the recommended dosage provides well above daily minimum requirements. Other Lanteen products Lanteen Flat Spring Diaphragm and Jelly, Lanteen Douche Powder Hexestrol (Lanteen), Hexyphean (Hexestrol with phenobartital), and Vi Teens Vitamin Tablets. Ethically advertised for prescription and use of the medical profession and available only through established drug outlets

Lea & Febiger, Philadelphia Pennsylvania (Booth 25) will exhibit among their new works Quiring's *The Extremities* Soffer's *The Adrenals* Olkon's *Essentials of Neuro-psychiatry*, Burch and Winsor's *Primer of Electrocardiography* Bell on *Renal Diseases*, and new editions of Levinson and MacFate's *Clinical Laboratory Diagnosis*, Katz's *Electrocardiography* Kovacs' *Electrotherapy and Light Therapy*, Musser's *Internal Medicine* Clement's *Nitrous Oxide-oxygen Anesthesia*, and other standard works.

Lederle Laboratories, Inc., New York (Booth 6) will feature products of current interest to the profession—Ledercillin Tablets and Lozenges, Penicillin, Anti Rh Serum, and the newer developments in vitamin therapy Immunization products of proved quality, also will be featured Lederle representatives will be on hand to answer questions and supply literature and samples.

Libby, McNeill & Libby, Chicago, Illinois (Booth 1) Libby's strained and homogenized baby foods are featured at the Libby Booth. Physicians are invited to stop and discuss new findings on the greater availability of iron and ease of digestion of Libby's Council Accepted Foods for babies

The Liebel-Flarsheim Co, Cincinnati, Ohio (Booth 122), considers it a privilege to exhibit models of their Bovie electrosurgical units and short wave diathermies at the meeting of the Medical Society of the State of New York. Its representatives cordially invite you to visit their booth for examination and demonstration of their latest electromedical equipment

Eli Lilly & Co, Indianapolis, Indiana (Booth 127) The Lilly exhibit will feature an interesting demonstration in miniature on penicillin culture Many Lilly products will be on display, and attending Lilly medical service representatives will be present to assist visiting physicians in every possible way

J B Lippincott Co, Philadelphia, Pennsylvania (Booth 45), will have a complete display of Lippincott Selected Professional Books, designed to fill the real needs of the medical profession, including outstanding works on management of the thoracic patient, diseases of the breast, peripheral nerve injuries, electrocardiography, syphilology, dermatology hay fever, industrial health, and general medical subjects of interest today Advance information on other new books and new editions now in preparation.

The Maltex Co, Burlington, Vermont (Booth 86) Maltex Cereal is a fine old New England product which people eat because they enjoy it Our exhibit describes the combination of whole wheat and barley malt which produces such a delicious flavor We also display Height-Weight Wall Charts, Daily-Diet Records, and other literature which will interest you

The Maltbie Chemical Co, Newark, New Jersey (Booth 105), cordially invites members and guests of the Medical Society of the State of New York to their booth. Maltbie therapeutic achievements include the antispasmodic antacid-adsorbent, Lusyn, for gastrointestinal dysfunctions and Calpurate, the unique theobromine compound, for acute and chronic cardiovascular disorders

The Maltine Co, New York (Booth 126) A new advance in thyroid—Proloid—is one of the featured products at our booth. Others, among the newer products developed at the Research Laboratories of the Maltine Co on display, are Tedral—for the relief of asthma and hay fever, and Depancol—a balanced choleretic Old friends, such as Maltine with Cod Liver Oil, Malto Yerbine, and Maltine with Vitamin Concentrates, will also be present

T H McKenna, Inc., New York (Booths 43 and 44), will have a comprehensive exhibit of the new and more important books of all medical publishers At this exhibit you have an opportunity of comparing the various books on any given subject and making your own selection

McNeil Laboratories, Inc., Philadelphia, Pennsylvania (Booth 125)

Mead Johnson & Co, Evansville 21, Indiana (Booth 48) "Servamus Fidem" means We are Keeping the Faith Almost every physician thinks of Mead Johnson & Co as the maker of Dextri-Maltose, Pablum, Oleum Percomorphum, and other infant diet materials, including the new precooked oatmeal cereal, Pabena But not all physicians are aware of the many helpful services this progressive Company offers physicians A visit to Booth No 48 will be time well spent

Medical Film Guild, New York (Booth XX), through their *Medical Films That Teach*, presents a refresher course in fundamental medical problems This program, during the war period, kept the military medical man abreast of modern civilian practice The new subjects reorient the military doctor to civilian procedures These films, each representing several years of research, are condensed into half-hour productions, each acting as a visual text book. They review such subjects as Parkinson's Disease, the major neuralgias, cervicitis, otolaryngologic diseases, contagious diseases, arterial blood pressure, hypothyroidism, and industrial medicine These are available to medical societies, medical schools, and hospitals, and include projection service at no charge, through grants for postgraduate instruction.

The Mennen Co, Newark, New Jersey (Booth 84), will exhibit their two baby products—Mennen Antiseptic Baby Oil and Mennen Antiseptic Baby Powder, in addition to their fungicidal foot powder—Quinsana The antiseptic oil is now being used routinely in the majority of hospitals that are important in maternity work

Merck & Co, Inc, Rahway, New Jersey (Booth 53), appreciate the opportunity of exhibiting at the 140th Annual Meeting of the Medical Society of the State of New York. The attending physician can obtain information on prescription chemicals, vitamins, antibiotics, and well-known Merck medicinal specialties at the Merck booth The Merck representatives in attendance will be glad to be of service

The Wm S Merrell Co, Cincinnati, Ohio (Booth 54), will feature the new Hexestrofen Tablets, combining the true estrogen, Hexestrol, with phenobarbital, for more complete treatment of menopausal syndrome Also shown will be the new therapeutic vitamin capsule, Thera-Concemin, based on the formula of Jolliffe, designed for the treatment of frank deficiency states.

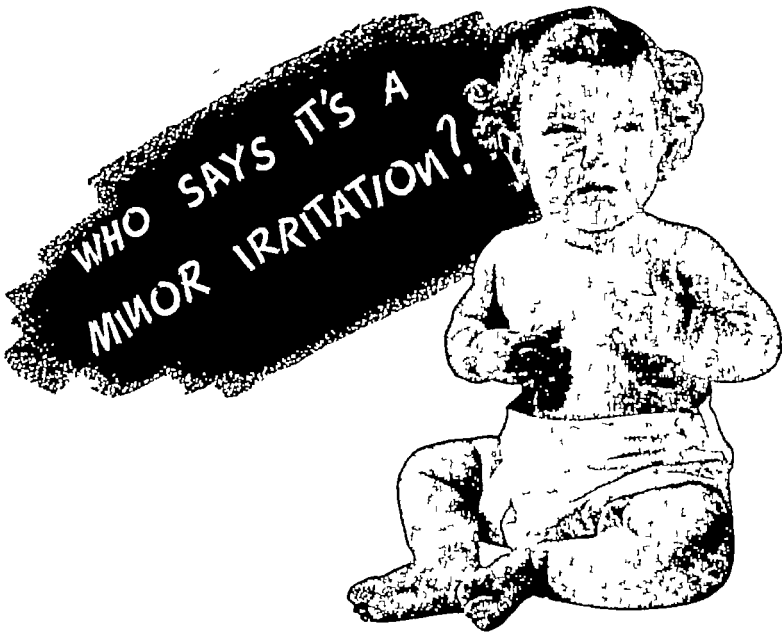
Ortho Pharmaceutical Corp, Linden, New Jersey (Booth 4), will exhibit their well-known line of gynecic pharmaceutical specialties, including Triple Sulfa Vaginal Cream, designed specifically for the treatment of bacterial vaginitis

The Oxygen Equipment Mfg. Corp, New York (Booth 14), will display and demonstrate the following Barach-Thurston Oxygen Tent with a "Clearlite" Transparent Plastic Canopy, Barach Sinusillin Rebreather for Sinusitis, O E M Aerosol Nebulizer for Penicillin, O E M Meter Masks, O E M Positive Pressure Mask, O E M Safety Cylinder Holder, O E M Open Top Box for Infants, Humidifying Units, Oxygen Analyzer, Regulator Flow Tester, and other equipment for the therapeutic administration of oxygen and helium-oxygen mixtures



Parke, Davis & Co, Detroit, Michigan (Booth 51) Representatives, well-informed concerning progress in pharmaceutical research, and desirous of presenting new advancements to you, will be in attendance at our Technical Exhibit to discuss the nature and employment of new and present products Displayed will be such outstanding products as Theelin, Mapharsen, and Adrenalin Preparations The latest type of biologicals will be on display Likewise Penicillin and other therapeutic agents of antibiotic, biologic, and chemotherapeutic interest will be shown. We sincerely invite your visit to this Exhibit

Pet Milk Sales Corp, St Louis, Missouri (Booths 79 and 80) A complete display of material illustrating the time-saving Pet Milk services available to physicians Specially trained representatives will be in attendance to give you information about the production of Pet Milk and its use for infant feeding Miniature cans will be given to physicians visiting the exhibit

Procter and Gamble Co, Cincinnati, Ohio (Booth 3), the manufacturers of world-famous Ivory Soap will display illuminated color transparencies showing various technics and equipment used in studying the mildness of soaps Copies of the popular Ivory booklet, "Bathing Your Baby the Right Way," and samples of Ivory Soap will be available for all members

Professional Nutrition Products, Inc., New York (Booth 21) P N P, a newly organized concern, specializes in nutritional products for prescription by the profession. Representatives will welcome

[Continued on page 816]

You wouldn't think so if you itched from diaper rash, eczema, chafing, chickenpox or scarlet fever It would seem mighty important to you and so would the soothing comforting relief of ENZO CAL.

Rubbed gently on irritated areas, the benzocaine in ENZO CAL promptly allays the burning, stinging pain and, at the same time, a protective, healing layer of semi colloidal calamine and zinc oxide is left on the skin.

Mothers, too, appreciate ENZO CAL because it is clean, convenient to use, and *greaseless.*

Prescribe ENZO CAL in your next case of pruritus or, better yet, suggest that your patients keep a tube on hand for routine use in the various skin irritations of infanthood

May we send you a FREE trial tube of ENZO-CAL? Address your request to us at 305 East 45 St., New York 17 N Y

[Continued from page 814]

physicians and discuss the first two products just being introduced Enzex, a natural complement to vitamin therapy, and Hydrogelin, for the treatment of common constipation Register for literature and samples

Radium Emanation Corp, New York (Booth 74), will exhibit a wide variety of instruments and applicators used in modern radium therapy, including permanent and removable composite, leakproof Radon Seeds The advantages of these seeds will be demonstrated by magnified sections showing their construction in detail.

Rare Chemicals, Inc., Harrison, New Jersey (Booths 32 and 33) Preparations exhibited by Rare will include Acidolate (nonlathering liquid) and Dermolate (new lathering solid), both nonirritating skin detergents, also Eucupin, local anesthetic with prolonged analgesic action, Gitalin, digitalis preparation, Salysal, anti-rheumatic analgesic, and Testosterone Propionate, "Rare Chemicals" androgenic preparation

Rees-Davis Drugs, Inc., Meriden, Connecticut (Booth 87) Hydrosulphosol Solution and Ointment—Chemical analysis confirms the presence in Hydrosulphosol of a high concentration of sulfhydryl ion Clinical applications indicate ability to stimulate cell function with maximal healing rate when applied to wounds such as burns, certain skin disorders, and nonhealing infected ulcers Laboratory tests show absorption of sulfur in some form with no evidence of toxic reaction when administered orally or applied topically The value and importance of Hydrosulphosol as a chemotherapeutic agent has been pointed out in a number of published reports dealing with clinical and laboratory studies.

L & B Reiner, New York (Booths 76 and 77), will display equipment of interest to every physician Cardiotron, the Direct-Recording Electrocardiograph, will be in actual operation. Stop in and let us show you how you can take instantaneous electrocardiograms The latest Jones Motor-Basal Metabolism apparatus will be on display We should like to have the opportunity to explain some of the exclusive features of the Jones, such as automatic check on accuracy and elimination of calculations and barometric or temperature corrections The H G Fischer line of x-ray and physical therapy units, representing some of the finest construction in this type of equipment, will also be shown, as will the Allison doctors' office furniture

Riedel-de Haen, Inc., New York (Booth 97), will display Decholin, the original hydrocholeretic, Degalol, a choleretic, Cholmodin, a laxative agent, and Sigmodal, an analgesic used in obstetric analgesia. Physicians are cordially invited to discuss with our representatives the wide therapeutic application of these products

Ritter Co, Inc, Rochester, New York (Booth 46) On exhibition are the Ritter Ear, Nose, and Throat Unit complete with instruments, Ritter Motor Chair, Ritter Shock Proof X-ray, Ritter Compressor, Ritter Rest and Relief Stool, Ritter Mobilrest Stool, Ritter Fluorescent Light, Ritter Sterilizer, and Ritter Bone Surgery Engine

A H Robins Co, Richmond, Virginia (Booth 26) This exhibit will bring to the attention of the physicians some of the latest therapeutic advances in the antispasmodic and cardiovascular field

J B Roerig & Co, Chicago, Illinois (Booth 50), will exhibit interesting products for use in arthritis, anemia, and dermatologic conditions Company representatives will be on hand to explain these various products in detail Attending physicians are cordially invited to call at the Roerig display

Rogers Diesel And Aircraft Corp, New York (Booth 27) Devices for the sterilization of air vaporize triethylene glycol according to the work of Robertson, Puck, Biggs, and Jennings The small unit vaporizes enough triethylene glycol to treat a large room having four air changes per hour Larger units, for use where air ducts are available, vaporize sufficient triethylene glycol to treat the air in assembly halls, operating rooms, etc Charts will illustrate the sterilization effect of the vapors and their lack of toxicity

Rystan Co, New York (Booth 116) Chloresium products, containing water-soluble chlorophyll derivatives, as used in the treatment of burns, wounds, and ulcers, is shown by a series of typical clinical cases in Kodachrome Lack of toxicity, acceleration of healing, and deodorization of foul suppurative wounds are outstanding properties of these products Similar response in upper respiratory infections is observed by the use of the nasal solution

Sandoz Chemical Works, Inc., New York (Booth 96) For the non-narcotic relief of migraine, physicians will be interested in Gynergen (ergotamine tartrate) Other well-known Sandoz products include Cedilanid (lanatoside C—crystalline glycoside from digitalis lanata, not present in purpurea), Bellergal, Belladenal, Digilanid, Strophosid, Glysennid, Calglucon, and Neo-Calglucon

Saratoga Springs Authority, New York (Booth 119) This exhibit consists of a photographic montage designed to show facilities available to the public at The Saratoga Spa as part of the health service of New York State The photographs were taken in and about the various buildings on the State's 1,200-acre reservation They display the bottling and distribution of the natural mineral waters, scenic views, recreation facilities, and various treatments using natural mineral waters as given at the bath houses These include mineral baths and packs, as well as heat cabinet, light ray, and other treatments State-bottled Geyser water will be served by an attendant throughout the Meeting

[Continued from page 816]

The Schenley Labs, Inc., New York (Booth 67), exhibit is devoted entirely to penicillin and penicillin products A series of transilluminated Kodachromes of various pyogenic skin infections shows the therapeutic efficacy of Penicillin Ointment Schenley A well-informed attendant will gladly discuss any phase of penicillin therapy and developments with interested physicians

Schering Corp, Bloomfield, New Jersey (Booth 55), will feature the latest developments in endocrine therapy, radiographic aids and other pharmaceutical advances Of particular interest is the presentation of Combisul-TD Combisul-TD is a sulfonamide combination based upon the now proved therapy which offers the therapeutic benefits of sulfathiazole and sulfadiazine with a material decrease in the danger of renal toxicity and crystalluria Schering professional service representatives will be present to answer inquiries and to provide valuable, informative literature

Julius Schmid, Inc, New York (Booths 92 and 93), invite physicians to visit their exhibit to view anatomic Kodachromes These illustrate, step by step, the insertion and placement of the Ramses Flexible Cushioned Diaphragm Representatives of Julius Schmid, Inc, will be in attendance to answer any questions asked by physicians concerning Ramses Gynecological Products

G D Searle & Co, Chicago, Illinois (Booth 49), cordially invites you to visit their exhibit where representatives will be happy to answer questions pertaining to Searle Products of Research Featured will be Searle Aminophyllin, Metanucil, Ketochol, Floraquin, Diodoquin, Pavatrine, Tetrathione, and Gonadophysin

Sharp & Dohme, Inc., Philadelphia, Pennsylvania (Booth 95), will feature Tyrothricin Concentrate for [illegible] use, Lyovac Normal Human Plasma, Sulfahalidine, Sulfasuxidine, and Calgesic Ointment, a [illegible] anesthetic and analgesic ointment which possesses antipruritic action A cordial welcome awaits all visitors

Sinclair Pharmacal Co, Inc., New York (Booth 60), has on display at its exhibit the various ingredients that enter the composition of their product, Boroleum. Boroleum is one of the "old timers," that for years has held its own as a relief for nasal conditions, and is in greater demand today than at any time since its inception. It is not a drastic vasoconstrictor, and gives results without disagreeable secondary effects

Smith, Kline & French Laboratories, Philadelphia, Pennsylvania (Booths 112 and 113) Benzedrine Sulfate Tablets, N N R. and Dexedrine Sulfate Tablets are featured at this exhibit Since its introduction, some ten years ago, Benzedrine Sulfate, N N R. (racemic amphetamine sulfate) has grown steadily in clinical usefulness and today occupies a unique place in routine medical practice For certain selected bases, however, it is often desirable to employ a drug combining an even more preponderant central nervous stimulation with a relatively weaker peripheral effect A closely related compound—Dexedrine Sulfate (dextro-amphetamine sulfate)—precisely fulfills these requirements Our specially trained professional representatives will be glad to answer questions concerning the possible uses of our products in your practice

Specific Pharmaceuticals Inc, New York (Booth 83), invites you to visit their exhibit Representatives will be on hand to answer questions regarding several of their interesting products, such as Analbis Suppositories, the effective chemotherapeutic for the treatment of tonsillitis, pharyngitis, and gingivostomatitis, and Profenil, the new synthetic non-narcotic antispasmodic Samples, literature, and reprints will be distributed to members of the medical profession

Spencer Inc., New Haven, Connecticut (Booth 89) You are cordially invited to visit our exhibit, featuring Spencer Individually Designed Supports for abdomen, back, and breasts You will be especially interested in these supports for patients who have undergone mastectomy You will also be interested in the Spencer Spinal Support for patients following cast removal, or as an aid to treatment of protruding disc, and other back derangements Supports for patients with hernia, visceroptosis with symptoms, postoperative needs, obesity, antepartum, and postpartum needs are also on display

E R. Squibb & Sons, New York (Booth 115), presents a technical exhibit intended to further the conservation and more effective use of penicillin

Frederick Stearns & Company Division, Detroit, Michigan (Booth 104), cordially invites you to visit our exhibit Members of our professional staff will be in attendance to discuss these distinctive professional specialties developed in the Stearns Research Laboratories Neo-Synephrine Hydrochloride—sympathomimetic drug for intranasal, ophthalmic, and parenteral use, Parenamine—a solution of amino acids, used in the prophylaxis and therapy of protein deficiency, Adnephrin—for symptomatic relief of bronchial asthma, Fergon—a better-tolerated, better-utilized iron salt, also, the Fairchild enzyme products now manufactured solely by Frederick Stearns & Company Division under the original Fairchild processes—Pepsencia, Gastron, and Holadin.

[Continued on page 820]

NOW *a spermicidal jelly with added advantages*

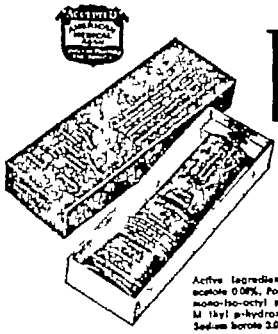
1

Lorophyn Jelly kills sperm in less than one minute after contact[1, 2]

2

Lorophyn Jelly has excellent spreading and sperm-contact properties.

3



Lorophyn Jelly possesses effective properties as a physical barrier

4

Lorophyn Jelly is non-toxic, non irritating[2]

[1] In tests by modified Brown-Gamble method.
[2] Eastman, N. J., and Scott, A. B.: Human Fertility 9:33 1944.

Accepted by the Council on Pharmacy and Chemistry of the American Medical Association

Active Ingredients Phenylmercuric acetate 0.08%, Polyethylene glycol of mono-iso-octyl phenyl ether 0.3%, Methyl p-hydroxy benzoate 0.09%, Sodium borate 3.0%.

Lorophyn jelly

E. A. TOWNS LABORATORIES Inc.
NORWICH NEW YORK

[Continued from page 818]

Tampax Incorporated, New York (Booth 19) With patients now so frequently inquiring about menstrual protection, physicians will wish to avail themselves of the opportunity to visit our exhibit where representatives will discuss the many benefits and exclusive features of this intravaginal tampon, supplied in three absorbencies Also available are published clinical reports demonstrating its adequacy, safety, and numerous advantages

The Tarbonis Co, Cleveland, Ohio (Booth 62) Tarbonis Cream—anti-inflammatory, decongestant, resolution promoting—presents tar in a nonirritant form, and a special vanishing-type cream base The active ingredient extracted from selected tars presents high concentrations of sulfur and unsaturated hydrocarbons, the substance to which the action of tar is credited

Teca Corporation, New York (Booth 66), shows its improved models of the well-known Two Circuit Hydrogalvanic Units, for office and hospital work. Among these are conveniently operated four-tank units for the treatment of lesions in the extremities Galvanic full-bath units are employed for systemic treatment, using standard tube with complete safety Of interest are the new Teca Bi-Trodes, modern instruments for testing and localized treatment Also shown is the new Teca low volt generator SP3, with original new facilities, permitting a more efficient and varied utilization of galvanic and sinusoidal currents Another low-volt unit, HP4, is used for ion-transfer and electrodiagnosis

U S Vitamin Corp, New York (Booth 75), will distribute a full color illustrated brochure, *Diagnosing Vitamin Deficiencies*, together with professional samples and literature on Vi-Syneral, Hypervitam, Lipo-Heplex, Desiver, and others

Varick Pharmacal Co, Inc., New York (Booth 36) The theme of this exhibit will be the use of Digitaline Nativelle, the original digitoxin, in single dose oral digitalization The panel will portray graphically, by means of a clock-like figure, the three to six hours required for digitalization. A miniature showcase will contain specimens of the product

Walker Vitamin Products, Inc., Mt Vernon, New York (Booth 18), will exhibit its line of vitamin specialities and individual vitamin tablets Unique in the specialty group will be their Protein Hydrolysate with vitamins and minerals This product consists of casein hydrolysate (50 per cent) providing all of amino acids and delightfully flavored with pure bouillon It also supplies liberal potencies of the essential vitamins and minerals, considered to be important as supportive therapy in restricted diets

Wallace & Tiernan Products, Inc, Belleville, New Jersey (Booth 106) Features Desenex—specific fungicidal agent for Athlete's Foot and other superficial dermatomycoses, bland and harmless to the skin, Azochloramid—stable chloramine for local therapy of wound infections, Monomestrol—safe, orally effective synthetic estrogen—sustained in action. Our representatives will welcome your inquiries and you are invited to register for literature and samples.

William R. Warner & Co, Inc., New York (Booth 108) Warner representatives will introduce and offer samples of "Thera-Vita" capsules, a new, therapeutic, multivitamin product especially designed for prescription use in the treatment or prevention of vitamin deficiencies associated with acute febrile illnesses, pregnancy, hyperthyroidism, restricted diets, and impaired assimilation of food elements, particularly in the geriatric patient

Westwood Pharmacal Corp, Buffalo, New York (Booth 47), features two products For patients with soap-sensitive skin, Lowila is a completely soapless, lathering detergent which cleanses without irritation Lowila Cake for face, hands, bath, etc, and Lowila Liquid for household use For the treatment of Vaginitis (Trichomonas vaginalis, etc.) and Cervicitis, Westwood presents Westhiazole Vaginal, a highly effective, sterile jelly in a convenient, single dose, disposable applicator Two representatives will be on hand to welcome you and provide samples and literature

White Laboratories, Inc, Newark, New Jersey (Booth 88), present information regarding White's Sulfathiazole Gum—expressly formulated for topical chemotherapy in oropharyngeal infections, White's Otomide—a more effective means of topical chemotherapy in ear infections—and a new specialty, White's Mol-Iron Tablets, a new and definite advance in the treatment of iron deficiency anemias White's ethically promoted vitamin specialties are also featured You will find a very cordial welcome by White's Medical Service Representatives in charge of the exhibit

Winthrop Chemical Co, Inc, New York (Booths 120 and 121), has available a number of interesting and highly informative booklets Ask particularly for your copy of Demerol, new analgesic, spasmolytic and sedative, and Creamalin, nonalkaline antacid.

Wyeth Incorporated, Philadelphia, Pennsylvania (Booths 58 and 59) Free samples of Bucillin, Wyeth's smooth-tasting penicillin troche, are at the Wyeth booth for your personal appraisal Visit with us and permit us to acquaint you with a few of our outstanding additions to the line of Wyeth biologicals, pharmaceuticals, and nutritionals, such as Purodigin (Digitoxin Wyeth), Strean's Pertussis Vaccine, Cerol (a new cereal for infants and children), and Lactamin, a complete amino-acid preparation

"KI" the MODERN way *

for conditions requiring Potassium Iodide

OLD SOLUTION FORMS of Potassium Iodide with variable dosages have proven to be largely unsatisfactory[1 2] and there has been a long recognized need for a more accurate simple and convenient preparation.

NEW ENKIDE (Brewer) fulfills this need—providing in a small, enteric-coated tablet a full gram (15 43 grains) or a half gram (7 72 grains) of Potassium Iodide easy to prescribe and easier to tolerate with minimum gastric distress. Supplied 100 or 500 on prescription only—at a price acceptable to the average patient.

(1) Riseman J E F *The Treatment of Angina Pectoris A Summary of Ten Years Objective Study* N E J Med. Vol 229 p 670 1943

(2) Garfield W T., *A New Method of Giving Potassium Iodide* N E J Med Vol 229 p 971 1944

Dosages recommended in ANGINA PECTORIS (1) and in SYPHILIS (2) In literature on request with PHYSICIAN'S SAMPLE.

Now Being Delivered

The Original INSTANTANEOUS

Direct-Recording

Portable

Cardiotron

•

Produces an Absolutely Permanent Standard Recording of Heart Action

THE INSTANT IT OCCURS!

It's already in use by leading physicians and hospitals—the ideal dependable EKG providing instant, accurate, direct recordings without the need for photographic reproduction or development.

Without any sacrifice in accuracy or dependability, CARDIOTRON produces an electrocardiographic record impervious to heat and time—a record which cannot be scratched or marred by rough handling and which will retain its original form after years of storage

No ink is used, no processing or developing is necessary either before or after taking the graph The CARDIOTRON operates from regular A C lines, with no batteries of any kind required, and will operate on D C lines through the use of a special light weight converter which is available

See It demonstrated at BOOTH 76-77

Manufactured by Electro-Physical Laboratories, Inc.

Division of ELECTRONIC CORPORATION OF AMERICA

We do appreciate the wholehearted cooperation of the Medical Society of the State of New York

The Yorkshire Indemnity Company of New York

90 John Street *New York City*

Official Carrier of the Group Malpractice Insurance Plan of the Medical Society of the State of New York

The Yorkshire is vitally interested in providing proper insurance for the Hospital risk as there is, in many instances, the overlapping of liability of the doctor and the institution. This interest goes beyond the development of a contract form and is best exemplified by the manner in which inspections are made and suggestions offered to the end that accidents shall be kept to a minimum.

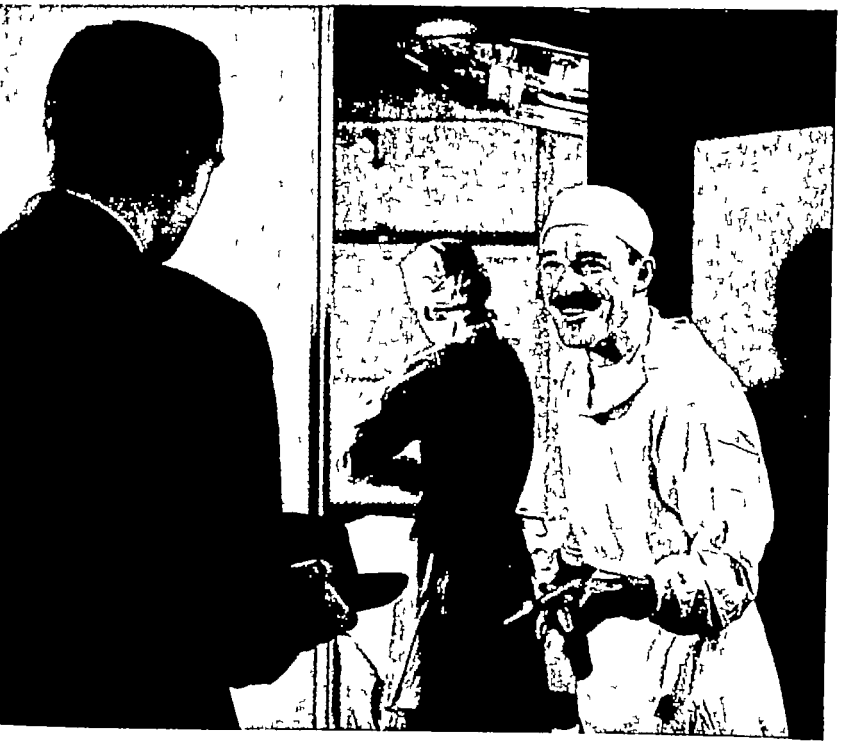
FULL COLOR HUMAN INTEREST GOOD POSTURE CHART expressly designed for physicians' offices, clinics and health centers. One of four in the new 1946 group added to the standard series widely distributed in schools, colleges, industrial plants, "Y's" and similar outlets. Write for your office copy of this educational chart on your professional letterhead. Samuel Higby Camp Institute for Better Posture, Empire State Building, New York 1, N Y

May 6 to 11 CAMP *8th Annual*
NATIONAL POSTURE WEEK

Once again National Posture Week takes its place on the calendar of public health education as it dramatizes the sound and ethical year-round program focusing the attention of the country on the significance of good posture as one element in good health and physical fitness

Since no field is more subject to the dangers of "glamorizing" and lay "experting," the Institute in all its appeals stresses the necessity of "seeing your physician" as the first step in the improvement of poor body mechanics Distribution of authentic literature through schools, colleges, medical and government bodies, and industrial, professional and civic public health groups is an important part of the program Press and radio give serious coverage



We hope to merit the continued cooperation of the medical profession during the first post-war observance of National Posture Week as peace presents its varied problems to those charged with maintaining the health of the nation

FREE: These two heavily illustrated booklets on posture prepared especially for distribution by physicians to their patients Their titles are "The Human Back its relationship to Posture and Health" and "Blue Prints for Body Balance." Ask for the quantity you need on your professional letterhead THE SAMUEL HIGBY CAMP INSTITUTE FOR BETTER POSTURE, Empire State Bldg, New York 1 N Y Founded by S H. Camp & Company, Jackson, Mich

Specialties for Diseases of the Heart and Blood Vessels

To lessen renal complications during administration of sulfonamides Combisul - TD

Combisul TD is a combination of sulfaTHIAZOLE and sulfaDIAZINE in equal parts in one tablet Administration of these two sulfonamides together reduces the likelihood of renal involvement even though the total quantity of sulfa drugs is the same as when either is used alone [1] [2] Danger of calculus formation with oliguria and anuria is largely eliminated by *Combisul TD* for even crystalluria is uncommon The chemotherapeutic activity of *Combisul TD* is equivalent to that obtained when either constituent is used in full dosage.

Combisul TD available in 0.5 Gm. tablets each containing 0.25 Gm. sulfathiazole and 0.25 Gm sulfadiazine. Indications and dosage are the same as for either drug administered alone.
For the treatment of meningitis, *Combisul DM* consisting of 0.25 Gm. sulfadiazine and 0.25 Gm sulfamerazine is available.
Combisul TD available in 0.5 Gm tablets. Bottles of 100 and 1000
Combisul DM available in 0.5 Gm. tablets. Bottles of 100 and 1000.

Triple Sulfa
VAGINAL CREAM

Non-specific vaginitides associated with breakdown of vaginal or cervical mucosa (as in *atrophic vaginitis* ulcerative vaginitis post-operative vaginitis or cervicitis and other similar conditions) appear to be caused principally by the overgrowth of secondary bacteria

Suppression of these secondary invaders is, therefore, the logical therapeutic aim.

Triple Sulfa Vaginal Cream, a rational combination of three sulfa derivatives provides bacteriostatic and bacteriocidal action, optimally specific at *different,* individual pH levels.[1] [2] Clinical investigation has demonstrated that complete mucosal healing and restoration of normal pH can usually be effected within twelve to twenty one days

Now available at most pharmacies.

TRIPLE SULFA VAGINAL CREAM — An optimal association of sulfathiazole N'acetylsulfanilamide N'benzoylsulfanilamide, and urea peroxide incorporated into a pleasant, water soluble absorptive cream base

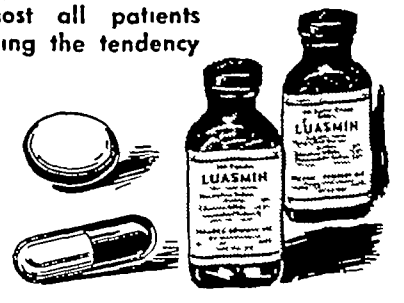
The nocturnal symptoms of many allergic disorders are often successfully controlled with

LUASMIN

CAPSULES and ENTERIC COATED TABLETS



(for prompt action) (for delayed action)

A LUASMIN capsule, administered as needed, and supplemented with an enteric coated tablet makes it possible for almost all patients to enjoy the benefits of a full night's sleep thus minimizing the tendency of recurrence of symptoms on the following day.

Each capsule or enteric coated tablet contains

Theophylline Sodium Acetate	3 grains
Ephedrine Sulfate	½ grain
Phenobarbital Sodium	½ grain

Half formula capsules and tablets are also available for children, or for adults when symptoms are mild

Write for descriptive literature and professional samples

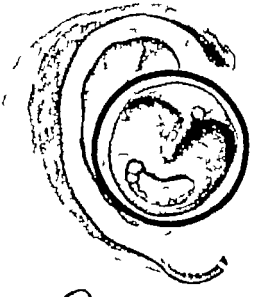
Medications of Choice FOR THE SPECIFIC INVOLVEMENT

Auralgan

in ACUTE OTITIS MEDIA

Symptoms

Pain, fever, edema leucocytosis, sense of fullness and impaired hearing



Treatment

Relief of pain and inflammation—*Auralgan*

Action

Decongestant, analgesic, bacteriostatic.

Scientific data and reprints of clinical studies reporting upon the use of Otosmosan available on request.

Otosmosan

in CHRONIC SUPPURATIVE OTITIS MEDIA

Symptoms

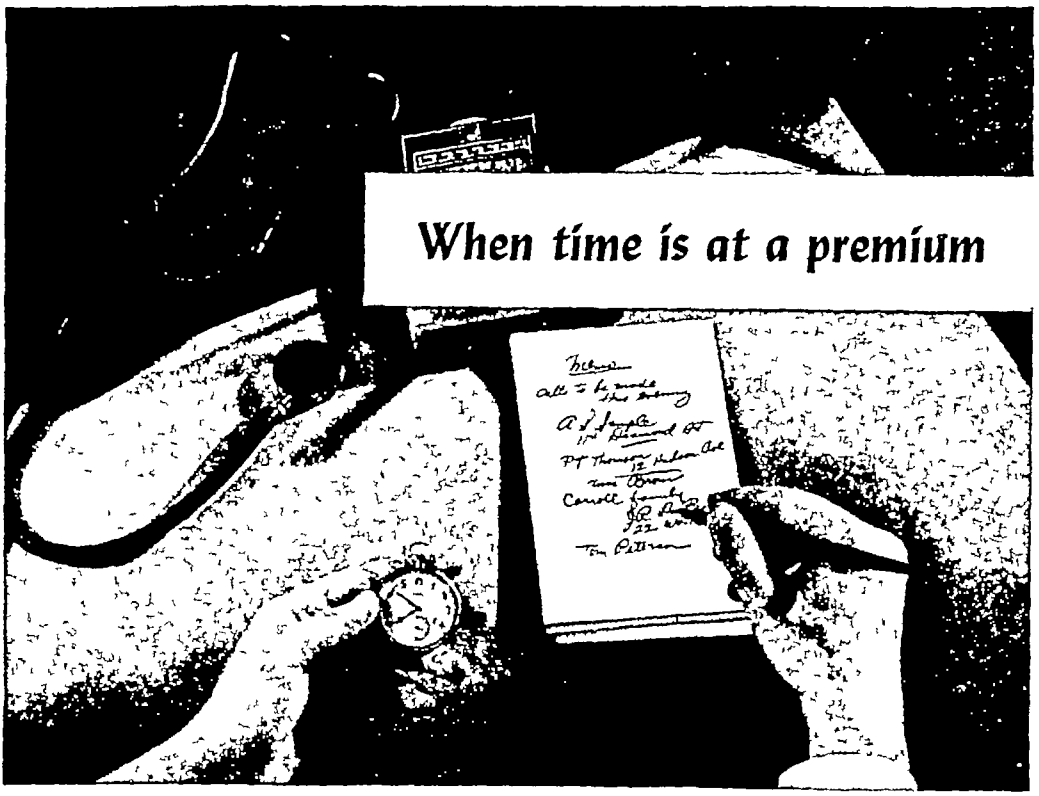
Persistent discharge, often foul smelling, usually no toxemia, no pain, no fever

Treatment

Otosmosan

Formula

SULFATHIAZOLE 10% - UREA 10% - In GLYCEROL (DOHO)



Action

Deodorizes the discharge, liquifies unhealthy granulations, bacteriostatic, permits normal epithelialization

Complimentary quantities for clinical trial

PYRIDIUM

(REG U S. PAT OFF.)

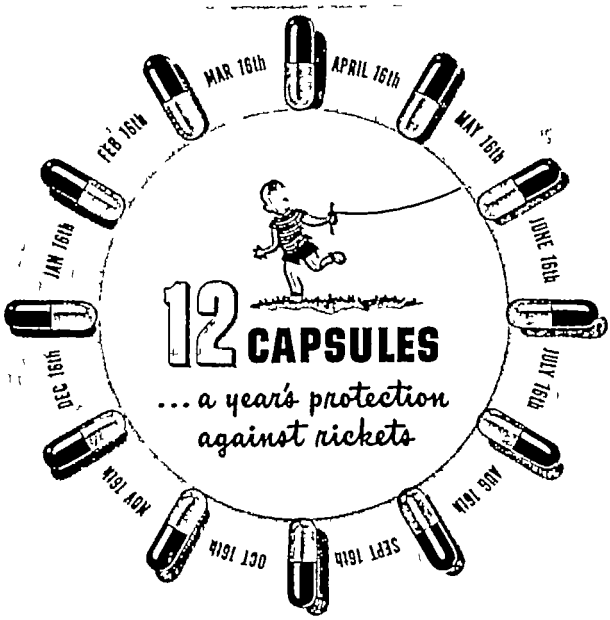
affords several distinct advantages

EASE AND CONVENIENCE OF ADMINISTRATION

Pyridium is convenient to administer No laboratory control, accessory medication, or other special measures are necessary for effective Pyridium therapy

LACK OF TOXICITY

Therapeutic doses of Pyridium may be administered with complete safety throughout the course of cystitis, pyelonephritis, prostatitis, and urethritis



RAPID RESPONSE

Prompt, *gratifying* relief of distressing urinary symptoms is the characteristic response to Pyridium therapy

PYRIDIUM
REG U S. PAT OFF
(Phenyleze-alpha-alpha-diamine-pyridine mono-hydrochloride)

For gratifying relief of distressing symptoms in urogenital infections

MERCK & CO, Inc *Manufacturing Chemists* RAHWAY, N J.

One capsule per month of Infron Pediatric provides adequate vitamin D for the prophylaxis against and treatment of rickets

The rationale of this convenient and economical new method of vitamin D administration has been established clinically by the work of Wolf, Ramlar, Hardy and Fishbein

Each capsule of Infron Pediatric contains 100 000 U.S.P Units of Vitamin D—Whitter Process—especially prepared for pediatric use.

Infron Pediatric mixes readily with the feeding formula, milk, fruit juices or water, and can also be spread on cereal.

Supplied in packages of 6 capsules—sufficient dosage for 6 months. Available at prescription pharmacies.

A Non-Systemic Antacid and Protective

IN peptic ulcer, Kamadrox affords rapid relief of epigastric discomfort and prompt objective improvement. It promotes healing of the ulcer crater because of the specific influence of its three ingredients (*Magnesium Trisilicate*, 50%, *Aluminum Hydroxide*, 25%, *Colloidal Kaolin*, 25%)

Kamadrox exerts prompt, profound, and sustained acid-combining power Yet it is systemically inert so that it cannot lead to alkalosis or secondary acid-rise By forming a coating over the ulcer crater, it provides mechanical as well as chemical protection. Kamadrox is astringent, demulcent, and adsorbent. Its ease of administration and pleasant taste are appreciated by the patient and assure his cooperation in carrying out the ulcer regimen

KAMADROX

KAMADROX POWDER is supplied in 4-oz. and 1-lb jars
KAMADROX TABLETS are supplied in bottles of 100, 500, 1,000 and 5,000 Each tablet contains *Magnesium Trisilicate*, 4 gr , *Aluminum Hydroxide*, 2 gr , *Colloidal Kaolin*, 2 gr
KAMADROX LIQUID. *Each fluidounce represents 64* gr (4 15 Gm) magnesium trisilicate and 32 gr (2 1 Gm) kaolin colloidal, suspended in 3½% aluminum hydroxide gel, aromatics, q s

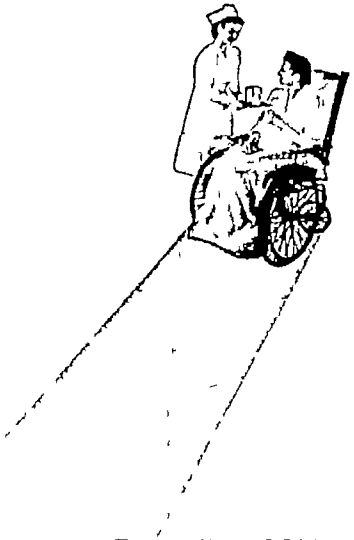
Successful management of high blood pressure calls for a regimen which is adjusted to individual requirements Physical activity is generally curtailed and overwork is avoided. In certain circumstances special diets are prescribed and the use of stimulants is restricted.

These measures are often supplemented with the administration of Theominal This combined vasodilator and sedative aids in reducing blood pressure to a more normal level. As a consequence hypertensive symptoms are relieved and the risk of complications is reduced.



DOSAGE. The customary dose of Theominal is 1 tablet two or three times daily, when improvement sets in the dose may be reduced. Each tablet contains theobromine 5 grains and Luminal* ½ grain.

*Luminal (trademark), Winthrop Chemical Company, Inc., brand of phenobarbital

"SMOOTHAGE" FOR THE CONVALESCENT

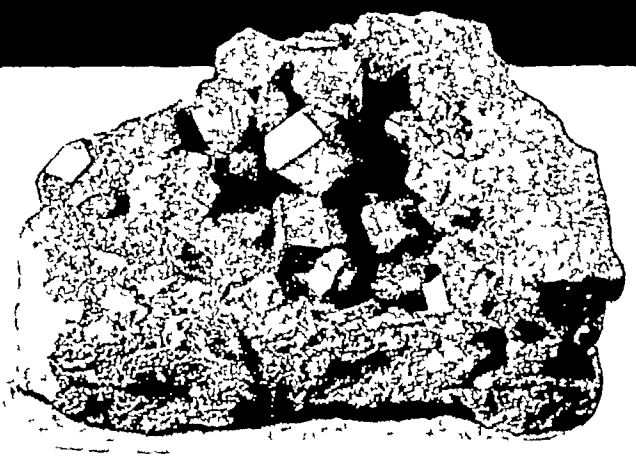
METAMUCIL

A PRODUCT OF SEARLE RESEARCH

By promoting normal peristalsis without irritating the delicate mucosa, Metamucil is particularly desirable for treating the constipation of hospital patients.

Metamucil provides 'smoothage' a modern concept for the treatment of constipation. It does not interfere with digestion or absorb oil soluble vitamins. It is rapidly miscible, pleasantly palatable.

Metamucil is the highly purified nonirritating extract of the seed of the psyllium Plantago ovata (50%), combined with dextrose (50%) In 1-lb 8-oz. and 4-oz. containers.



Metamucil ® the registered trade-mark of G D Searle & Co

SEARLE RESEARCH IN THE SERVICE OF MEDICINE

HYDROSULPHOSOL

Provides all 9 desired requisites as a superior therapy in thermal, acid and caustic burns.

Provides for mechanical exclusion of air at site of burn • Insures prompt relief of pain • Aids in abating burn shock • Bacteriostatic influence • Non-toxic effect • STIMULATES TISSUE REPAIR • Rapidly reduces inflammation and edema • Results in absence or marked reduction of scar tissue • Tends to shorten convalescent period.

HYDROSULPHOSOL is a true solution of sulfur bearing compounds resulting solely from the reduction of flowers of sulfur by a catalytic process In aqueous solution, it is capable of rapidly releasing its high concentration of sulfhydryl ion (-SH radical) in such form as can be effectively utilized by the body in the synthesis of sulfur-containing amino acids functionally active in cell stimulation and directly related to tissue respiration and repair.

Unlike the sulfa group and many other sulfur compounds, Hydrosulphosol is non-toxic when administered orally or topically applied in heavy concentrations, and will not result in damage to liver and kidney function

Similar to human milk

★The name is never abbreviated, and the product is not like any other infant food — notwithstanding a confusing similarity of names

The fat of Similac has a physical and chemical composition that permits a fat retention comparable to that of breast milk fat (Holt, Tidwell & Kirk, Acta Pediatrica, Vol XVI, 1933) In Similac the proteins are rendered soluble to a point approximating the soluble proteins in human milk Similac, like breast milk, has a consistently ZERO curd tension The salt balance of Similac is strikingly like that of human milk. (C. W Martin, M. D., New York State Journal of Medicine, Sept. 1, 1932) *No other substitute resembles breast milk in all of these respects*

A powdered modified milk product especially prepared for infant feeding made from tuberculin tested cow's milk (casein modified) from which part of the butter fat is removed and to which has been added lactose, olive oil, cocoanut oil, corn oil and fish liver oil concentrate.

SIMILAC } **SIMILAR TO HUMAN MILK**

Therapeutic VICTORIES . .

IMPROVING collateral coronary circulation—especially during acute and subacute phases—may, in large measure, account for the "therapeutic victories" of the clinician today in the management of coronary heart disease.

Toward this end, Maltbie's Calpurate—with its powerful coronary dilating, myocardial stimulating and diuretic actions—is increasingly preferred . particularly because it is so remarkably free from gastric side effects. Its salts, being almost insoluble in the stomach and readily absorbed by the intestine, are said to be "least likely to cause distress."

FORMULA Calcium theobromine—calcium gluconate in molecular proportions.
PACKAGED as tablets (each containing 7½ gr calcium theobromine—calcium gluconate) in bottles of 100, 500 and 1000—or as powder in 1 oz. bottles.
ALSO AVAILABLE with ¼ gr phenobarbital per tablet when sedation is desired.

THE MALTBIE CHEMICAL COMPANY • NEWARK, NEW JERSEY

CALPURATE

FOR TODAY'S CARDIOVASCULAR PATIENT

IDEALLY EQUIPPED BY NATURE TO PROVIDE RESTORATIVE CARE

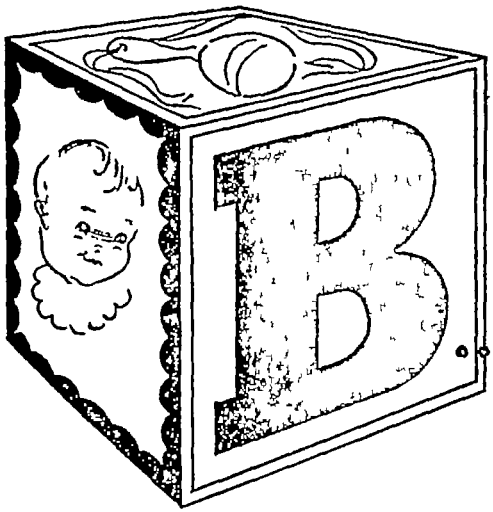
Unsettled times like these bring the overburdened physician more than the normal number of patients suffering from chronic disorders of a cardiac, vascular or rheumatic nature

Here at the Spa, in superb plant facilities placed in a restful setting of great natural beauty, your patient will find the restorative care he needs to prepare him for the full benefit of your continued medical direction

Under regimens of treatment which you yourself recommend, your patient, relaxed in mind and body, draws a full measure of improved health from the Spa's naturally carbonated mineral waters

Well trained physicians are available in Saratoga Springs for consultation with your patient on the details of the program

Secure in the knowledge that your instructions for his care will be faithfully carried out, you find needed relief from your overburdened practice

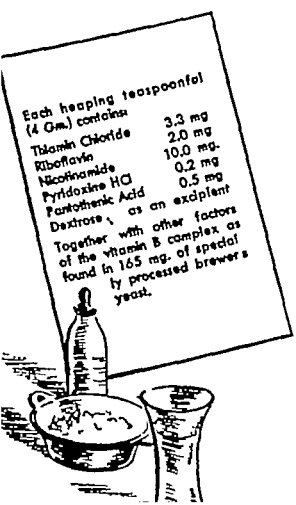


THE SARATOGA SPA

"PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

Many physicians have recently come to the Spa for the same kind of treatments that helped their patients here After a restorative "cure" at the Spa, you, too, would return to your practice refreshed—revitalized—ready for the busy days that still lie ahead

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION



For professional publications of the Spa, and physician's sample carton of the bottled waters, with their analyses, please write W S. McClellan, M D , Medical Director, Saratoga Spa, 155 Saratoga Springs, N Y

Most DEPENDABLE Method

The combined use of an occlusive diaphragm and vaginal jelly remains, in the published opinions of competent clinicians, the most dependable method of conception control.

Dickinson[1] has long held that the use of jellies alone cannot be relied upon for complete protection. It is noteworthy that in the series of patients studied by Eastman and Scott[2], an occlusive diaphragm was employed in conjunction with a spermicidal jelly for effective results Warner[3], in a carefully controlled study of 500 patients, emphasized the value of a diaphragm.

In view of the preponderant clinical evidence in its favor, we suggest that physicians will afford their patients a high degree of protection by prescribing the diaphragm and jelly technique.

THYROBROM,* a brominated thyroid in tablet form, provides every pharmacological action afforded by thyroid, U S P, with a minimum of toxic effects that ordinarily attend the administration of plain thyroid

The therapeutic effectiveness of THYROBROM, and proof of its clinical advantages, is set forth in a recently published paper reporting a controlled study of 60 obese cases [1] Administered in the same dosage as thyroid, U S P, THYROBROM was reported to be

- ▲ 15% more effective in raising B M R
- ▲ 35% more effective in reducing weight
- ▲ 64% less causative of palpitation and nervousness than thyroid, U S P

Each THYROBROM tablet contains *brominated* thyroid 2 gr, made from the finest grade of clean fat free, desiccated whole thyroid THYROBROM'S iodine content 0 2% equals the U S P standard for thyroid

THYROBROM may be prescribed in hypothyroid obesity or in any indication for thyroid U S P It may be tried in cases in which thyroid U S P., is not well tolerated

ADMINISTRATION Adults—½ to 1 tablet (1 to 2 gr) daily preferably given in the morning. Dosage may be gradually increased to meet individual requirements but should seldom exceed 4 gr per day Discontinue if untoward symptoms arise Therapy should be controlled by periodic examination. Any thyroid preparation is contraindicated in cardiac disease, adrenal cortex insufficiency hypertension diabetes and hypothyroidism secondary to pituitary dysfunctions

HOW SUPPLIED: Bottles of 30 tablets grooved for easy division.

Editorial

The Annual Meeting, Again

It seems reasonably certain that Col James C Harding of the Veterans Administration will be the principal speaker at this year's banquet In view of the enormous strides which have been made in the reorganization of the Veterans Administration, and the increasingly important relationships which are now developing between the American Medical Association, state medical societies, and the Medical Bureau of the Administration under Maj Gen Paul B Hawley, what the principal speaker will have to say should be of great interest to veteran medical officers and to all physicians throughout the State.

Undoubtedly, medical care for veterans in their own localities by their own physicians will be discussed as well as the extensive revision of inpatient care and the expanding opportunities for physicians in the Veterans Administration

The program of the scientific meeting will be of much interest and variety, we are assured by Dr Duncan Clark, Chairman of Sections and Sessions.

This first full Annual Meeting since the termination of the war should be well attended from all parts of the State.

The exhibitors this year will be numerous, and many new things in the way of books, office equipment, drugs, and modalities for treatment will be shown. It is hoped that the attendance will be large and that all will take advantage of this first opportunity to see and hear what is new

"Is there anything whereof it may be said, See, this is new ?"[1] Come and see!

The Governor's Public Health Program

As currently reported,[2] Governor Dewey's public health program, now in the hands of the legislature, constitutes a drive against tuberculosis of no mean proportions. It proposed to spend some $14,000,000 a y in the State, with nearly $6,000,000 allocated to New York City There is outlined, also, a revised system of financial aid by the State to local health departments

[1] ...clesiastes, Chapter 1, verse 10.
[2] ...y York Herald Tribune, March 5, 19

The tuberculosis control plans with the State providing about half of the cost for public care and treatment of patients would be worth about $3,000,000 to New York City, and the new State aid to the local health department budgets would send another $2,800,000 to the city

On tuberculosis control, Governor Dewey proposed that localities could take the option of retaining their own hospitals or of turning them over to the State In either case, the State would aid the localities by standing half of the cost for treatment of their tuberculosis patients on a patient-day basis

Governor Dewey recommended, also, that the "means" test as a condition for admission to approved tuberculosis hospitals be removed "In other words," he said, "every person in our state can, under this plan, go immediately to a hospital for treatment without financial concern"

Other recommendations made by Governor Dewey would provide

1 Establishment of a service in the State Department of Health to recruit and train physicians and nurses for public health work

2 Establishment of a new joint interdepartmental health council in the state government, to consist of the commissioners of health, social welfare, mental hygiene, and education, and the chairman of the Health Preparedness Commission

Of the entire program, Governor Dewey said in his special message "This program will, I believe, be the broadest step forward in health service ever undertaken by this state or any other state It will multiply our present cost from $3,000,000 to $14,000,000, but I firmly believe it will give the largest return of any expenditure by the state in happiness and better health for our people"

The proposed abolition of the "means" test seems to be a progressive step with which the medical profession might agree as removing an objectionable barrier to better control of tuberculosis As to the cost of the program, it would appear picayune, indeed, for a people who have recently spent billions for explosives to blow up the begats of Adam to object to a few millions of dollars for the improved public care and treatment of the diseased

The matter of cost in relation to a program of public care for the sick raises the question of balance What is a proper relation between the cost of necessary administration and the p[illegible] the public dollar which provides direct benefit to the patient in shelter, food, medicine, and professional medical care? In the recent rapid expansion of the field of public health work, not only the plant itself but the machinery in it has grown apace With the general theory that public health is purchasable and that within certain limits any community can determine its own death rate there can be little disagreement However, it is the individual patient whose health in the mass, after all, is responsible for progress or failure in the general community health, who may be forgotten or buried under a mass of public health machinery, multiplying social workers, inefficient administration, political ambition, and bureaucratic perpetuation Are the administrative costs of public health becoming too high? Are these and the costs of ancillary services, hospital construction and maintenance absorbing a disproportionate part of the public dollar? What residue remains for direct care of the individual patient?

These questions arise from the report of the health conditions in New York State in 1945 [3] The total death rate in the entire state was 11 0 "However," says the report, "if one were to take account of the natural aging of the population, the 1945 death rate would actually be the lowest in the entire period of years for which there are accurate corresponding figures"

"The war years have added to the population of the State 200,000 *more* births than would have occurred had the birth rates of the immediately preceding peace years been continued"

In view of the increased life expectancy to 65 years, the number of living people who may become recipients of public medical care should advance rapidly Will this mean simply an expanded bureaucracy to administer to their needs, or is it time now to examine the efficiency of public health and medical care, with the objective of making a larger proportion of the public dollar available to the needs of the individual either in public health education, in preventive medicine, or in direct benefits?

Money has been plentiful in the past It has done much good Its availability both

[3] Health News, Vol. 23, No 8, Feb 25, 1946

from private and public sources, has elevated public health care and education to the rank of big business. The field has attracted many men and women of outstanding ability as well as others of enormous mediocrity No one begrudges the money spent in this field, there should be more, if necessary The physician-citizen-taxpayer asks only that the individual patient be not submerged in a vast pile of inefficient benevolence or, eventually be lost in a welter of public munificence. Midas—remember him?

The Woman's Auxiliary

Mention of Woman's Auxiliary activities several times in the Annual Reports of the Society this year attests the demonstrated and growing usefulness of this branch of the State Medical Society A review of Auxiliary activities around the state in the past several years confirms the conviction of many county societies that this organization has far outgrown its original role of popularizing the magazine *Hygeia*, and had branched out into other constructive channels of assistance to the medical profession

This year, for example, the auxiliaries have been "selling" an idea—the idea of voluntary medical insurance. Spurred on by the Society's Public Relations Bureau, supported staunchly by its genial state president, Mrs Edwin A. Griffin, and its hardworking program chairman, Mrs. Michael M Schultz, and with the cooperation of the Bureau of Medical Care Insurance, the State Auxiliary has put on a quiet but most convincing demonstration of the kind of job it can do From an impetus to help promote voluntary medical-care insurance, has developed a series of effective community meetings on this subject sponsored by the State Auxiliary and carried out by local units It can be said that the Woman's Auxiliary has been instrumental in putting Mr Farrell before more audiences throughout the State than any other single agency

A score of these auxiliary-sponsored community meetings have been held throughout the state. Sometimes, the medical societies and auxiliaries have met jointly Always, community representatives were invited. Schenectady County is typical of those auxiliaries that worked with their menfolk and saw to it that community representatives and the press were there to hear about medical-care insurance in New York State A dinner party in this instance preceded a well-attended meeting, complete with speakers from New York State and from out of the state There was plenty of discussion from the floor and informative printed matter was distributed

That was the pattern for most of the meetings. Often, as happened in Long Island, further talks on medical-care insurance were requested as a result of the community meeting sponsored by an Auxiliary Needless to say, this series of gatherings brought to several large audiences throughout the state discussion of a not too well understood subject

During the campaign against chiropractic legislation and the antivivisection bill in the state legislature, and during the intensive work against the Wagner-Murray-Dingell Bill, many county societies discovered the wealth of assistance that could be obtained from their Woman's Auxiliaries Experience has shown that whenever any county medical society has entered into an effective partnership with its Auxiliary the society has acquired an earnest hardworking unit. Auxiliaries have welcomed responsibility and have discharged it well when requested

During the war years the Auxiliary members have not only worked in behalf of the profession, but also have distinguished themselves in community war activities. Working as an auxiliary unit has had the added value of presenting doctors' wives as a constructive community group This has a far-reaching public relations value.

County medical societies that have not so far formed an auxiliary have missed the satisfaction of seeing at first hand the energy, the faithfulness, and willingness to serve of

a united and purposeful group of women They have not had the opportunity to find out for themselves that with encouragement and proper guidance a Woman's Auxiliary can be a distinct asset

The pressure of community war work has had much to do with the slowdown in new membership of the New York State Auxiliary Logically, in this State there could be the largest organization of its kind in the country However, several other states, including California, have far outstripped New York in growth of auxiliary membership in the last few years Now that the war is over, the time is propitious to strengthen each present county auxiliary and to organize new ones There are still many counties without auxiliaries Such counties might well consider the formation, now, of local units All counties, then, could and should provide both leadership and working sinews for the growing State Auxiliary

The Viral Etiology of Congenital Anomalies

Evidence of a causal relationship between viral infections in early pregnancy and congenital anomalies in the offspring has been accumulating since Gregg,[1] of Australia, reported in 1941 a high incidence of congenital cataract following maternal rubella Since that report, approximately 150 cases have been published in which congenital cataract, cardiac malformation, cerebral dysgenesis, deaf-mutism, microphthalmos, biliary atresia, and glomerulosclerosis have followed the occurrence of maternal rubella (and less frequently of measles and influenza), usually in the first two or three months of gestation The bulk of these reports were Australian, some American, and a few British

Recently, Conte, McCammon, and Christie[2] investigated, in Tennessee, 120 children with congenital defects and found that only 4 2 per cent had a history of gestational maternal rubella Fox and Bortin[3] in three epidemics occurring in Milwaukee between 1924 and 1944 found only one anomalous infant among eleven pregnancies complicated by rubella These adverse reports indicate that the correlation of maternal rubella and congenital defects is not a consistent one, despite the impression of some earlier authors who found an exceedingly high positive correlation Further studies by virologists, clinicians, and statisticians are necessary to answer the following questions Why has the connection between virus disease and anomalies only recently been described? Is this a new disease? Why do more severe viral infections often leave the infant unharmed? Why is the incidence apparently different in different localities? Are the defects the result of a specific viral infection, or is the time of involvement relative to embryologic development of equal or greater importance?

The work of Warkany[4] showing an etiologic relationship between maternal diet and congenital anomalies in animals is pertinent to the present problem Possibly, lesions similar to those he observed have confused some reports attributing anomalies to rubella In any case, the fact that similar anomalies can be produced by widely different etiologic agents indicates a lack of specificity of these agents and suggests that the stage of embryologic development in which they act is the more important factor

More knowledge is obviously necessary to validate the suggestion that abortion be performed as a Public Health measure in all cases of early pregnancy complicated by rubella [5,6]

Current Editorial Comment

Eradicate Diphtheria Control by prompt and early immunization of this dread disease of childhood has constituted such an outstanding accomplishment that there is no excuse for the occurrence of more than isolated sporadic cases Where there is a lack of such accepted preventive measures, the plague will manifest itself This is well shown by reports of conditions in Europe, where during 1943–1944 it was estimated by competent observers that there were two million cases exclusive of the Soviet Union, with probably 100,000 fatalities, the greatest increase being among adults who had never been immunized

In this country, the figure has been well maintained and low morbidity levels have continued during the war period In 1943 the death rate among children up to ten years of age fell below five per 100,000 But eternal vigilance must be continued, for the prevalence of this disease has shown little change since 1940 This fact cannot be disregarded and those sections of the United States where high rates persist must take the necessary measures of control to reduce what has been proved to be a preventable high mortality rate

To have their children immunized as soon as possible after the ninth month and promptness in calling the doctor when symptoms of the disease manifest themselves, are the responsibilities of the parents. Immediately to report the case, early and adequate injections of antitoxin, isolation of the patient, and avoidance of the spread of the disease are the well-known but sometimes neglected duties of the physician Diphtheria can be wiped out, but there must be coordination of effort between the public, the physician, and the health authorities These warnings cannot be repeated too often and that is why we call renewed attention to the matter at this time

"The complete and early conquest of diphtheria in America is entirely practicable To achieve this requires extension and intensification of the organized fight against the disease in those areas of the country where most of the cases and deaths are found For there are still large sections of the United States where diphtheria is far too prevalent. The death rates children in certain states are more times as high as in the case is best controlled For example, during the four-year period 1940–1943, the 25 states with the highest rates from diphtheria, which contain slightly less than half of the total population, reported 83 per cent of the total number of deaths from diphtheria in the country as a whole The actual number of deaths in this area was nearly five times that in the rest of the country

"Virtually all of this loss of life is unnecessary The application on a country-wide basis of the simple and safe methods of immunization of susceptible individuals would eradicate the disease from this country"[1]

Health Department Fellowships The New York State Department of Health has available a limited number of fellowships for physicians desirous of equipping themselves with the necessary field and academic experience for the practice of civilian public health on a full-time basis Six to twelve months of orientation and field work are provided under the guidance of experienced district state health officers followed by an academic year at a postgraduate school of public health where the master's degree in public health is earned Fellowship provisions are generous and include tuition Those completing the training are professionally qualified for appointment on the staff of most local and state health departments

Applicants must possess certain basic qualifications, among which are United States citizenship, graduation from a medical school approved by the American Medical Association, internship of at least one year's duration in a general hospital approved for internship by the American Medical Association, and license to practice medicine in New York State or eligibility to take the examination to obtain such license The upper age limit is 35 years

STREPTOMYCIN IN THE TREATMENT OF A CASE OF PERSISTENT URINARY INFECTION

HARRY G JACOBI, M.D., New York City

(Associate Attending Physician, Lenox Hill Hospital)

STREPTOMYCIN is the name given to the antibacterial substance isolated from the culture filtrate of a certain strain of Actinomyces griseus, which was first described in January, 1944 by Schatz, Bugie, and Waksman [1] They found that this filtrate was formed only by growth of these organisms in special media containing complex growth-promoting substances, such as meat extract or corn-steep liquor The great importance of the discovery of this antibiotic is due to the fact that it has been found to exhibit rather striking antibacterial activity against certain gram-positive and gram-negative bacteria. It has therefore been received with a great deal of interest and hopeful expectation

In September, 1943, Waksman[2] had reported upon the isolation, production, and activity of another antibiotic, streptothricin, which he obtained from the growth of A lavendulae The in vitro activity of streptomycin[3] has been found to be almost identical with that of streptothricin, except that the former seems to show greater activity against infections produced by certain pathogenic bacteria and also seems to have a lower toxicity

Interest has therefore been concentrated chiefly upon streptomycin[4] because of its more potent antibacterial activity, as manifested in a much wider and more selective bacteriostatic spectrum than streptothricin. Briefly, it may be stated that the chemical nature of streptomycin is an organic base, soluble in water and acid solutions, but not in ether or chloroform It is thermostable and has a low degree of toxicity as determined by means of the experimental laboratory animal

Waksman and his coworkers have certainly done a splendid piece of original investigative work in the isolation of these antibiotic substances from these soil micro-organisms and have clearly described certain of their characteristic features [5] As with all new preparations, however, adequate knowledge of the therapeutic and toxic possibilities is extremely important before this preparation can be released for general use

In order to be of any use therapeutically, adequate means must be made available for the proper and accurate assay of this product Like other antibiotic substances, the potency of streptomycin is expressed in terms of units of antibacterial activity, as determined by its power of inhibiting the growth of a test organism This unit of measurement[6] is based upon the inhibition of growth of a standard strain of Escherichia coli as determined by the dilution method, using either a series of dilutions in liquid media or the agar-plate streak method The unit of streptomycin has therefore been defined as "that quantity of the antibiotic agent which inhibits the growth of a given strain of E coli in 1 ml of nutrient broth or agar" This is also referred to as the S-unit Two other designations have been made, the L-unit, referring to that amount of material which will inhibit the growth of a standard strain of E coli in 1 liter of medium, and the G-unit. The L-unit is equivalent to 1,000 S-units and the G-unit refers to 1 Gm of the crystalline material Assay of streptomycin powder as it is now made available for investigative purposes cannot as yet be considered as of standard uniformity, so that there may occur some variations in potency in the presently available material The potency of each lot must be carefully assayed The actual determinations of the blood and urine concentrations are carried out by the agar diffusion or so-called cup method, using a standard strain of Staphylococcus aureus SM, which is streptomycin-sensitive and which has been found not to be inhibited by normal blood

In carrying out such investigative work as this, several definite facts must be determined (1) studies showing the level of blood concentrations at varying intervals following the administration of streptomycin, (2) similar studies in regard to the urine concentration, (3) studies showing the eventual disposition and elimination of the substance after its administration, (4) the effective optimum dosage necessary to produce therapeutic results, and (5) the occurrence of toxic reactions or other signs of intolerance to the preparation

The investigative work attempting to answer some of these questions has already begun to make its appearance in the medical literature [7–12] As more evidence is made available from such studies, the efficacy and indication for the use of streptomycin will become more clearly and firmly established

Regarding the concentration of this substance in the blood after a single intramuscular injection

The supply of streptomycin used in this study was kindly furnished by Merck and Co., Rahway New Jersey

it was found that in a series of 4 patients thus injected with 600,000 units of streptomycin a maximum of 18 units per cc of blood serum was reached at the one-hour period and remained within that level until the fourth hour [7] These same investigators also report one patient who received a total of 3,000,000 units every twenty-four hours and found that after the third day of such administration, the blood serum level usually varied between 20 and 60 units per cc The highest urine concentration of samples taken three hours after the injection of 600,000 units of streptomycin was 520 units per cc with an average level for 10 cases of 353 units per cc of urine Some very significant findings have also been reported by Helmholz[13] regarding the in vitro bactericidal effect of urine containing streptomycin in varying dilutions For his observations, he made use of a twenty-four-hour specimen of urine containing 1,330 units of streptomycin per cc which was obtained from a patient who had been taking 2,000,000 units of streptomycin daily for weeks He found that there was practically no interference with the growth of various bacteria in urine containing less than 66 units of streptomycin per cc At 100 units of streptomycin per cc and with inoculations up to 2,000 bacteria per 0 5 cc sterilization occurred in twenty-four hours After making a considerable number of varying titrations, he concluded that 100 units of streptomycin is probably sufficient to reduce rapidly the number of any bacteria found in urinary infections and that 235 units, which is only about one fifth of the concentration that was obtained in his particular specimen of urine, is sufficient, even with massive inoculations of bacteria, to sterilize the infected urine

To confirm such observations clinically by the action of this drug is of the utmost importance In rendering such reports, the determining factor, in the final analysis, is the possibility of practical application and use offered by this and similar substances In reporting such experiences, the weight of numbers does not always overbalance the thoroughness of individual case study It is for that reason that I believe the following report merits careful consideration, for our patient was excellently suited for such observations, having had a persistent urinary infection extending over a period of almost six years during which almost every known bactericidal agent had been tried without success

Method of Procedure

The streptomycin was made up into solution freshly prepared with the use of pyrogen-free distilled water and the concentration varied from 125,000 to 175,000 units per cc, depending upon the volume and total dosage required at each injection This total volume never exceeded 3 cc and was as low as 2 cc Most of the solutions employed contained 125,000 units per cc The injections were given intramuscularly, and for the first seventy-two hours, these were administered every three hours and from then to the end of the period of treatment the interval between injections was four hours All blood specimens were collected under sterile precautions and the timing of these specimens was so arranged as to reflect the picture at varying intervals following the injections

Thus, a blood specimen was obtained corresponding to fifteen minutes, one half hour, one hour, two hours, three hours, and four hours following some one of the injections The urine specimens were likewise collected at certain specified periods during the twenty-four hours, so that they too would reflect some definite time interval from the injection of the streptomycin These specimens were kept in the refrigerator until they were transported to the laboratory for determination of their streptomycin content Repeated blood counts were done throughout the period of observation

It is, of course, important in carrying out such observations as these, to obtain the necessary laboratory facilities to insure accurate quantitative determinations of the concentrations of the drug in the blood and urine Foster and Woodruff[14] described a method for the determination of streptothricin in aqueous solution This method was, however, not found to be satisfactory for streptomycin determinations because of the fact that human blood contains a substance which has a marked inhibitory effect upon the test organism used, Bacillus subtilis, and also because this method was not sufficiently sensitive to measure accurately concentrations of the drug in blood serum below 20 units per cc Stebbins and Robinson[15] have devised a method which overcomes these difficulties by the use of an organism (Staph aureus SM) which is streptomycin sensitive and also is not inhibited by normal blood By increasing the pH of the medium and decreasing the salt concentration, the sensitivity to the streptomycin was found to be increased similar to that reported by Foster and Woodruff in the streptothricin assay

Fortunately, the determinations of the blood and urine concentrations of streptomycin do not have to be done immediately after obtaining the specimens, but may be delayed for a considerable period of time without deterioration of their concentration This is quite in contrast with that of the action of specimens containing penicillin Helmholz[13] also refers to this property in his studies He reports that the specimen of urine

FIG. 1 X-ray taken October 21, 1942, twenty-five minutes after the intravenous injection of the dye, showing a large calculus in the lower end of the left ureter Also marked dilatation of right kidney pelvis.

FIG 2. X-ray taken October 21, 1943 showing ureteral catheters and two small and one large calculus in pelvis of right kidney

which he used for his in vitro observations contained 1,330 units of streptomycin per cc. when the determination was made on the fresh specimen Determinations performed after two and three months still showed concentrations of 1,175 and 1,131 units respectively

Case Report

The patient (Hist. No 406) is a 63-year-old white man who had a prostatectomy performed in February, 1939 The procedure involved preliminary suprapubic drainage with subsequent transurethral resection. The choice of this cautious procedure was made because of the x-ray findings of marked dilatation of both ureters and kidney pelves. It was hoped thus to avoid the risk of pyelitis attacks. In spite of this precaution, however the patient developed severe pyelitis shortly following the simple suprapubic cystotomy and then subsequently developed another severe attack of pyelitis after the transurethral resection. Cultures of the urine at this time showed growth of B proteus.

After discharge from the hospital the patient's main difficulty was due to his persistent pyuria. In spite of all the various known therapeutic measures, all of which were tried in succession, the urine could not be freed from this infection, and cultures continued to show the presence of B. proteus. Of the various measures that were tried over a considerable period of time, it was found that alternating periods of high-acid-ash diet followed by sulfathiazole administration helped to clear the urine somewhat, but only temporarily With the discontinuance of the medication the marked pyuria would return.

In September, 1942, x-ray of the abdomen revealed a large calculus, apparently in the lower end of the left ureter Intravenous pyelography performed at this time confirmed this finding (Fig. 1). The patient, however had had no special symptoms referable to this calculus until October 21, 1942. At that time he began to have severe [illegible] gross hematuria, and marked pain in the left lower quadrant of the abdomen. Operation was advised and carried out for the removal of this calculus. After a rather stormy convalescence the patient was discharged from the hospital in the early part of January 1943. He gradually regained [illegible] strength and went to stay at [illegible] for several months.

When he returned to New York in [illegible], 1943, he did so because of the recurrence of very bloody urine accompanied by a [illegible] fever. Culture of the urine still showed the presence of B. proteus and also Staph. albus. [illegible] showed a huge stone [illegible] of the right kidney in addition to one or two other smaller stones in that area. These kidney [illegible] ptosed (Fig. 2)

The patient was [illegible] 1943, and operation was performed for the removal of stones in the pelvis of the right kidney with an attempt to [illegible] The subsequent [illegible]

FIG 3 X-ray taken April 21, 1944, forty-five minutes after the injection of the dye, showing laminated calculus in lower end of the left ureter Note marked improvement in pelvis of right kidney

FIG 4 X-ray taken April 19, 1945, ten minutes after the intravenous injection of the dye, showing another calculus formed at lower end of the left ureter

same as after previous operations Urine cultures taken on April 10, 1944 and April 19, 1944 still showed B proteus At about this time a routine check-up x-ray again showed a large button-like laminated calcified stone in the lower end of the left ureter (Fig 3), and so in May, 1944, the patient was again admitted to the hospital for removal of the obstructing calculus in the left ureter The patient left the hospital after about eight weeks, still with marked pyuria due to B proteus, and this in spite of intensive sulfonamide therapy and adequate doses of penicillin. The latter, of course, was used particularly because of the presence of an intercurrent pulmonary infection with a penicillin-sensitive organism The best results were temporarily obtained by using about 2 Gm. of sulfathiazole daily The urine would clear somewhat but would again become cloudy shortly after the drug was discontinued

On November 16, 1944 urine culture still showed B proteus The patient continued having difficulty with his urine except when he was kept on sulfathiazole medication He also had some burning and pain on urination, and again began to show gross blood in his urine on several occasions On account of the bleeding and because a check-up x-ray examination showed that another calculus had formed in the lower end of the left ureter (Fig 4), readmission to the hospital was advised. In April, 1945, operation was again performed and an attempt was made this time to obliterate the dilated pocket at the lower end of the left ureter, where it was felt that the resulting stagnation of urine was an important factor in calculus reformation After a rather stormy convalescence, complicated by several attacks of severe bleeding, the patient was able to leave the hospital in about ten weeks The urine culture still showed the presence of B proteus, however The next time this patient's urine was cultured was on September 27, 1945, and for the first time B proteus was not present, but instead of this organism, B pyocyaneus was isolated Since then several repeated urine cultures have shown only B pyocyaneus

Further therapy was getting to be quite a problem, and all measures seemed to be only palliative at best It was feared, of course, that if the urinary infection persisted, further calculus formations would probably occur The possibility of using streptomycin was then explored and we proceeded to test the infecting organism cultured from the urine as to its sensitivity to streptomycin Urine culture performed on October 22, 1945 again showed the presence of B pyocyaneus, which was tested and found to be definitely sensitive to this antibiotic The report showed that it was completely inhibited by 2 units of streptomycin per cc It was then definitely decided that this form of therapy was indicated and worth while using in this case

Treatment was started on October 29, 1945 at 8 30 A.M., at which time an initial dose of 500,000 units of streptomycin dissolved in 3 0 cc of pyrogen-free distilled water was given intramuscularly This was followed in three hours by a similar dose, and thereafter 250,000 units dissolved in 2 0 cc of distilled water were given by this route every three

TABLE 1 STREPTOMYCIN ADMINISTRATION

Date	Total Units in 24 Hours	Injections in 24 Hours	Interval
October 29 1945	2,500 000	8	3 hours
October 30, 1945	2,250 000	8	3 hours
October 31 1945	2 000,000	8	3 hours
November 1 1945	1,500 000	6	4 hours
November 2, 1945	1,500,000	6	4 hours
November 3 1945	2 125 000	6	4 hours
November 4 1945	2 125 000	6	4 hours
November 5 1945	2,000,000	6	4 hours
November 6 1945	2 000 000	6	4 hours
November 7 1945	2 000 000	6	4 hours
Total Dosage	20 000 000		

hours for three days and then every four hours for a total period of ten days and until a total of 20 000,000 units had been administered (Table 1) The blood serum (Table 2) and urine concentrations of streptomycin (Table 3) were determined at various intervals as well as urine cultures. Daily blood counts were also done (Table 4) After twenty-four hours of therapy a most dramatic change was noted in the appearance of the urine which changed rather suddenly from a very cloudy, stringy solution to a perfectly clear one. The progress of the case throughout the period of therapy can best be appreciated by reference to the tabulations recorded in the above-mentioned charts. The urine culture taken twenty four hours after the commencement of therapy was sterile and repeated cultures taken during the course of therapy were all sterile (Table 5) *

The patient experienced no toxic reactions from the drug and the only complaint was that associated with the discomfort to be expected from the repeated intramuscular injections.

Discussion

The patient, for a period of almost six years following a transurethral prostatectomy, showed persistent pyuria due to infection and repeatedly developed calculi, which required four major operations for their removal. The infective organism until shortly after the last operation was found to be B proteus, and then for some unexplained reason this organism was displaced by B pyocyaneus. Unfortunately, both these organisms could not be controlled by either sulfonamides or by penicillin Streptomycin therapy was then instituted after it was determined that the organism was definitely sensitive to streptomycin by laboratory tests. The results have been most dramatic and confirm the efficacy of this antibiotic against such infections. No toxic symptoms or untoward systemic reactions were experienced as the result of its use Neither was there any untoward reaction noted on the corpuscular elements of the blood, such as anemia or leukopenia.

The important problem which we faced was trying to figure out the exact dosage to be given to this patient and also the interval between injections, so as to produce the most effective therapeutic results. There was always the danger that if too small a dose were to be used initially a resistance to streptomycin might develop in the infecting organism. The experimental reports were, of course, only suggestive as a guide to dosage Thus, Helmholz's reports[12] were quite interesting in this respect. Our experience with penicillin dosage was not to be relied upon as being of any value because of the difference in the action of the two antibiotics as determined in laboratory animals. It was possible, however, to get some orientation as to dosage by the comparison of these two antibiotics by virtue of the fact that reports have shown that the potency of both these substances can be compared against such an organism as Staph aureus (strain SM), against which both these antibiotics are effective. In this connection it has been found that the growth of this organism is completely inhibited by a concentration of 0.08

* Repeated cultures of the urine up to 3/1/46 still showed sterile, clean urine.

unit of penicillin, whereas the minimal amount of streptomycin that causes complete inhibition is 1 unit per ml of culture medium One can readily see that, based upon such antibacterial activity determinations, one unit of penicillin represents about ten to twelve times as much antibacterial activity as one unit of streptomycin Inasmuch as I had been accustomed to using penicillin with effectiveness in severe infections by giving 50,000 units as the first dose, to be followed by 50,000 units in three hours and then giving 25,000 units every three hours thereafter intramuscularly, I therefore decided to use the equivalent dosage in streptomycin units, i e, 500,000, the first two doses followed by 250,000 every three or four hours thereafter

There are several other points of importance that have to be more clearly understood and which undoubtedly play an important part in the therapeutic evaluation of this antibiotic The most important of these is whether, like penicillin, the dose of streptomycin can be decreased as the treatment progresses It has been found that streptomycin, because of its tendency to produce resistance to it in the infecting organism, must be maintained in fairly adequate dosage throughout the period of therapy and, therefore, the dosage may even have to be increased rather than decreased as the treatment progresses The second point is the relationship of the reaction of the urine to the effectiveness of the streptomycin concentration Foster first called attention to this fact with reference to the sensitivity of streptothricin [16] He found that the effectiveness of streptothricin became increased with an increase in pH This same effect also holds true with respect to streptomycin and it has been found that at least a twofold sensitivity increase occurs with every pH-unit increment, and there even appears to be some indication that this sensitivity may be increased to as high as threefold in the higher pH ranges

Also, it has been found that streptomycin seems to be excreted more slowly by the kidneys than is penicillin and therefore the blood levels are much more stable and can be maintained more readily at an effective level by four-hour intervals between injections or perhaps even at longer intervals The urinary levels, as the result of this, seem to serve as a more sensitive indicator, however, of the effectiveness of the dosage than the blood levels This can be seen by reference to Graph 1, for on November 1 and 2, 1945, when the dosage of the streptomycin was reduced from 2,000,000 to 1,500,000 for the twenty-four-hour period, the urine level dropped from a high of 1,000 units per cc on October 31, 1945 to a low of 500 units per cc on November 1 at 8 00 P M, while the blood level continued to remain at 28 and 30 units With a return to 2,125,000 units intake on November 3 the urine concentration immediately rose again to 800 units, while the blood-serum levels continued to remain the same

After the administration of the first two doses of 500,000 units each at three-hour intervals the blood concentration taken at the five-hour period showed only a concentration of 12 units per cc It reached the level of 25 units after 1,500,000 units had been given and only fourteen hours after the initial dose Unfortunately, no blood level was determined at the nine-hour period The urine reached a concentration of 130 units per cc after 1,000,000 units had been given and 200 units per cc at the five-hour period After the administration of 1,250,000 units and nine hours after the initial dose the urine reached a concentration of 800 units of streptomycin per cc. In other words, adequate therapeutic levels in the urine were reached in this case sometime after the administration of the third dose of streptomycin or between the sixth and ninth

GRAPH 1

hour after the initial dose and after 1,250,000 units had been administered

Blood specimens taken at fifteen minutes, one-half hour, one, two, three, and four hours after injections of the streptomycin dose did not show any significant variations in the concentration of this antibiotic in the circulating blood stream

In other words, the concentration of the streptomycin does not fluctuate during the period between injections, but is maintained more or less within certain limits even when the interval between injections is increased from three to four hours and the dose is decreased The urine levels show a greater degree of sensitivity depending upon such factors as volume of output, reduction in dosage, and time interval between injections

The maximum blood concentration noted in this case was 30 units per cc of blood serum and was obtained in the specimen taken at 5 14 P.M on November 1, 1945 in spite of the fact that beginning at 8.30 A.M on November 1 the interval between injections was increased to four hours, while the dose was kept the same at 250,000 units This effected a change in the total twenty-four-hour dosage from 2,000,000 to 1,500,000 units The reduction did not show its effect on the level of the blood concentration, which even on the next day, November 2, still showed a concentration of 28 units The urine seemed to be more sensitive to the changed dosage as reflected in the concentration at 8·00 P.M on November 1, 1945, which reached a concentration of 500 units During the next twenty-four hours, and while the daily dose was still maintained at 1,500,000 units, the urine concentration was 660 units at 12.30 P.M on November 2 This rose, however, to 800 units at 4·45 P.M on the same dosage Such findings would seem to indicate that a so-called "additive effect" takes place with the administration of this drug

Streptomycin is apparently a drug of low toxicity There is some pain experienced at the site of injection, but this is not any different than with the use of penicillin I encountered no histamine-like response in this case, as has been reported by some investigators and which might perhaps be explained as due to the use of inadequately purified materials Such impurities usually give rise to throbbing headaches and flushing of the skin There was also no sensitiveness to the preparation noted, although some observers have reported an acquired sensitization to the drug, so that if after an interval of a few weeks, streptomycin therapy was resumed, severe febrile reactions would be encountered

These patients responded, however, to desensitization routine Hinshaw also reports transient deafness in 1 patient and vestibular disturbances in 3 patients receiving prolonged therapy with streptomycin.[12] Some peripheral neuritis has also been reported

The importance of the possibility of using streptomycin as a prophylactic agent in most of the cases undergoing prostatectomy and other genitourinary surgery is worth considering Most of the cases of prolonged pyuria, due particularly to the very tenacious B proteus and B pyocyaneus, may thereby be greatly reduced if not completely eliminated

Summary and Conclusions

1 A case is reported of prolonged urinary infection extending over a period of almost six years, with calculus formation necessitating repeated surgical interference

2 The infecting organism was at first B proteus, which was subsequently displaced by B pyocyaneus

3 All therapeutic measures that had been tried were ineffective in clearing up this condition

4 A most dramatic response was obtained with the use of streptomycin with complete clearing of the urine, twenty-four hours after the commencement of the therapy, during which 2,500,000 units of streptomycin were administered This patient received altogether a total of 20,000,000 units over a period of ten days

5 No toxic manifestations were noticed as the result of using this antibiotic

The streptomycin determinations in our studies were carried out under the direction of Dr Gregory Shwartzman, bacteriologist to the Mt. Sinai Hospital, in New York City, to whom I am indebted for the making of these determinations I also wish to acknowledge my appreciation to Miss Beatrice Toharsky for her kind cooperation

PLAGUE AUTHORITY SAYS LEPROSY IS NO LONGER A "HORROR" DISEASE

Approximately four hundred persons in the United States are suffering from leprosy, one of the oldest of known diseases, and N E Wayson, M D , noted plague authority in the U S Public Health Service, says that in view of modern medical concepts it is folly to associate horror and superstition with the disease

Writing in the September issue of *Hygeia*, the health magazine of the American Medical Association, Dr Wayson says that "the condition of nearly all patients improves definitely within a short period after entering a well-conducted hospital An increasing percentage of patients in these hospitals are discharged as arrested and return to their home environments and useful occupations"

Dr Wayson, who once served as director of the Leprosy Investigation Station in Honolulu, says that leprosy is now considered an infectious disease, caused by a germ or micro-organism which enters the body through either the nose or throat or skin and may be distributed throughout all the tissues of the body

"This particular bacterium," the article said, "can be found in the tissues in various forms of the disease and has been accepted as its cause for that reason, although it is not discovered in every lesion or tissue change appearing during the course of the disease However, at present there is no accepted proof that this bacterium has ever been grown in test tubes in the laboratory, nor that the disease has been produced artificially in man or in lower animals by inoculation

"The onset of leprosy is insidious and without a characteristic evolution which permits determination of the time it invades the body, nor the length of time it has been incubating in the tissues before it becomes evident

"Bones of the fingers or toes may soften, shrink, or even break spontaneously When acute inflammation occurs in and around nerves, severe pain is produced, but leprosy is otherwise a relatively painless condition"

Dr Wayson points out that the course of the disease may be short or it may continue for as many as fifty years Arrest may come in the early stages, or later

"Only a relatively small percentage of leprous persons can be said to die of leprosy," he said "A large proportion die because of intercurrent afflictions Many die of tuberculosis and disease of the kidneys

"So far as is known, leprosy is communicated directly from those in whom the disease is active, and not from those who have had it and have recovered, even though they are crippled and scarred The conclusion is reached that leprosy is not easily communicated from the sick to the well Under conditions which are favorable to the communication of leprosy, as high a percentage of children of a household may contract the disease as would contract tuberculosis under conditions conducive to its spread

"Hygiene and treatment which contribute to the support and well being of the patient are beneficial in practically all cases Measures which restrict or eliminate association with well people, and particularly with children, reduce the likelihood of the occurrence of new cases"

THE CONSERVATIVE TREATMENT OF PILONIDAL CYST

B G P Shattuck, M.D., and H Doubilet, M D, Brooklyn, New York

NOTWITHSTANDING the special technics and modifications introduced in recent years, the treatment of pilonidal cyst by radical excision has not proved completely satisfactory from the standpoint of either civilian or military surgery Analysis of the published follow up reports revealed that in general the various surgical methods had caused an excessive loss of man-days, prolonged convalescence, and had led to a high incidence of recurrences Thus, critical reports have shown that in one year the Navy lost 36,150 man-days due to pilonidal cyst.[1] Hospitalization following surgery varied from thirteen to twenty-five days when primary suture and radical excision were done and averaged seventy-seven days when the wound was permitted to close by granulation Recurrences varying from 5 4 per cent to 23 2 per cent have been reported[2 3] and painful scars were found to occur in 36 per cent of the cases.[4] As a result there has been an increasing tendency in recent years to swing away from radical surgical extirpation as a means of solving this vexing problem, and an increasing search for a more conservative nonoperative treatment.

Sclerotherapy for pilonidal cyst was recommended in 1933,[5] in 1939,[6] and again in 1942[7] However, this procedure did not meet with general acceptance, since the factor of chronic tissue infection seemed to prevent total obliteration in a significant number of pilonidal cysts With the advances in chemotherapy a wide variety of topical antiseptics as well as sulfonamides[8–10] were tried in combination with the radical excision and primary suture of pilonidal sinus These various modes of treatment also resulted in many failures, due to the ineffectiveness of the antiseptic drugs, and further indicated that local tissue infection was a potent cause of recurrence.

The present clinical investigation was intended as a preliminary report on the effect of a penicillin-sodium morrhuate mixture in the treatment of pilonidal cyst. The local use of penicillin and its antibiotic properties have been well established More significantly, the bacterial flora of pilonidal cyst, as reported by both Shute[11] and Scott,[9] have included many organisms now known to be susceptible to penicillin inhibition As regards the sodium morrhuate solution, its value as a sclerosing agent because of its necrobiotic and fixative properties has been well established, particularly for the obliteration of varicose veins In vitro, penicillin dissolved in sodium morrhuate solution was found to maintain the same antibacterial activity as when dissolved in water or normal saline solution. This was demonstrated by a series of special laboratory tests employing the agar-cup technic in which penicillin-sodium morrhuate solution was used as the test medium

Three types of pilonidal cyst were treated (1) the noninfected pilonidal cyst, (2) the infected pilonidal cyst with one or more discharging orifices, and (3) the pilonidal abscess In every case, established surgical principles were observed when necessary, such as incising the roof of the cyst, simple incision and drainage of abscess pockets, removal of internal hairs, and curettement of necrotic lining membrane

The penicillin-sodium morrhuate solution was prepared by adding 5 cc of 5 per cent sodium morrhuate solution to 100,000 units of the dry penicillin in its rubber-stoppered vial Penicillin was readily soluble in sodium morrhuate solution Injections were made directly into the cyst or sinus tracts using a 2 cc syringe with a 20-gage or other suitable-sized cannula. The amount of solution injected varied with the size of the cavity or sinus Usually 1 cc of solution was sufficient for the first injection Later, as sclerosis progressed, smaller amounts were sufficient. In the acute case with abscess formation, the cavity was incised or unroofed and cleansed thoroughly of all necrotic tissue. It was then packed with a flat 2 by 2 gauze kept moist with the penicillin-sodium morrhuate mixture Early in this investigation the sinus tracts were injected twice daily in patients admitted to the hospital. Later it was found that an injection once daily or every other day was equally effective It was then evident that the entire treatment could be carried out on ambulatory patients seen in the clinic. The penicillin-sodium morrhuate solution was well tolerated and painless even when frequently repeated No anaphylactic or cutaneous reactions were observed in this series as a result of its use.

A total of 27 consecutive cases were treated by the previously described methods Ten of these were recurrences after radical surgery, including 3 cases with a history of three recurrences after three surgical operations. In 4 patients activity of the pilonidal cyst recurred after conservative surgical drainage for abscess formation. The other 13 cases were untreated

cases exhibiting either the characteristics of an active pilonidal cyst or were referred for surgery because of pilonidal abscess Cultures from the pilonidal area were taken in every case, both before and after treatment

The organisms usually recovered from the cultures of the pilonidal sinuses were Staphylococcus aureus, Staph albus, hemolytic micrococcus, anaerobic hemolytic streptococcus, Bacillus proteus, and B subtilis After the first or second injection the cultures failed to show any growth A minimum of four up to a maximum of forty-six injections were required for the complete obliteration of the pilonidal cysts in this series The maximum amount of penicillin used for any one case was 1,190,000 Oxford units The average amount of sodium morrhuate solution was 7 0 cc After two to three injections, drainage from the orifices subsided rapidly and decreasing amounts of the solution were required The sacrococcygeal area became firm, the external skin lost its tenderness and remained dry No patient was discharged until the "pilonidal area" was regarded as clinically healed, the manifestations of which were closure of the orifices so that a probe could not be inserted, the absence of sensitivity to palpation, and the failure on pressure to express any fluid Follow-up observations over a three-month period showed recurrences in only 4 cases These were characterized by a slight discharge, for which additional injections were given to obtain complete obliteration

Case Abstracts

Case 1—In hospital thirty days Injections, thirty Total solution, 15 cc Penicillin dosage, 1,190,000 units Three previous surgical excisions, wide irregular undermined scar, 7 5 × 2 6 cm , with multiple orifices

Case 2—In hospital fifty-four days Injections, forty-six. Total solution, 20 8 cc Penicillin dosage, 1,752,000 units Three previous surgical pilonidal operations, midline scar 10 cm. long, lower half of scar undermined, drainage from two sinus openings Unroofed and packed with penicillin-sodium morrhuate solution

Case 3—In hospital fourteen days Injections, fourteen. Total solution, 4.8 cc Penicillin dosage, 475,000 units Recurrent drainage for past ten years Three fine midline sinus openings, one sinus tract extended 1 5 cm into left buttock

Case 4—In hospital twenty-four days Injections, twenty-six Total solution, 10 5 cc Penicillin dosage, 795,000 units Incision and drainage of pilonidal abscess one year ago, two midline sinus openings, one sinus tract 2 5 cm to left of midline draining yellowish fluid.

Case 5—In hospital eleven days Injections, eleven Total solution, 5. cc Penicillin dosage, 500,000 units. Pilonidal abscess draining spontaneously Unroofed and packed with penicillin-sodium morrhuate solution.

Case 6—In hospital fifteen days Injections, twenty Total solution, 8 8 cc Penicillin dosage 947,000 units Persistently draining pilonidal abscess originally treated elsewhere by incision and drainage Unroofed and packed with penicillin-sodium morrhuate solution.

Case 7—In hospital seven days Injections, seven Total solution, 2 cc Penicillin dosage, 200,000 units Tenderness and drainage from sacrococcygeal area for past fourteen months, two midline sinus openings, one sinus tract extending 1 cm to left of midline

Case 8—In hospital thirty-six days. Injections, twenty-four Total solution, 5 cc Penicillin dosage, 487,000 units Chronic persistent drainage after two surgical excisions

Case 9—In hospital twenty-seven days Injections, twenty-seven Total solution, 5 2 cc Penicillin dosage, 583,000 units Untreated pilonidal cyst with history of drainage for three years One deep sinus tract 3 cm deep On pressure foul yellow pus was expelled

Case 10—Outpatient Injections, seven. Total solution, 1 2 cc Penicillin dosage, 112,500 units Original surgical excision of pilonidal cyst followed by incision and drainage of recurrent pilonidal abscess At examination a sinus tract 3 cm long was found near the end of the midline scar

Case 11.—Outpatient Injections, seven. Total solution, 1 2 cc Penicillin dosage, 112,500 units Small untreated pilonidal cyst with one fine orifice in midline sinus tract

Case 12—In hospital nineteen days Injections, three Total solution, 1 8 cc Penicillin dosage, 181,250 units Recurrence after one surgical excision of pilonidal sinus Operative scar partially opened

Case 13—In hospital eighteen days Injections, thirteen Total solution, 1 7 cc Penicillin dosage, 170,000 units Recurrence after one surgical excision with breakdown of scar and drainage

Case 14—In hospital ten days. Injections, ten. Total solution, 7 5 cc Penicillin dosage, 800,000 units Pilonidal cyst with abscess formation extending to left buttock for a distance of 3 5 cm in addition to three other sinus openings injected

Case 15—In hospital nine days Injections, nine. Total solution, 9 cc Penicillin dosage, 900,000 units Untreated pilonidal cyst with abscess Abscess 4 × 2 cm incised and treated with penicillin-sodium morrhuate solution

Case 16—In hospital fourteen days Injections, twelve Total solution, 6 cc Penicillin dosage, 600,000 units Recurrence after incision and drainage of pilonidal abscess twice repeated

Case 17—In hospital eight days Injections, eight. Total solution, 5 cc. Penicillin dosage, 500,000 units New untreated pilonidal cyst. Tract curetted

Case 18—In hospital twenty-one days Injections, sixteen. Total solution, 20 cc. Penicillin dosage, 2,000,000 units Recurrence after three radical surgical procedures Orifices injected and obliterated by injections

Case 19—In hospital eleven days. Injections, five. Total solution, 10 cc. Penicillin dosage, 1,000 000 units. Recurrence of two sinus tracts after radical operation.

Case 20—Outpatient. Injections, twelve. Total solution, 8 cc. Penicillin dosage, 800 000 units New untreated pilonidal cyst with four orifices.

Case 21—Outpatient. Injections, ten Total solution, 5 cc. Penicillin dosage, 500,000 units New untreated pilonidal cyst with central orifice and orifice leading to right buttock

Case 22—Outpatient. Injections, twelve. Total solution, 8 cc. Penicillin dosage, 800,000 units Recurrence after conservative incision and drainage for abscess six months ago

Case 23—Outpatient Injections, fourteen Total solution, 6 cc. Penicillin dosage, 600,000 units. Pilonidal abscess treated by incision and drainage and packing with penicillin-sodium mor rhuate solution.

Case 24—Outpatient. Injections, six. Total solution, 3 cc. Penicillin dosage, 300 000 units. Pilonidal abscess one year after radical excision. Treatment by incision and drainage and packing with penicillin-sodium morrhuate solution

Case 25—Outpatient. Injections, four Total solution, 3 cc. Penicillin dosage, 300 000 units. Untreated pilonidal sinus. Injections through central orifice

Case 26—Outpatient. Injections, fourteen. Total solution, 10 cc. Penicillin dosage, 1,000,000 units. Large untreated pilonidal sinus with five discharging orifices.

Case 27—Outpatient. Injections ten Total solution, 5 cc. Penicillin dosage, 500,000 units. Recurrence after surgical excision Orifices injected with penicillin-sodium morrhuate solution

Summary

Twenty-seven patients with pilonidal cyst, pilonidal sinus, or abscess were treated by conservative surgical methods and the local injection or application of a penicillin-sodium morrhuate solution Twenty-three of these patients showed no evidence of recurrence during a three-month period of observation The remaining 4 patients showed a slight recurrence which was treated successfully by further injections.

TWO-YEAR BLOOD PLASMA SUPPLY FREE

Enough blood plasma to meet civilian needs for perhaps two years will be distributed throughout the country for use without charge.

The distribution is being arranged by the American Red Cross. The Army and Navy have declared surplus 1 250 000 units. This amount represents some 2,000,000 blood donations made to the armed forces through the Red Cross.

Howard T McNamara, chairman of the Broome County Red Cross Chapter explained that the plasma used in this area will be distributed to the North Atlantic Area warehouse in New York City and then made available to veterans' hospitals, civilian hospitals, and doctors by the State Department of Health

No charge will be made by the Red Cross for the product or for shipment. Each package will bear a statement to the effect that the plasma has been declared surplus by the armed forces, Mr McNamara said

A plan for the distribution of the plasma will be made by the state medical societies, state hospital associations and the Red Cross. The initial shipment will be a three-month supply, with replacements made upon request of the State Health Department. Distribution will be made upon the basis of population and number of doctors and hospitals.

The Veterans A [illegible] furnished with a five-year supply of pl [illegible]

PROBLEMS OF PEPTIC ULCER IN THE ARMED FORCES AND IN THE RETURNED SOLDIERS*

ABRAHAM L GARBAT, M D , New York City
(Director in Medicine, Service 1, Lenox Hill Hospital)

WE USE the term "peptic ulcer" to include both gastric and duodenal ulcer We realize, however, that it is not an ideal term, because gastric and duodenal ulcers are not derivatives of the same cause and they have different effects upon the gastric physiologic mechanism [1]

What Is the Incidence of Ulcer in the Armed Forces?

Gastroduodenal ulceration has been a most important medical disorder in the armed forces of all the nations Complete statistics are naturally not yet available, but enough has already been published to bear out this statement In the British Army the incidence is high [2] Up to January, 1942 the number of patients discharged from the Army on account of peptic ulcer totaled 23,574 [3] Tidy[4] reports the occurrence of 55 per cent of peptic ulcer in patients hospitalized for dyspepsia Hurst,[5] quoting Payne and Newman,[6] records this figure as 79 per cent in the early days of the war The Germans reported an incidence of 33 per cent [7] Estimates from American Army hospitals are also high Berk and Frediani[8] noted gastroduodenal ulceration in 41 per cent of patients admitted to the gastrointestinal service of the Tilton General Hospital from September, 1941 to March, 1944 This approximates the reports from other general hospitals,[9] although some statistics are lower

There may be some disparity according to the locality and type of hospital from which the report comes, but in general it may be said that 10 per cent of all medical hospital admissions are gastrointestinal cases, and 1 per cent of all medical admissions are due to ulcer It is interesting to note that high incidences appear among troops that are stationed in zones protected from combat, as well as among troops that are placed in active combat and field positions In one report,[8] ulcer constituted 39 9 per cent of the admissions to the gastrointestinal service in enlisted personnel before the North African campaign began, and was 40 5 per cent during the following sixteen months of the active campaign Captain Berk[10] made an interesting observation that ulcer symptoms did not appear when the soldiers were in active combat for their lives, but did appear when they were removed to rest areas after hostilities ceased The same was also noted in a group of German soldiers whose recurrent ulcer symptoms appeared in higher percentage when they were merely on patrol duty than when they were on active combat It would be more enlightening if we could have comparative statistics regarding the incidence of ulcer in civilians of the same young age group under ordinary circumstances Possibly, these high Army figures may be a reflection of increased prominence of peptic ulcer also in civilian life, or, possibly, they may be due to improvements in our methods of diagnosis Be that as it may, the frequency of peptic-ulcer symptoms among the fighting men reflects the importance that this problem will present to the medical profession when the men come home Among veterans, peptic ulcer is the most common digestive disease In 1940 there were 4,356 service-connected cases with 454 additional nonservice-connected cases These drew total monthly awards for compensation of $176,371 [11]

What Are the Factors That May Account for the High Incidence of Ulcer in the Fighting Forces?

The factors that account for this high incidence of ulcer in the fighting forces are, first and most important, the changed emotional status that the ulcer-susceptible inductee becomes exposed to in his new surroundings Almost daily he may sustain mental trauma from states of anxiety, fear, hostility, disappointment, depression, revenge, hatred, etc In addition, natural features of Army life may help to bring about nervous imbalance e g , the state of physical and mental fatigue, the feeling of authority and subordination, the conflict between one's instinct of self-preservation and the desire to do one's duty, the problem of sexual frustration and maladjustment, etc [12] These various new emotional states bring about psychophysiologic alterations in the gastric mucosa and gastric nerve supply that are conducive to ulcer formation We older practitioners had always known the great role that the nervous factor played in the origin of ulcer, but it required the well-sounding term "psychosomatic disease" to have this relationship recognized by the younger physicians and the laity

Second, the factor of the Army diet has to be considered I personally ascribe a great deal of harm to an incorrect diet, especially if associated with nerve strain The different foodstuffs and their mode of preparation have various effects

* Read at the Hospital Clinic of the Eighteenth Graduate Fortnight of the Academy of Medicine, October 15, 1945

upon the gastric emptying time, upon gastric spasm, upon the quantity of stimulated gastric secretion, and its degree of acidity One may also consider a possible allergy as the cause for a gastric upset after the taking of a particular foodstuff Then, too, hurried and intemperate eating when one is worried or angry is very harmful, and the overuse of tobacco, coffee, or alcohol will add insult to injury Attention cannot be paid to these details even if soldiers are on limited duty

Did the Ulcer Patients in Service Develop Their First Symptoms During the War, or Did They Already Have Complaints Before They Were Inducted?

No individual was accepted into the Army when he presented to the induction board definite evidence of having or having had an ulcer The specialists reviewed the patient's history, letters from his physician, and x-ray plates, and attempted to distinguish between functional and organic complaints, but during the early days of the draft, the call for men was so acute that the importance of digestive discomforts did not receive equal and sufficient consideration by all examining boards

From the American Army reports, Berk and Frediani[9] collected a group of statistics which showed that 88 to 95 per cent of all military personnel with ulcer had digestive symptoms prior to their entry into military service In their own series it was 74 per cent Rush[13] reported only 50 per cent, Chamberlin,[8b] 69 per cent. In the British Army, Tidy[14] states that 81 per cent of the ulcer patients seen in the hospitals had the onset of the dyspepsia in civilian life. As for the duration of the symptoms prior to induction, it varied anywhere from eight days to twenty years. In Berk and Frediani's group of inductees, 59 per cent informed their induction board of their digestive difficulties Almost half of this group claimed to have had symptoms at the time of their appearance before the Board Morrison[15] similarly found that 50 per cent of the inductees informed their board of digestive symptoms or furnished evidence which would lead to the diagnosis of ulcer

What Was the Disposition of the Soldier When He Had Digestive Complaints, and Afterwards When a Diagnosis of Ulcer Was Made?

When the complaints were minor, the soldier was treated in the dispensary, but as soon as the soldier had persistent digestive discomforts, he was hospitalized The average length of service prior to the first hospitalization differed in the various series reported Thus, C
Kerr[16] reported that 70 per cent of symptoms two months after entering the Army, and the remaining 30 per cent within eight months, Morrison[15] found that one fourth complained within the first six months, and 65 per cent within the first twelve months In contrast to the rapid appearance of ulcer distress in new inductees, in the Regular Army personnel afflicted with ulcer, the average duration of service before the first hospitalization was about four years

Once peptic ulcer was definitely established, the disposition of the soldier differed somewhat in the different areas of warfare and at the different periods of the war Usually, as soon as the diagnosis of peptic ulcer was definitely established the soldiers were prepared for a medical discharge to take place on the completion of their course of hospital treatment. In some areas the policy was more liberal The soldiers with uncomplicated ulcer whose symptoms first appeared while in service or whose services were considered essential were returned to limited duty when their symptoms cleared up Many remained well, but very soon it was found that many would come back again and again, with the same symptoms, as long as they were on any duty, even though they continued to obtain feeding between meals and were able to continue to take their medication Presumably, they were exposed to the same causative factors, though to a lessened degree

One report[17] followed up 40 patients who had been treated in the hospital until the healing process was completed, only to find that 60 per cent had a recurrence of symptoms within two months after the return to duty in England In another report of 537 ulcer cases collected by Walters and Butt[18] from various Naval hospitals, 25 per cent had repeated hospitalizations for treatment. Of 16 patients who were operated upon for perforated peptic ulcer,[19] 4 were returned to noncombat duty after repair of the ulcer, and within twelve months all four had a recurrence of symptoms This would not be surprising if physicians would only realize that it takes anywhere between six and eighteen months for an ulcer to actually heal In the more recent stages of the war, enlisted personnel were not returned to limited duty, but were discharged from the service However, officers, particularly if their work was considered very essential, were often retained in service on limited duty, if their difficulties persisted, then they, too, received a medical discharge. Several such officers are now under my treatment. I am convinced that their complaints were kept up by mental stress, which did not begin to less-- [illegible] entirely out of the service.

In the light of such

PROBLEMS OF PEPTIC ULCER IN THE ARMED FORCES AND IN THE RETURNED SOLDIERS*

ABRAHAM L GARBAT, M D , New York City
(Director in Medicine, Service 1, Lenox Hill Hospital)

WE USE the term "peptic ulcer" to include both gastric and duodenal ulcer We realize, however, that it is not an ideal term, because gastric and duodenal ulcers are not derivatives of the same cause and they have different effects upon the gastric physiologic mechanism [1]

What Is the Incidence of Ulcer in the Armed Forces?

Gastroduodenal ulceration has been a most important medical disorder in the armed forces of all the nations Complete statistics are naturally not yet available, but enough has already been published to bear out this statement In the British Army the incidence is high [2] Up to January, 1942 the number of patients discharged from the Army on account of peptic ulcer totaled 23,574 [3] Tidy[4] reports the occurrence of 55 per cent of peptic ulcer in patients hospitalized for dyspepsia Hurst,[5] quoting Payne and Newman,[6] records this figure as 79 per cent in the early days of the war The Germans reported an incidence of 33 per cent [7] Estimates from American Army hospitals are also high Berk and Frediani[8] noted gastroduodenal ulceration in 41 per cent of patients admitted to the gastrointestinal service of the Tilton General Hospital from September, 1941 to March, 1944 This approximates the reports from other general hospitals,[9] although some statistics are lower

There may be some disparity according to the locality and type of hospital from which the report comes, but in general it may be said that 10 per cent of all medical hospital admissions are gastrointestinal cases, and 1 per cent of all medical admissions are due to ulcer It is interesting to note that high incidences appear among troops that are stationed in zones protected from combat, as well as among troops that are placed in active combat and field positions In one report,[3] ulcer constituted 39 9 per cent of the admissions to the gastrointestinal service in enlisted personnel before the North African campaign began, and was 40 5 per cent during the following sixteen months of the active campaign Captain Berk[10] made an interesting observation that ulcer symptoms did not appear when the soldiers were in active combat for their lives, but did appear when they were removed to rest areas after hostilities ceased The same was also noted in a group of German soldiers whose recurrent ulcer symptoms appeared in higher percentage when they were merely on patrol duty than when they were on active combat It would be more enlightening if we could have comparative statistics regarding the incidence of ulcer in civilians of the same young age group under ordinary circumstances Possibly, these high Army figures may be a reflection of increased prominence of peptic ulcer also in civilian life, or, possibly, they may be due to improvements in our methods of diagnosis Be that as it may, the frequency of peptic-ulcer symptoms among the fighting men reflects the importance that this problem will present to the medical profession when the men come home Among veterans, peptic ulcer is the most common digestive disease In 1940 there were 4,356 service-connected cases with 454 additional nonservice-connected cases These drew total monthly awards for compensation of $176,371 [11]

What Are the Factors That May Account for the High Incidence of Ulcer in the Fighting Forces?

The factors that account for this high incidence of ulcer in the fighting forces are, first and most important, the changed emotional status that the ulcer-susceptible inductee becomes exposed to in his new surroundings Almost daily he may sustain mental trauma from states of anxiety, fear, hostility, disappointment, depression, revenge, hatred, etc In addition, natural features of Army life may help to bring about nervous imbalance e g , the state of physical and mental fatigue, the feeling of authority and subordination, the conflict between one's instinct of self-preservation and the desire to do one's duty, the problem of sexual frustration and maladjustment, etc [12] These various new emotional states bring about psychophysiologic alterations in the gastric mucosa and gastric nerve supply that are conducive to ulcer formation We older practitioners had always known the great role that the nervous factor played in the origin of ulcer, but it required the well-sounding term "psychosomatic disease" to have this relationship recognized by the younger physicians and the laity

Second, the factor of the Army diet has to be considered I personally ascribe a great deal of harm to an incorrect diet, especially if associated with nerve strain The different foodstuffs and their mode of preparation have various effects

* Read at the Hospital Clinic of the Eighteenth Graduate Fortnight of the Academy of Medicine, October 15, 1945

must disappear entirely before a patient can be considered cured On the other hand, there will be cases in which roentgen plates will not show a definite crater, but only a markedly and persistently deformed duodenal cap This may be indicative of superficial ulceration, or only erosion, or even only duodenitis, but ulcer treatment should be instituted, because these conditions require just as careful management as if a crater were demonstrated I have often been asked, "Can one get along with fluoroscopic examination alone, and omit the taking of films?" My answer to that is, almost without reservation, 'No" After one has interpreted x-ray plates for many years, and one has noted how often one is in doubt whether a crater is present or not, one must come to the conclusion that as a general method for diagnosing gastroduodenal lesions, fluoroscopy alone is insufficient and inaccurate All roentgenologists naturally include careful fluoroscopy in their roentgen examination

(b) Is it worth while to perform a routine gastric analysis in patients complaining of gastric discomforts? The question has brought up a good deal of discussion. A number of authorities have expressed the opinion that this examination is not of sufficient deciding importance, and should be entirely discarded in military hospitals.[12] Others disagree with this viewpoint. I see no reason for having one standard for Army hospitals and a different one for civilian practice Personally, I would consider any gastrointestinal examination incomplete if I did not include a routine gastric analysis, if only for one of many reasons, namely, that the finding of an anacidity helps to eliminate the probable diagnosis of an ulcer, and such experiences are not too infrequent.

Then, too, the estimation of the quantity of gastric secretion and the degree of the gastric acidity at the time of the acute ulceration when compared with the findings later on when the symptoms are quiescent, are helpful facts in deciding when the duodenal ulceration is healed [1] It is not necessary to do a fractional gastric analysis, a one-time complete extraction after a Boas-Ewald test meal is sufficient. The fractional method should be resorted to only if the Ewald test shows an anacidity or a subacidity

In What Physical State Will We Find the Discharged Soldier with Ulcer When He Returns Home?

The returnees who had ulcer while in service will fall into different classes according to their physical state when coming home. At many of the Army general hospitals no attempt is made to prolong hospitalization of the uncomplicated ulcer patient Every patient on discharge is given to understand that, despite the fact that he is no longer being hospitalized, it is by no means considered that his ulcer is cured He is given a booklet containing an outline type of dietary and rules of living and he is strongly urged to place himself in the hands of a physician in civil life.[13]

(1) First, there will be a group coming home who will be feeling perfectly fine and without any complaints. They will have had a complete examination before their discharge, and their ulcerative process will have been found improved or cleared up If these men come to their family physician at all, they will simply need advice pertaining to the prevention of recurrence of the ulcer, they should be told to come back for a general check-up in three or four months From a morale standpoint, it is wise not to fuss with them unnecessarily The fact that they are no longer under military routine will be an additional aid for their well-being.

(2) Another group coming home will be feeling well, but their last check up in the Army still showed activity of the ulcer These individuals should be continued on the dietetic and medicinal ulcer regimen, and be followed up at regular intervals.

(3) Another group will come back with vague digestive complaints, but after being home for a little while, their difficulties will disappear, in these, the discomforts were being kept up by emotional factors of military life, and once these were entirely removed, the symptoms disappeared Unless their army medical check up had been done recently, these men should undergo careful study to determine whether any organic lesion coexists, and obtain appropriate management

Similarly in civilian life, I have had individuals with continuous suffering after every meal, even though on a very careful regimen, who would lose every bit of their discomfort as soon as they would board a train for a holiday, away from the source of their emotional irritation

(4) Finally, there will be a group who will persist with digestive discomforts even after they are comfortably settled at home Their continued illness may be due to either a continuation of their emotional imbalance, with or without an uncomplicated ulcer, or to the presence of a refractory ulcer It may be infrequent, but some returnees become emotionally ill only after returning home, they may develop new conflicts due to failure in adaptation to the home environment of family or love life, they may become apprehensive concerning new duties, or fear of their future, their personalities may even have been altered by overseas experiences.

How Are We to Determine Whether an Emotional Factor Still Exists or Is Playing a Role, and How and by Whom Is It to Be Treated?

One would expect that the problems which were considered to be major causative factors in military life, would disappear when the boys come home I refer to the previously mentioned emotional states of fear, anxiety, hostility, resentment, etc In the great majority of the returnees, these disturbing mental attitudes *will* disappear, but in many, the effects leave an emotionally unstable person who will need help

If the family physician or gastroenterologist is patient and understanding, he will have no difficulty in determining from simple conversations with the soldier whether or not there still exists a psychogenic factor If it does, and there is an active ulcer in addition, the physician will be confronted with several decisions should he alone continue to treat the patient, or should he only supervise the ulcer management and refer the patient to someone else for psychotherapy, or should he hand over the patient entirely to the psychotherapist? I definitely do *not* advise the last course, I consider the medicinal and dietetic management of the ulcer to be of paramount importance, and there are few if any psychotherapists who are sufficiently versed in the medical treatment of ulcer to be entrusted with the entire responsibility, the problems of the ulcerative process are too complex to be treated entirely from a psychogenic approach The conjoined treatment by the medical man and the psychiatrist, each supervising his own field, is not, as a rule, satisfactory One will often infringe on the territory of the other, an innocent expression by one or the other would only confound the patient all the more, many of the psychiatrists are not adjusted to be able to work in conjunction with the medical man

It is my opinion that in the great majority of the emotionally unstable ulcer patients the medical man alone is best fitted to take entire care of the patient Not all emotional disturbances are psychiatric problems, and not all of the psychogenic problems of the ulcer patients are deeply hidden, usually they are quite evident and do not require major psychotherapy Minor psychotherapy is usually sufficient, and can be carried out by the attending physician, provided, and this is most important, that the personality of the general practitioner or the gastric specialist is adapted for such work He must be able to devote sufficient time to the patient for him to tell his story in his own detailed way, and guide him here and there by careful conversation and casual questioning The physician cannot be in a hurry, he must take his time, he cannot be impersonal, he must demonstrate sincere interest in the soldier, he must create the impression that, at the moment, only the *patient's* problems are vital and nothing else, he must have good human understanding and human judgment, he must impress the patient with the significance that his symptoms may have arisen after some mental trauma If we do not succeed by this simple method of so-called mental catharsis, or if by an analysis through the question and answer technic we are still at a loss as to a logical interpretation of the patient's complaints, or if simple rationalization of the rudimentary difficulties were not sufficient for the patient to accept this better understanding of his illness, then we must recognize that more complicated influences may be involved, such as hereditary factors, or early life occurrences, or that a real mental disease may exist *Such* problems will require *major* psychotherapy in the form of deeper analysis and more powerful suggestion This belongs to the realm of a suitable psychiatrist and the patient should be referred to him for special treatment, but the medical man must continue to supervise the dietetic and medicinal therapy

Before leaving this particular subject, I must sound a word of warning not to permit the pendulum of the recent psychosomatic trend to swing too far this way As a result of such popularity I have already observed unfortunate happenings, where purely organic disease has been overlooked. The general public has generously adopted the well-sounding term "psychosomatic disease" We of the older school have always understood the close union between mind and body, and for many years have treated our patients from both angles There is nothing new or mysterious about this relationship A recently published, excellent book on psychosomatic medicine very lucidly expresses the situation [24] "The mere discovery of unpleasant circumstances in the life situation of an individual is no indication of emotional complications, and still less of the psychogenic origin of the difficulty"

What Are the General Rules an Ulcer Patient Should Follow in Order to Avoid a Recurrence?

I believe that a proper diet is an important mainstay not only in the treatment of ulcer, but in the prevention of recurrences I have outlined such a hyperacidity diet in a recent publication [25] It is based on the principles that the permitted foods do not stimulate an excessive amount of gastric secretion, but bind a good deal of the acidity, that they do not stay in the stomach too long, nor mechanically irritate the gastric mucosa At the same time, the diet is sufficient in calories and vitamins There may have to be

modifications to suit the individual case, but all in all, it can be a pretty well-fixed dietetic regimen Feedings of milk or other soft food such as custards should be taken as regularly as possible between meals, in the middle of the morning, the middle of the afternoon, and before retiring

In addition to the adherence to a proper diet the strict elimination of improper foods as well as the prohibition of strong alcoholic drinks, excessive coffee, or tobacco is important

Excessive physical fatigue or exposure to respiratory infections must be avoided

Use of an antacid should be routine Some gastroenterologists do not rely much on antacid medication as an adjunct in the treatment of gastroduodenal ulceration My experience has definitely taught me that symptomatic improvement, and probably pathologic improvement of the ulcer, is greatly enhanced by the routine use of antacids, nerve sedatives, and antispasmodics Neutralization of hyperacidity lasts only so long as the patient takes his antacids The high-acid figures will return again as soon as medication is stopped if the duodenal ulcer is not healed [1] When the ulcer is active and the patient is on an hourly or two-hourly feeding schedule, antacids should be given every two hours, nerve sedatives and antispasmodics every four hours, and also during the night if the patient is awake, but at all events a liberal dose of antacid should be administered just before retiring When the patient is on a more normal schedule of three meals a day, antacids should be taken three times a day, either one half hour before meals, or one hour after meals, and always just before retiring At this stage, sedatives and antispasmodics should be administered only if indicated, and not routinely as in the early stages of the ulcer treatment

The patient must keep away from emotional upsets, either of an acute nature or a chronic persistent annoyance All of us have noted the occurrence of sudden gastric hemorrhage in ulcer patients exposed to an unexpected and severe mental strain Alvarez has published several such striking examples [2] Just recently a patient of mine, who had been perfectly well and free of ulcer symptoms for over twenty years, suddenly suffered a severe gastric bleeding several hours after he heard over the radio of the death of President Roosevelt. In instances in which the patient knows that he has experienced an acute mental shock of a major magnitude, Alvarez advises that the individual take milk or other simple feedings and antacids hourly during that whole night. Similarly, if an ulcer patient knows that he has to go through a protracted period of mental anxiety, I have proposed that he adhere to an hourly or two-hourly schedule of feedings made up of bland foodstuffs, such as are included in the early stages of my fixed ulcer regimen milk, eggs, custard, junket, jellos, cereals, cream soups, baked potato, noodles, rice, spaghetti, cream cheese, melba toast. In addition to the diet, nerve sedatives, antispasmodics, and two-hourly antacid medication should be administered I am convinced that such precautions have avoided major catastrophes

Should the Returned Soldier Be Put to Bed for His Ulcer Treatment, or Allowed Ambulatory Treatment?

From a morale standpoint, it is unwise to hospitalize or put to bed the soldier who has come home and who is so eager to get away from confinement, restrictions, institutions, rules, and regulations that were so dominant in his military life If at all possible, take care of the patient by the ambulatory form of treatment Permit him to enjoy the new pleasures and surroundings, and his family and his friends that he had been looking forward to so much In by far the great majority of cases, the ambulatory form of treatment will suffice. The returnee can even undertake a light occupation if he so desires. Some neurotic patients are positively harmed by bed rest

However, there will be a very small group in which bed rest, at home or hospital, will be essential These are cases with

(*a*) Hemorrhage, either acute, massive, or persistent oozing, this does not refer to very minute bleeding as evidenced by a faint benzidine or guaiac test in the stool. These can still be treated as ambulatory

(*b*) Deeply penetrating ulcers with excruciating pain not relieved by the usual routine therapy This does not necessarily exclude cases in which the patients complain of a gnawing distress or discomfort at or near mealtime, or during the waking hours, and where x-ray even shows a definite crater These may nevertheless be treated promptly to ambulatory treatment, but in such cases a trial period should be undertaken

(*c*) A group of cases who, though recently, have been exposed to surgery in the Army, and who have renewed discomforts after their return home Ambulatory treatment should be tried first, and if unsuccessful, but not otherwise Walters and Butt [3] advocate a conservative medical surgical attitude toward a group of Army personnel with chronic or recurrent ulcer In their consideration of the [illegible] 25 per cent of patients with medically refractory ulcer had recurrent difficulties, therefore [illegible] could be cured by [illegible] service They [illegible] early gastric resection [illegible] be influenced [illegible]

order to return a higher percentage of military personnel to duty An ulcer-afflicted soldier should be discharged, and that was the principle last adopted by the Surgeon General's office

(*d*) Finally, there is a small group of ulcers, so-called recalcitrant, refractory, or intractable, where, do what you will, the patient will not be relieved by ambulatory medical therapy, be sure, however, that you try, first, various changes in medication, various modifications of diet, and the different approaches to a possible emotional imbalance, it may not be the ulcer that is refractory, but the patient who is intractable, so that it is not the ambulatory factor alone that makes the difference When soldiers return to home surroundings that are disturbing and distasteful, bed rest or hospitalization may become advisable in order to separate them from these harmful influences

When the patients are put to bed and the dietetic and medicinal therapies do not bring about symptomatic relief in about five or six days, I resort to the Einhorn method of duodenal intubation with duodenal feeding, which puts the stomach and duodenum to almost complete rest Other physicians employ the Winkelstein continuous intragastric drip therapy Either of these procedures should receive consideration before surgery is contemplated, but neither of these methods will often become necessary if my ulcer regimen[25] is carried out with careful detail, and if the physician is more medically inclined and less surgically minded

When Should Surgery Be Advised?

As yet, there is no entirely satisfactory surgical treatment for duodenal ulcer However, certain conditions will be met with which will make it advisable, or imperative, to resort to surgery In the returned soldier particularly, an ultraconservative attitude should be adopted, because the favorable healing effects of a changed environment from a life of rules and tension to surroundings of freedom and relaxation should be given a full chance to manifest themselves

We may have an outline of surgical indications, but we should have no hard and fixed rules that certain complications always require surgery

1 Acute perforation is the only process that permits of no surgical hesitation

2 Repeated gastric hemorrhage in the age group of our young soldiers does not become a surgical problem as urgently as in civilian groups of patients over 50, in the latter, fatal hemorrhage is more liable on account of the poorly contracting, possibly arteriosclerotic bleeding vessels In the young soldier, group transfusions will often suffice to tide them through the difficult bleeding period, and thus give the physician a chance for later medical treatment Blackford and Cole[27] pointed out that fatal hemorrhage in young patients is so rare that one probably is never justified in performing an emergency operation

If operative interference is to be undertaken for a massive hemorrhage, Lahey recommends that it be done within forty-eight hours [28] Several years ago I treated a patient 42 years old, who had had repeated duodenal hemorrhages which brought the hemoglobin down to 45, he came to me after he left one of our city medical centers because he refused operation• He responded perfectly well to ambulatory treatment and was free from difficulties for two years About six months ago, his soldier-son suddenly came home from abroad and the father had another gastric hemorrhage He again refused operation, again reacted quickly to treatment, and again is feeling well on a simple medical regimen

3 Pyloric obstruction is often mentioned as a surgical indication This general term needs modification, however In many instances the pyloric obstruction is inflammatory in nature and clears up by careful diet, medication, and repeated morning gastric lavage, on the other hand, the obstruction may be cicatricial in nature from a healed ulcer, in such cases the medical routine, which should always be tried first, will not give complete or sufficient relief, and surgery becomes indicated In some instances, the combination of cicatrix and inflammation exists, and removal of the inflammatory factor by medical treatment will suffice to relieve the patient of his obstructive difficulties even though a moderate cicatricial deformity will persist, but this will not be sufficient for surgical intervention

4 Real intractable peptic ulcer One cannot deny that in spite of every precaution that one follows, and every form of medical treatment that one tries, we will meet with nonreacting ulcer patients in whom we are forced to resort to surgery because of continued severe discomforts In this class belong also those who had already been operated upon, who are still sufferers, and in whom renewed surgery should be undertaken only as the very last resort

Mostly everything that has been said about the diagnosis and management of duodenal ulcer holds true also for gastric ulcer, but here, several additional factors come up for consideration As an aid in diagnosis, the gastroscope has become a very helpful instrument that should be resorted to without too much hesitation, but only by experienced hands I do not advise it as a routine procedure, but it should certainly be used in every case in which there is the least

doubt of malignancy Not all ulcers become malignant and require radical surgery, but we must be on guard constantly not to overlook an early malignant lesion That may be easily said, but not so easily accomplished In many instances, evidence of malignancy can only be proved from numerous microscopic slides As for the ratio of the occurrence of gastric ulcer to duodenal ulcer in the military forces, it has been variously reported as from 1 to 0 to 1 to 40, but about 1 to 25 is a good average.[8]

When Can We Consider an Ulcer Attack Arrested?

1 The individuals should be free of discomforts

2 All x ray evidence of persistent deformity, combined with irritability and spasm, should be materially gone

3 The occult blood test (guaiac) in the stool should be repeatedly negative

4 In duodenal ulceration, a previously found gastric hypersecretion and hyperacidity should be greatly reduced This principle is on the basis of Shay's work, which showed that an unhealed duodenal ulcer accounts for the marked gastric hyperacidity which disappears when the ulcer is healed [1]

5. In gastric ulcer, gastroscopic examination would corroborate a healed mucous membrane, a normal sedimentation rate would exclude the probability of a malignancy

You notice that I was very careful in framing my question, when is an ulcer attack arrested, rather than when is the ulcer cured

I have always been very cautious about claiming that an ulcer is "cured" I have looked upon gastroduodenal ulceration not as a local pathologic process, but as a constitutional disease like pulmonary tuberculosis, in which the activity may be gone, and the disease may be arrested, but the underlying tendency still remains, and the potentiality for a renewed flare-up ever present. One cannot help adopting such a policy after one has repeatedly observed instances of sudden hemorrhage or recurrent discomforts or even acute perforation in individuals free of symptoms for latent periods of many years I educate my patients to this conservative viewpoint as the safest precaution against regret and disappointment

Summary and Conclusions

Peptic ulcer has been an important medical problem among the military forces of all nations It will be just as important a civilian problem when these soldiers return home

The family physician will be the first one who will be called upon to meet this situation, and he should be acquainted with the factors which played a causative role and be prepared with the proper management of the various contingencies

There are reviewed the incidence, the causative factors, the methods of diagnosis, the routine of ambulatory treatment, the psychogenic factors, and the psychogenic approach in treatment

Annual Meeting

Hotel Pennsylvania, April 29–May 3, 1946

THE attention of members attending the meeting is called to the fact that all scientific and commercial exhibitions will be available for inspection on Monday and Tuesday of that week, although the meetings of the sections do not begin until Wednesday The motion pictures will also be on these days

THE OBSTETRIC FORCEPS

Louis A Bunim, M D , Brooklyn, New York

THE obstetric forceps is aptly compared to a pair of artificial hands, the use of which is to grasp the fetal head and pull it through the pelvis when the natural forces acting from above are unable to expel it by themselves The average textbook treats this very important subject from the standpoint of the history of the forceps and then describes it as an instrument for the extraction of the head through the pelvis The different authors then give a generalized description of the various instruments available to the operator who is anxious to perform this common, yet most serious, operation

It occurs to the writer that a more comprehensive understanding can be obtained by the student of obstetrics if he studies this problem from the following points of view

(*a*) Abuse of forceps He must bear in mind that it is more important to know when to apply forceps than how to apply them

(*b*) The conditions All of these must be satisfied before application is attempted

(*c*) The indications Any one of these may necessitate the use of forceps

(*d*) The skull and intracranial septa He must understand the mechanics of the pathologic manifestations brought about as a result of the improper application of these forceps

(*e*) The pelvic architecture. He must visualize the pelvis, the available space, and understand why the mechanism of labor is failing to accomplish the delivery naturally

(*f*) The instrument itself Here the student must ask himself the question, "Which is the best available forceps for this operation?"

Abuse of Forceps

The literature is replete with many cogent, and often eloquent, pleas for a more conservative attitude toward the use of obstetric forceps The obstetricians point out that the forceps, as an aid in obstetrics, are said to be one of the most useful instruments ever devised Yet the havoc wrought by ignorance of the instrument and its application is enough to make one wonder whether women would not have been better off without forceps De Lee[1] emphasizes that the forceps is an instrument designed to extract the fetus by the head from the maternal passages without injury to it or the mother As soon as the safety of either is encroached upon, the instrument ceases to be the forceps of obstetrics and becomes simply an instrument of extraction similar to the craniotomy forceps To brace the feet against the table and pull with all the strength of the back and shoulder muscles is brutal and unsatisfactory Craniotomy is more humane The physician should always remember, when working with forceps, that he has a child's brain in the grasp of a powerful vise, and that only the greatest care and gentleness will save its wonderfully delicate structure from injury

To begin with, it should be stressed that it is not the intent of this paper to decry the use of the obstetric forceps, but rather to emphasize the need, on the part of the physicians, to understand when to use the instrument, as well as how to apply it Solomons[2] points out the difference between "failed forceps" and "tentative forceps " In the latter a skilled and competent obstetrician applies the instrument with full intention to deliver by some other method if it seems to him that a continuance of the delivery with forceps will be attended by marked trauma to mother or child By "failed forceps" is meant that a general practitioner applies the instrument without any knowledge of the conditions or indications which should be present for a successful application, where he persists in his effort, and in that effort mutilates the mother or child, or both The enormous number of "failed forceps" in some places is due to ignorance not on *how* to put on forceps but *when* to do so Solomons correctly adds that the entreaties of relatives and the patient, the stress of a busy practice, or domestic calls are no excuse for the too early application of an instrument which may ruin a woman's health, may kill or ruin a child, and may give an ill name to an instrument which, when used properly at the right time and right place, is a boon to the woman This does not mean that frequent application is advisable or advocated, nor does it mean that forceps delivery is considered preferable to natural spontaneous delivery But I do believe that low forceps, while somewhat more dangerous than natural delivery, need scarcely be so in skilled hands, and certainly has compensations in the peace of mind to the mother, especially in regard to absence of a dread of future labors

Conditions and Indications

The use of forceps may be a simple matter when done at the proper time But when forceps are applied at the incorrect time, it becomes a diffi-

cult operation and is frequently disastrous to the patient and the baby The physician who familiarizes himself with the conditions which must always be present before application will never have difficulty, provided he has had the necessary training to be able to make a correct diagnosis

The following conditions must be fulfilled before forceps can be applied with safety

1 The os must be fully dilated, so that its rim cannot be felt with a finger in the vagina Application of forceps before this invites such dangers as laceration of the cervix, which may result in hemorrhage and collapse and probably fetal trauma in the form of skull fracture or cerebral hemorrhage or both

2 The head should be engaged This means that there must be no marked disproportion between the head and pelvis If this rule is disregarded and the forceps applied, they will probably slip and much damage will accrue to mother and child

3 Bladder and rectum must be empty, otherwise they may not only be injured but also may act as direct impediments to delivery

4 The membranes should be ruptured If forceps are applied outside the membranes, the grip is not satisfactory and they may slip, or possibly the placenta may be separated

5 The head should be fixed in a proper position. Anterior parietal presentation, or face with chin posterior or brow presenting are unsuitable positions for forceps

While all the conditions must be fulfilled before forceps are applied, there may be only one indication. The indications may be divided as follows

1 Signs of Danger to the Child.—(*a*) Fetal heart. If the fetal heart rate is above 160 or below 120 danger is present. The fetal heart should be listened for during a pain as well as after it is over Often there is a temporary slowing or acceleration. One should, therefore, listen carefully to determine whether recovery will occur Where the change in the fetal heart rate is significant, it will often be accompanied by other signs of danger in the child or in the mother

(*b*) Meconium unmixed with liquor amnii is coming away and the head is presenting Usually solid meconium is a danger sign, but it is nearly always accompanied by other fetal or maternal danger signs

(*c*) Tumultuous movements may precede death of the fetus

(*d*) A large caput succedaneum shows that the fetal head has been subjected to prolonged pressure.

(*e*) Prolapse of the cord Forceps are indicated here even if the os is almost fully dilated provided the cord is presenting The os must be at least four fifths dilated, and even then the dangers already mentioned are present

2 Signs of Danger to the Mother—(*a*) Heart and lung diseases, acute and chronic, call for immediate delivery when it can be effected without stress, i.e., when the head is on the perineum

(*b*) Toxemias, including eclampsia and eclampsism

(*c*) Placenta praevia

(*d*) Prolonged labor with rising pulse and temperature, with or without signs of threatened rupture of the uterus.

Exhaustion due to want of sleep, or fatigue from inertia are not indications for forceps Nor is a slight degree of contracted pelvis

Caldwell[3] believes that even though the majority of cases of stillbirth are due to so-called fetal distress, it is nevertheless a very great mistake to apply forceps hastily when the child is showing distress and thus kill it by trauma. It is much better to push the presenting part up, relieve the uterine contractions if necessary, and then plan the operative delivery after the child has plenty of oxygen and the fetal heart is relieved The woman may then continue the delivery herself Bernstein attacks the same problem from another angle He points out that despite the fact that three out of four forceps deliveries are undertaken for so-called fetal distress, there is little acceptable evidence that instrumentation is advantageous to the child The advantages accruing from the use of forceps largely benefit the mother On the assumption that compression of the head and congestion of the cerebral vessels produce the fetal cardiac variations, the birth of a live child after further compression by forceps would seem to constitute prima facie evidence that a hurried delivery was not necessary

The Fetal Skull

In considering the anatomy of the fetal skull, one can divide the head into two portions a lower, fixed closely articulated area, i.e., that portion of the skull below the malar eminence, and a vault. The latter consists of thin elastic plates, loosely connected by membranes. During labor this yielding area must undergo considerable change in shape and size. When this change is carried too far or too abruptly by a force applied from without, serious damage will result. This accident is very often obviated by the dural septa, which support the cranium from within. These septa not only act as shock absorbers during labor but also carry the large venous sinuses with their rich blood supply

The dural septa are two in number, the falx and the tentorium The falx cerebri is a thin sickle-shaped septum, extending from the crista galli of the ethmoid bone in front to the internal occipital protuberance posteriorly Its upper border is attached to the cranial vault just beneath the sagittal suture Its lower border is free The tentorium cerebelli is the large tentlike septum that separates the cerebrum from the cerebellum The upper surface of the tentorium is held taut by its attachment to the falx along its entire median plane The free tentorial border forms the incisura tentorii, an arched opening The fibers of the tentorium and of the falx decussate and thus form two distinct layers The septum appears to be much stronger in the area of the occiput and thus offers greater resistance and protection to the advancing vertex when in flexion

Evaluation

The septum and its blood supply will offer a great deal of resistance and protection to the fetal brain as long as the forces of labor are not too strong or too sudden There must be a gradual process of molding in order to safeguard these structures from snapping

When the force from without is abrupt the fibers in the dura will yield and marked changes in the shape of the cranial cavity will then take place Anteroposterior compression results in raising of the vault of the cranium with consequent elevation of the junction of the falx and the tentorium, causing tension of the vein of Galen and its tributaries Excessive and sudden anteroposterior pressure results in a rupture of the tentorium at a rather uniform point

The subsequent increased tension of the vein of Galen results in a rupture of the vein itself Since the force producing these lesions never ceases after the accident, cerebral trauma will follow as a result of the excessive changes in the cranial cavity Excessive lateral compression results in large tears in the substance of the falx

The Pelvis

The importance of a knowledge of the anatomy of the female pelvis has been ably demonstrated by Caldwell and Moloy [3] Their studies, with the aid of stereoroentgenograms, have shown that female pelves vary considerably in size, shape, and contour Under the new classification all pelves that are free from disease are divided into four parent types on the basis of morphology gynecoid, android, anthropoid, and platypelloid Each pelvis, besides having a parent type from which it gets its family name, is said to have a tendency and an outlet, which elements usually correspond to the parent type but may differ from that expected with a parent type When the former conditions are obtained, the pelvis is classed as a pure form, when the latter condition exists, it is classed as a mixed form

The parent type is determined by the characteristics of the posterior segment of the pelvic inlet, which is the portion of the inlet behind the greatest transverse diameter of the superior strait The contour of a pelvis depends on its anterior segment or that portion of the inlet anterior to the greatest transverse diameter The anterior segment is often called forepelvis

The Forceps

A delivery may be accomplished with only one, or at most two varieties of forceps Great advantage can be obtained when the operator possesses a thorough knowledge of the instrument and is able to discriminate in the use of the various kinds of forceps for any given situation in which the head is arrested in its progress in a particular pelvis The usual question asked by the nurse in charge is "What forceps do you wish, Doctor?"

It is incorrect to call for any definite type of forceps until the obstetrician has made a complete study of the position of the head, its station in the pelvis, the type of pelvis, and the available space, in addition to all other ordinary prerequisites that are necessary before the forceps can be safely applied

Taking into consideration that all proper conditions exist, the operator must consider three features of prime importance

1 The application of the forceps to the child's head,

2 The traction used in accomplishing delivery,

3 The direction in which the force applied can be carried out

The application of forceps must be cephalic and accurate The blades should lie evenly against the side of the head, reaching from the parietal bosses to, and beyond, the malar eminences It is at this area that the fetal skull is fixed, as described above, and therefore it is the safest and most secure location The best application of forceps on a molded head is obtained by using a forceps that has a long tapering cephalic curve Those with a short full curve do not fit evenly, cause pressure points, and often do not reach malar eminences, thus resulting in slipping

When the forceps are to be applied with the occiput anterior and head well below the spine any blade which will fulfill the requirements of the molding may be used with the least effort For other positions and presentations there are

several new types which will be considered with the various forceps operations A high head in a platypelloid pelvis may be asymmetric in such a position that a straight cephalic application cannot be obtained unless the forceps have a sliding-lock principle to accomplish lateral flexion before one can rotate the head anteriorly

The direction of force is a very essential feature in the use of the forceps The guide to it is very well furnished by a traction handle The axis-traction principle automatically directs the force away from the symphysis, keeps it in the plane of least resistance, and thus simulates the physiologic mechanism of labor This will maintain the head well flexed and minimize the trauma to the fetal skull and maternal soft parts at the same time.

Choice of Instruments

In the selection of an instrument which would fulfill the requirements of application and traction in a given pelvis, there are a number of very excellent forceps from which to choose Many of them differ from one another only in minor details

1 The Simpson Forceps—This is one of the best types and is the most widely used Its cephalic curve is the best to be found in any obstetric forceps, it has an English lock, and a lateral projection on each handle near the lock to enable the operator to obtain a firmer grasp The shanks of the Simpson instrument are separated from the blade to the lock by 7 cm When the fingers of both hands are applied here as a fulcrum the necessity of axis traction may be eliminated. The Dewees forceps is a slight modification of the Simpson forceps.

2 The Axis-Traction Forceps—When this instrument is applied to a head that is high in a normal pelvis, the great advantage of traction is that the force may be exercised during the entire process, so that the head is made to move in proper axis along the entire length of the canal The blades are practically one with the head of the child, and the application handles indicate the direction in which the head is moving As long as the operator keeps the traction rod parallel with the shank while exerting traction, he may feel assured that he is using his power to the best advantage

Years ago A. R. Simpson said, "If a practitioner, accustomed only to the use of the old forceps, will use the axis-traction forceps in one or two difficult cases he will find that it works with so much safety to the mother and child, and with so much ease to himself, that he will ever after use it in every case Since it came into use the range of forceps application has been greatly widened and the sphere of the competing operation of premature labor has been correspondingly narrowed "

The most popular axis-traction forceps is Dewees', with the traction rod attached to the end of the handle. The Luikart axis-traction forceps with a closed fenestra and sliding lock, Hague-Ferguson's, and the uncomplicated, light, fixed traction forceps of Hawks and Dennen have all been recommended by leading obstetricians The latter blades are a modification of the Simpson type The inner surfaces are beveled, simulating the cushioning of the Kielland The special curve in the shank plays the role of the axis-traction rod

3 The Kielland Forceps—These are essentially a straight forceps presenting a shallow pelvic curve or "S" shape which brings the forceps tip nearly in a line with the long line of shank and handle It has a sliding lock which makes it possible to apply one blade further along the head than the other The cephalic curve is excellent and ideal for rotation

4 The Barton Forceps—These differ from the classic type in that the blades join the shank at an angle corresponding with that between the axis of the superior strait of the pelvis and that of the pelvic outlet. For purposes of application a joint is incorporated at the junction of the anterior blade with its shank, permitting the blade to be swung through an arc of a circle until it is nearly parallel with the shank. Like the Kielland forceps, the instrument is provided with a sliding lock There is no pelvic curve in the Barton forceps

5 The Piper Forceps.—These are designed for the extraction of the aftercoming head in the pelvis in breech presentation. The special S-shaped shank causes the head to flex while traction is exerted in the handles in the direction in which they point One must remember that the tips of the blades are applied over the yielding portion of the fetal head and not on the malar eminences Therefore, they should be used only for flexion and very little traction but never for rotation

Operative Procedures

Having satisfied all the essential prerequisites of forceps application, the operator must decide the type of pelvis, and the position and station of the fetal head in question. In the gynecoid-type pelvis forceps operations are usually not necessary, but when indicated the forceps are relatively simple to apply The Simpson type or Hague-Ferguson axis-traction forceps will be the instrument of choice. One must always bear in mind that the lower the head, the more it is flexed, the smaller the diameter of the advancing

vertex and, therefore, the easier the pull and the less the damage to mother and child If no immediate indications for termination of labor exist, one should wait until the head is well down on the pelvic floor before resorting to forceps Pressure from above, while exerting traction from below, results in improvement of the mechanism of labor and makes the operative procedure much simpler

In the android pelvis, the forceps are frequently indicated and are usually difficult to apply When the head is in midpelvis and in an anterior position or laterally flexed, the axis-traction or the Kielland forceps will be the instrument of choice Traction should be the first maneuver following the application, and rotation should be attempted only when the presenting part has reached a low level Attempts to rotate at a high level will injure the soft tissue and compress the fetal skull The transverse arrest is the most common variety This head may be rotated manually However, with this type of pelvis, where the side walls are straight, the transverse arrest in the midpelvis is best treated by a cephalic application of the Barton forceps When correctly applied, the maneuver should consist of anterolateral flexion traction with descent to the pelvic floor in the same position and low anterior rotation on the inner aspects of the pubic rami Here, on account of the narrow pubic arch, one may remove the Barton forceps and complete the delivery with small Simpson forceps In cases of bad android pelves with converging side walls and prominent spines, a cephalic application of the Kielland forceps is ideal Anterolateral flexion of the vertex is followed by spiral anterior rotation with simultaneous descent in order to avoid the spine and utilize the larger intertuberous diameter.

In instances of midpelvic arrests in occipitoposterior position in an android pelvis one may try manual rotation to transverse first When manual rotation fails, the anterior blade of the Barton forceps, when sliding over the occiput, will bring the fetal head in the transverse diameter and not infrequently even in the anterior position

In the anthropoid pelvis, engagement occurs in the occipitotransverse position in approximately 40 per cent, in the occipitoposterior in 30 per cent, and in the occipitoanterior in 30 per cent of the cases Here the occipitoposterior should be considered as an even more favorable variety of engagement than the more frequent occipitotransverse position High arrests occur until the presenting part spontaneously rotates or is artificially rotated manually or with a high midforceps operation Once again the operator is forced, on account of the small transverse diameter, to elevate the vertex with the Kielland forceps, rotate the head in an anteroposterior diameter and complete the delivery by pulling straight down in the direction of the handles When occipitoposterior remains as posterior and descends in this position to the pelvic floor and is associated with considerable molding, it seems plausible to deliver the head with Kielland forceps in the posterior position rather than to attempt to rotate artificially to an anterior position One should consider that in posterior position 3 to 4 per cent are delivered spontaneously by this mechanism

In the platypelloid pelvis the abnormality lies in the inlet If the conjugata vera is less than 9 cm , the vertex usually engages in transverse position in 80 per cent Here the difficulty commonly experienced is that the vertex remains in a deep transverse arrest Manual and even instrumental methods of rotations fail in the pelvis that conforms to the flat type Barton forceps have been found very useful in these cases because they maintain the original position of arrest This forceps can direct the head backward away from the symphysis or forward with lateral flexion, so that anterior rotation may be accomplished on the inner aspect of the pubic rami, or under the subpubic arch

For face presentation, when the chin is anterior and an indication should require prompt delivery, one can introduce a Simpson forceps By raising the handles, the blades will sink in the direction of the sacral hollow The operator can then pull first downward until the chin appears under the pubis and then upward to deliver the rest of the head in flexion When the chin is in posterior position in midpelvis, one can rotate the head to mentotransverse either manually or with the Kielland forceps, then by the reapplication of the Barton forceps continue to rotate the chin anteriorly and deliver the head in flexion after the chin appears under the pubis

In all difficult forceps deliveries where moderate trauma to the soft parts is anticipated the following suggestions are offered

(*a*) Give the patient an intravenous infusion of 5 per cent glucose in distilled water alternating with saline solution This is allowed to run slowly until the conclusion of the operation

(*b*) Do a pudendal nerve block to permit maximum relaxation of the pelvic floor Gas-oxygen anesthesia is supplemented to control apprehensive individuals

(*c*) Morphine sulfate, 1/4 grain injected hypodermically, will offer additional relaxation of the patient and will not affect the fetus if the delivery is terminated within one half hour

(*d*) Do not introduce the instruments in the vagina during a uterine contraction. At this time the head fits the vagina rather snugly and too much resistance is encountered from the soft parts and fetal skull

(*e*) Have an assistant exert pressure on the fundus with each traction on the forceps This aids mechanisms of labor and less force is required on the instrument

(*f*) Pull rather slowly and in the direction of the pelvic axis to prevent extention of your episiotomy or additional laceration to the vagina.

(*g*) Do the lateral episiotomy prior to the introduction of the instruments if the forceps will be low In cases of midforceps or where rotation will be required it is advisable to do the episiotomy when the head descends to the pelvic floor

(*h*) Catheterize after forceps delivery In case of bloody urine irrigate the bladder with normal saline and leave a retention catheter for forty-eight hours Careful attention should be paid to this drainage of the catheter The bladder should be irrigated every twelve hours with acriflavine 1 1,000

Conclusion

1 A knowledge of the anatomy of the fetal skull, the pelvic architecture, and the mechanical function of the different forces will aid in selecting and properly executing any required obstetric maneuver

2. A knowledge of the mechanism of labor in a normal or abnormal pelvis will aid in early recognition of arrested progress

3 A careful diagnosis of the arrested progress and a skillfully planned procedure executed by one or two properly chosen forceps will result in a satisfactory delivery

4 Pelvic architecture can only be accurately determined by roentgen examination This should be done at term in those patients in whom dystocia is anticipated on routine pelvic examination Emergency x-ray studies can be made on cases where dystocia is manifested during labor

In presenting this paper, the author does not claim anything original, but wishes to stress the relation between the head, pelvis, and the forceps The pelvis rather than the forceps is the essential factor involved in an operative procedure

THE PSYCHOANALYTIC INSIGHT OF NATHANIEL HAWTHORNE

In a paper by Dr C P Oberndorf, of New York, with the above title (*The Psychoanalytic Review*, October, 1942) attention is drawn to the intuitive acquaintance of Hawthorne with psychoanalytic concepts. There are but few of these in American literature. Thus in *The Scarlet Letter*, the case of the young minister, the father of the illegitimate child of the heroine of the story has been placed under the care of a Dr Chillingworth. His handling of the case is entertainingly described by Dr Oberndorf as follows

Physician Chillingworth at once suspected the mental origin of his patient's illness and decided that only with relief from the mental burden could the pastor's bodily health be restored. The technic of his approach, as described by Hawthorne, is that of the ideal psychoanalyst and the philosophy of his treatment wholly psychoanalytic.

Let us see how the sensitive artist writing in 1848 has recorded the method of treatment and the clinical course it took in the case of a patient who supposedly lived about three hundred years ago

"Chillingworth scrutinized his patient carefully, both as he saw him in his ordinary life keeping an accustomed pathway in the range of thoughts familiar to him, and as he appeared when thrown amidst other moral scenery, the novelty of which might call out something new to the surface of his character He deemed it essential, it would seem, to know the man, before attempting to do him good Wherever there is a heart and an intellect, the diseases of the physical frame are tinged with the peculiarities of these In Arthur Dimmesdale, thought and imagination were so active, and sensibility so intense, that the bodily infirmity would be likely to have its groundwork there."

In this philosophy may have originated Hawthorne's aversion to medicine as he saw it practiced in his days— a factual medicine with a therapy relying largely on the pill box and the scalpel. Here, himself turned physician Hawthorne brings out with force and clearness that the course of disease is influenced by the mind of the sufferer—and further, that feelings of guilt and conflict may in themselves produce the picture of physical illness. We may pause a moment to muse over the novelty of such a newly coined term as psychosomatic medicine.

With this idea in mind let us follow Hawthorne's conception of a method for alleviation of psychogenic symptoms.

"So Roger Chillingworth—the man of skill, the kind and friendly physician—strove to go deep into his patient's bosom, delving among his principles, prying into his recollections, and probing everything with a cautious touch, like a treasure-seeker in a dark cavern.

Few secrets escape an investigator who has opportunity and license to undertake such a quest, and the skill to follow it up."

PROBLEMS IN PREVENTING INFECTIONS IN NEWBORN NURSERIES

SAMUEL FRANT, M D , HAROLD ABRAMSON, M D , and MARGARET LOSTY, R N , New York City

(From the Bureau of Preventable Diseases, New York City Department of Health)

FOR some time now, the attention of obstetricians and pediatricians has been directed toward the prevention of respiratory, gastrointestinal, and skin infections in nurseries for the newborn Technics have been evolved which, in the hands of well-trained nurses, have proved exceedingly successful For example, as long ago as 1928, Dr Gladys H Dick and her coworkers at The Cradle were able to eliminate infections of intestinal origin by sterilization of everything entering an infant's mouth or nose [1] Skin infections such as impetigo have been reduced in number and extent by meticulous attention to skin hygiene, and prevention of respiratory infections is now being approached from the standpoint of reduction of organisms in the surrounding air Many newborn nurseries now have ultraviolet-light installations, and under serious consideration at the present time is the use of aerosols Oiling of the nursery floor and impregnation of bed linens with oils will, no doubt, also be further investigated

However efficacious the new physical methods which are being emphasized so strongly, such as ultraviolet irradiation, aerosols, and oiling, may prove to be, there is no question that in general the proper care of the newborn infant in a lying-in hospital still demands that scrupulous attention must be given to well-defined details of nursery technic

A marked impetus was given to campaigns for measures of prevention, particularly of enteric diseases, when attention was called to the prevalence of a previously unrecognized specific and highly communicable diarrheal disorder This disease, which we have called epidemic diarrhea of the newborn, has been recognized throughout the world as a definite clinical entity [2] The cause is still unknown, but there is increasing evidence that no matter what it is, the mode of transmission is amenable to methods by which other diarrheal disorders are prevented, namely, the elimination or blocking of all the pathways by which pathogenic material may reach the nose or mouth of the baby

How important is the problem of epidemic diarrhea in New York City? To date, since 1934, we have had reported to this Department one hundred and fifty-one outbreaks in sixty-five hospitals giving maternity care Of almost 16,000 infants at risk, 2,439 have been attacked, and 844 have died The case fatality, namely, 35 per cent, emphasizes the serious nature of the disease And the experience in New York City is by no means unique Both the American and foreign literature report an increasing number of outbreaks of this disease, hardly any part of the North Temperate Zone appears to be free How can a disease with such important public-health aspects be properly prevented?

In this city all cases of "diarrhea in the newborn up to three weeks in age occurring in a newborn nursery"* are immediately reportable by telephone There is no reference in the Sanitary Code to any specific diarrheal disorder, reporting is required in all instances of diarrhea, regardless of cause When any case of diarrhea is reported, immediate investigation is made to determine the presence of epidemic form of the disease Isolation measures are immediately instituted to prevent spread Prevention of spread is, however, not the ultimate goal of an alert department of health Prevention of occurrence in the primary objective to be achieved

Very early in the study of the condition we realized, as many others also have, that the mass care of newborn infants in hospital nurseries creates conditions making for their continual exposure to the danger of cross infection The marked rise in recent years in the frequency of hospital deliveries, due to the greater demand for expert maternity care and to the increase in membership in hospital insurance plans, has added to the problems of newborn-baby services In almost the same physical setup in existence fifteen years ago, institutional deliveries have increased from 66 to well over 95 per 100 births

How, then, can a newborn-baby service be conducted so that complete safety may be obtained? You perhaps are aware that the Sanitary Code of the City of New York was the first to contain provisions for the conduct and maintenance of newborn and maternity services [3] After extensive experience with these regulations, we are now even more convinced that greater attention must be paid by public-health authorities to the minutiae of the various technics used on these services In accepting this responsibility, the Department of Health has during the past year drawn up supplementary Standards and Recommendations for Maternity Hospitals,

Read before the Joint Meeting of the Sections of Obstetrics and Gynecology and of Pediatrics at the New York Academy of Medicine, December 13, 1945

*Sanitary Code, Section 86, Department of Health, New York City, December 8, 1936

which have been approved both by a group of obstetricians, pediatricians, nursing educators, and hospital administrators, and by the Advisory Obstetric Council of the Department of Health.

These standards and recommendations carry forward the ideas advanced at the very beginning of our study of the problem, and should assure the safest possible care of newborn babies in lying-in hospitals. They are based on certain fundamental principles which are recognized by all epidemiologists as necessary for the prevention of communicable conditions, and may briefly be summarized as follows:

1. A Physical Plant Properly Designed and Maintained.—This means a complete separation from all other parts of a hospital of the maternity and newborn-infant service. A basically "clean" service has problems of medical and nursing care which differ radically from those of other services of a hospital. There are even very good arguments that a well-organized maternity service should be in a completely separate building, solely devoted to this, where sufficient space to carry out all the necessary activities and nursing techniques can be provided. In many instances one of the most important factors contributing toward unsatisfactory conditions today is lack of space and the makeshift attempt to crowd into this inadequate space the entire complex and necessary physical plant and nursing activities of an obstetric unit. As a corollary, the medical and nursing personnel staffing a maternity service should be restricted to duty there. The gynecologic and pediatric services should be completely divorced from maternity services.

The completely separate maternity unit should be provided with all modern safeguards against the spread of infection through the plumbing system. In recent years sanitary engineers have shown us that plumbing hazards exist in most of our older buildings, such as cross-connections between waste lines and the potable-water system. In addition, submerged inlets are by no means rare, and whenever reduction in water pressure occurs, either through corrosion of pipes or through unexpected demands, back siphonage of sewage and waste into the drinking water becomes a possibility. In fact, visible proof of just such back siphonage was found not long ago in one of our New York City hospitals. At an inspection, flushing of a hopper caused a flow of old blood and water at the rim flush, obviously produced by previous back siphonage of the stopped-up drain. The hopper had just received material from a mortuary table and negative pressure had siphoned some of the infected material into the clean water supply. Fortunately in this instance, no illnesses resulted, but how many times daily this may occur, even in the best-run hospital, is unknown. Installation of vacuum breakers and check valves and of approved over-the-rim inlets will readily safeguard the potable-water system. It certainly is much better insurance to take care of these easily corrected plumbing defects than to carry the responsibility for possible spread of disease throughout the entire hospital.

2. Adequate and Adequately Trained Personnel.—One of the great advances in medicine has been the realization that a general practitioner is not sufficiently qualified to render the best treatment in highly specialized conditions. Further postgraduate work is insisted upon, and specialization in medicine has been accepted as a necessity for proper medical care. The same should hold true for nursing care. No longer should it be considered satisfactory for a nurse with only generalized training to be responsible for directing the activities of a maternity service, a newborn service, or a premature service. Nursing educators, public-health authorities, and hospital administrators should be keenly aware of the increased responsibilities of these positions and be prepared to further the education of maternity and nursery personnel with formal, recognized, postgraduate courses in these specialties.

The Department has arranged for hospital staff nurses to attend refresher observation periods of at least one month each in a teaching institution. Hospitals have welcomed the help thus extended by the Health Department in meeting their problems.

In addition to a competent and adequate staff on duty at all times, assurance must be given that everyone assigned to the maternity and newborn service is free from communicable disease. Before beginning this duty, all personnel should be examined and certified as being free from communicable disease in any form and free from any communicable carrier state. Anyone absent should be re-examined before returning to duty. All examinations should include, when indicated, bacteriologic investigations and, of course, it is essential that all persons have chest x-rays to rule out tuberculosis. However, laboratory results should not be considered the most important criterion, no individual with any obvious clinical infection should be permitted to remain on duty.

3. Isolation Units.—A sharp distinction between the care of "clean" or uninfected maternity patients and their babies and those ill and infected must be made, and two distinct units should be created within the maternity services, each being cared for by separate obstetric personnel. This means that in the case of the mother, there should be a larger "clean" pavilion and a smaller isolation pavilion, each with separate labor and delivery rooms, and postpartum rooms with sepa-

rate nursing staffs Similarly, in the case of newborn infants clean nurseries should be established with a formula room to serve them, and in addition an isolation nursery with separate equipment and personnel In view of the necessity for immediate removal of an infant with any suspicious symptoms, we have advocated an additional so-called "suspect nursery" to which infants may be removed temporarily until the question of infection is definitely decided Also, in hospitals where ritual circumcision is performed, babies should be returned to a special postcircumcision nursery and kept there until discharge from the hospital

4 Proper Nursing Technics—For control of infection, too great emphasis cannot be placed upon the necessity for complete aseptic technic in the nursing care of infants This technic should be as closely as possible comparable to that carried out in an operating room, with proper capping, masking, and gowning, and scrupulous care with respect to handwashing in between the handling and feeding of each infant This aseptic technic should also include the sterilization of infants' wearing apparel and diapers, and of all equipment which comes in contact with the baby's nose and mouth Barriers and other physical methods to prevent and control infection are not sufficient in themselves The aseptic nursery technic, in our opinion, constitutes a highly important phase of care of the infants, and should apply with equal force not only to the nursing personnel but to the medical staff as well

Both the mother and particularly her baby deserve to be considered as individuals, and should receive individualized care as far as possible There is no doubt that the realization now exists that we can no longer give mass care to mothers and babies The trend of care must be in the direction of breaking down the large maternity wards and dormitory-type nurseries into smaller and smaller units and toward the individual type of care which is given to the mother and the baby in the private home There should be nursery units of such a size that each contains no more babies than can be safely and adequately taken care of by one nurse Bassinets should be so spaced that infection from one to the next cannot occur In addition, provision should be made at each bassinet for complete individual care The common dressing table and the sink slabs for bathing should be eliminated Every nursery should have conveniently located hot and cold running water facilities with foot-, knee-, or arm-control levers to facilitate use and an adequate supply of soap and towels Proper receptacles for soiled articles should also be placed in the nurseries, with well-fitting covers controlled by foot levers

In order that more nursing time be available for the essential nursing needs of the infant, it is now realized that certain routine procedures in the nursery can well be dispensed with[6] As examples the following may be cited the daily weighing of perfectly normal newborn infants, their daily bathing or oiling and eye care, the four-hour temperature taking Practice has shown that these procedures can be safely omitted and that temperature-taking only once a day suffices Elimination of these routines allows more time for the care of the infant, and the details of aseptic nursing care can be more easily carried out In addition, certain nursing procedures in the care of the mother, such as perineal and breast care, can well be reduced to once a day, thereby further shortening the routine procedures of the nurse Another practice which deserves consideration is that of propping of bottles in the nursery It is perhaps much better that the baby be brought to the mother for each feeding in order to acquaint her as soon as possible with the needs of the baby The elimination of propping will also lessen the hazard of suffocation

There should be frequent review of the nursing policies and the procedures should be written and posted in the maternity division Conferences between the medical and nursing staffs should be held regularly to discuss problems which continually arise

5 Formula Room and Formula Preparation—In keeping with the philosophy that the maternity service should be a separate unit of the hospital, adequate provision must be made for the preparation of formulas used in feeding newborn babies The formula room should, under no circumstances, prepare formulas for infants on pediatric services, but should be reserved solely for use by the newborn service, which is basically a "clean" service and should have no connection with the care of sick infants Of course, all formula preparations must be made under strict aseptic precautions Bottles, nipples, and nipple caps should be sterilized just prior to use

The formulas should then be poured, the bottles nippled and nipple-capped, and the entire product either autoclaved for ten minutes at 110 to 115 C or sterilized by some other approved method Each baby should have his own set of bottles, complete for twenty-four hours feeding, and properly refrigerated at all times In order to provide for extra feeding nipples in a nursery, should it be necessary to remove the nipple on the bottle, packages containing individually wrapped and sterilized nipples should be available Some objection may be raised that the autoclaving of the finished formula will induce

caramelization of the milk, but in experiments conducted by competent investigators this is minimal, and in no way detracts from the nutritional value of the formula

6 *The Problem of the Premature Infant*—Since premature babies are so susceptible to infection, special attention must be paid to their care. Few hospitals in the city are so equipped as to provide adequate care Surveys have shown that although many hospitals may have modern incubators, only very few have a sufficient number of nurses specially trained for this function When one realizes that the death rate in premature infants constitutes at least one half of the neonatal mortality rate, the importance of the problem is brought home. Hospitals should either provide complete service or transfer premature babies to institutions where adequate equipment exists and where experienced personnel is available.

These are the basic principles upon which prevention of the spread of infection from baby to baby must be built. Strict adherence to these principles will go far toward eliminating this great dread which is ever present on a maternity and newborn service. Hospital deliveries have become a part of modern living and the medical and nursing professions must furnish the best possible care Certainly no obstetrician or pediatrician can quarrel with the desire to do what the old adage "*primum non nocere*" insists upon, namely, at least to do no harm

FACTS ON USE OF DDT

Since the proper use of DDT requires special knowledge and training a bulletin has been published as a technical guide for the Army to its safe and efficient use, Maj Gen Norman T Kirk, Surgeon General of the Army, announced recently The publication contains information on the precautions to be taken in handling DDT its mode of action in insect control and the proper methods of application of the DDT insecticide items issued by the Army

It is emphasized that, although DDT may be safely handled as an insecticide, it is, nevertheless, a toxic material. Poisoning may occur from ingestion of DDT or by absorption of DDT solutions through the skin DDT powder and aerosols are not absorbed through the skin, and have been found to produce no ill effects when inhaled in small amounts. However in conditions where air currents do not carry away the dust from the user, it is wise to wear suitable respirators as protection against excessive inhalation.

DDT acts on insects both as a contact poison and as a stomach poison Studies have shown that the poisonous effect of DDT on mosquito larvae is fully as powerful as that on the adult insect, although on some other insects, such as flies, the larvae are not equally affected by the insecticide. In applying DDT as a mosquito larvicide to open water receptacles, a prolonged effect may be obtained because of the residual action of the chemical. However, in applying it to natural water bodies the effect is much shorter, due to the binding action of mud in the water, which apparently checks the effectiveness of DDT It should also be considered that amounts of DDT greater than 0 2 pound per acre may prove fatal to fish and wild life For extermination of insects such as ants roaches fleas, bedbugs, and flies, DDT oil solution or powder should be used, with particular attention to cracks, holes, and seams in walls, floors, and bedding, as indicated One of the most valuable characteristics of DDT lies in its tendency to remain deadly to insects over a prolonged period of time In applying DDT solutions to walls and other large suface areas, a coarse spray is usually employed, but in applying it to screens or mesh surfaces, ordinary paint brushes may be used Although the effectiveness of the treated areas against insects persists for some time, the insects which come in contact with the chemical may not die until an hour or more has elapsed and immediate death should not be expected.

When applying solutions of DDT in kerosene, precautions concerning the inflammability of the kerosene should be observed Care should be taken to keep electric motors and other sparking or heating apparatus from the zone of spray No open fires or smoking should be permitted until the spray has dried and ventilation is complete. The kerosene in the solution is harmful to rubber equipment and may cause a mild skin irritation when in contact with the skin

Thanks to the properties of DDT, many lives have been saved in this war and much disease prevented Extermination of disease-carrying insects has reduced the incidence of typhus, malaria, and other ravaging diseases of the war areas.

Although rapid progress has been made in the development of DDT since it first made its appearance in the field of science, much remains to be learned before its full potentialities in insect control can be realized Signs of progress are evident in the spraying of large areas by aircraft, the mass delousing of communities in Europe and the better methods of manufacture Investigation is continuing on every aspect of DDT, however, in search of new and extensive improvements in everything from its chemical beginning to its final application in the field.—*Release from the Office of the Surgeon General*

CONGENTIAL HEMOLYTIC DISEASE AND ERYTHROBLASTOSIS FETALIS: TWO DISEASE SYNDROMES

A Preliminary Report

ALEXANDER S WIENER, M D , Brooklyn, New York

(From the serologic laboratory of the Office of the Chief Medical Examiner of New York City, and the Transfusion Division, Jewish Hospital of Brooklyn)

THE generally accepted concept that the manifold clinical manifestations of erythroblastosis fetalis are all part of a single disease syndrome seemed to be supported by Levine's demonstration that the Rh factor of Landsteiner and Wiener is involved in about 90 per cent of the cases Levine's theory does not explain the manifold clinical manifestations, however, nor why, in the majority of cases, no abnormal isoagglutinins can be detected in the maternal serum as required by his hypothesis, nor why, in some cases with potent agglutinins, the infant is perfectly normal though Rh positive These puzzles have been solved by the discovery[1,2] that individuals sensitized to agglutinogens, such as Rh, A, B, Hr, etc , may form two sorts of antibodies, namely, agglutinins (bivalent antibodies) and blocking antibodies or glutinins (univalent antibodies) The clinical manifestations depend on which variety of antibody is present in the maternal serum, so according to the present writer's concept erythroblastosis fetalis actually comprises two clinical syndromes instead of only one Before presenting the clinical, serologic, and pathologic features of the two syndromes a few remarks concerning the differences in the actions of two sorts of antibodies are necessary

Agglutinins are assumed by the author to be bivalent (having two combining groups) so they act by combining with the antigens on the surface of the red cells to produce agglutination by the formation of a lattice-work, each agglutinin linking two red cells together Thus, abnormal agglutinins in a patient's serum can readily be detected by the use of the usual agglutination tests in saline media Univalent antibodies, on the other hand, can be detected only by the use of special technics, namely, the blocking test or the conglutination test Univalent antibodies are presumably composed of smaller molecules and therefore should be capable of traversing the placental barrier more readily than agglutinins When only the agglutination test was known, it was not unusual to encounter patients strongly sensitized to the Rh factor, as evidenced by a stillbirth or a severe intragroup hemolytic transfusion reaction, but without demonstrable antibodies (with the methods available) These puzzling cases are now explained by the demonstration of blocking antibodies in the serums of such patients

The difference between agglutination and conglutination can be summarized as is shown in the outline on the following page [3]

Thus, for conglutination to occur, a third component is necessary—conglutinin or X protein Conglutinin appears to be a loose complex of albumin, globulin, and phospholipid, together with fibrinogen, which is adsorbed by antigens but only after they have been sensitized by their specific univalent antibodies Because of its colloidal properties, X protein causes red cells to stick together and this is the basis of the conglutination test, which must be performed in serum or plasma media instead of saline media like the agglutination test In vivo, X protein, probably in conjunction with complement, appears to bring about a gradual hemolysis of the sensitized red cells, the amount of X protein required being inversely proportional to the degree of sensitization of the red cells In the fetus only the simple precursors of X protein are present, but after birth, the profound physiologic changes resulting (cooling of the skin, dehydration) cause these to aggregate into larger molecules of conglutinin, thus accounting for the frequently delayed onset of hemolysis until after birth

With this background, the two clinical syndromes produced by isoimmunization in pregnancy may now be summarized as follows [4]

Congenital Hemolytic Disease (with Anemia and/or Hydrops)

In this syndrome the maternal serum contains univalent isoantibodies (blockers or glutinins) If only very small amounts are present in the maternal serum, the infant will usually be born alive, with anemia, or will develop anemia shortly after birth Such patients usually recover completely after proper blood transfusion therapy without sequelae of any sort When larger quantities of univalent antibody are present in the maternal serum, the process progresses further *in utero* until the degree of anemia is such that anoxemia of the capillary walls permits exudation of serum proteins into the tissue spaces (hydrops) A stillbirth results, or a living infant with hydrops, an almost invariably fatal condition In these

Summary of the Difference Between Agglutination and Conglutination

$$\left.\begin{matrix}\text{Rh-positive}\\ \text{red cells}\end{matrix}\right\} + \left\{\begin{matrix}\text{Bivalent Rh antibodies}\\ \text{(agglutinins)}\end{matrix}\right\} \rightarrow \text{Agglutination}$$

$$\left.\begin{matrix}\text{Rh-positive}\\ \text{red cells}\end{matrix}\right\} + \left\{\begin{matrix}\text{Univalent Rh antibodies}\\ \text{(glutinins or blockers)}\end{matrix}\right\} + \left\{\begin{matrix}\text{Conglutinins}\\ \text{(A Protein)}\end{matrix}\right\} \rightarrow \text{Conglutination}$$

"pale" cases, the characteristic pathologic findings are marked pallor, hydrothorax, ascites, anasarca, hepatomegaly, splenomegaly, hemorrhages into lungs, subarachnoid spaces, etc., and microscopically, extramedullary islands of hemopoiesis in the liver and spleen, and hemosiderosis of the liver and kidney

Erythroblastosis (with Icterus Gravis and Kernicterus)

Since the agglutinins are presumably larger molecules than the blocking antibodies, these only rarely traverse the placenta during pregnancy, when they do, stillbirths are apt to result During labor and delivery, due to the increased intrauterine pressure, agglutinins may be milked into the fetal circulation, thus accounting for the onset of the disease after birth. At birth the infant may appear perfectly normal, but the agglutination of red cells in the smaller vessels causes the formation of agglutination thrombi with resulting damage to the liver, brain, etc The infant develops deep jaundice with little or no anemia, becomes stuporous, takes its feedings poorly, may have convulsions, then coma and death usually supervene In the fortunately only rare cases that survive, the infant may develop signs and symptoms of a severe neurologic disorder characterized by choreoathetosis, frequently together with mental deficiency Postmortem examination in these "toxic" infants, who die shortly after birth, reveals the presence of generalized icterus, splenomegaly, hepatomegaly, and kernicterus The kernicterus is not caused by jaundice per se, but represents an in vivo staining reaction of ganglion cells damaged by interference with the circulation In support of this idea may be cited the demonstration in the small vessel in the brain of agglutination thrombi distending the lumens of the vessels.

The new concept of two distinct clinical entities with different pathogenesis helps solve contradictory reports concerning this problem. Naturally, the prognosis treatment, and prophylaxis will depend upon the pathogenesis The statement that modern transfusion therapy may only serve to save infants for the worse fate of mental deficiency is misleading because in the author's experience all infants (approximately 20 to date) saved by such treatment are developing into perfectly normal children The reason for this is that the infants that recover are those with congenital hemolytic disease (due to univalent antibodies), those with erythroblastosis (due to bivalent antibodies), who are apt to develop sequelae of mental deficiency or cirrhosis of the liver, fortunately only rarely survive

VENTRICULAR FIBRILLATION PERSISTING THIRTY MINUTES AFTER CLINICAL DEATH

WILLIAM HOROWITZ, Capt ,(MC),AUS,* and JULIUS BURSTEIN, M D , New York City

(From the First Medical Division and the Department of Electrocardiography, Morrisania City Hospital)

WHEN the myocardium primarily is involved in deaths due to infectious or degenerative diseases, total cessation of all cardiac activity is a much more frequent finding than ventricular fibrillation However, ventricular fibrillation is probably an important cause of sudden death in disease of the coronary arteries and electrocution [1] Obviously, ventricular fibrillation, producing no effective systole, must cause death in short order Transient ventricular fibrillation, an extremely rare condition, is compatible with life [2]

Wiggers[3] has described an initial premature ventricular contraction as setting off ventricular fibrillation In the present case report it will be noted that the electrocardiogram (Fig 1E), taken eleven days before death, revealed marked myocardial irritability manifested by numerous ventricular premature contractions from atypical foci

This report will trace the progress of a patient with hypertensive and arteriosclerotic heart disease over a period of nine years Exitus was due to ventricular fibrillation which continued, according to our records, for thirty minutes after clinical death. Although ventricular fibrillation has been known to continue for as long as one hour after death, the extreme rarity of recorded evidence of such a phenomenon[1] warrants this presentation.

Case Report

W E , a negro janitor, was well until 1928, when at the age of 45, he suffered a severe pneumonia attack. Following recovery he noted slight dyspnea on exertion, moderate ankle edema, and occasional nocturia His first admission to Morrisania City Hospital was in February, 1932, at which time enlarged breasts, infantile external genitalia, an apron of abdominal fat, and hypertension were described His blood pressure ranged from 160 mm of mercury to 200 mm systolic and from 100 mm to 130 mm diastolic The fasting blood sugar was 85 mg per cent, urea nitrogen, 18 mg per cent, and creatinine, 1 0 mg per cent Blood serology was negative Radiographic examination of the skull revealed no abnormality No electrocardiogram was taken at this time Since there were no findings of cardiac decompensation, he was discharged with a diagnosis of hypopituitarism and essential hypertension

On June 24, 1935, age 52, he re-entered the hospital with symptoms of shortness of breath and palpitation on mild exertion On examination rales were found at both lung bases The heart was slightly enlarged to the left with sounds of good muscular quality, regular sinus rhythm, and occasional extrasystoles The rate was 85 per minute The liver edge was two fingerbreadths below the right costal margin The electrocardiogram (Fig 1A) showed regular sinus rhythm, slightly inverted and coved T_1, multiple ventricular premature contractions from atypical foci in all leads, depressed T_3, and left axis deviation He improved on bed rest and was discharged to the Cardiac Clinic

The electrocardiogram (Fig 1B) taken on his third admission, on September 7, 1935, showed a change from sinus rhythm to auricular fibrillation, inversion of T_1, a large Q_3 with raised ST_3 The signs of cardiac decompensation had now increased so that he was orthopneic The blood pressure was 190 mm of mercury systolic and 110 mm diastolic The patient was digitalized and given mercurial diuretics intravenously On this regimen improvement was rapid He was referred to the Cardiac Clinic on a maintenance dose of digitalis

From this time auricular fibrillation persisted and digitalis was continued without interruption. He had several more admissions to the hospital for bouts of cardiac decompensation which were treated by bed rest and mercurial diuretics in addition to the digitalis In the electrocardiogram (Fig 1C), taken March 23, 1937 on a visit to the Clinic, no marked changes were noted except that the Q_3 and elevated ST_3, seen previously, had disappeared On July 12, 1939 the electrocardiogram (Fig 1D) showed an increase in the voltage of the QRS complexes in the first three leads The fourth lead, taken for the first time, showed no further evidence of pathologic changes

During the few years preceding his eleventh and final admission on October 25, 1941, he had lost approximately 100 pounds in weight In contrast to the tall, robust, 250-pound negro of the first admission, he was now 58 years of age, moderately emaciated, very weak, and markedly orthopneic On examination moist rales were heard at both lung bases The heart showed generalized enlargement, the sounds were entirely irregular, rate 88, of poor muscular quality, and without murmurs There was no pulse deficit The liver edge was palpable three fingerbreadths below the right costal margin There was 1 plus edema of the legs Blood pressure was 200/120. Urinalysis revealed specific gravity, 1 018, albumin, 2 plus, 6 to 8 granular casts per high power field Fasting blood sugar was 102 mg per cent, urea nitrogen, 34 1 mg per cent, creatinine, 2 6 mg per cent This mild renal insufficiency was probably due to congestive failure The electrocardiogram taken on October 30, 1941 (Fig 1E), eleven days before death, showed ventricular premature contractions from atypical foci in all leads In lead four, two beats from varying foci occur consecutively This excessive cardiac irritability may have been a premonitory sign of the ventricular fibrillation which followed The patient seemed to improve and was fairly comfortable on a regimen of bed rest, intravenous mercurial diuretics, and continuation of the digitalis However, on November 11, 1941, at noon, he suddenly uttered a loud scream, complained of pain over the heart, and ceased breathing One of us (W H) was on the ward at the time and immediately examined the patient, no pulse, respiration, heart tones, or blood pressure were obtainable It was decided to run an electrocardiographic tracing in the expectation that this might prove to be ventricular fibrillation.

The recording was begun approximately 10 minutes after clinical death. Fig 2A demonstrates the

* Contribution to this communication preceded entry into the Army of the United States.

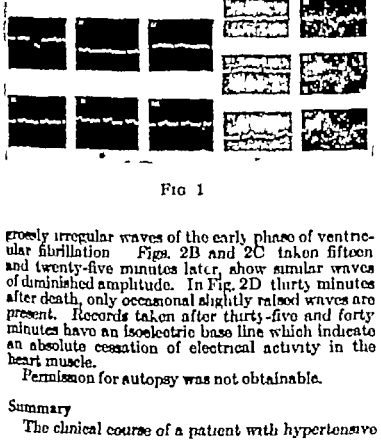

FIG 1

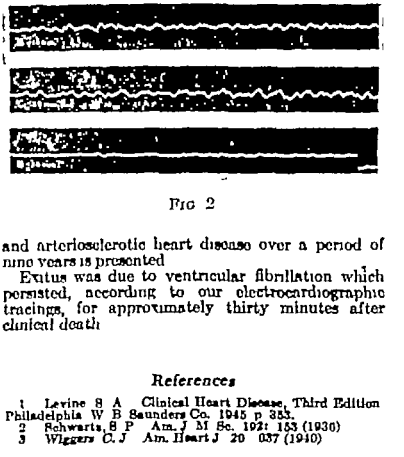

FIG 2

grossly irregular waves of the early phase of ventricular fibrillation Figs. 2B and 2C taken fifteen and twenty-five minutes later, show similar waves of diminished amplitude. In Fig. 2D thirty minutes after death, only occasional slightly raised waves are present. Records taken after thirty-five and forty minutes have an isoelectric base line which indicate an absolute cessation of electrical activity in the heart muscle.

Permission for autopsy was not obtainable.

Summary

The clinical course of a patient with hypertensive and arteriosclerotic heart disease over a period of nine years is presented

Exitus was due to ventricular fibrillation which persisted, according to our electrocardiographic tracings, for approximately thirty minutes after clinical death

SEQUELAE FOLLOWING ORAL AND TOPICAL USE OF PENICILLIN

LOUIS KLEINFELD, M D , New York City

PENICILLIN is one of the few powerful therapeutic agents which seldom has any toxic effects although cases of urticaria have been reported as well as possible changes in clotting time. However, I have observed two additional disagreeable sequelae to the use of penicillin by the oral and topical routes.

The first of the sequelae is the onset of abdominal cramps and distention following the ingestion of penicillin. The second is the occurrence of ulcerative lesions as a result of penicillin given orally or applied locally

Case Reports

Case 1 —R. F reported symptoms of cramps and distention after having swallowed three enteric-coated tablets, each containing 25 000 units of penicillin, making a total of 75,000 units. He took three more tablets an hour later The symptoms soon stopped, but recurred following one 25,000-unit dose of penicillin the next day

Case 2 —L. K had similar symptoms following a similar dosage with penicillin tablets (buffered with sodium citrate)

Case 3 —Mrs. L. M., who is subject to frequent severe sore throats, had acute pharyngitis in August, 1945. In spite of huge doses of penicillin being administered by injection and perorally, bizarre-looking membranous patches occurred on the pharyngeal mucous membrane. The condition took weeks to wear off Two months later the patient developed symptoms suggesting the onset of one of her recurrent severe sore throats. In an attempt to prevent the progress of the condition, penicillin drops were instilled through the nose into the nasopharynx at three-hour intervals and penicillin pastilles were given every three hours. The next day the patient developed what seemed to be acute rhinitis. The pharyngitis improved but the following day stomatitis occurred consisting of a crop of red discrete lesions on the hard palate, at about the place where the pastille would usually lie. All medication was stopped, but the next day a moderate glossitis was noticed. This began to improve the following afternoon, but became worse as soon as penicillin aerosol was nebulized into the pharynx. Again all medication was stopped and the nasal and oral lesions both cleared up promptly

Case 4 —(Verbal report by Dr M C Myerson) A patient was seen who developed ulcerative lesions on the pharynx tongue, and lips following the administration of oral penicillin for about four days. Rapid improvement took place within twenty-four hours after the penicillin was stopped.

Case 5.—(Reported by Dr J Watnick) He also saw a case of stomatitis and gingivitis following the

administration of oral penicillin for three days The condition cleared up spontaneously in about a week after the cessation of penicillin

Case 6—(Reported by Dr W Steinhardt) A pustular dermatitis of the nares, seen following the application of penicillin ointment, cleared up as soon as the use of the ointment was discontinued

Although it is quite possible that some of the symptoms could be ascribed to the substances with which the penicillin was mixed (for example, the formalin which coated the capsule in Case 1), it is probable that the penicillin itself was the common factor

It is conceivable that the occurrence of ulcerative mouth lesions during penicillin administration might lead the attending physician to increase the dose in the belief that more adequate dosage was indicated, and it is possible that such a procedure could result in serious consequences

The foregoing case reports show that penicillin given orally or applied locally may cause disagreeable symptoms, such as ulcerative lesions of the mucous membranes and abdominal symptoms

100 East 74th Street

PROFESSIONAL TRAINING PLANNED FOR ARMY DOCTORS

In order to provide qualified doctors for peacetime, Army plans have been formulated to interest Medical Corps officers who are serving for the duration of the war to apply for commission in the Regular Army, Maj Gen Norman T Kirk, Surgeon General of the Army, announced recently

Among the more important attractions which will be offered Medical Corps officers who remain in the Army are the following

1 The Regular Army Medical Corps officers will be assured a professional career offering broader possibilities in a larger field than the practice of the average civilian doctor affords

2 The training and the assignments of Army doctors will be arranged to aid the Army doctors in obtaining board certification for specialties from the recognized civilian specialty boards

3 Graduate training will be continued with the establishment of Army fellowships, residencies, and special courses

In addition to the above attractions, which carry decided weight with any professional men, the Army affords security in its pension system, hospitalization care, and other considerations not usually available in civilian practice, General Kirk said

Civilian practice on the whole involves considerable uncertainty, and the locality in which a man has established himself and other factors seriously limit the scope of the practice a doctor can engage in, General Kirk said

This program which is being inaugurated is designed to obtain and utilize to the best advantages the professional skill now available in the Army, according to Col Floyd L Wergeland, Director of the Training Division of the Surgeon General's Office, and Chairman of the committee handling the professional training of Army doctors

The plans under this policy call for the establishment of graduate training programs at Army Installations where the residencies will meet the requirements of specialty boards, and arrangements will be made for accrediting by the appropriate specialty boards, Colonel Wergeland said Another phase of the program includes the establishment of Army internships at selected Army general hospitals

Plans outline a procedure for giving professional rehabilitation and specialized training to Regular Army Medical Corps officers who have been in administrative work during the war These doctors who have not been able to engage in practice because of administrative responsibilities will serve as understudies with doctors who have been active in professional practice This assignment will lead to continued professional service and eventually specialty-board certification

Medical Corps officers in the Regular Army will be kept in professional capacities without material interruption under this plan

The advantages of a professional career in the Army will also be brought to the attention of medical students to interest them in an Army commission Only those who stand scholastically in the upper third of their classes will be prevailed upon to consider the Army for a career

Reserve or AUS officers now on active duty who desire consideration for commission in the Regular Army may forward through channels a Statement of Interest to War Department, Adjutant General's Office, in accordance with the provisions of War Department Circular 243

Civilian physicians and former Organized Reserve Corps and AUS officers now on inactive duty status may submit Statement of Interest direct to the Adjutant General's Office

Future announcements as to securing commission in Regular Army Medical Department will be publicized in current professional and military publications —*Release from the Office of the Surgeon General*

ACUTE LUPUS ERYTHEMATOSUS DISSEMINATA TREATED WITH PENICILLIN

MILTON H MORRIS, M D , Far Rockaway, New York

(*From the St. Joseph's Hospital*)

R. K., a woman aged 20 years, a bookkeeper by occupation, was admitted to the St. Joseph's Hospital, with fever of one week's duration. During this week at home she was treated with the usual antipyretics, sulfadiazine, and penicillin.

Present Illness.—For the past eight months the patient had complained of weakness fatigue and loss of appetite She had irregular and occasional pains in the ankles and knees. Two weeks previously the fatigue and pain in the knees became more severe and the patient consulted a physician who prescribed vitamins and suggested that since she was at the seashore she should spend more time in the sunshine.

She then spent an entire morning in the sunshine. Two days later the patient was seized with chills high temperature, and from this time the acute episode of the illness dates.

Past History.—The patient had been well all her life, except for an appendectomy at the age of 9 She had no menstrual disorders.

Family History.—Her mother was 55 years old and in good health, her father died at the age of 47 from a ruptured gastric ulcer There was no history of tuberculosis

Physical Examination.—The patient was acutely ill, drowsy, and confused Her pulse was 130, respirations 38, temperature 105 2 F Her blood pressure was 110 mm. hemoglobin systolic, and 70 mm. diastolic. There was loss and thinning of the hair of the head. Over the bridge of the nose and extending symmetrically over both cheeks was a red, slightly mottled rash, well demarcated from the surrounding skin It was not elevated and assumed a butterfly appearance. Over the upper lip were some herpes and bullae which were hemorrhagic in appearance. The pharynx was congested and on either side of the soft palate were two large ulcerations The heart showed a tachycardia with a systolic murmur at the apex. The respiratory rate was increased, at the right base the breath sounds were decreased and impaired resonance on percussion was present. There was slight cervical adenopathy On the tips of the fingers a small circumscribed red rash was present.

Clinical Course.—During the first week the temperature remained high, fluctuating between 103 and 106 F The pulse varied between 140 and 160 per minute. The respirations remained high between 40 and 50 per minute The patient was drowsy and incoherent. Swallowing was painful and difficult because of the bilateral pharyngeal ulcerations. At the apex a systolic murmur was heard and a gallop rhythm was present. The patient was in extremis and it was the consensus that death was not far off

On the eighth day a remarkable change occurred. The patient seemed brighter and more interested in her surroundings and expressed a desire for food. The temperature dropped to 101 F , the respirations fell to 30 per minute but the pulse remained at 120 per minute. The general condition improved the ulcerations of the pharynx looked cleaner, the signs in the chest were less pronounced. The only residual symptom was the rapid pulse and the tendency of the patient to act morose and depressed and inquire continuously as to whether she was getting better She improved rapidly, her temperature becoming normal on the tenth day and remaining so Because of the depressed state it was thought advisable to send the patient home which was done twelve days after her admission to the hospital and nineteen days after the acute onset of her illness. She now presented a complete clinical remission. One month later she had resumed her work as a bookkeeper Her depressed state had left her and she had gained 15 pounds in weight. Her only complaint was a sensation of itching over the area of the erythema.

Treatment.—At home the patient received 400,000 units of penicillin and 10 Gm of sulfadiazine At the hospital the patient received 30 000 units of penicillin every four hours continuously for ten days making a total of 1,800 000 units of penicillin, given at home and hospital, which the patient received The patient also received 1 cc. of liver extract daily, 25 mg of pyridoxine 400 mg of vitamin C, and 1 cc. of the B complex.

Laboratory.—X-ray examination of the chest on August 14, 1945 showed an area of thin mottled, confluent density involving the mesial half of the right base, which had the appearance of an atypical pneumonia.

Agglutinations August 14, 1945 Negative for typhoid (O-H), paratyphoid, Brucella abortus, Proteus X-19 Blood culture August 14, 1945 No growth in seven days Stool culture August 14 1945 Negative for enteric organisms. Heterophile reaction Negative Serology Negative Kline test. Nonprotein nitrogen 30 Sedimentation rate (one hour) 44. Electrocardiogram Low voltage and sinus tachycardia.

Guinea pig inoculation intraperitoneally with patient's serum, followed by repeated exposure to sunlight and ultraviolet light, produced no harmful effects to the animal.

Discussion

Although the cause of acute lupus erythema disseminata is obscure, the pathology has been well described and the gross clinical picture well coordinated, so that a syndrome has evolved which permits of diagnosis The pathologic picture is that of diffuse involvement of all tissues of the body *with special predilection for skin, bone marrow,* heart, kidneys, and serous membranes in which there is a fibrinoid degeneration of the basic or supporting structures The subjective and objective clinical findings may be divided into two phases, one the result of a severe intoxication, and the other phase reflected by signs and symptoms incriminating such various organs and systems as are in that particular case involved by the pathologic process It is worthy of repetition that the English consider the disease a septicemia and in some way related to the streptococcus hemolyticus Certainly many of the features of the disease would favor this viewpoint, *viz*, the toxicity and prostration, the temperature, the depression of bone marrow, and the widespread nature of the disease

Treatment has included many and different drugs unrelated to the cause and pathology of the disease The treatment in the above case consisted of the usual drugs with the addition of large doses of penicillin The rapid recovery of a patient in extremis and the healing of large ulcerations of the pharnyx, the resolution of a large area of pneumonitis which is usually terminal in the disease, suggest the beneficial effects of penicillin in the treatment of acute *lupus erythematosus disseminata, not as altering* the basic pathologic anatomy but by overcoming the toxemia and infection, the immediate cause of death in the acute phase

Summary

A case of acute lupus erythematosus is presented, in which a remission occurred quickly with a rapid subsidence of the toxemia

The relationship between the toxemia and the cause of death during the acute phase is emphasized

The value of large doses of penicillin overcoming the toxemia and thus inducing an early remission is suggested

Although penicillin in large doses is not known to alter the basic pathologic process, its further use in this disease with continued observation may enlighten us further in this respect

---

LESS ORGAN MUSIC

When Music, heavenly maid, was young
And Earth was adolescent
She sang of love, of flowers, of spring
And Luna's silver crescent

The poets, too, loved noble themes
Of fame, romance, and glory,
Of lovely, lily ladies
And barons bold and gory

But now, the muse, gone modern,
Sings odes to liver pills,
She chants of vitamins and dope
That's good for gastric ills

She makes me sick with rhapsodies
To noxious drugstore mixtures
It's for my doctor to repair
My inner tubes and fixtures

My mamma told me, long ago,
Such things should ever be
A secret kept in reticence
Between the Doc and me

Organs that modest Nature hid,
As knowing them unsightly,
Why drag them out to rhyme about
And croon their functions nightly?

Oh, lyric Muse, return again
To lilt of love's young dreams
My colon and my ductless glands
Are not poetic themes

Trill triolets to violets
Or lambs upon the lea
But leave, I beg, for Art's own sake,
My viscera to me —*D W La F, in Tonics and Sedatives, J A M A, Jan 12, 1946*

Additional Annual Reports

To the 1945 House of Delegates

Medical Society of the State of New York

Report of the Treasurer

To the House of Delegates, Gentlemen.

The financial status of the Society is shown on the following pages by excerpts from the annual report of our Auditors, Messrs. J K. Lasser & Company, for the year 1945

It should be noted that in this report a change from previous years has been made in the method of noting our securities in the balance sheet of December 31, 1945 They are here valued at their cost to us instead of at their market value as of that date. This change of method makes a great difference in the amount of total assets. And also in the analysis of financial income, expense and surplus, and the surplus balance which it gives. On this latter sheet it will be seen that there is no item called "Appreciation in Market Value of Securities Owned," although there was an increase of about $33 000 in their market value during the year. Also, there is an item among the deductions of $10 512.18 called "Reduction to Cost of Securities Previously Carried at Market Value." This sum was the excess of the market value over the cost value at the time of the last annual report, that is, on December 31 1944.

Even with this change in bookkeeping there is shown an increase of $17 762 in our surplus balance. There has been an income from our securities and bank balances of about $14 000 and there has been an excess of operating income over operating expenses of about $17,000 This excess of income over expenses is due to the splendid showing of our JOURNAL which itself had a net favorable balance of $37 000, and which was thus able to turn a $20,000 deficit into a $17 000 credit.

As was done the year before, the Board of Trustees voted to place this net surplus of the JOURNAL in the reserve fund for future possible needs of this publication. This is as was explained in my report a year ago a safety procedure to prevent the cost of the JOURNAL at any future time from being a drain on the Society's funds to the detriment of the other activities of the Society

Remissions of dues to our members in, or just released from the uniformed forces of the United States amounted to $44,340. It will not be until 1947 or 1948 that most of these will be paying dues again. Meanwhile our expenses will be mounting. We are at work now on the *Directory*, which will cost at least $24,000 before we have finished, and we hope soon to be able to move into the larger quarters on the seventh floor of the building in which we are now located, with a corresponding increase in rental costs.

In closing, I wish to thank those of the office staff who have charge of the books and the other financial details of the Society for the fine spirit they have shown in their work and for the great care and accuracy with which the records have been kept. It has been a pleasure to work with them.

Respectfully submitted,

KIRBY DWIGHT, M D , *Treasurer*

March 22, 1946

Auditors' Statement

We have completed an examination of the balance sheet of the Medical Society of the State of New York as of December 31, 1945, and the statements of income and surplus for the year ended with that date, and have reviewed the system of internal control and the accounting procedures of the Society and, without making a detailed audit of transactions, have examined or tested accounting records of the Society and other supporting evidence by methods and to the extent we deemed appropriate.

In our opinion, the accompanying balance sheet and related statements of income and surplus present fairly the position of the Medical Society of the State of New York at December 31, 1945 and the results of its operations for the year ended that date.

Respectfully submitted,

J K. LASSER & Co

Report of the Council

PART XII

Malpractice Defense and Insurance

The Council Committee on Malpractice Defense and Insurance, consisting of

J Stanley Kenney, M D , *Chairman* New York
Thomas M D'Angelo, M D . Jackson Heights
James M Flynn, M D : Rochester
W P Anderton, M.D , ex officio New York
Kirby Dwight, M D , ex officio New York

submitted the following report

Each year it is the duty and privilege of the Committee on Malpractice Defense and Insurance to submit, through the Council, a report of its activities and recommendations to the members and the House of Delegates of the Medical Society of the State of New York

The past year has been an active and generally satisfactory one for the Committee, but further study has served to emphasize the fact that the complexity and importance of our malpractice insurance and defense affairs require far more intimate understanding and continuity of supervision than can be provided, as at present, by a committee of the Council, all of whose members are liable to frequent change Last year the Committee recommended that its duties be delegated to a special committee of the House of Delegates, to be organized so as to provide the needed continuity of supervision, and submitted a proposed amendment to the Bylaws which, if adopted, would authorize the appointment of such a committee

The proposed amendment which will come before the House of Delegates for consideration this year is as follows

"A Special Committee to be known as the Malpractice Insurance and Defense Board, consisting of five members including a chairman, shall be appointed by the President with the approval of the Council. Five members of the committee shall be appointed in 1946 for one, two, three, four, and five years, respectively, and, thereafter, one new member shall be appointed each year Vacancies for any cause shall be filled for the unexpired term by appointment by the President with the approval of the Council. The Secretary, Treasurer, Legal Council, and Indemnity Representative shall be ex officio members of the Committee with voice but without vote It shall be the duty of the Committee to study and supervise on behalf of the Society all matters having to do with malpractice insurance and defense"

In its resolution proposing the foregoing amendment, the Committee pointed out that the Group Plan has grown to the size of a corporate enterprise, large enough to require the supervision of a board of directors whose members remain in office long enough to acquire an intimate understanding of the many business and professional problems involved It should be added that the insurance laws of the State of New York, which govern all insurance operations in this state, must also be studied and thoroughly understood

To further emphasize the Committee's desire to see the proposed amendment adopted, we would quote the following clause from the Committee's report submitted to the House of Delegates at its 1945 annual meeting

"This enterprise (the Group Plan) has now been in existence twenty-four years, and so long as it

BETTER BABY FEEDING

with

Campbell's STRAINED BABY SOUPS

***Q** Will Baby like these soups?*

A If he is like most babies, he will! Mothers who have tried Campbell's Strained Baby Soups say that they are better tasting—that Baby takes them readily and appears to enjoy their tempting, normal flavors. Each soup retains to the utmost the natural flavors of the meats and vegetables employed. The texture is smooth and the consistency uniform and pleasing to the infant.

***Q** Why five kinds?*

A. Doctors agree that it's important to get Baby accustomed to a variety of flavors early in life, so that he will accept all foods readily and will not develop "fussy" eating habits. Also, it takes many different foods to supply the more than 50 nutrients needed for infant development and energy—hence we use vegetables and a cereal in the preparation of each one of our four meat soups.

***Q** What about vitamin and mineral retention?*

A The latest scientific information has been drawn upon in developing a cooking method which insures the efficient conservation of vitamins and the retention of minerals. A comprehensive analysis of each soup may be had upon application to Campbell Soup Company, Camden, N. J.

5 KINDS:

LIVER
CHICKEN
LAMB
BEEF
VEGETABLE

All in Glass Jars

Campbell's Strained Baby Soups represent fine quality in ingredients, in care and method of cooking, in retention of minerals and conservation of vitamins—*and in good flavor*. Every resource of Campbell's Kitchens is devoted to that aim.

LOOK FOR THE RED-AND-WHITE LABEL

continues to accomplish the purposes for which it was organized there is every reason that it should be continued indefinitely and, certainly, past the years of active participation in Society affairs of those whose foresight sponsored it and whose support has brought it thus far along the road of service to the Society The long view of the matter requires this continuity of contact with our insurance affairs, which is not possible in our present setup"

For these reasons, the Committee urges as its most important recommendation to the House of Delegates that the proposed amendment to the Bylaws be approved.

Following the presentation of its report last year, the Committee continued its correspondence with the American Policyholders' Insurance Company of Boston. To date, it has been unable to secure from that Company in writing a serious proposal for our malpractice insurance business under the terms and conditions of the basic requirements for the Group Plan as adopted by the House of Delegates The Committee, therefore, reaffirms the recommendation in the 1945 report to the House of Delegates that the American Policyholders' Insurance Company cannot be considered as the carrier of the Group Plan. As a matter of policy, the Committee still holds the view that no temporary saving in rates would justify any member of the Society going outside the Group Plan to buy his malpractice insurance as an individual.

At the request of the Committee, the Council has published and mailed to each member a booklet entitled *Group Plan of Malpractice Defense and Insurance*, containing a condensed history of the Group Plan and what it stands for, it also includes the amended rules and regulations of the Society governing malpractice insurance and legal defense This material was also published in full in the March 1, 1946 issue of the NEW YORK STATE JOURNAL OF MEDICINE, Vol. 46, No 5, page 535, under the title "Special Article—The Group Plan of Malpractice Insurance and Defense, A Message from the Committee." Other matter, in addition, at one time or another has been published in the JOURNAL, but members who missed the particular issues involved, or who have come into the Society since then, have complained that the details of the Group Plan and the Society's legal defense have never been explained to them. These details have now been set forth fully in the new booklet which has been printed and bound in an attractive form and size so that it can be kept in a member's desk for ready reference when required. In addition, an appropriate supply has been mailed to the secretary of each county society The Committee recommends that the House of Delegates, by a special communication to each county society, request them to bring to the attention of their members the importance of reading this booklet carefully, and direct that a copy of it be placed in the hands of each new applicant for membership

Each year the Group Plan loses a certain number of members through ordinary attrition, such as, death, retirement, moving out of the state, entering employment in which malpractice protection is not needed, etc During the year, 355 members discontinued their insurance for these and similar reasons This is slightly above the average and is due to the fact that 45 members entered the armed forces during the year and discontinued their insurance During the same period, however, 1,365 new applications were received, so that the net gain for the year was 1,010, bringing the total number of insured to 8,923, or 45 8 per cent of the entire membership as of the first of the year

Over half of the net increase occurred during the last four months of the year, and this same rate of increase has continued during the first two months of this year If this rate of increase continues, it is likely that the net gain for the current year will raise the percentage of members insured to over 50 per cent

Comparing the number of members insured to the total membership, is, however, somewhat misleading because of the large number of members who are engaged in activities which entail no malpractice liability It is estimated that of the total members practicing medicine in this state under circumstances which expose them to malpractice suits, about 75 per cent are now insured in the Group Plan.

After long observation it had appeared that the number and cost of malpractice actions in this state vary in inverse ratio to the general prosperity The past year, however, during which all communities of the state enjoyed a high degree of prosperity, proved to be an exception to that rule. During the year, the average cost of operating the Group Plan over the last ten years increased $1 46 per insured member Only eleven cents of this increase can be attributed to the inclusion of x-ray therapy in the basic coverage, and none of it to the fact that the policy contract was extended last year to include liability on account of the acts of nonaffiliated and noninsured doctors while acting as emergency substitutes for insured members The remaining $1 35, therefore, is chargeable entirely to ordinary normal losses caused, apparently, by the pressure of work carried by members who remained in civilian practice and by an increase in the average cost of disposing of suits and claims. As to the latter, the tendency of courts and juries to award greater damages for personal injuries of all kinds is due, in part, to the increased earning capacity of patients but it is also due, to a considerable extent, to the depreciated value of the dollar A thousand dollars will not buy as much as it did before the war and this fact is well understood by all juries In the future it may be expected that the cost of judgments will keep pace, if not run ahead, of any further inflation in our national economy

If the cost of losses under the Group Plan continues to rise during the current year, the Society may be compelled to approve a return to the base rate of $30 in 1947 We hope that by cooperative and concerted action by each component county society the incidence of malpractice suits can be reduced, making such a change in rates unnecessary

It has frequently been said that our malpractice rates are too high. If by that it is meant that we pay too much for the protection furnished by the Group Plan, nothing could be further from the fact One item alone will serve to prove this point. On the first of this year, there were in the office of the Legal Counsel, 323 unsettled and outstanding suits and claims for which, upon his recommendation, reserves of $491,352 were established, which amounts to an average of about $25 for each member of the entire Society These reserves are not carelessly made or overestimated, but are carefully examined and re-estimated four times a year by the Legal Counsel and reduced to the lowest value he considers safe to place upon them

If, on the other hand, these oft repeated complaints refer to the high cost of furnishing malprac-

for more effective

Oral **VITAMIN B COMPLEX THERAPY**

LIPO-HEPLEX

(U. S. VITAMIN)

3 significant Fractions of Liver

- **AQUEOUS**
- **LIPOID**
- **80% ALCOHOL-INSOLUBLE**

. combined with

IMPORTANT CRYSTALLINE B VITAMINS

Current laboratory and clinical investigations show that a combination of the aqueous *and* lipoid fractions of liver, providing more complete nutritional therapy, is clinically superior to aqueous extracts alone since certain essential nutritional factors are removed in the preparation of the usual aqueous liver extracts.

Provides in each capsule the vitamin extracts and concentrate (water-soluble, 80% alcohol insoluble and lipoid fractions) derived from a total of 11.5 grams of liver including folic-acid fractions (L. casei factor [Bc] etc.), biotin, inositol, and other nutritional factors present in the liver fractions. Each capsule contains

Thiamine HCl (B_1)	2.0 mg
Riboflavin (B_2)	2.0 mg

U. S. VITAMIN CORPORATION • NEW YORK 17,

tice insurance protection, they are entirely correct The cure for this, however, does not lie in trying to find some venturesome but uninformed insurance company willing to insure us at lower rates regardless of our costs The only sure and economic sound way to reduce our insurance rates is to reduce the number and cost of our losses That this can be done has been amply demonstrated by the x-ray therapists of this state who, during the twenty-one years between 1924 and 1945, reduced the cost of their insurance protection from $99 to $28

It is assumed, of course, that no doctor wants to be sued for malpractice, but it would appear that there are too many members of the Society who are completely indifferent to the numbers of suits filed against their fellow members, unaware, perhaps, that the cost of these suits does not come out of the treasury of an insurance company, but directly out of their own pockets and those of the other insured members of the Society

The number of malpractice suits can be materially reduced by a wholehearted acceptance by the membership of two basic principles The first, and primary, objective should be to reduce the causes of malpractice suits against ourselves This can be obtained by an unflagging effort to bring to our patients the best and most conscientious care which modern medical science makes possible

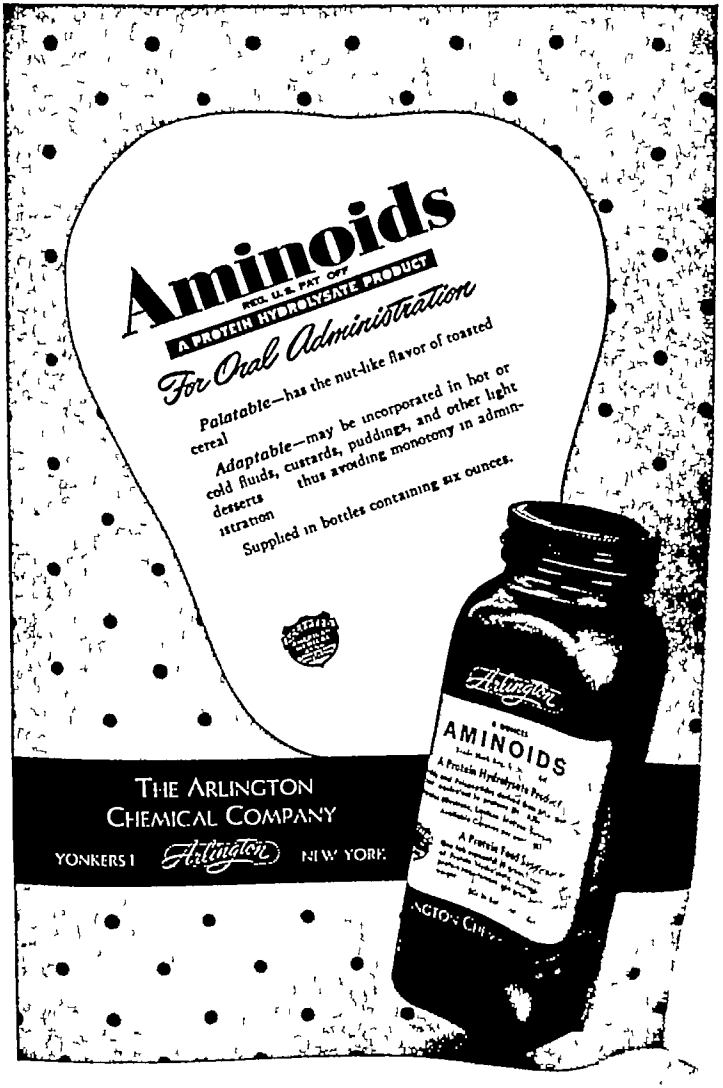
The second objective should be to make every legitimate effort to prevent unjustified suits against fellow practitioners

Patients are entitled to our counsel and advice, but, in giving it, three rules should be observed

1 Be sure to know all the facts and factors involved.

2 Abstain from needless and ill-advised criticisms of fellow practitioners

3 Practice the golden rule



A successful malpractice action is not only a blot upon the professional reputation of the doctor involved, but upon his profession as well This fact should make the acceptance of the foregoing principles unanimous but, if a further incentive is necessary, it can be stated that, if these principles were accepted and practiced by all the members of the Society, our malpractice insurance rates would be reduced 50 per cent

The Committee would again call to the attention of all the members of the State Society Part III of the 1945 Annual Report to the House of Delegates, particularly Section 1, which concisely states the purposes for which the Group Plan was organized

While much that this portion of the report contains has been incorporated in the booklet above referred to, a careful rereading of this succinct summary should clarify much of the misunderstanding that may exist regarding the Group Plan.

The Committee cannot close this report without paying their respects and gratitude to the Yorkshire Indemnity Company, the carrier of the Group Plan, and its officers for their keen interest and unfailing cooperation in all problems related to the malpractice insurance business of this Society, also for the patient, faithful, and conscientious service at all times to the Committee and, in the larger sense, to all the members of the State Society, of the Indemnity Representative, Col Harry F Wanvig, under whose competent direction the Group Plan has accomplished every purpose for which it was organized We are deeply indebted, also, to Mr William Martin, the Legal Counsel of the Society, for his diligent and skilled services and ready assistance

We again bespeak the adherence of the members to the Group Plan. In these disturbing times the need for solidarity and a united front in medicine is more imperative than ever Full cooperation and participation in the efforts of your Society to furnish the best malpractice insurance protection and defense available anywhere in the United States, which we believe the Group Plan affords, is the surest way to stabilize this business and bring about lower rates

Department of Workmen's Compensation

CONDUCTED BY DAVID J KALISKI, DIRECTOR

Payment of Medical Fees to Authorized Physicians and Licensed X-Ray and Pathologic Laboratories

RECENTLY our attention was called to the fact that a certain voluntary hospital in New York City rendered a bill to an insurance carrier for physical therapy treatments in an ambulatory compensation case The employer had signed an authorization for such treatment. The insurance carrier, in accordance with the provisions of Section 13-f(1) of the Workmen's Compensation Law, which states that fees for medical services shall be payable only to a physician or other lawfully qualified person permitted to render medical care, refused to pay the bill to the hospital, whereupon the hospital entered suit against the carrier Before trial, the suit was withdrawn by the hospital when the provisions of the law were brought to its attention by this Bureau, and the physician who rendered the services in the hospital was paid by the carrier

Under the date of February 14, 1946 the Superintendent of Insurance, the Honorable Robert E Dineen, wrote the following letter to all insurance carriers licensed to sell compensation insurance in this State

"I am writing this letter to the chief executives of every company licensed to write workmen's compensation insurance in this State, to ask for their cooperation in investigating alleged violations of certain sections of the Workmen's Compensation Law Complaints have been made to this department that some carriers are paying bills for medical services of physicians or other persons who have not qualified under the Workmen's Compensation Law to render medical care. If true, this violates the law, as explained below, and will require correction

"Sections 13-b and 13-c of the Workmen's Compensation Law provide for the licensing of persons trained in laboratory or diagnostic technics

"Section 13-f(1) of the New York Workmen's Compensation Law provides in part as follows

"'Fees for medical services shall be payable only to a physician, or other lawfully qualified persons permitted by Section 13-b of this chapter, to render medical care under this chapter, or the agent, or to the executor or administrator of the estate of such physician'

"As we construe these provisions of the statute, they provide, in effect, that only physicians, x-ray and other laboratories licensed by the chairman of the Workmen's Compensation Board may be paid by the carriers under the Workmen's Compensation Law

"As you know, the Insurance Law contains provisions imposing an obligation on the part of the superintendent to see to it that companies under the jurisdiction of the department obey not only the insurance law, but all other laws of the State (Sections 511-f, 513, 515 Insurance Law)

"In the light of the foregoing, I wonder if you would be good enough to ascertain and report to me at the earliest opportunity the procedures employed by your claim department to prevent any violation of the cited provisions of the Workmen's Compensation Law"

ROBERT E DINEEN, *Superintendent of Insurance*

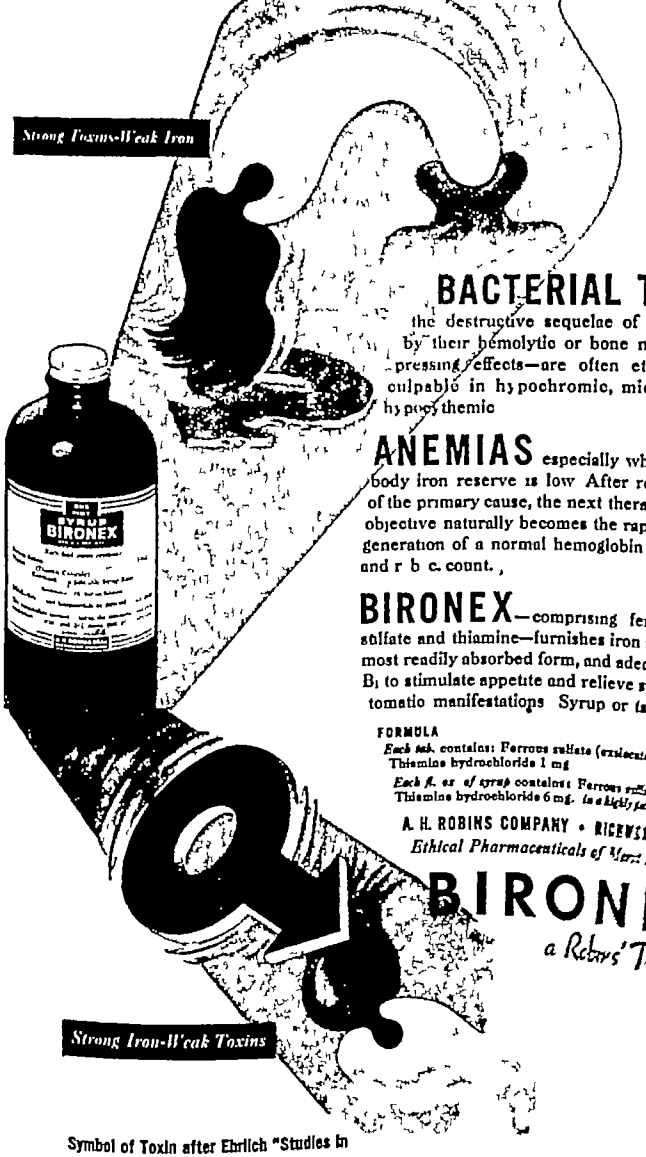
The above letter was published in the *Journal of Commerce and Commercial*, New York, on Monday, February 18, 1946 It would indicate that greater vigilance will be maintained by insurance carriers in the future, in the consideration of bills received by them for medical care In this connection it is pertinent to note that only recently the Chairman of the Workmen's Compensation Board, Miss Mary Donlon, advised physicians that they should be more vigilant in obeying the law in the referral of x-ray and laboratory work and such examinations should be referred only to physicians or laboratories authorized under the Workmen's Compensation Law

The Bureau of Workmen's Compensation of the Medical Society of the State of New York invites all physicians to inform the Director of any instance where either a hospital, physician, or carrier has not practiced or proceeded in accordance with the provisions of the Workmen's Compensation Law as outlined above.

U N R.R.A BUILDS EMERGENCY MEDICAL STOCKPILES

A stockpile of vaccines and biologicals, as well as water-purifying equipment, is being built up in London by the United Nations Relief and Rehabilitation Administration to be ready to combat possible outbreaks of epidemics, it has been announced at the agency's Washington headquarters

The reserve stock of supplies is being acquired from sources both in the United States and the United Kingdom.



Arrangements have been made for packaging the supplies so that they can be shipped by air and thus can be flown immediately to the scene of any outbreak of disease in countries where the agency operates Because London is close to most of these countries, the stockpile is stored there

Included among the supplies are diphtheria antitoxin, toxoid and Shick-test toxin, smallpox vaccine, tetanus antitoxin, and vaccines for use against plague, typhus, and gas gangrene

The purifying equipment includes twenty-four portable gasoline engines with hypochlorinating units capable of processing fifty gallons of water per minute for drinking and hospital purposes as well as a dozen other purifying outfits

All these units also are capable of air

Postgraduate Medical Education

Progams arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL *The members of the committee are Oliver W H Mitchell, M D , Chairman (428 Greenwood Place, Syracuse), George Baehr, M D , and Charles D Post, M.D*

Postgraduate Refresher Courses

REFRESHER courses have been arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York, on Tuesday afternoons, in the auditorium of the Nassau Hospital, Mineola, for the Nassau County Medical Society

A lecture on "The Relationship Between Pneumonia and Lung Abscess," by Dr Richard H. Bennett, clinical professor of medicine, Long Island College of Medicine, will be held on April 16 at 4 30 P M

On April 23, there will be a joint meeting of the Veterans Committee and the Nassau County Medical Society in the auditorium at 9·00 P M "The Management of Arthritis, Acute and Chronic" will be discussed by Dr L Maxwell Lockie, professor and head of the department of therapeutics, University of Buffalo School of Medicine

This series of lectures was begun on Tuesday, March 5, and has been held each Tuesday thereafter

The following lectures and lecturers have already been given "The Clinical Application of Sulfonamides and Penicillin," Joseph H Bunim, M D, assistant professor of clinical medicine, New York University College of Medicine, "Toxemias of Pregnancy," Frank P Light, M D, instructor of obstetrics and gynecology, Long Island College of Medicine, "Gynecology in General Practice," P Gordon Douglas, M D, associate professor of obstetrics and gynecology, Cornell University Medical College, "The Treatment of Burns and Hand Infections," David Goldblatt, M D, assistant clinical professor of Surgery, College of Physicians and Surgeons, Columbia University, "Management of Acute Cardiovascular Emergencies," Clarence E. de la Chapelle, M D, professor of clinical medicine, New York University College of Medicine, "Gastrointestinal Ulcerations," Albert F R. Andresen, M D, professor of clinical medicine, Long Island College of Medicine

These lectures were provided by the Medical Society of the State of New York, with the exception of those by Drs Bunim, Light, Douglas, Goldblatt, and Bennett, which were provided jointly by the New York State Department of Health and the Medical Society of the State of New York.

Series of Lectures Given for Sullivan County

"CHEMOTHERAPY in Obstetrics (Postabortal and Postpartum Infections)" will be the subject of a lecture to be given on April 17 by Edward C Hughes, professor of obstetrics, Syracuse University College of Medicine

On April 10, Dr Horace E Ayers, professor of obstetrics and gynecology, New York Medical College, discussed obstetric maneuvers on the Ayer's manikin, illustrating the discussion with a sound film in color

The series was started by Dr Edward P Maynard, Jr, professor of clinical medicine, Long Island College of Medicine, who spoke on heart disease and pregnancy at the meeting on April 3 *

Lectures for Monroe County Medical Society

AT THE Rochester Academy of Medicine on April 3, Dr William Dock, professor of medicine, Long Island College of Medicine, gave a lecture on "Peptic Ulcer and Gastric Cancer" On April 18, "Office Management of Female Pelvic Disorders," will be presented by Dr Clyde L Randall, professor of gynecology, University of Buffalo School of Medicine These lectures were given for the members of the Medical Society of Monroe County

Syphilis

THE Cortland County Medical Society attended a lecture given by Dr James Lowry Miller, assistant clinical professor of dermatology, College of Physicians and Surgeons, Columbia University, on "Syphilis" on Friday, April 19, in the staff room of the Cortland County Hospital *

Three Monthly Meetings for Tioga County

THE Tioga County Medical Society attended three lectures on March 12, April 9, and May 7 "Hypertension and Hypertensive Heart Disease," was discussed by Jules Redish, M D, assistant professor of medicine, New York University College of Medicine, and "The Treatment of Burns and Lacerations," by Emmett A. Dooley, M D, assistant clinical professor of surgery, New York Post-Graduate Medical School, Columbia University

On May 7 a lecture entitled "Growing Feet of Children," by R. Plato Schwartz, M D, associate professor of orthopedic surgery, University of Rochester School of Medicine and Dentistry, was given in the Green Lantern Inn, Owego

* This instruction has been arranged by the Medical Society of the State of New York in cooperation with the New York State Department of Health.

ONEERING THAT POINTS TO DISCOVERY DISCOVERY THAT DEMANDS LEADERSHIP

William Hewson

1739 1774

Although it received little recognition during Hewson's lifetime his analysis of coagulation added an essential element to the knowledge which led to parenteral therapy Hewson isolated the substance which he called "coagulable lymph," later named fibrinogen.

Baxter · PIONEERS IN PARENTERAL THERAPY

Another *Baxter* FIRST ... the Vacodrip

In 1935 the Vacodrip was made available for better use of parenteral solutions. It provided the means to control accurately and safely the rate of solution administration from the Baxter Vacoliter The one piece all glass, easily cleaned Vacodrip which could be simply plugged into the Vacoliter became an integral part of the Baxter Technique for Parenteral Therapy Baxter s many years of pioneering and leadership in the field of parenteral therapy are your protection. Here is a parenteral program complete trouble free and confidence inspiring No other method is used in so many hospitals.

Symposium for Montgomery County

ON APRIL 25, 1946, at the Elk's Club, Amsterdam, a symposium on "Hypertension" will be given for the Montgomery County Medical Society The medical treatment of "Hypertension" will be discussed by Dr Charles E Poindexter, associate clinical professor of medicine, College of Physicians and Surgeons, Columbia University, and the surgical treatment by Dr J William Hinton, associate clinical professor of surgery, College of Physicians and Surgeons, Columbia University

Warren County Hears Lecture

WARREN County Medical Society heard a lecture on April 11, given by Dr Henry H Ritter, professor of clinical surgery, New York Post-Graduate Medical School, Columbia University, on "Traumatic Surgery with Emphasis on the Treatment of Wounds and Shock"*

Joint Meeting of Broome and Tioga Counties

THE Broome and Tioga County medical societies heard a lecture on "Management of Phlebitis" on April 9 Dr A. Wilbur Duryee, associate clinical professor of medicine, College of Physicians and Surgeons, Columbia University, was the lecturer

Schenectady County Instruction

DR CLAYTON W GREENE, professor of medicine, University of Buffalo, School of Medicine, discussed chemotherapy and the antibiotics at a postgraduate instruction given for the Schenectady County Medical Society Tuesday evening, April 2, at 8 30 P M in the Medical Library, Ellis Hospital, Schenectady

The March lecture was given by Dr Fred J G Hiss, professor of clinical medicine, Syracuse University College of Medicine His subject was "Rheumatic Fever—Rheumatic Heart Disease."*

Coronary Heart Disease

"THE Differential Diagnosis and Treatment of Coronary Heart Disease" was the subject of the lecture on April 11, given by Dr Henry Field, Jr, associate professor of medicine, University of Buffalo School of Medicine, to the Steuben County Medical Society

Medical Treatment of Toxic Thyroid

DR. GEORGE H. KOEPF lectured to the St. Lawrence County Medical Society on April 11, on "Medical Treatment of Toxic Thyroid." He is associate in physiology and instructor in medicine at the University of Buffalo School of Medicine

Management of Acute Cardiovascular Emergencies

MANAGEMENT of acute cardiovascular emergencies was the subject of Dr Charles E Kossmann, associate professor of medicine, New York University College of Medicine, at a meeting of the Tompkins County Medical Society

The talk was given on March 19 in Ithaca

Lecture Given by Dr Clyde Randall

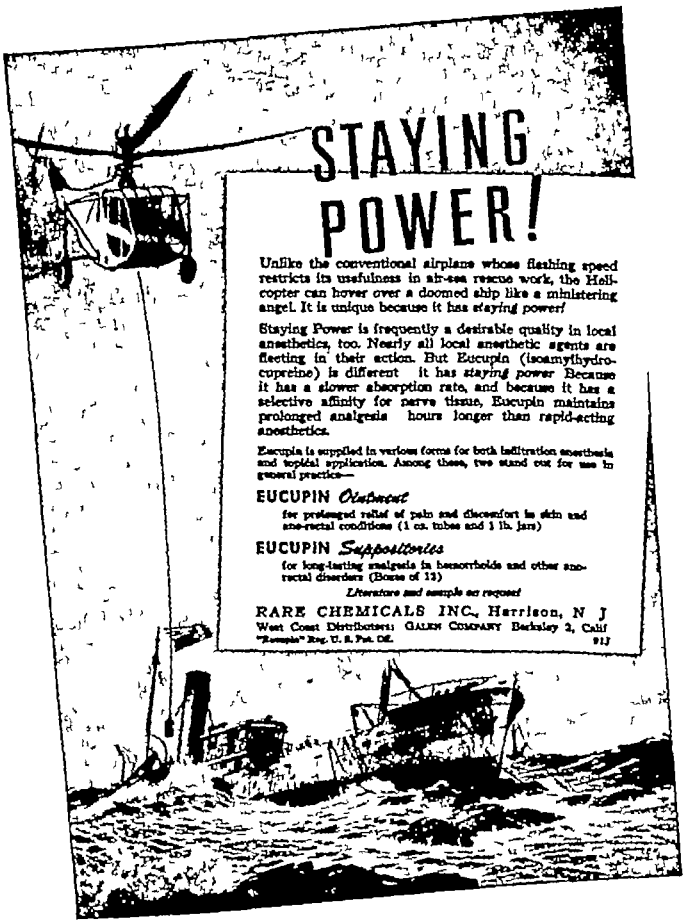
ON WEDNESDAY, April 10, the members of the Wyoming Medical Society attended a lecture on "The Significance and Management of Abnormal Vaginal Bleeding" given by Dr Clyde L Randall, professor of gynecology, University of Buffalo School of Medicine *

Thursday Evening Lectures at Jefferson County

CLINICAL Diagnosis and Treatment of Cardiac Arrhythmias," by Dr Walter W Street, professor of clinical medicine, Syracuse University College of Medicine, given on March 14, was the first of a series of lectures given to the Jefferson County Medical Society

On April 11, "The Treatment of Thyrotoxicosis with Thiouracil and Other Agents," was presented by Dr George H. Koepf, associate in physiology and instructor in medicine, University of Buffalo

On May 9, "Peptic Ulcer and Gastric Cancer," was discussed by Dr William Dock.



He is professor of medicine at Long Island College of Medicine.

Illustrated Lecture on Skin Diseases

"COMMON Diseases of the Skin—Illustrated with Color Photography," by Leon H Griggs, M D, associate professor of clinical medicine (dermatology and syphilology), Syracuse University College of Medicine, was the title of the lecture given on April 9, for the Wayne County Medical Society at Lyons.

Tropical Diseases

MEMBERS of the Ulster County Medical Society, met on April 4, at the Governor Clinton Hotel, Kingston, to hear Dr Harold W Brown, professor of parasitology, De Lamar Institute of Public Health, College of Physicians and Surgeons, lecture on "Tropical Diseases in the Returning Veteran."

STAYING POWER!

Unlike the conventional airplane whose flashing speed restricts its usefulness in air-sea rescue work, the Helicopter can hover over a doomed ship like a ministering angel. It is unique because it has *staying power!*

Staying Power is frequently a desirable quality in local anesthetics, too. Nearly all local anesthetic agents are fleeting in their action. But Eucupin (isoamylhydrocupreine) is different — it has *staying power*. Because it has a slower absorption rate, and because it has a selective affinity for nerve tissue, Eucupin maintains prolonged analgesia — hours longer than rapid-acting anesthetics.

Eucupin is supplied in various forms for both infiltration anesthesia and topical application. Among these, two stand out for use in general practice—

EUCUPIN *Ointment*

for prolonged relief of pain and discomfort in skin and ano-rectal conditions (1 oz. tubes and 1 lb. jars)

EUCUPIN *Suppositories*

for long-lasting analgesia in hemorrhoids and other ano-rectal disorders (Boxes of 12)

Dr. Perkins Named Deputy State Commissioner of Health

DR. JAMES E PERKINS, former director of the Division of Communicable Diseases, has been appointed Deputy State Commissioner of Health to succeed Dr Paul B Brooks whose retirement became effective January 1

Dr Perkins was graduated in medicine from the University of Minnesota and holds the degree of Doctor of Public Health from Johns Hopkins University His association with the New York State Department of Health began in 1934 when he was appointed epidemiologist in the Division of Communicable Diseases Later he served as district state health officer in charge of Fulton and Montgomery Counties

Since 1938 Dr Perkins has been director of the Division of Communicable Diseases During his administration a number of major research projects were conducted including investigations on the prophylactic value of Phase I pertussis vaccine, the manner of spread of pneumococcal infection through communities, the manner of spread and control of epidemic keratoconjunctivitis in war industries, the therapy of poliomyelitis with gamma globulin, and the initiation of a study of the control of airborne infection through ultraviolet light irradiation.

In 1945, Doctor Perkins spent four months in Italy as a member of the Italian Medical Nutrition Mission studying the effect of the war on the Italian civilian population with respect to communicable disease and malnutrition. He served in this connection as a reserve officer in the United States Public Health Service, assigned to the United Nations Relief and Rehabilitation Administration under which the Mission was operating

Doctor Perkins has been Associate Professor of Public Health and Preventive Medicine at Albany Medical College since 1937 and has directed the Extension Course in Public Health He is associate editor of the *American Journal of Public Health* and holds the office of secretary of the Epidemiology Section of the American Public Health Association.

Dr Hollis S Ingraham has been appointed provisionally to the position of Director of the Division of Communicable Diseases to succeed Dr James E Perkins

Dr Ingraham received the degree of Doctor of Medicine from Harvard University Medical College in 1933 and was awarded the degree of Master of Public Health by the Harvard School of Public Health in 1935 He joined the staff of the State Department of Health in July, 1934, as epidemiologist-in-training In 1935 he became assistant epidemiologist and a year later was appointed epidemiologist In the fall of 1938 he was named District Health Officer in charge of the Kingston District

In June, 1942, Dr Ingraham was commissioned Lieutenant in the Naval Reserve and was later promoted to the rank of Lieutenant Commander He was attached to the Naval Medical School at Bethesda, Maryland, where he taught preventive medicine and did research on the prevention of respiratory infections in submarines and at naval training stations In 1944 he was assigned to overseas duty with the United States of America Typhus Commission at Cairo which was engaged in the control of typhus epidemics in Egypt, French Morocco, and Saudi Arabia He was later assigned to research on relapsing fever at Cairo. He returned to the United States on January 1 and entered on terminal leave January 4.

Dr Ingraham is a Fellow of the American Public Health Association He has contributed a number of articles to medical and public health journals

Drop in Standards in Medicine Threatens

UNLESS prompt steps are taken to restore medical education to the high level of the Nineteen Twenties, the United States will face a serious threat to its standards of medical care a decade hence, Dr Alan Gregg, director for the medical sciences of the Rockefeller Foundation, declared on April 2 at the Columbia University Club

"Even such scientific contributions as penicillin or the blood substitutes would be useless without trained physicians at hand to prescribe and administer them," Dr Gregg said "Indeed, an ill-trained or ignorant doctor can (and does) make mistakes as disastrous to the patient as if they were deliberate injuries"

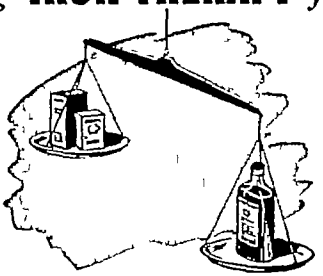
Medical schools must increase their annual budget at least 50 to 75 per cent to discharge their responsibilities and to approach meeting their opportunities, the speaker contended

"Though our battle casualties were 30 to 40 per cent neuropsychiatric," he continued, "there are not three medical schools in the United States with departments of psychiatry adequately supported from endowment Industrial and preventive medicine and medical sociology remain undeveloped There is not one exemplary department of dermatology in the country

"There is not a single medical school with an ideal organization of pharmacologic teaching and research In neglect of our interests and responsibilities in the tropics, the United States contains no school of tropical medicine that covers the subject adequately"

Pathology Society Welcomes Veterans

THE NEW York State Society of Pathologists cordially invites returning servicemen who are residents of the State and who have been trained or are now receiving training in pathology, to become members of the Society Applications can be forwarded to



Dr M J Fein, Secretary-Treasurer, 30 East 40 Street, New York 16, New York.

In prescribing **IRON THERAPY** *you can choose*

IONIZED IRON

C frequent
Constipation
Anorexia
Dehydration

or OVOFERRIN

C frequent
Constipation
Anorexia
Dehydration

The frequent association of gastro intestinal disorders and hypochromic anemia requiring iron therapy creates a thera peutic problem. OVOFERRIN offers a definite solution readily appreciated by the practitioner because

OVOFERRIN DOES NOT IONIZE

In colloidal form easily assimilated, it is practically unaffected by the gastric juices, is readily absorbed in the intestinal tract without the distressing side effects so common with usual ionized IRON preparations

NO STAINING OF TEETH • NON-ASTRINGENT

Such a combination of advantages in a palatable IRON preparation permits continuous, prolonged therapy so often necessary in hypochromic anemia

That's why you can bridge the gap between iron deficiency and *effective* iron therapy with

OVOFERRIN

without distressing side effects

℞ MAINTENANCE DOSAGE

One teaspoonful 2 or 3 times a day in water or milk.

℞ THERAPEUTIC DOSAGE

ADULTS One tablespoonful 3 or 4 times daily in water or milk.
CHILDREN One to 2 teaspoonfuls 4 times daily in water or milk.

Made only by the

Applications for membership from Drs Harry L Fulton and William J Murray were approved by the Board of Censors

A scientific session with Dr Lester S Knapp, attending proctologist, Buffalo General and Millard Fillmore Hospitals, as speaker was held on March 12 He discussed "Carcinoma of the Lower Bowel" The applications of Drs David H Chapman, Louis J Damish, Manuel de Diego, and Rosine M Silberer for membership were approved. The Blood Bank Committee made a report on the need and advisability of establishing a Central County Blood Bank. Present plans called for a showing of a colored movie on the subject.

The members of the Society were guests of the Endicott Johnson Medical Department for dinner on April 9 "The Management of Phlebitis" was discussed by Dr A Wilbur Duryee, associate professor of medicine, Columbia University College of Physicians and Surgeons The membership applications of Drs A H Fotouhi, Benjamin Lewis, Anthony Meloro, and J E Ryan were accepted

• • •

Dr Carl C Janowsky has replaced Dr John Robertson, who recently entered private practice, as ear, nose, and throat specialist with the Endicott Johnson Medical Department in the Washington Avenue, Endicott, offices, it was announced in February

Before entering military service, he was in private practice in New York City for nine years During that time he was surgeon in the ear, nose, and throat department of the New York Hospital and Cornell Medical Center, New York City, and instructor in clinical otolaryngology at Cornell University Medical College

In October, 1942, Dr Janowsky entered the Army with a captain's commission and served with the Mayo Clinic Unit until June, 1943

Following transfer to the 99th General Hospital as chief of the ear, nose, and throat service, he completed 18 months in the European Theater

While there he also acted as consultant to the 819th Hospital Center, consisting of eight General Hospitals with a minimum bed capacity of 8,000 patients

Cattaraugus County

Several Cattaraugus County physicians have recently been discharged from service Dr J Stuart Fleming, who was a flight surgeon with the Eighth Air Force, has resumed his practice in Salmanaca, others are Dr Marion Donato formerly regimental surgeon and commanding officer of the 290th Infantry Regiment's medical detachment, Dr S Castilone, of Olean, a captain in the Medical Corps, and Dr Francis P Keefe, a flight surgeon with the fourteenth Air Force who leaves the service with the rank of major

Cayuga County

Dr Darrell D Althouse, of Auburn, who was recently discharged from military service, was the guest speaker at the February meeting of the Auburn Unit of the National Council of Catholic Nurses, held at the Catholic Daughters Home, South Street

Dr Althouse who served 26 months overseas and participated in the invasion of Bougainville, the British North Solomon Islands, and Luzon described the organization of the medical units in which he served overseas He highly praised the work of the medical corps men who served with him stating that "a high percentage of the men received well deserved decorations and honors" He spoke of the important role that blood plasma played in helping to save the lives of men wounded in battle stating that "almost every wounded man in his area received one unit of plasma and many of the more seriously wounded men received four or five units of this miracle producing substance"

Dr Althouse mentioned the excellent record of the Army Medical Corps and said that "1,700 men in his company were wounded in one Pacific battle, all but three lived" *

Woman's Auxiliary

To the Medical Society of the State of New York

County News

Kings County On Lincoln's Birthday, February 12, a meeting and membership tea was held at St Bartholomew's Community House at two o'clock It was well attended, eight new members were admitted after introduction by the president, Mrs Henry J Jauch

Mrs Clifton Dance was chairman of the day and the past-presidents acted as hostesses They were Mrs John L Bauer, Mrs Edwin A. Griffin, Mrs Frederick E Elliott, Mrs Milton B Bergmann, Mrs Louis Harris, Mrs Allen Hull, and Mrs A. F R. Andresen.

The eleventh anniversary meeting was held on Tuesday, March 12, at St Bartholomew's Community House Mrs Thurman Givan, formerly of the Woman's Army Corps, and wife of the president of Kings County Medical Society, spoke of *"Personal Experiences on the Alcan Highway"* The showing of pictures of the rugged country, the contrasting modern cities and huge airfields were most interesting and informative

The Tea which followed, was in honor of Mrs. Edwin A Griffin, state president She gave a brief résumé of the history of the Woman's Auxiliary and paid tribute to Mrs John L Bauer for the pioneering and organizing of the Auxiliaries of the counties and the State of New York. Bridge was played during the social hour Admission was a bundle of rummage to be sold at the Thrift Shop for the benefit of the Brooklyn Division of the Cancer Relief Committee. There was a large attendance and several new members were welcomed by the President, Mrs Henry J Jauch.

Nassau County The Woman's Auxiliary to the Nassau County Medical Society and their friends heard Mr George P Farrell, director of the Bureau of Medical Care Insurance of the State Medical Society, speak at an open meeting which was held at the Nassau Hospital Auditorium March 26 Also present was Miss Yolande Lyon, field representative of the Medical Society of the State of New York

Mr Farrell and Miss Lyon explained the medical insurance plans which are now in existence throughout the country, and told of the progress, aims, and the purposes of the various plans

The meeting was very instructive and enjoyed thoroughly by those present Mrs. E Freeman Miller presided at the meeting, assisted by Mrs Albert M Bell, program chairman. Refreshments were served at the close of the meeting by Mrs John L Neubert and her committee.

A board meeting of the auxiliary was in the auditorium on March 19

The Auxiliary met on March 12 at the Catholic Women's Club, Utica, for luncheon, with thirty-seven members attending and Mrs Bradford F Golly, of Rome, presiding Mr Harold C Stephenson, executive secretary of the Hospital Plan, Inc, gave an informative talk on the Wagner-Murray-Dingell Bill. Many questions were asked showing the interest that was aroused This was followed by a business meeting

Oneida County. The February meeting was held in the Hamilton Room of the Hotel Hamilton, Utica, with Mrs. Bradford F Golly, of Rome, presiding In spite of most unpleasant weather, there were forty members present to greet our State president, *Mrs Edwin A. Griffin, of Brooklyn, who in her* charming manner gave us a delightful talk

Onondaga County The Woman's Auxiliary to the Onondaga County Medical Society held its April session at the home of Mrs S W Bisgrove, of Marcy, on April 2

Mrs. A. H Garofalo, of Syracuse, opened her home for the March meeting of the Auxiliary The guest speaker was Dr E S VanDuyn who spoke on the topic, "Almshouses"

A committee meeting was held at the home of the president, Mrs Dwight V Needham, on January 18 when plans were made for the Tenth Anniversary Dinner

Mrs Edwin A. Griffin, of Brooklyn, president of the Woman's Auxiliary to the Medical Society of the State of New York, brought greetings to its Auxiliary of Onondaga County at the Tenth Anniversary Dinner meeting in the University Club on February 5

Mrs Dwight V Needham, presided at the dinner Mrs Francis R Irving gave an outline of the organization's activities for the past decade. Professor Warren B Walsh, of Syracuse University, was guest speaker, his topic was "Russia."

Queen's County. The Woman's Auxiliary of the Medical Society of Queens heard Mrs. A. J Carlson, of the American Red Cross, speak on "Nursing Begins at Home" at a meeting in the Medical Society Building in Forest Hills. Mrs. Joseph D Hallinan, president, introduced the speaker and heard reports from committee chairmen

The Auxiliary was host to 100 persons at a party held at the Medical Society building, to celebrate the auxiliary's thirteenth anniversary Mrs Joseph D Hallinan, greeted the guests Mrs Miller Sanders of Forest Hills, was in charge of arrangements and Mrs. Meyeron Coe, of Queens Village, Mrs James M Dobbins, of Astoria, and Mrs Henry Mencken, of Flushing, served tea

The State President, Mrs Edwin Griffin, will be guest of honor of the Auxiliary at a dinner party, which will be held at the Forest Hills Inn, Forest Hills, on April 23, at 7·00 P M A meeting will follow at the Medical Society building The executive board will give a play, entitled "A Woman's Privilege" The cast, directed by Mrs William Godfrey, of Flushing, includes Mrs. Joseph D Hallinan, of Richmond Hill, Mrs Daniel J Swan, of Flushing, Mrs Harold Foster, of Jackson Heights, Mrs. William Flanagan, of Richmond Hill, and Miss Lucy Lanza, of Astoria

Rensselaer County The Woman's Auxiliary to the Rensselaer County Medical Society on March 13, conducted its membership tea in the clubrooms of the Troy Woman's Club, Inc Mrs. Victor C Jacobsen, president, welcomed the guests and presided at the short business session.

Dr Stephen H Curtis gave an interesting talk on medical insurance Mrs W W St John was general chairman of the tea at which two new members were welcomed They are Mrs. George Reed and Mrs Kennedy Creevey

Schenectady County The regular monthly meeting of the Auxiliary was held Tuesday March 26 at the Mohawk Golf Club, Schenectady Mrs. Luther M Kice, legislative chairman from Garden City, Long Island, was our speaker on present *legislation that is pending. There were guests from* Albany, Troy, and Saratoga Auxiliaries present

ARE VITAMINS ALWAYS ENOUGH?

In malnutrition, convalescence, anorexia and old age, more than vitamins are often indicated Besides vitamins there are maltose, dextrose and dextrins and other food elements present in Maltine with Vitamin Concentrates

Some of the food elements in Maltine with Vitamin Concentrates—approximate content per 30 cc. (2 tablespoonfuls)

VITAMIN A	10,000 U S P units
VITAMIN D	1,000 U S P units
THIAMINE HYDROCHLORIDE	3 mg
RIBOFLAVIN	4 mg
NICOTINAMIDE	40 mg
+MALTOSE	9 6 gm
+DEXTROSE	4.2 gm
+DEXTRINS	10.2 gm
+PHOSPHORUS	279 mg
+CALCIUM	303 mg
+CHOLINE*	36 mg
+INOSITOL*	44 mg
+FOLIC ACID*	22 mcg

*These constituents are members of the natural B Complex. Their need in human nutrition has not been established

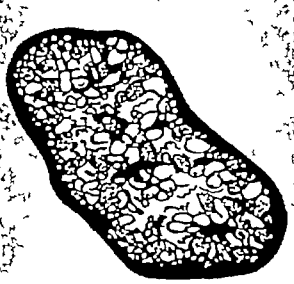
Two tablespoonfuls supply at least twice the minimum daily requirements of the above vitamins and supplementation of other easily digested food elements. The Maltine Company New York 22.

MALTINE WITH VITAMIN CONCENTRATES

MORE THAN A CAPSULE COULD HOLD

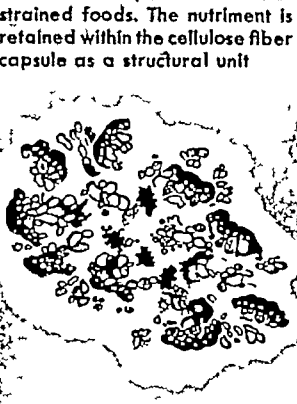
DUAL-PROCESSED FOR

Greater nutrient availability...



...EASIER DIGESTIBILITY
...SMOOTHER TEXTURE

In the preparation of vegetables and fruits as baby foods, home-sieving and commercial straining produce a relatively fine subdivision of the cooked food Under the microscope, foods so prepared are characterized largely by the predominance of readily identified intact food cells and by long coarse cellulose fibers



To accomplish a still finer subdivision . one more suitable for early supplementation of the infant's milk diet Libby places strained foods through an additional process—homogenization—and thus advantageously changes their physical structure In this manner, the finest practicable subdivision of the vegetable cell is attained, and the contained nutriment becomes homogeneously dispersed throughout the mixture

In consequence, Libby's Baby Foods present greater nutrient availability, easier digestibility, smoother texture, they afford greater utilization of food-iron*, they can be bottle-fed as part of the "formula" without perceptibly retarding the rate of flow through a nipple opening of normal size, they may be fed and are well tolerated as early as the fifth week of life And their cellulose content, comminuted to bland ultra-small particles, maintains an unimpaired "bulk" action

**Reprints available on request*

Intact food cell, characteristic of strained foods. The nutriment is retained within the cellulose fiber capsule as a structural unit

After homogenization The capsule is ruptured and comminuted, the nutriment is released—subdivided—and dispersed, exposing a large surface area to the action of digestive juices

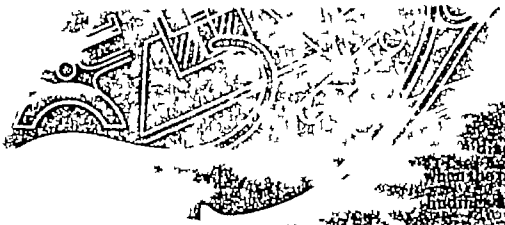
THESODATE Brewer

The ORIGINAL ENTERIC-COATED TABLET OF THEOBROMINE SODIUM ACETATE

to control frequency and severity of attacks in **CARDIOVASCULAR AND RENAL DISEASES** *and to prevent* **EDEMA**



Clinical experience and studies have proven the value of Theobromine Sodium Acetate in certain Cardiovascular and Renal Diseases In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs

It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin The enteric coating (especially developed for Thesodate) permits larger doses without the drug's contact with the Gastric Mucosa

Supplied—in 7½ grains with and without Phenobarbital ½ grain, in 5 grains with Potassium Iodide 2 grains and Phenobarbital ¼ grain, and in 3¾ grains with and without Phenobarbital ¼ grain. Capsules, not enteric coated, are available in the same potencies for supplemen ary medication.

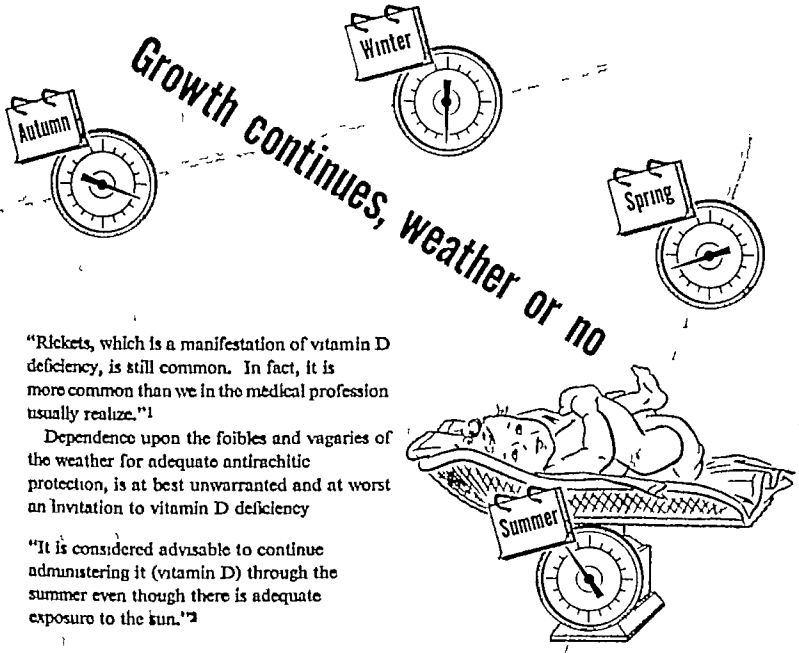
AMERICAN INSTITUTE FOR PSYCHOANALYSIS

under the auspices of the

ASSOCIATION FOR THE ADVANCEMENT OF PSYCHOANALYSIS

The American Institute for Psychoanalysis offers



1 Postgraduate orientation courses for physicians and psychiatrists

2 Training for psychiatrists who wish to become certified to practise psychoanalysis Applications for admission to this course in training may be made now

CURRICULUM FOR ACADEMIC YEAR 1946–1947 NOW IN PREPARATION

For information regarding requirements for admission, tuition, loan fellowships and curriculum, write to the Dean's office Karen Horney, M.D , American Institute for Psychoanalysis, 135 East 63rd Street, New York 21, N Y

Growth continues, weather or no

"Rickets, which is a manifestation of vitamin D deficiency, is still common. In fact, it is more common than we in the medical profession usually realize."[1]

Dependence upon the foibles and vagaries of the weather for adequate antirachitic protection, is at best unwarranted and at worst an invitation to vitamin D deficiency

"It is considered advisable to continue administering it (vitamin D) through the summer even though there is adequate exposure to the sun."[2]

White's COD LIVER OIL CONCENTRATE

provides vitamins A and D—derived exclusively from cod liver oil—in the proportions as found in U.S.P. cod liver oil

Prescribing White's Cod Liver Oil Concentrate winter, spring, summer and autumn avoids risk and assures adequate intake of vitamins A and D to meet the needs of physiologic growth every month of the year

Liquid for drop dosage, Tablets which may be chewed, and small, easily swallowed Capsules, provide acceptable dosage forms spanning needs from infancy through maturity

Infant antirachitic prophylactic dosage costs *less than a penny a day*

SEE THE ABBOTT COLLECTION

Paintings of **Amphibious Operations**

WITH PRIDE Abbott Laboratories announces that the Abbott Collection Paintings of Amphibious Operations is to be shown to the public at the Albright Art Gallery in Buffalo beginning May 10th Through the cooperation of the United States Navy, Marine Corps and Army, eight of America's most distinguished artists, commissioned by Abbott Laboratories, were enabled to make this authentic, on the spot record of Amphibious Operations The more than one hundred paintings in this Collection cover training of amphibious crews, production and transportation overseas of landing vessels, battle action at Saipan, Tinian, Tarawa, Bougainville and the Philippines • It is hoped that all friends of Abbott Laboratories find it possible to attend. ABBOTT LABORATORIES, North Chicago, Illinois

Albright Art Gallery, BUFFALO, MAY 10—MAY 26

SPECIFY WITH CONFIDENCE...

Penicillin Troches Schenley — 1,000 units each. Supplied in bottles of 25.

PENICILLIN TROCHES SCHENLEY

With a base which dissolves slowly, and thus gradually liberates penicillin at the site of infection, these troches provide an effective means for treatment of mouth and throat infections due to Vincent's organisms Penicillin Troches Schenley retain potency over long periods when kept at recommended temperature

Penicillin Tablets Schenley — 25,000 units each. Supplied in bottles of 20.

PENICILLIN TABLETS SCHENLEY

Buffered with calcium carbonate, these superior tablets are indicated in the treatment of gonorrhea and in the continuing therapy of pneumococcic, streptococcic, and staphylococcic infections after acute phase of infection has been controlled Stability of tablets permits ambulatory patients to carry with them the required daily dose.

Indicated therapy in Sequelae of

Epidemic Encephalitis

Pills Stramonium (*Davies, Rose*)

2½ grains

Physicians in private practice as well as in neurological clinics have widely prescribed these pills since 1929, and their continued interest in and use of them point to the serviceability of this therapy

Stramonium Pills (*Davies, Rose*) exhibit in each pill 2½ grains of alkaloidally standardized Stramonium (powdered dried leaf and flowering top of Datura Stramonium, U S P), equivalent to 25 minims (1 54 cc) of Tincture U.S.P

As a reassurance of the activity of the finished pills, they, too, are alkaloidally assayed, thus establishing as far as possible uniformity and dependability

A package for clinical trial and literature mailed free of charge upon request

typical case histories

ACUTE ULCERATIVE TONSILLITIS—

TREATMENT
6-8 Tablets Sulfathiazole Gum chewed daily

RESULTS
Immediate improvement Temperature normal after 72 hours

ACUTE RHINITIS AND SECONDARY PHARYNGITIS—

TREATMENT
Sulfathiazole Gum, 1 tablet chewed for 1 hour every 2 hours

RESULTS
Throat symptoms improved immediately, entirely disappeared after 48 hours. Patient continued with common head cold

PLAUT-VINCENT'S ANGINA—

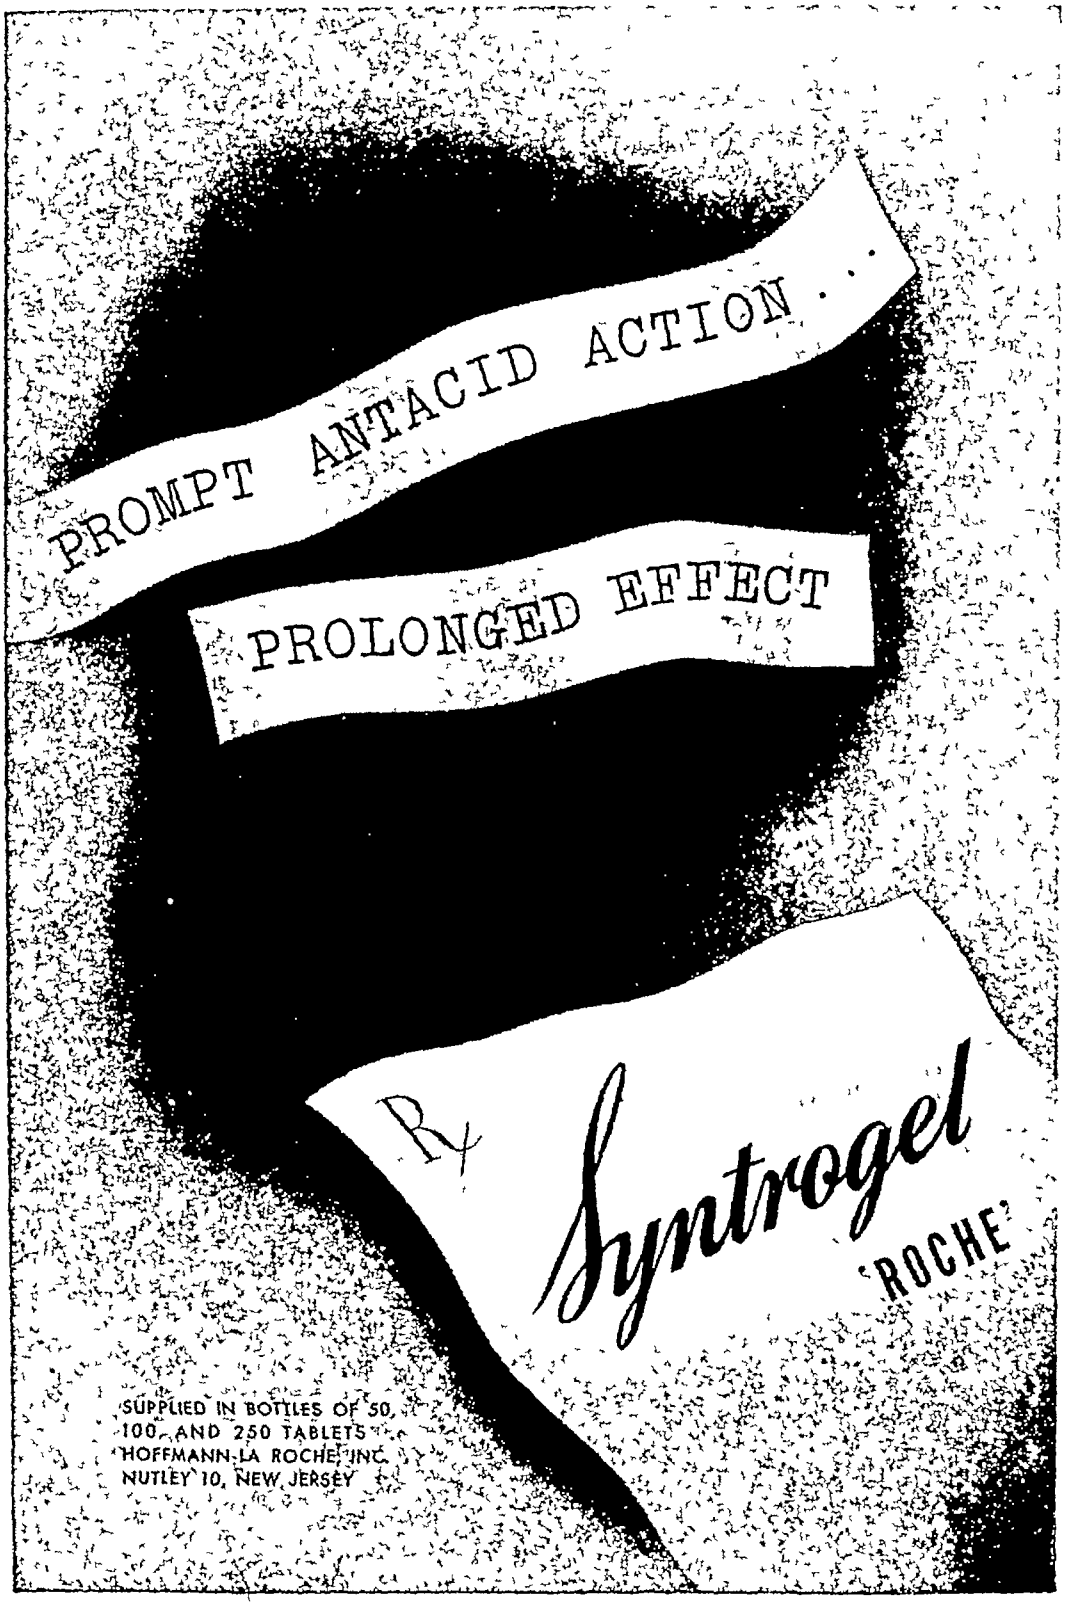
TREATMENT
One Sulfathiazole Gum Tablet chewed ½ to 1 hour, every hour for 8 doses

RESULTS
Complete recovery within 56 hours.

ite s Sulfathiazole Gum now has been used with marked success in ny thousands of cases of miscellaneous infections of oral and pharyngeal ues, notably acute tonsillitis and pharyngitis, septic sore throat, infec- is gingivitis and stomatitis, Vincent's infection, also indicated in the vention of local infection secondary to oral and pharyngeal surgery

NICAL ADVANTAGES:

ingle tablet chewed for *one-half to one hour* provides a salivary concen- tion of locally active sulfathiazole averaging approximately 70 mg per t. Moreover, resultant blood levels of the drug, even with maximal sage, are so low (rarely reaching 0 5 to 1 mg. per cent) that systemic ic reactions are virtually eliminated



Supplied in packages of 24 tablets, sanitaped in slip-sleeve prescription xes.

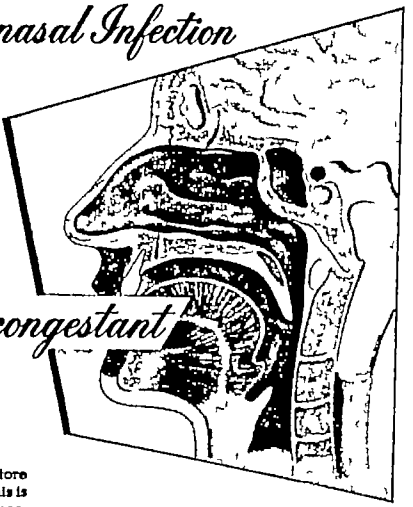
PORTANT: Please note that your patient requires your prescription to tain this product from the pharmacist.

A product of

WHITE LABORATORIES, INC.

Pharmaceutical Manufacturers Newark 7, N J

Syntrogel tablets contain: Aluminum hydroxide, Calcium carbonate, Magnesium peroxide, and Syntropan 'Roche'



In treating Para-nasal Infection

support nature's own first line of defense . . . with

ARGYROL

Bacteriostatic Decongestant

without rebound action

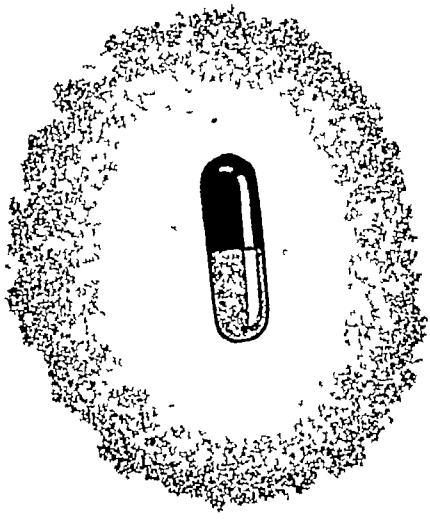
Your main purpose of course is to restore normal function in the nasal passages. This is made doubly difficult with the use of vaso-constrictors whose action is frequently followed by compensatory congestion thus creating a vicious circle.

Avoid that vicious circle with ARGYROL

ARGYROL is the natural, the obvious choice of the discriminating practitioner because the cleansing demulcent and bacteriostatic actions of ARGYROL *aid the natural defense mechanism* without disturbing the normal physiology of the mucous membranes.

Three-Fold Action of ARGYROL:

1. ARGYROL is decongestive without irritation to the membrane and without ciliary injury
2. ARGYROL is powerfully bacteriostatic, yet non toxic to tissue
3. ARGYROL stimulates secretion and cleanses, thereby enhancing Nature's own first line of defense.



Three-Fold Approach to Para-nasal Therapy:

1. The nasal meatus by 20 per cent ARGYROL instillations through the nasolacrimal duct.
2. The nasal passages with 10 per cent ARGYROL solution in drops.
3. The nasal cavities with 10 per cent ARGYROL by nasal tamponage

ARGYROL *the Physiologic Anti-infective with broad, sustained action*

Made only by the **A. C. BARNES COMPANY, NEW BRUNSWICK, N. J.**

ARGYROL is a registered trade mark, the property of A. C. Barnes Company

ERTRON

unlike any other antiarthritic

CLINICALLY EFFECTIVE

It is now known that Ertron is unique—differing clinically and chemically from all other drugs used as antiarthritic medication

An extensive bibliography, based on ten years of clinical research, affords ample evidence regarding the effectiveness of Ertron in arthritis.

CHEMICALLY UNIQUE

It can now be stated, on the basis of recent laboratory research, that Ertron is chemically different

Simply stated, Ertron is electrically activated vaporized ergosterol prepared by the Whittier Process Each capsule contains 5 mg of activation-products having a potency of not less than 50,000 U.S.P Units of vitamin D

Ertron contains a number of hitherto unrecognized factors which are members of the steroid group The isolation and identification of these substances in pure chemical form further establish the chemical as well as the therapeutic uniqueness of Ertron.

ERTRONIZATION THERAPY

Physician control of the arthritic patient is essential for optimum effect To Ertronize, employ Ertron in adequate daily dosage over a sufficiently long period to produce beneficial results If signs of overdosage appear, discontinue medication for about ten days—then continue with three capsules per day gradually building up to the patient's level of tolerance.

Ertron is the registered trade-mark of Nutrition Research Laboratories

Ethically  *promoted*

QUARTERLY REVIEW OF UROLOGY

HUGH J JEWETT, M.D., Editor in Chief, Johns Hopkins University

EDITORIAL BOARD

WILLIAM F BRAASCH, M.D *Mayo Clinic*
FLETCHER COLBY, M D *Harvard University*
EDWIN G DAVIS, M.D *University of Nebraska*
ARCHIE L. DEAN, M.D *Cornell University*
CLYDE L. DEMING, M D *Yale University*
AUSTIN I DODSON, M.D *Medical College of Va*
FRANK HINMAN, M D *University of California*
CHARLES HUGGINS, M D *University of Chicago*
REED NESBIT, M.D *University of Michigan*
WINFIELD W SCOTT, M D *University of Rochester*

The Quarterly Review of Urology is designed to present in a concise and authoritative manner not only all progress in the field of Urology alone, but also important developments in other branches of Medicine, which are or may become of urologic significance For a single individual to keep abreast of this mass of material, in which Urology is often inextricably intertwined with other clinical and preclinical sciences, heretofore has been impossible

The members of the Editorial Board are charged with the responsibility of selecting from every dependable source all contributions which in their judgment are of fundamental importance and unusual merit, to which they may add their own comments. This material is classified under the following headings

1 Nutrition and Metabolism
2 Pre and Postoperative Therapy
3 Anesthesia
4 General Surgical Technic
5 Infections, Parasites, Toxins and Drugs
6 Calculosis
7 Hemorrhage and Shock
8 Anomaly
9 Kidney and Capsules
10 Ureter
11 Bladder and Urachus
12 Urethra and Glands
13 Penis
14 Urine
15 Scrotum
16 Testis
17 Epididymis
18 Spermatic Cord and Vas
19 Seminal Vesicles and Ejaculatory Ducts
20 Prostate and Verumontanum
21 The Musculo-Skeletal System
22 The Respiratory System
23 The Cardiovascular System
24 The Hemic and Lymphatic Systems
25 The Digestive System
26 The Endocrine System
27 The Nervous System
28 Cancer Research
29 Urologic Armamentarium

Each anatomic division includes Embryology, Pathology, Diagnosis, and Treatment, and some also embrace Biochemistry, Physiology, and Pharmacology At the end of each division there will be references to current articles not abstracted that may be useful to authors in the compilation of their bibliographies

From a great diversity of domestic and foreign journals there is brought together in the Quarterly Review of Urology a most comprehensive compilation of all the significant advances in every branch of urology All of the essential details of the new diagnostic methods and tests, as well as every new therapeutic procedure are presented so that the busy practitioner may safely and successfully employ these new methods in his own practice Especial attention will be given to the illustrations to depict modifications and advances in surgical technic. In medical therapy and chemotherapy, etc., exact dosages, indications and contraindications will be so presented that the reader will have specific informative clinical assistance that will not require further reference Each issue of the Quarterly Review of Urology will contain a classified table of contents, a cross reference subject index and an authors index. The concluding number of each volume will include a cumulative cross reference subject and authors index so that all of this vital information may be quickly available.

united in strength

Concentrated for potency from approximately 7 Gm. fresh liver, 7 Gm. rice polishings and brewers' yeast equivalent to 13 Gm. fresh yeast *per teaspoonful,* Elixir 'OMNI BETA'* contains all the known as well as the unidentified factors of the vitamin B-complex. A single teaspoonful daily supplies thiamine 1.5 mg., riboflavin 2.0 mg., niacinamide 10.0 mg., pantothentic acid 1.40 mg., and pyridoxine hydrochloride 0.40 mg., plus generous amounts of choline, biotin, para-aminobenzoic acid, inositol and folic acid. Achievement of this well-balanced formula is made possible by utilizing all three of the richest natural sources of the complex to which pure crystalline factors are added. Uniting these primary sources permits *ideally simple administration with full* scale protection in a single teaspoonful daily

For additional pharmaceutical details consult your pharmacist—for more extensive medical data write Medical Division of William R. Warner & Co.

TO THE PHYSICIAN WHO SMOKES A PIPE We suggest an unusually fine new blend—COUNTRY DOCTOR PIPE MIXTURE. Made by the same process as used in the manufacture of Philip Morris Cigarettes.

. . . There are times when sedation is necessary . . . why not prescribe a sedative that is relatively free from unpleasant side-effects? • 'Delvinal' sodium vinbarbital *is such a sedative!* • It will provide your patients with a night of restful sleep, in the majority of instances, with relative freedom from unpleasant side-effects of excitation or "hangover." • 'Delvinal' sodium vinbarbital is Council-accepted A mild sedative, it provides a relatively brief induction period and a moderate duration of action. • Indicated for the relief of functional insomnia, for general sedation, preanesthetic hypnosis, psychiatric sedation, obstetric amnesia, and in pediatrics. • Supplied in ½ gr., 1½ gr., and 3 gr. capsules Sharp & Dohme, Philadelphia 1, Pa.

'DELVINAL'

DYSPEPSIA

the most common gastric disturbance

"Dyspepsia" due to hyperchlorhydria is the most common of all gastric disturbances By prescribing Creamalin for the control of hyperacidity, the physician is assured of prolonged antacid action without the danger of alkalosis or acid rebound Through the formation of a protective coating and a mild astringent effect, nonabsorbable Creamalin soothes the irritated gastric mucosa Thus it rapidly relieves gastric pain and heartburn

CREAMALIN

YOU CAN'T OVERRATE THE VALUE OF CONTROL

When you come to think of it, it's surprising how much control means In various forms it adds enjoyment to sports—security to daily routine—satisfaction to work of skill.

And as *quality control* it assures safety in medicines. This is particularly well demonstrated in the development and production of U D pharmaceuticals For throughout modern U D. laboratories and plants a carefully conceived and remarkably efficient system of tests and checks results in products with an enviable reputation for consistent excellence

Credit for maintenance of these high standards rests with a body of doctors, chemists and pharmacists, known as the Formula Control Committee. As the ultimate precaution, this group personally checks every finished product

Such professional attention insures that your prescriptions are filled with finest ingredients when you specify U D pharmaceuticals. Your neighborhood Rexall Drug Store offers this service—together with complete facilities for meeting your patients' needs reliably and economically.

The sole aim of the Quarterly Review of Obstetrics and Gynecology is to provide the busy physician with a resume of the important current advances in obstetrics, gynecology and endocrinology From a great diversity of domestic and foreign publications there is brought together a most comprehensive presentation of all the significant advances in these important fields Every new clinical procedure is presented in concise form but without sacrificing any essential detail

The organization and simplification of the new data and the separating of the less significant findings from the important facts result in a presentation of a wealth of scientific material of permanent value and authority

The data presented are classified under the following systematic plan.

OBSTETRICS

Physiology of Pregnancy
Physiology of Labor
Physiology of Puerperium
Hygiene and Management of Normal Pregnancy Labor and Puerperium
Physiology and Care of Newborn
Pathology of Pregnancy
Pathology of Labor
Pathology of Puerperium
Pathology of Newborn
Operative Obstetrics
Social and Legal Aspects

GYNECOLOGY

Endocrinology

COULD THIS BE YOUR HOUSE?

Now that the war's over and a lot more civilian goods are on the market, it's a big temptation to spend just about all you make, and not put anything aside

But to fall for that temptation is plenty dangerous It's like trying to live in the house above —a house that might come tumbling down about your ears at the first little blow of hard luck

Right now the best possible way to keep your finances in sound shape is to save regularly—*by buying U S Savings Bonds through the Payroll Plan*

These Bonds are exactly like War Bonds Millions of Americans have found them the safest, easiest, surest way to save. The U S A protects every dollar you invest—and Uncle Sam gives you his personal guarantee that, in just ten years, you'll get *four dollars back for every three you put in!*

If you stick with the Payroll Savings Plan, you'll not only guard against rainy days, you'll *also* be storing up money for the really important things—like sending your children to college, traveling, or buying a home

So—any way you look at it—isn't it smart to buy every single U S Bond you can possibly afford!

Stick with the Payroll Savings Plan!

SAVE THE EASY WAY... BUY YOUR BONDS. THROUGH PAYROLL SAVINGS

NEW YORK STATE JOURNAL OF MEDICINE

This is an official U S Treasury advertisement—prepared under auspices of Treasury Department and Advertising Council

Eleven of 15 white collar workers in good health and on adequate diet experienced a precipitous depression in blood hemoglobin averaging 14% following blood donation of 500 cc. The period of hemoglobin restoration could be shortened one third by giving Licuron B after donation of blood but only one sixth by giving ferrous sulfate If Licuron B was also given prophylactically it prevented or minimized hemorrhagic anemia but larger doses of ferrous sulfate did not obtain this beneficial effect *

Licuron B is the bi active antianemic. (1) It provides the copper iron ratio which is basic therapy in hypochromic anemia (2) It raises the nutritional status of the patient with liver B-vitamins augmented by the crystalline vitamins thiamine riboflavin and niacinamide. Licuron B is supplied in sugar coated tablets Lakeside Laboratories, Milwaukee 1, Wisconsin

PROTEIN

*"As a Prophylactic and Therapeutic Agent"**

"There are many opportunities for practical dietary application of the advances in our understanding of protein economy. The provision of liberal protein diets in instances where the value of protein has been demonstrated offers both prophylactic and therapeutic advantages to the patient."

PREGNANCY AND LACTATION

"Protein is one of the essentials for which there is greater need The growth needs of the fetus must be met and if adequate dietary protein is not supplied, the mother's protein stores will be drained The demands for protein during lactation are even greater One further reason for providing a liberal supply of protein lies in the favorable effect which protein has upon calcium absorption"

DISEASES OF THE KIDNEY

" actual improvement in the well-being of nephritic patients may be observed following the use of high-protein diets both in adults and children In some instances functional capacity of the kidneys has been reported to improve on such a regime. . For the treatment of nephrosis the same dictum holds true, only to a greater extent. "

DISEASES OF THE LIVER

"For many years carbohydrate alone has been considered the one substance capable of providing protection for the liver cells

Protein has now been shown to be considerably more effective in this respect

The effect of protein on the liver is not only reparative, but also definitely protective against the agents known to be toxic to the liver "

PEPTIC ULCER

" . a rather high incidence of moderate hypoproteinemia in peptic ulcer cases has been reported Any ulcer, be it peptic, infectious, or the result of pressure and circulatory changes, represents a loss of tissue and requires protein for rebuilding. "

OTHER CONDITIONS

"In old age, for instance, all too often the food intake deteriorates to soft foods of limited variety Yet in such instances the same protein requirements for maintenance of the numerous body functions are still in effect. Protein may also be lost because of its excessive breakdown under the influence of fever or heightened body metabolism, and negative nitrogen balances may develop, as for instance in hyperthyroidism .

"With the demonstration of this increased importance of protein dietetic therapy, it can only be recommended that there be an increased use of high-protein diets"

Among the protein foods of man meat ranks high not only because of the percentage of protein contained, but primarily because the protein of meat is of high biologic quality, applicable for every protein need

*Anderson, Geo K., M D *The Importance of Protein in Diet Therapy,* J Am Dietet A 21 436 (July-August) 1945

the unique combination of advantages in

MANDELAMINE

Reg. U. S. Pat. Off.
(Methenamine Mandelate)

- **PROMPT EFFECTIVE ACTION**
  Disturbing urinary symptoms are usually alleviated within three to five days.
- **SAFETY**
  Virtual lack of toxicity facilitates therapy and eliminates need for selection of patients.
- **CONVENIENCE OF THERAPY**
  Supplementary acidification, restriction of fluid intake, dietary control or other special measures are unnecessary
- **WIDE RANGE OF THERAPEUTIC ACTIVITY**
  Remarkably efficient in the treatment of pyelonephritis, cystitis, prostatitis, and infections accompanying renal calculi or neurogenic bladder

Mandelamine is supplied in enteric coated tablets of 0.25 Gm. (3¾ grains) each, in packages of 100 tablets sanitapak, and in bottles of 500 and 1000.

The First Year

THE SUCCESSFUL NUTRITIONAL history of S-M-A babies is due to the remarkable similarity of S-M-A to mother's milk It is essentially the same as human milk in percentage of protein, fat, carbohydrate and ash, in chemical constants of the fat and in physical properties

S-M-A* IS RECOMMENDED for normal, full term infants in the early weeks of life when a supplementary food is required for the breast-fed infant It may be given to infants of any age whenever the mother's milk is unavailable, of poor quality or insufficient quantity

S-M-A is derived from the milk of tuberculin-tested cows Part of the butter fat of this milk is replaced with animal and vegetable fats, including biologically assayed cod liver oil Milk sugar, vitamin A and D concentrate, carotene, thiamine hydrochloride, potassium chloride and iron are added *REG U S PAT OFF

Increased Use of DDT

The compound 2,2-*bis*-(*p*-chlorophenyl)-1,1,1-trichloroethane, subsequently referred to as DDT, was first synthesized in 1874 Pharmacologically, it attracted little attention until the war years when entomologic investigations revealed it to have insecticidal properties of extraordinary efficacy We have been made aware by the press and radio of the remarkable quickness and thoroughness with which DDT kills insects It, therefore, has had wide application on the farm and in the stable What, then, of its toxic properties to warm-blooded animals who breathe it from the air, absorb it through the skin, or ingest it with food?

Because DDT is insoluble in water and is a large particle-size dust, there appears to be little danger in its use for dusting clothes in concentrations up to 10 per cent in most powders A large part of the dust is retained in the upper portions of the respiratory tract and is not absorbed. Aerosols, unless dissolved in fatty oils, are not toxic in 1 to 5 per cent solutions Temporary exposure to fly sprays in 1 per cent solutions is believed, on experimental basis, to be nontoxic.[1]

While there is little skin absorption from dusting powders containing DDT because of its insolubility, injections employing solvents allow considerable absorption, and doses as low as 0 5 cc of a 30 per cent solution of DDT per Kg, applied daily, may cause death after thirty days to rabbits, guinea pigs, and rats [2] When ingested, however, in doses varying from 150 to 750 mg per Kg, small laboratory animals show hyperexcitability followed by fine and coarse tremors, culminating in flaccid or spastic paralysis with occasional convulsions preceding death by respiratory paralysis [3] DDT is capable of causing subacute toxicity when ingested by laboratory animals in small amounts for periods of from three to twenty weeks Definite signs of toxicity are produced by levels in the diet of 0 05 per cent for rats and mice, 0 1 per cent for guinea pigs, and less than 0 05 per cent for growing chicks [4] Characteristic of DDT poisoning is the wide variation in individual susceptibility, making the estimate of a safely tolerated dose extremely difficult The pathologic findings in both the acute and chronic poisoned animals show the organ

most consistently damaged is the liver In the acute cases, i e, those receiving larger amounts, the lesion is most often central necrosis, the chronic or lower dose cases show both central necrosis and subacute degeneration The kidneys, thyroid, and muscles show degenerative changes in some animals, but it is striking that only slight central nervous system lesions can be demonstrated, in spite of the pronounced neurologic symptoms observed Vacuolation around large nerve cells in the spinal cord and cerebral motor nuclei, appear to be the only histologic alterations found [5 6]

The mechanism of damage is not known Lewis and Richards[7] were unable to affect growth of fibroblasts, macrophages, entoderm, liver cells, kidney epithelium, nerve fibers, and muscle fibers when DDT was added to the culture medium in which these cells were growing No apparent differences occurred, whether the DDT was added as crystals or in oily emulsion

The whole animal is subject to toxicity from DDT, single cells in culture are not Suckling rats, as well as their mothers, are fatally poisoned if the mother receives DDT containing 0 1 per cent in their diet for several days Tilford and Guthrie[8] also showed that nine adult rats and one half-grown kitten, fed solely on milk from goats receiving daily oral dosages of 1 Gm of DDT per 3 6 to 4 1 Kg of body weight, died in two to twenty-nine days with typical DDT symptoms Butter made from the toxic milk produced typical toxic symptoms with eventual death in a second series of adult rats

The data point out the need for more research on the toxicity of milk from dairy cows which ingest DDT residues on food or from licking themselves after being sprayed or dusted with this insecticide Likewise, the increasing tendency of fruit and vegetable growers to use DDT for insect control in orchards, gardens and vineyards, raises the question of toxicity from residues on fruits and vegetables On the basis of studies thus far made, the United States Food and Drug Administration has established an administrative tolerance of 7 parts per million, or about 0 05 Gm of DDT per pound [9]

The medical profession may well follow the increased use of DDT It is possible that by so doing it may recognize what appear to be obscure symptoms as simple toxicity from ingestion by one way or another of this powerful insecticide

Graciously Permitted to Select

We reprint in full from *Industrial Medicine*[1] the editorial below

The "Washington Letter," in *J.A.M.A.*, February 2, 1946, notes that a Democratic Representative in Congress charges the American Medical Association with "misleading the public," in that it has "misrepresented the Wagner-Murray-Dingell bill" This accusation from a member of the Democratic party comes to attention on the same day we learn "that Mr Roosevelt at the Yalta conference agreed Russia should hold full sovereignty over the Kurile Islands," whereas we were assured "shortly after Yalta that there were no secret agreements whatever of a political nature" "Last June after the death of Roosevelt, Churchill told the House of Commons that no secret agreements had been reached at Yalta except a pledge to give Russia three votes in the UNO assembly The State Department, after consultation with Roosevelt, had made a similar solemn assertion in a formal statement a week before Roosevelt died" Reserving for a moment any comment on the alleged "misleading" by the A M.A, it may be remarked that deliberate misleading of the public seems invested with an aura of great virtue when it is done by prominent Democrats, becoming a horrible crime only when someone not amenable to all administration

[1] Vol. 15, No 2, February, 1946, p 116.

proposals can be accused of doing it Thus, while there still echoes in our ears the 1940 pre-election misrepresentation of the "again, and again, and again," promise to the mothers of America that their sons would not be sent to fight on foreign soil! Now, as to the A.M.A That organization has not misrepresented the W-M-D bill, misrepresentation is no part of its purposes or practices But even if some one were desirous of misrepresenting, why go to any pains in this instance when the bill itself is its own misrepresentation—with what it lacks in that respect being lavishly (and expensively to the taxpayer) furnished by its proponents For example, the title and preamble are belied by the substance

And again, it is affirmed and reaffirmed in press propaganda, speeches and radio exhortations—even in "fireside chats"—that the bill provides for "free choice of physician" On "free choice" see paragraph 2 of Section 905 of the bill itself "Every individual entitled to receive services from a physician shall be permitted to select, from among those designated in paragraph 1, those from whom he shall receive such services, except specialist services and to change such selection in accordance with such rules and regulations as may be prescribed" To anyone appreciative of what freedom means in a free country where every citizen is a sovereign citizen, the phrase "shall be permitted to select" is the shibboleth of the yoke of slavery The citizen is "permitted" to select now, without any government benevolence, it is a part of his inherent rights as a citizen to make his own selection. This pernicious, alien, collectivist and bureaucratic bill ("two bureaucrats to every physician") proposes that he give up his present freedom and receive in return a qualified permission If that is "free choice" then the Bill of Rights itself becomes a Bill of Permissions and the concentration camp for "free" American citizens who don't like it is just over the horizon

Administrations come and go, charges of misrepresentations in Washington are a dime a dozen, W-M-D bills succeed each other, each later version seemingly more obnoxious, more expansive, than the last—and more expensive In graciously offering the citizen-taxpayer the permission to select "from among those designated those from whom he shall receive such (medical, or other*) services " the Government would, as *Industrial Medicine* points out, graciously permit him to select just what he can now select without anyone's permission *But*, were the bill passed, our citizen-taxpayer would *not* be permitted to select *the large army of voting bureaucrats* who would staff the bureau or agency or facility, or whatever would administer the law, he would be graciously permitted to pay their not inconsiderable aggregate salaries, even be required to do so, and, like it The current administration, not the A.M.A or the citizen-taxpayer, would attend to *that* detail with no little thankfulness for the bounty of Allah, the bottomless character of the citizen-taxpayer's patience and purse, and the brighter prospects of the next election. If that is "misrepresentation," make the most of it and prove it! Washington papers please copy

* Insertion ours—Editor

That Postphlebetic Leg

The occurrence of an inflammation in the veins of the leg constitutes a serious complication in surgery and obstetrics It is to be feared, both for its immediate and its more remote effects, which are either death or invalidism. Usually, the lesion is centered in the deep veins of the leg and often is unrecognized in its earlier manifestations notwithstanding the warning signs A patient making an apparently normal recovery from an operation or a delivery has a slight rise of temperature, with perhaps a mild chill before there is much pain or swelling in the leg Before the pathology of the condition became so well known, continued bed rest with elevation of the extremity, bandaging, and ice bags was the accepted method of treatment, as a result, the general circulation was slowed rather than stimulated Today we endeavor to avoid stasis of the venous circulation by earlier rising after operation or delivery For damage to the intima of the vessel for whatever reason tends to cause a deposit of the blood platelets in the area with thrombus

formation This fills the vein and may be displaced by a sudden muscular movement or unwarranted massage, and is the most common source of the frequently fatal embolus But, it is the thrombus, becoming fixed to the vein wall, which produces complications that may be lifelong

It has been shown experimentally by Ochsner and others that a severe thrombophlebitis causes an overstimulation of the sympathetic ganglia along the lumbar spine with a resultant spasmodic contraction of the arterioles throughout the extremity This is followed by circulatory stasis, stagnation of the lymphatic stream and venous congestion Such a condition is accompanied by pain and swelling of the leg which may last for years and cripple the patient, both mentally and physically It is logical, therefore, as pointed out in a recent article by McPheeters and Alexander (*Minnesota Medicine*, January, 1946), that the treatment should be approached from an entirely different standpoint If Ochsner's theory is correct as to the cause of the arteriole spasm, then the spasm may be overcome by the injection of novocaine by lumbar sympathetic block But this must be done at the onset of the phlebitis so that the complicating events can be prevented and the patient's leg be returned to normal in the majority of cases within a few days

McPheeters and Alexander are emphatic about the value of this form of treatment which has not been commonly recognized by the profession The results in the acute cases often are miraculous and the chronic cases with edema of the leg, dermatitis, exzema, and ulcerations can be helped a great deal

The early getting out of bed after operations and delivery, which is being adopted so widely, may overcome the tendency to venous stasis and its complications but, in addition, patients should be encouraged to move about in bed before this time Physicians should inform themselves about such therapeutic procedures which will evidently reduce the incidence of this postoperative complication

The Prognosis of Syphilis

The morbidity and mortality caused by syphilis have been the subject of extensive studies since the early years of the twentieth century With few exceptions the consensus has been that the life expectancy of syphilitics is much less than that of nonsyphilitics The validity of this opinion is challenged by Schamberg[1] in a critical review of the literature, both American and European

The prevailing views of life-insurance physicians are best indicated by a few of those quoted by Schamberg "Without adequate treatment the syphilitic's chances of a long life are seriously threatened by late fatal manifestations of syphilis—with adequate modern treatment he is protected from this threat but apparently left abnormally vulnerable to death from certain conditions apparently unrelated to syphilis—namely, pulmonary tuberculosis, appendicitis, pneumonia, suicide, and cancer The tendency of the cured syphilitic to succumb is so marked during the first ten to fifteen years after his initial lesion, that the ultimate mortality experience with the cured group is at best very little better than with the inadequately treated group"

"Syphilitics are not good life-insurance risks at standard rates This is so well known to all life insurance physicians that it seems almost presumptuous to say more on the subject Given a frank case of syphilis, we always have a substandard risk Applicants with history of syphilis should be considered substandard risks and double mortality should be expected"

On the other hand, reports based on clinical studies give, in general, a much more optimistic picture It is clearly shown that the incidence of neurosyphilis and cardiovascular syphilis is inversely proportional to the amount of treatment received early in the course of the disease "Most of the older studies were carried out on patients

[1] Schamberg, Ira Leo Am J Syph, Gonor, & Ven Dis p 529 (Sept.) 1945

treated in the prearsenical era Even were one to assume their conclusions to be correct, they would not apply to present-day patients who are given the benefit of modern treatment, inasmuch as it has been shown so conclusively that modern treatment effectively prevents many of the serious late manifestations of syphilis"

The author discusses six factors bearing upon the validity of American life-insurance-company findings One of these factors is that of the method of selection of syphilitic applicants

The fallacy of accepting the statement of an applicant is illustrated by these quotations "Many persons with latent syphilis don't know they have it, and most of those who know deny it It has been said repeatedly that insurance companies are declining to insure a small group of honest syphilitics, but are accepting freely day by day a much larger group of syphilitic liars. Of 410 insured persons in the United States who died of syphilis, only 5 had given a history of syphilis on application for insurance."

Schamberg's conclusions will seem revolutionary to most physicians

1 There is no evidence that syphilis adversely influences life expectancy except through the known lethal effects of its serious late manifestations, in particular those of the central nervous system and cardiovascular system There is no evidence that syphilitic infection per se, or antisyphilitic treatment, predisposes to tuberculosis, pneumonia, nephritis, or other nonsyphilitic diseases

2 On the basis of existing evidence, increased mortality in syphilitics is caused in part by deaths due directly to syphilis, in part to the higher death rate in segments of the population which have a high syphilis prevalence

3 Adequate antisyphilitic treatment will, in the majority of cases, prevent the development of the late manifestations of syphilis

4 The attitude of life-insurance companies toward the syphilitic applicant is at present grossly unjust Two sound courses of procedure would appear to be open to the insurance companies

(a) Disregard syphilis entirely, ask no questions regarding it, take no serologic test. In view of the improving standards of present-day diagnosis and treatment of syphilis, and in view of the frequently benign character of the disease, in relatively few insured syphilitics will death result from syphilis

(b) Perform routine serologic tests for syphilis on every applicant for insurance In those in whom positive or doubtful tests are discovered death losses may be obviated by proper clinical and laboratory examination, and by setting up clear-cut criteria of adequate treatment based on present-day knowledge Applicants found to have adequately treated latent syphilis may be granted standard insurance with no extra premium and the mortality in this group will be found to be a function of the mortality of the component socioeconomic and occupational groups of which it is composed On the basis of simple and well-accepted clinical and laboratory procedures, the life-insurance companies may insure at standard rates the majority of syphilitics applying for insurance, with no risk of increased death losses

5 Employers may safely hire syphilitics, may prevent deaths due to syphilis, and thus obviate increased compensation costs, through similar clinical evaluation of their employees

Editorial Comment

A Possible Factor in Causing Postpartum Hemorrhage The incidence of puerperal fever has been reduced to a remarkable degree but hemorrhage still remains more or less unconquered, notwithstanding the many efforts made to reduce the fatalities from this source Precautionary and remedial measures often meet with failure, so that any new suggestions by which this complication of labor may be explained deserve attention

Bleeding takes place at three periods during the delivery of the fetus, the separation of the placenta, and after its expulsion Greenberg[1] has investigated the clotting time of the blood at each of these periods in a series of normal deliveries and found that in a considerable number of test-tube samples, blood failed to clot even after days

[1] Am J Obst. & Gynec., November 1945 p. 832.

One of the components of postpartum blood is responsible, evidently it is that which issues from the uterus after placental expulsion This nonclotting component, together with an atonic uterus, may be directly concerned with the unsolved problem of pathologic and too often fatal postpartum hemorrhage Confirmatory studies by other investigators will be awaited with interest

. .

The Hazards of Blasting Caps "The Institute of Makers of Explosives—a trade association of commercial explosive manufacturers—has conducted a comprehensive campaign since 1926 to safeguard children against injury and possible death by instructing them, and their parents and teachers, concerning the dangers of handling blasting caps

"Blasting caps are detonators used in firing high explosives They are necessary to set off dynamite in mining, opening roadways, clearing forests, building bridges, and in many important operations in agriculture and industry Each year a large number of children are injured while playing with caps which have been left carelessly in farm buildings, along highways, near construction work, and in other public places Accidents are caused by striking caps with a stone or hammer, by holding lighted matches to them, throwing them in bonfires, or by picking the explosive in the cap with a pin or nail It is dangerous to attempt to pull the wires out of an electric blasting cap, and this type of cap will explode when its wires make contact with electric current

"As part of its continuing campaign against such accidents, the Institute has produced an interesting educational film for showings in schools, before civic organizations, and other group meetings in the interests of promoting the safety of American children This entertaining two-reel sound and color film, entitled 'Blasting Cap!,' is prepared especially to appeal to children It portrays dynamite in action in field, quarry, and mine, depicts the dangers of playing with blasting caps, and gives practical suggestions for avoiding accidents from that source

"Free 16-mm prints of this new film are available on request, and a dramatic display poster for bulletin boards, and copies of a folder suitable for use in group discussions and safety lectures may be obtained free in quantity When copies of the film are requested, the date of desired showing and estimated size of audience should be indicated Communications should be addressed to Institute of Makers of Explosives, 103 Park Avenue, New York 17, New York "[1]

Penicillin in Gonorrhea The publication, *Venereal Disease Reports*, for May, 1945, issued by the U S P H S, contains a word of caution concerning the treatment of gonorrhea with aqueous solutions or oil-beeswax suspensions of penicillin The May issue is devoted to three articles dealing with current experience in the treatment of gonorrhea The first, by Thomas and Meyer, presents two schedules of treatment involving the usual aqueous solution of penicillin sodium and two schedules involving single injections of penicillin in a mixture of beeswax and peanut oil The second, by Van Slyke and Heller, presents the results of a cooperative study of the use of a single injection of penicillin in beeswax and peanut oil

"The third, by Graham, Greenblatt, and Cannefax, discusses the use of a single injection of penicillin in a refined wax-oil mixture similar to the beeswax and peanut oil used by other workers

"One word of caution is in order Although there has not as yet been demonstrated any tendency for Neisseria gonorrhea to develop penicillin fastness in vitro, nevertheless, this phenomenon may eventually occur and may necessitate re-evaluation of the antibiotic Some workers have had less success with the penicillin treatment of gonorrhea than was observed in the present reports Also, there has as yet been no conclusive report concerning the possible development of asymptomatic carrier states following penicillin therapy Nevertheless, at the present time and pending further investigation of such problems, aqueous solutions of penicillin given in three or more intramuscular injections over a period of approximately four hours, or oil-beeswax suspensions of penicillin given in single injections, seem to provide suitable therapy for gonorrhea At least, the present unsatisfactory response to the sulfonamides justifies a change to penicillin even though it may not be the final solution to the problem of treating this disease "

TROPICAL LICHEN PLANUS—NEW GUINEA VARIETY

A Clinical Report on 24 Cases

Louis Dantzio, Maj ,(MC), AUS, and Louis E Marshall, Maj ,(MC), AUS, Utica, New York

THE dermatologic problems in the global conflict have assumed greater importance than anticipated This is especially true of the Southwest Pacific, where New Guinea stands out as the sore spot A recent survey of skin diseases at a large army general hospital reveals that overseas patients are afflicted with such diseases as dermatophytosis, seborrheal dermatitis, dermatitis venenata, dermatitis exfoliativa, and lichen planus The incidence of lichen planus and its failure to respond to therapeutic measures in the respective locality stimulated further interest and investigation

Twenty-four cases of atypical lichen planus originating in the New Guinea area have been received and studied at Rhoads General Hospital, Utica, in the past year All presented varied and atypical manifestations, making recognition of the disease on first inspection difficult. The response to therapy in each instance was slow but satisfactory The clinical data from close observation of these cases is presented for general information

The unusual features of this variety of lichen planus can best be illustrated by a comparative study with the variety of lichen planus commonly seen in this country

Lichen planus[1] as it is understood is a characteristic papular, erythematous, violaceous, pruritic eruption with sites of predilection involving the flexor surfaces of the wrists, forearms, inner aspects of the thighs, and the legs The lesions may be discrete, grouped, or in large patches as a result of coalescence Rarely is the entire body involved Involution of the lesions may or may not produce residual atrophy or brownish pigmentation Ordinarily the general health is not affected and all laboratory investigation is usually not remarkable The histologic picture, however, is characteristic

In the cases studied, 6 had universal involvement and 18 had a generalized distribution of lesions Fifteen patients had scalp and face involvement and 13 presented palmar and plantar lesions. The fingernails were dystrophic in 50 per cent of the patients The sites of predilection seem to be the scalp, face, hands, and feet The eyelids and lips were commonly involved The buccal mucosa and tongue were strikingly involved in 4 patients In involution of the lesions, residual atrophy and pigmentation were present to a variable degree In 1 patient the pigmentation was bluish-black All but 3 patients showed a partial alopecia of the scalp, eyebrows, axillæ and pubis The lesions were papular, usually oval shaped, especially along the lines of cleavage, irregular in outline, and variable in size from a pinhead to a split pea Coalescence produced plaques and patches The color varied from erythema to violet to bluish-black Many lesions were psoriasiform in appearance, others were verrucous and exudative The physical examination in each case was not significant except in 6 patients in whom the liver was found enlarged from one to three fingerbreadths. The hippuric acid test, the cephalin-flocculation test and the icteric index were surprisingly normal in these patients The routine laboratory investigations were not remarkable Biopsies were done on all the patients and in each case the picture presented the recognized features of lichen planus. [illegible] of the histologic data is attached [illegible]

The cause of lichen planus is [illegible] present concepts entail such possibilities as infectious, neurogenic, and [illegible] allergic slups The neurogenic factor is [illegible] consensus of opinion today is that [illegible] secondary to the primary [illegible] disturbance Montgomery and Alde[illegible] theory [2] Engman and Mook [illegible] tious theory [3] Recently [illegible] importance of nutrition, with [illegible] to vitamins [4] Focal infection [illegible] crine factors have also been [illegible] criminating agents

In the series studied 6 gave a history of [illegible] overworked, 7 gave a history [illegible] over home conditions [illegible] mental upset Three patients [illegible] fever prior to onset of [illegible] malaria at the time of [illegible] weight, varying from [illegible] six months The disease [illegible] Many complained of [illegible] and hyperhidrosis [illegible] sensitive to temperature [illegible] fortable in warm weather [illegible] he in cooler weather [illegible] often absent. The [illegible] important Nine [illegible] econ- in the 26 to 35 [illegible] e for age group Al[illegible] wa study, two were [illegible] thou hospital with [illegible] dis to onset of [illegible] Guinea from [illegible] to nine [illegible]

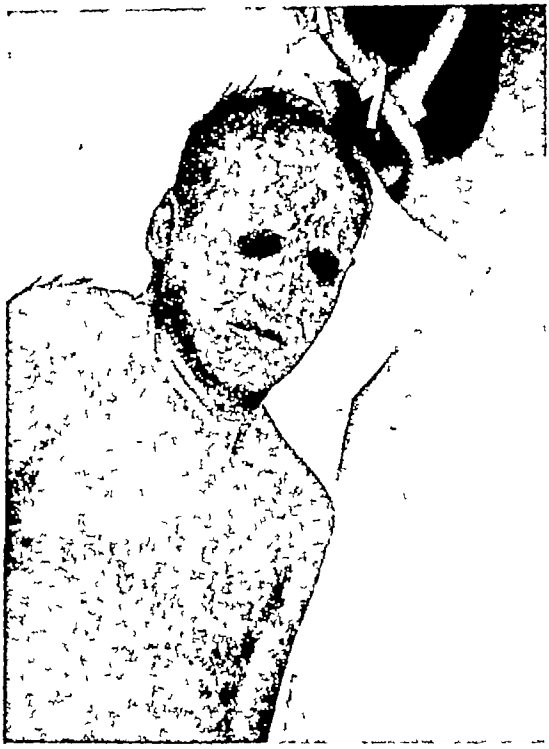

FIG 1 Case 1 Showing extensive involvement of scalp, face, eyelids, and upper trunk Note alopecia of scalp and outer third of eyebrows

FIG 2 Case 1 Photomicrograph (x 1000 oil immersion) showing liquefaction necrosis of basal cells and numerous chromatophores

three months, 9 patients developed it in nine months, and 7 patients in two months Progress of these patients in the overseas hospitals was unsatisfactory Enroute to the United States, 7 improved, 5 remained stationary, and 8 became worse

In their stay at Rhoads General Hospital all improved This can be attributed to the mental ease, better nutritional intake, supplementary vitamins, pyschotherapy, and parenteral therapy The latter consisted of crude-liver-extract injections, 2 to 3 cc , semiweekly for twenty injections This was given on the basis of a vitamin deficiency, bearing in mind Jolliffe's[5] definition of conditioned deficiencies as those caused by factors that interfere with the ingestion, absorption, or utilization of essential nutrients or by factors that increase their requirements, destruction, or excretion Certainly all these patients were subjected to factors that could well produce a vitamin deficiency In a broad sense one can say that acclimatization to the tropics requires not only physiologic adaptation to the climate, but also hygienic and pyschic adaptation to the environment

The family history in each case was essentially negative and noncontributory The past personal history was also not remarkable, save for 2 patients who had a mild form of lichen planus prior to arrival in the tropics The eruption in each patient became worse, the spread, however, being limited to the trunk, forearms, thighs, and legs The palms, soles, and face were spared

The role of atabrine in this disease is worthy of discussion In the malarial countries all soldiers were required to take atabrine as a prophylaxis against plasmodial infections In view of this the possibility of a drug eruption was entertained At Rhoads General Hospital suppressive atabrine therapy was administered to patients with a history of recent malarial episodes Many patients studied had malaria Suppressive atabrine therapy was instituted for one to two months No dermal reaction was noticed at any time Five patients were well on the way to complete recovery when they developed recurrent malarial febrile episodes Atabrine was given in therapeutic dosage Here again no allergic skin manifestations appeared With this evidence, it was reasonable to assume that no drug allergy existed, in other words, dermatitis medicamentosus was ruled out There is, however, another aspect to consider and that is the possibility of drug toxicity In view of the prolonged administration of atabrine prophylactically, it is reasonable to assume that the bacteriostatic or bactericidal effect of the chemotherapeutic drug has its counterpart in a toxic

FIG 3 Case 1 Photomicrograph (x 100) showing irregular atrophy and acanthosis of epidermis and band-like cellular infiltrate in upper cutis

effect on animal tissue, with the liver cell being the most sensitive That this toxicity is not entirely dependent on overdosage has been shown, and the various degrees of susceptibility may depend on the ability of the liver to detoxify That this ability can be influenced by nutritional factors, such as the vitamin B complex, proteins, the sulfur-containing amino acids, and choline, is known.

Whether or not the liver function in each patient was so impaired as to prevent detoxification of the drug is a thought deserving further investigation Our laboratory investigation for liver function did not indicate any abnormality, but it is known that the present tests are not conclusive

The following case reports reveal pertinent data and photographs of two striking cases in the series

Case Reports

Case 1—This patient has been in the Southwest Pacific for seven months. His normal weight was 178 his admission weight was 130

He first complained of heat rash over the arms and trunk. The eruption rapidly spread to involve the scalp face, and lower extremities On admission, examination revealed a diffuse, scaly violaceous erythroderma over the entire body Palms and soles revealed many maculopapular, violaceous scaly lesions. Scalp, axillae, and pubic areas revealed similar lesions and a partial alopecia. The buccal mucosa and the dorsum of the tongue revealed many lacelike, whitish streaks. Cervical, axillary, and inguinal glands were enlarged The liver edge was palpable three fingerbreadths below the costal margin The remainder of the physical examination was normal Liver function tests were normal. All laboratory findings were within normal limits. On discharge, many affected areas revealed residual brownish pigmentation and atrophy

The histologic report revealed a moderate hyperkeratosis and a mild parakeratosis, acanthosis, and spongiosis. The basal-cell layer and the dermoepidermal junction are indistinct due to a perivascular lymphocytic infiltration Edema in the upper cutis was moderate. Numerous chromatophores were scattered throughout the upper cutis.

A diagnosis of lichen planus was made.

TABLE 1 COMPARATIVE ANALYSIS OF HISTOLOGIC FINDINGS

Recognized Characteristic Features of Lichen Planus	Histologic Findings of Patients Studied
Relative and absolute hyperkeratosis	a. absent—2 b relative—6 c. absolute—16
Increase in stratum granulosum	a. absent—3 b. poorly differentiated—13 c. well differentiated—8
Moderate acanthosis	a. absent—11 b present—13
Liquefaction necrosis of basal-cell layer	a. absent—9 b mild—5 c. marked—10
Cellular infiltrate limited rather sharply to upper part of cutis	a. absent—0 b focal—7 c. band-like—17
Edema and pigmentation	Dilated vessels of corium, with edema:
Dilation of blood vessels	a. absent—2 b present—22
	Chromatophores a. absent—4 b present—20

Case 2—This patient has been in the Southwest Pacific for six months His normal weight was 155, on admission his weight was 130

He first complained of physical exhaustion and diarrhea for several days. Food intake in this period was minimal. About one week later, he complained of tingling sensations and pruritus all over his body, but no rash was present Subsequently, he developed red blotches on the palms and lips These rapidly spread to face, trunk, and extremities. On admission, the scalp, face neck, trunk, and extremities, including palms and soles were covered with erythematous, violaceous, thickened scaly patches in retiform manner, most marked on face trunk and upper extremities. The eyelids and lips revealed erythematous brownish atrophic linear lesions. The tongue and buccal mucosa revealed white, lacelike lesions. The liver edge was palpable two fingerbreadths below the costal margin.

A complete blood count revealed a slight secondary anemia. A malarial smear was positive for plasmodium vivax. All other laboratory work was normal. The patient was given atabrine without any effect on skin lesions. Prior to hospital discharge, a recurrent malarial episode necessitated further atabrine therapy This was given without

FIG 4. Case 2 Shows generalized distribution of lesions Note face, eyelids, and lips

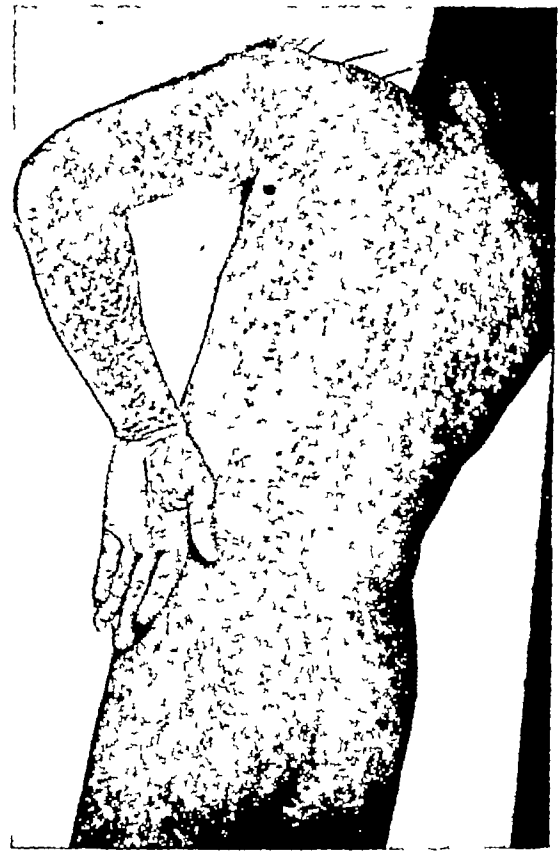

FIG 5 Case 2 Shows posterior aspect of patient Note extensive involvement, also palmar lesions

any untoward reaction on skin At the time of discharge, the liver edge was not palpable

The histologic report revealed a picture compatible with the diagnosis of lichen planus

Histology

The histologic picture of lichen planus is characteristic but not always diagnostic in itself as it may be simulated closely by the inflammatory stage of senile keratosis or leukoplakia[6] An infiltrate limited to the upper cutis may also be seen in lichen-planus-like lesions occurring in syphilis, disseminate lupus erythematosis, and lymphoblastoma Usually concomitant findings permit definite pathologic diagnosis In this series a histologic study was made in each case and the findings definitely suggested the diagnosis of a lichen-planus-like eruption Table 1 is an analysis of histologic findings in cases studied compared to the recognized characteristic features of lichen planus

Summary

Tabulation of the pertinent clinical data

1 All patients studied were returned from New Guinea

2 The age factor was unimportant

3 Two gave a history of having had a mild form of lichen planus in the United States prior to arrival in New Guinea The eruption in each case became worse overseas

4 History of grief and long-continued anxiety prior to onset of illness was elicited in 20 patients

5 Many complained of overwork, insomnia, and malaise

6 Dietary imbalance affected all with weight loss, varying from 10 to 45 pounds

7 The majority of patients became ill in three to six months after arrival in New Guinea from the United States

8 The onset was insidious and unaccountable Generalized spread occurred in two to three weeks

9 Sites of predilection were the hands, feet, face, and scalp

10 Eyelids and lips were involved in most of the patients

11 The fingernails were dystrophic in 50 per cent of the cases

12 The eruption was atypical and extensive,

resembling dermatitis exfoliativa, psoriasis, and eczema

13 Lesions varied in color from erythema to violet to bluish-black.

14 There was partial alopecia of scalp, eyebrows, axillae, and pubis in most of the cases

15 Residual pigmentation and atrophy were present in all cases.

16 The skin was sensitive to temperature changes Patients were uncomfortable in warm weather and fairly comfortable in cool weather

17 Pruritus was variable

18 The liver was enlarged one to three fingerbreadths in 8 patients. Liver function tests, however, were negative

19 Improvement in hospital was attributed to mental ease, better nutritional intake, supplementary vitamins, psychotherapy, and crude-liver-extract injections

Conclusion

A study of 24 patients returned from the New Guinea area with generalized lichen-planus-like eruption was made at Rhoads General Hospital That all patients studied were in a state of nutritional deficiency was without question. That many patients were in a state of endocrine exhaustion can be postulated because of the nutritional deficiency, the extensive alopecia, and the temporary loss of libido Whether or not the vitamin-enzyme-hormonal factors served as predisposing factors in the susceptible individual is to be determined Just what is the exciting factor in the causation of the disease is speculative The possibility of a viral infection is tenable and further study will detract or lend support to this concept The role of atabrine in this disease is discussed for further study

Major Louis E. Marshall, formerly chief of laboratory service Rhoads General Hospital, Utica, New York is now stationed at the Army Institute of Pathology Washington, D C

SYNTHETIC PENICILLIN WAS SOUGHT DURING WAR IN SECRET RESEARCH

Details of efforts to synthesize penicillin under a $3 000 000 secret war research program were revealed on January 11 by Dr, Vannevar Bush, director of the Office of Scientific Research and Development. Eleven American chemical and drug firms participated, along with a number of university and nonprofit research organizations, as well as United States Government and British laboratories.

From the start of the program in 1943 until termination of the research work last November 1, the participating American commercial firms spent $2,500 000 of their own funds on the experiments, while the Government contributed almost $500 000 to advance the research in Government laboratories and under O.S.R.D contracts with scientific institutions.

"Although the program, as originally intended because of the then limited output of natural penicillin, did not result in development of a commercially feasible method of synthesizing penicillin, it did result in substantial progress in a new and important field of medical research, and disclosed several artificially produced penicillins of potential value," Dr Bush said

He added that the "progress made and the unique degree of cooperation shown by the commercial firms are a landmark in the already bright history of industrial cooperation with the Government in war time research."

The pharmaceutic and chemical firms that participated included the Abbott Laboratories, Cutter Laboratories, the Hayden Chemical Corporation, Eli Lilly and Co Merck and Co, Inc., Parke, Davis and Co Charles Pfizer Company, Inc., the Shell Development Company, E. R. Squibb and Sons, the Upjohn Company, and the Winthrop Chemical Company, Inc.

The program, Dr Bush said, was an example of the patriotic contribution of commercial pharmaceutic and chemical companies in that, in several instances, they were willing to risk sizable investments in natural penicillin production facilities which the synthetic program might have made valueless. The commercial firms, also said the O.S.R.D agreed to permit the Government to turn over to their business competitors valuable information which each firm had produced through its own funds and efforts. They also agreed to accept the decision of the O.S.R.D director in disposing of all patent rights arising out of the program

Dr Bush further said that the great improvement in methods of producing penicillin by fermentation already had resulted in production of substantial quantities, and a diminished need for the synthetic product Further, he stated, the price of the natural product had been steadily lowered to a point where the commercial value of synthetic penicillin had become debatable.

U.N.R.R.A. announced on January 11 that penicillin will be continuously available in several European countries as the result of arrangements which are being made in cooperation with the Canadian Government.—*N Y Times, Jan 12, 1946*

BICIPITAL SYNDROMES AND THEIR TREATMENT

JAMES M TARSY, M D , Brooklyn, New York
(From the Arthritis Department, New York Postgraduate and St Mary's hospitals)

SINCE their discovery bicipital lesions have gained increasing recognition as harbingers of pain in and about the shoulder joint Meyer,[1 2] in over one thousand shoulders dissected at Stanford University, found, among other forms of pathology, numerous instances of complete or partial destruction of the tendon of the long head of the biceps brachii More recently, Lippmann[3,4] has stressed the causal relationship between tenosynovitis of this tendon and periarthritis

Anatomy and Mechanics of the Biceps Tendon

The biceps brachii arises from two heads the short head, from the apex of the coracoid process, the long head, which is the anatomic seat of most bicipital syndromes, from the supraglenoid tuberosity, at the upper margin of the glenoid cavity [5] From its origin it arches over the head of the humerus, lying in the shoulder joint between the superior part of the capsule and the humeral head, to be thence continued through a fibrous tunnel, lining the bicipital groove [5] It is retained in this groove by the transverse humeral ligament and by a fibrous prolongation from the tendon of the pectoralis major

The tendon is enclosed in a special sheath of synovial membrane which extends as an outpouching from the synovia of the shoulder joint into the bicipital groove for a distance of approximately two inches [5 6]

As the biceps muscle is flexed, the tendon stiffens in its groove, but no motion occurs therein Motion does occur, however, with various movements of the glenohumeral joint, as in elevation, abduction, and adduction of the upper extremity

According to Schrager,[7] the function of the tendon of the long head of the biceps can be summarized as follows

1 It helps to maintain and coaptate the head of the humerus against the glenoid cavity
2 It reinforces the capsular ligaments
3 It prevents the head of the bone from being pulled too close upward under the acromion (Treves)
4 It supplements the deficiency of the subspinous muscle
5 Both biceps heads are flexors and medial rotators of the arm at the shoulder, both are abductors—the long head abducts the arm and rotates it inward

These anatomic considerations are of importance in visualizing the traumatic mechanism to which this tendon is subject in work and play They are equally important in the clinical examination of the patient, as in the localization of the lesion, and, finally, in the proper treatment of such a lesion

Clinical Features

The tendon of the long head of the biceps is subject to the following lesions

1 Tendinitis
2 Tenosynovitis
3 Partial rupture
4 Complete rupture
5 Dislocation
6 Elongation

Tenosynovitis implies an inflammation of the tendon and its surrounding sheath It is not improbable, however, that tendonitis may and does occur without involvement of the sheath [5] Elongation usually follows dislocation, although each entity may occur separately Meyer[1] has stressed the absence of inflammation in tendons of shoulders studied by him in patients averaging 60 years or over The lesions studied were the products of attrition due to use or overuse It is doubtful, therefore, that all cases considered as tenosynovitis are actually such Many cases clinically classified as inflammatory in origin are degenerative in nature, occurring in elderly individuals as the result of attrition or overuse Such shoulders undoubtedly present clinical signs similar to those encountered in the chronic phase of tenosynovitis Their treatment perhaps differs little from that of true tenosynovitis, although their response to therapy is undoubtedly slow, if not actually poor

Bicipital Tenosynovitis

Pain and disability may be precipitated by trauma to the shoulder, such as occasioned by a sudden pull on the abducted upper extremity, a blow over the biceps tendon, or severe and unaccustomed exercise Schrager[7] mentions trauma, metastatic infection, exposure to cold and dampness, effusions, and rheumatic tendencies as the most common causes Sudden jarring of the elevated arm while in abduction, as in straphangers, attempt to break a fall, a fall upon the extended hand (Colles' fracture), muscle strain, especially in the presence of preceding diseases (osteoarthritis, rheumatoid arthritis, and gout) are some of the more

specific causes of tenosynovitis Ensuing clinical signs are invariably consistent with the severity of the trauma sustained, condition of the tendon previous to injury, and nature of the pathologic changes in and about the tendon

Schrager[7] describes three distinct clinical phases acute, subacute, and chronic The acute phase is characterized by violent pain in the shoulder, loss of function, and tenderness localized at the bicipital groove It may persist for a few days to several weeks and gradually subside, or become subacute In the subacute phase pain is usually less intense and sometimes paroxysmal in character, especially at night Function, though somewhat impaired, is better tolerated This stage usually lasts a period of several weeks or months, or finally becomes chronic According to Schrager, the subacute phase may start frankly as such in cases of rheumatic causation.

The chronic phase exhibits the modified symptoms of the more active types, with voluntary or involuntary fixation of the scapulohumeral structures and loss of scapulohumeral rhythm, as described by Codman This phase may last several years[8] or an indefinite period of time The writer successfully treated one case of bilateral periarthritis of five years' duration

Physical Examination

In the early stages there is pain at the anterior aspect of the shoulder aggravated by movements of the arm, as in performing abduction and external rotation This pain may be associated with muscular spasm and discomfort in the trapezius, scalenus, deltoid, arm, and even the muscles of the forearm[8] Pressure over the bicipital groove reveals the site of maximum tenderness Tenderness over other aspects of the shoulder joint is usually absent Supination of the forearm and hand against resistance (the operator holding the patient's wrist so as to resist supination) with the forearm at right angles to the arm (Yergason's sign) causes an intensification of pain in the region of the bicipital groove A more reliable test employed by the writer is one in which, parallel with this maneuver, the operator abducts the arm well above shoulder level, at the same time exerting pressure over the bicipital groove. In bicipital involvement the subject complains of a sharp, lancinating pain over the point of pressure.

Tenosynovitis and Periarthritis

Pain may at first be accompanied by marked spasm which inhibits normal motion of the shoulder joint. Limited mobility of the shoulder, however, should not always be interpreted as periarthritis, since complete function is not infrequently established as soon as the pain subsides The spasm in such instances arises from the *locus dolens* acting as a trigger point, and is undoubtedly protective in nature Spasm in many painful situations involving the [illegible] joint and surrounding areas has been relieved almost instantaneously following dissipation of the painful mechanism by local injection of procaine[9 10] or brachial plexus block[11] On the other hand, the acute phase may become subacute or chronic. When such is the case a true periarthritis may develop as the result of continued spasm, immobilization and fibrosis Fusion of the tendon to the bicipital groove or obliteration of the intra-articular portion of the tendon, by eliminating the source of pain and the need of further protection on the part of the periarticular muscles, may result in a spontaneous cure of the periarthritis[8 9]

All of the thirty two shoulders explored surgically by Lippmann[4] showed fibrositic inflammatory changes of varying degree involving the biceps tendon and its sheath In the early cases the tissues were reddened, vascular, and edematous, the tendon itself was dull, swollen and discolored In the later cases, the sheaths were thickened, fibrotic, and less vascular, the tendon was roughened and scarred, and the signs of acute inflammation were completely absent In the early cases this tendon was able to glide in its sheath, in the [illegible] chronic cases it was completely bound down to the intertubercular groove These pathologic changes were paralleled by [illegible] such as bicipital-groove tenderness, limited mobility of the [illegible] inferred that bicipital [illegible] forerunner of periarthritis

Lippmann's cases [illegible] the terminal stage of [illegible] neglected or improperly [illegible] subjects representing a [illegible] sponse In contrast, [illegible] of Moseley's patients [illegible] physiotherapy "[illegible] watch the development of a [illegible] shoulder " [illegible] in the early stages [illegible] peutic response

Based on a [illegible] periarthritis, it [illegible] the onset of what [illegible] to as "secondary [illegible] any injury or [illegible] ligamentous [illegible] The injury or [illegible] tently sufficient [illegible] dinitis, and [illegible] The lesions [illegible]

chronic cases appear to fall into this category Minor lesions, unless therapeutically abused, usually clear up spontaneously with rest, or respond to more or less simple measures, such as heat, massage, or procaine infiltration

Partial Tears and Complete Rupture of the Biceps Tendon

Both the long and short biceps tendons may be subjected to partial tears and complete rupture Most ruptures, partial or complete, involve the tendon of the long head of the biceps or the muscle itself Partial tears, because of their gradual production, frequently fail to present a distinct symptomatology, and for this reason are often overlooked or treated as other forms of shoulder lesions, i e , arthritis, bursitis, or supra-*spinatus tendinitis* [12] *Such tears, together with* bicipital tenosynovitis, often form the pathologic basis of the so-called "senile shoulder" or of other painful shoulder conditions in the aged, and for this reason are deserving of being included in the host of causes capable of giving rise to shoulder pain and disability

Rupture of the long head may occur at the supraglenoid tuberosity, intracapsular portion of the tendon, extracapsular portion, or in the musculotendinous junction It has also been known to involve the muscle itself, the lower tendon at the radial insertion, and the short head of the biceps Most ruptures, 43 6 per cent, according to Loos,[13] occur at the junction of the muscle with the tendon In Gilcreest's series of 106 cases,[12] 34 patients developed ruptures at the intra-articular portion of the tendon of the long head, 20 at the upper musculotendinous junction, 14 had extra-articular ruptures, in the remaining patients, ruptures involved other portions of the entire bicipital structure

Both complete and incomplete ruptures are commonly preceded by retrogressive changes which undermine the vital resistance of the tendon When trauma is superimposed on an already devitalized tendon, tears of several of its fibers or complete transverse fission of the entire structure may readily occur Such tears, however, also occur in healthy muscles subjected to great strain, such as muscular contraction against too great a resistance [5,12] When only several fibers are torn, the only complaint may be pain and stiffness, with little or no disability Examination reveals an area of tenderness corresponding to the laceration Use of the extremity, however, is not necessarily impaired, and the tear may gradually heal with disappearence of any discomfort present and gradual return of complete mobilization In the aged, secondary changes may take place with chronic pain and stiffness Continued abuse in such instances may cause gradual fraying and shredding of the biceps tendon, with the fibers taking on new and lower attachments [12]

The four great causes of rupture are age, disease, attrition, and acute trauma

Age, or physiologic imbalance, as in many other disease processes, is the common denominator of shoulder pathology In aging processes the muscles and tendons lose their normal elasticity or resilience (Gilcreest) This is partly due to a decrease in the vascularity of these structures Gilcreest[12] mentions the researches of Rau, who found that after the age of 30 the circulation of blood in a tendon becomes less rich, being gradually reduced to a few short vessels which enter it and the peritendinous membrane This leads to weakening of its tensile strength so *that attrition or acute strain may bring about* rupture These findings are paralleled by the capillary studies of Lombard[14] and Kovacs, Wright, and Duryea,[15] who noted a definite decrease in the number of skin capillaries in the region of Heberden's nodes and joint swelling [16] These aging processes and vascular changes affect not only the muscles and tendons, but the joints and body as a whole

Certain diseases, such as myositis or myofibrositis, osteoarthritis and rheumatoid arthritis, arteriosclerosis, neoplasms, and acute and chronic infections, have also been found to be responsible for a certain percentage of ruptures Myositis, through inflammation or degeneration of the muscle, presumably weakens its tensile resistance, and is, in consequence, a cause of tears occurring at the junction of the muscle and the tendon Osteoarthritis with roughening of the bicipital groove is, according to certain investigators, [5 12 17] responsible for wear and tear of the long head of the biceps tendon as it glides in this groove The role of rheumatoid arthritis as a predisposing factor in facilitating such tears was noted at necroscopy by Ledderhose [18] Gilcreest, however, in reviewing some of Meyer's anatomic material, was greatly surprised to see many specimens of the shoulder joint completely free of the slightest evidence of arthritis These same specimens, however, did reveal intra-articular destruction of the tendon of the long head of the biceps In over 20 of these specimens could be noted absence of the articular portion of this tendon as the result of extracapsular destruction Meyer's own observations[1] pointed to a low-grade, long-standing process with final destruction of the long head of the biceps and attachment of the tendon stump distal to the lesser tuberosities He attributed such destruction to friction, as indicated by the fraying and fringing of the other soft parts of the joint, as well as fraying and shredding of the tendon itself

The role of certain occupations, particularly those requiring repetitious movements of one muscle or a group of muscles, with continued use of the arm in a position of marked abduction and external rotation, is well known The imposition of trauma in a tendon previously frayed and degenerated by arduous labor may readily result in rupture

Trauma may be acute or chronic, extrinsic or intrinsic In Gilcrest's series there were 32 instances of sudden rupture as the result of acute, severe muscular effort Each one of these patients was lifting a weight of approximately 150 pounds with his forearms partly flexed and his biceps in strong contraction The added strain while attempting to throw the load over his shoulders by suddenly erecting the body, resulted in rupture This is a classic example of acute, intrinsic trauma A good many ruptures have, however, been known to occur as the result of extrinsic or external trauma, such as a blow on the shoulder or arm Chronic trauma is well illustrated in the typist or pianist who develops a calcification in the supraspinatus tendon as the result of keeping his arms in a state of constant abduction In this position the tendon is pinched between the acromion and the greater tuberosity of the humerus

Dislocation and Elongation

Notwithstanding the supposed rarity of this lesion, many instances confirming its not infrequent presence have been reported in the literature and verified at autopsy [18] Meyer and his coworkers, in their dissections of over one thousand arms, found 59 cases of marked dislocation of the tendon of the long head of the biceps and many others of lesser degree Gilcrest had four clinical cases One such patient, operated upon by him, probably had the first recorded operation for relief of such a condition Moseley mentions having seen only 2 cases which came to operation, and having two more under observation

It is especially common in laborers past middle life, and may be due to gradual stretching, detachment, or destruction of the joint capsule proximal to and in the region of the lesser tuberosity Malformation or a localized osteitis, as recorded by Bera,[19] by reducing the prominence of the lesser tuberosity also favors dislocation Arthritis and violent muscular effort have also been mentioned as responsible causes Occupation is probably the most important cause External rotation and abduction of the arm over 90 degrees is the usual mechanism of production in acute and recurrent luxation.

The symptoms vary according to whether the luxation occurs suddenly or by gradual stages, whether it is complete or incomplete When the onset is gradual, or if the tendon has slipped forward slightly, there may be vague soreness in and about the groove increased on elevation and external rotation of the extremity [19] When the onset is acute, pain may be sudden and sharp and accompanied by a click, locking of the shoulder, and marked weakness of the arm [8] The clinical picture, however, is often obscured by the presence of tenosynovitis

Diagnosis

Diagnosis is made possible by a history of sharp pain and disability induced by a sudden movement of the arm, as in elevating the extremity in external rotation Occupations requiring repetition of such movements are particularly suggestive of this condition On palpation the presence of an empty groove or of the tendon outside the groove may confirm the diagnosis *Gilcrest[19] describes a diagnostic test* in recurrent dislocation which utilizes these maneuvers by reproducing the luxation The patient is asked to extend and fully elevate the corresponding extremity with the limb in complete external rotation The observer, standing either behind or in front of the patient, places his finger on the tendon of the long head of the biceps at the bicipital groove As the subject lowers the arm to an angle of 110 to 90 degrees a definite snap is felt by the palpating finger This snap, usually accompanied by a sharp pain, is frequently audible to both observer and patient.

Treatment

Bicipital Tenosynovitis —The treatment must take into consideration four important factors (1) acuity of the inflammatory process, (2) intensity of pain, (3) the nature of the established pathologic changes, and (4) the presence or absence of periarthritis

Acute Stage.—In the acute stage, and when pain is severe, rest in bed with the patient in a position of ease is of primary importance Rest relieves pain and spasm and inhibits progression of concomitant pathology to its more advanced forms It also tends to raise the threshold of pain by exerting a beneficial influence on the body as a whole In addition to bed rest the arm should be supported by one or two pillows and all movements of the shoulder avoided as much as possible In ambulatory patients shoulder-drag may be eliminated by the use of a sling This means of support should be continued for a number of days until the acute process has subsided Persistent immobilization should be used with caution, however, since it favors formation of adhesions and the onset of periarthritis

Schrager[1] considers diathermy as the principal remedy in the acute stage He ascribes its use-

fulness to hyperemia and activation of the blood supply, both of which induce repair by promoting absorption of inflammatory exudates Diathermy should be administered from thirty to sixty minutes daily, preferably in the patient's home or in the hospital

The use of radiant heat is also of value, although short-wave diathermy is probably superior The lamp should be a distance of at least 3 feet above the shoulder so as to insure continuous radiation Gentle, stroking massage is also indicated in this stage, severe massage may be actually injurious, and should be avoided Pasteur suggests ionization with salicylates, iodides, and atropine Its usefulness in this phase is questionable, however Procaine ionization has been used for its analgesic effect by the writer, and would, on the basis of results obtained in a few cases, appear to be worthy of trial

Subacute Stage —In the subacute stage, when pain has subsided somewhat, short-wave diathermy or infrared may be followed by more strenuous massage Vibratory massage skillfully applied over the tender area is also useful, and like heat, may be employed to relieve spasm, increase circulation, and promote absorption of inflammatory exudates Low-frequency currents, such as the slow sinusoidal, may also be applied over the inflamed tendon to reduce pain and promote cellular repair [21]

Chronic Stage (*Periarthritis*) —In the chronic stage, characterized by muscular spasm, involuntary fixation of the shoulder, and muscular atrophy, heat, massage, and active and passive motion are also indicated Manipulation should be according to tolerance, since little is to be gained by undue force or persistence in the face of pain and protective spasm, or when the tendon and its sheath are presumably bound down to the intertubercular groove Creeping exercises, such as wall-climbing, following office treatment, consolidate any gain obtained and should be religiously employed by the patient

Lippmann feels that "manipulation is clearly useless before stiffness becomes noticeable, and harmful during the period when adhesions are forming and stiffness is becoming progressively more severe" In his opinion, "manipulation under anesthesia, or gently by exercises, serves only to increase pain and disrupt soft adhesions which inevitably reform"

In the writer's opinion, rest is undoubtedly imperative in acute inflammatory processes accompanied by severe pain After the acute phase has subsided manipulation and exercise, if not too severe, tend to inhibit the formation of adhesions by improvement of local tissue physiology When adhesions are soft or in the process of formation they may be readily ruptured by manipulation without undue trauma The main function of manipulation would, therefore, appear to be one of re-establishing the physiologic integrity of inflamed or degenerated structures Aggressive manipulation in the presence of fibroplastic changes binding the tendon and its sheath to the bicipital groove may not always be desirable, however.

Local Analgesia —When pain and disability persist, as in the subacute and chronic stage, the area of maximum tenderness corresponding to the bicipital groove may be injected with 0 5 to 1 cc of 1 per cent procaine hydrochloride The tender area is readily localized by the diagnostic maneuver previously described In a thin or not too obese person the groove may be felt on palpation of the anterior aspect of the shoulder A wheal is raised over this area and a $1^1/_2$ inch, 22 mm gage needle is inserted through the wheal as far as the approximate location of the tendon Correct localization is invariably signaled by the patient on contact with the inflamed area Considerable care should be exercised by the operator to avoid penetration of the tendon or overtraumatization of the needled area This procedure is to be followed by firm manipulation of the corresponding extremity Injections may be repeated several times weekly until satisfactory results have been obtained, and should be followed by wall-climbing excercises several times daily, preferably after a hot bath

The value of local analgesia and manipulation, as above described in relieving pain and spasm and increasing mobility of the arm, was signally brought out in a patient with periarthritis treated by the writer In this instance, the pain and disability had persisted for a period of three years, having failed to respond to a variety of therapeutic measures, including diathermy, massage, and brachial plexus block Shoulder motion was painful and markedly limited Forced elevation of the arm to the point of intolerance failed to increase materially the range of motion When manipulation was repeated soon after injection, definite relaxation of the shoulder muscles could be felt, with an immediate increase of mobility of at least 3 inches This result was attributed to the analgesic action of procaine upon the inflammatory site, with neutralization of the trigger point and dissipation of the spasm-inducing mechanism It is doubtful, however, if such a result could have been obtained in the presence of advanced pathology characterized by the presence of firm adhesions binding the tendon to the groove, such as described by Meyer[1] and Lippmann [4] Repetition of the above procedures several times weekly resulted in the gradual disappearence of pain and the establish-

ment of normal function This result was repeatedly duplicated by the writer in other cases of periarthritis secondary to bicipital tenosynovitis

Brachial Plexus Block.—Brachial plexus block has also demonstrated its usefulness in the treatment of periarthritis [11] Immediate improvement, in a good number of instances, has followed this procedure parallel with the rupture of soft adhesions after manipulation, although it was not unusual, later, to have a temporary increase in pain and stiffness This temporary reaction was in most cases followed by gradual relaxation of the shoulder muscles and increased mobility

Tears and Ruptures

The treatment of tears and ruptures is both palliative and surgical, depending on the nature of the injury sustained Conservative measures are, in themselves, capable of restoring function in partial or inconsequential tears Both Keen and Gilcreest, however, feel that the superior functional results obtained with surgery as compared to conservative therapy justify the use of the former Following a tear or a rupture many patients are treated at first as having sustained a contusion or a sprain [12] If the tear is not too extensive, Gilcreest[12] advises initial immobilization of the arm in acute flexion for a period of two or three weeks, after which time healing should have occurred spontaneously Gentle massage and diathermy may now be employed The use of massage at an earlier period is contraindicated for apparent reasons As the pain decreases, graduated movements, both active and passive may be instituted Motion is important, especially in the aged, and should be employed as soon as feasible Disuse, whether as the result of a tear or cardiovascular disease, may, in the physiologically depleted, readily result in stiffness or "freezing" of the shoulder

For rupture of the long head of the biceps at its attachment to the superior lip of the glenoid or near its upper end, Gilcreest advises suture of the ruptured tendon to the tendon of the short head of the biceps as well as to the coracoid process Lippmann[3] favors a less extensive procedure, i e., suture of the tendon to the lesser tuberosity with the arm in adduction and external rotation

Local Analgesia.—In partial, or not too extensive tears, the injection of a small amount of a 1 or 2 per cent solution of procaine hydrochloride, according to the technic specified under tenosynovitis, is indicated Although this injection may not exert any specific healing action on the tendon fibers themselves, it probably does hasten improvement by relieving pain and, consequently, spasm and congestion Analogous results have been obtained in the case of a sprained ankle Its greatest usefulness, perhaps, lies in the treatment of the "senile shoulder," where surgery is frequently undesirable

NINE KOREAN PHYSICIANS BEGIN YEAR OF TRAINING IN UNITED STATES

Nine physicians from Korea, recently welcomed to the United States by Maj Gen. Norman T Kirk the Surgeon General, and Brig Gen James S Simmons, Chief of Preventive Medicine Service have begun a year of study in the field of public health, sponsored by the International Health Institute of the Rockefeller Foundation

Three of the physicians are attending Johns Hopkins University Medical School, three Harvard University Medical School, and three, the University of Michigan Medical School

The purpose of the year of training, General Kirk said, "is to lay the foundation for a self-sufficient medical service for the Korean nation For more than thirty years the Japanese have dominated all medical and other scientific work in Korea as well as its national and local government affairs. No Korean has been allowed to serve in a position of responsibility in the nation or in his own community"

—*Release from the Office of the Surgeon General*

fulness to hyperemia and activation of the blood supply, both of which induce repair by promoting absorption of inflammatory exudates Diathermy should be administered from thirty to sixty minutes daily, preferably in the patient's home or in the hospital

The use of radiant heat is also of value, although short-wave diathermy is probably superior The lamp should be a distance of at least 3 feet above the shoulder so as to insure continuous radiation Gentle, stroking massage is also indicated in this stage, severe massage may be actually injurious, and should be avoided Pasteur suggests ionization with salicylates, iodides, and atropine Its usefulness in this phase is questionable, however Procaine ionization has been used for its analgesic effect by the writer, and would, on the basis of results obtained in a few cases, appear to be worthy of trial

Subacute Stage—In the subacute stage, when pain has subsided somewhat, short-wave diathermy or infrared may be followed by more strenuous massage Vibratory massage skillfully applied over the tender area is also useful, and like heat, may be employed to relieve spasm, increase circulation, and promote absorption of inflammatory exudates Low-frequency currents, such as the slow sinusoidal, may also be applied over the inflamed tendon to reduce pain and promote cellular repair [21]

Chronic Stage (Periarthritis)—In the chronic stage, characterized by muscular spasm, involuntary fixation of the shoulder, and muscular atrophy, heat, massage, and active and passive motion are also indicated Manipulation should be according to tolerance, since little is to be gained by undue force or persistence in the face of pain and protective spasm, or when the tendon and its sheath are presumably bound down to the intertubercular groove Creeping exercises, such as wall-climbing, following office treatment, consolidate any gain obtained and should be religiously employed by the patient

Lippmann feels that "manipulation is clearly useless before stiffness becomes noticeable, and harmful during the period when adhesions are forming and stiffness is becoming progressively more severe" In his opinion, "manipulation under anesthesia, or gently by exercises, serves only to increase pain and disrupt soft adhesions which inevitably reform"

In the writer's opinion, rest is undoubtedly imperative in acute inflammatory processes accompanied by severe pain After the acute phase has subsided manipulation and exercise, if not too severe, tend to inhibit the formation of adhesions by improvement of local tissue physiology When adhesions are soft or in the process of formation they may be readily ruptured by manipulation without undue trauma The main function of manipulation would, therefore, appear to be one of re-establishing the physiologic integrity of inflamed or degenerated structures Aggressive manipulation in the presence of fibroplastic changes binding the tendon and its sheath to the bicipital groove may not always be desirable, however.

Local Analgesia—When pain and disability persist, as in the subacute and chronic stage, the area of maximum tenderness corresponding to the bicipital groove may be injected with 0 5 to 1 cc of 1 per cent procaine hydrochloride The tender area is readily localized by the diagnostic maneuver previously described In a thin or not too obese person the groove may be felt on palpation of the anterior aspect of the shoulder. A wheal is raised over this area and a $1^1/_2$ inch, 22 mm gage needle is inserted through the wheal as far as the approximate location of the tendon Correct localization is invariably signaled by the patient on contact with the inflamed area Considerable care should be exercised by the operator to avoid penetration of the tendon or overtraumatization of the needled area This procedure is to be followed by firm manipulation of the corresponding extremity Injections may be repeated several times weekly until satisfactory results have been obtained, and should be followed by wall-climbing excercises several times daily, preferably after a hot bath

The value of local analgesia and manipulation, as above described in relieving pain and spasm and increasing mobility of the arm, was signally brought out in a patient with periarthritis treated by the writer In this instance, the pain and disability had persisted for a period of three years, having failed to respond to a variety of therapeutic measures, including diathermy, massage, and brachial plexus block Shoulder motion was painful and markedly limited Forced elevation of the arm to the point of intolerance failed to increase materially the range of motion When manipulation was repeated soon after injection, definite relaxation of the shoulder muscles could be felt, with an immediate increase of mobility of at least 3 inches This result was attributed to the analgesic action of procaine upon the inflammatory site, with neutralization of the trigger point and dissipation of the spasm-inducing mechanism It is doubtful, however, if such a result could have been obtained in the presence of advanced pathology characterized by the presence of firm adhesions binding the tendon to the groove, such as described by Meyer[1] and Lippmann [4] Repetition of the above procedures several times weekly resulted in the gradual disappearence of pain and the establish-

FIG 1. Immediate reduction in pulmonary ventilation, when breathing oxygen, in a patient with pulmonary emphysema.

turned off each time *before* the tent is opened for treatment or examinations. Oxygen may also be administered by catheter in the nasal or oropharynx at a flow of 5 to 7 liters per minute. Provided that the terminal inch and one half is perforated by six to eight small orifices, this simple method of oxygen administration can be efficiently and comfortably used * At present no indication exists for the administration of carbon dioxide to patients with bronchial asthma, since it increases pulmonary ventilation and accentuates the dyspnea Whether short periods of carbon dioxide inhalation have value as an expectorant, as reported by Basch and his coworkers,[3] requires further investigation

Helium-oxygen Inhalation

The use of helium-oxygen mixtures in respiratory obstruction was based on the demonstration that inhalation of this gas was accompanied by decreased physical effort and by a lowering of the intrapleural negative pressure during inspiration.[3,4] The more limited the area of obstruction the greater the physical advantage of helium In patients with status asthmaticus, inhalation of this lighter than-oxygen gas, especially when positive pressure is added, may produce dramatic relief of dyspnea. However, the pathologic changes in the lungs of these patients include not only bronchial spasm but congestion and edema of the bronchial wall, as well as pulmonary emphysema, which require in many instances a period of three to five days before a remission is obtained Although helium and oxygen were originally used more or less continuously for two to five days, the expense of such a program led to the study of their use in limited periods As a part of a program of progressive bronchial relaxation, our therapeutic regimen in cases of status asthmaticus is to employ its administration for two hours two to three times a day, preferably in the positive-pressure hood designed for this purpose [2,5,6] A mixture of 25 to 30 per cent oxygen with the remainder helium is given with a positive pressure of 3 to 5 cm of water in the hood for two hours in the morning and two hours in the afternoon, and in severe cases, two hours in the evening in addition In the absence of trained technical supervision the Meter mask[7] may be employed to give helium-oxygen mixtures for one half to one hour at a time for a total period of four or six hours a day Under these circumstances an 80 per cent helium 20 per cent oxygen mixture at a flow of 4 to 6 liters per minute is generally adequate to keep the collecting bag more than one half full One liter of oxygen per minute may be added through a Y tube to the helium-oxygen mixture The inspiratory disk in the Meter mask is generally removed in cases of asthma when the helium-oxygen mixture is used Wiekner[8] made a valuable suggestion of nebulizing epinephrine during the inhalation of helium-oxygen mixtures. The gas is passed through the nebulizer, which contains 1 1,000 epinephrine Two to 4 cc of 1 500 epinephrine may be continuously inhaled with the helium oxygen atmosphere

The employment of helium with oxygen is part of the regimen referred to in which aminophylline is also used together with potassium iodide and sedation [4,9–11] Aminophylline is employed by rectal administration with the syringe-catheter method in dosages of 7 to 10 grains on arising and on retiring, or when necessary for acute attacks [12] In severe cases three rectal instillations of aminophylline in a day may be used

Although there is danger in excessive use of morphine, as reported by Lamson *et al* [13] Vaughan and Graham,[14] and Harkavy,[15] the prudent and intelligent use of morphine derivatives is at times of great value in the treatment of intractable asthma and status asthmaticus The fact that these drugs may be given in an unwise manner should not condemn their employment by physicians who understand the hazards as well as the significance of central nervous-system relaxation In over 200 patients dilaudid has been used to facilitate progressive bronchial relaxation without habit formation or untoward results In some cases a small hypodermic dose such as $^1/_{64}$ of a grain, three to four times a day for a period of four days has been used, in others, $^1/_{32}$ of a grain may be administered at night and in the morning, if necessary, for three or four days If relief of asthma is not obtained by a single injection of $^1/_{32}$ of a grain of dilaudid, the drug *should not be repeated* until an interval of twelve hours has elapsed, unless a dosage of $^1/_{64}$

* KY Jelly is the safest lubricant for the catheter although it dries quickly Vaseline may be blown in the air stream and produce irritative changes, since it is not absorbed by the lungs.

of a grain has been employed originally In some patients it is desirable to give 1/64 of a grain of dilaudid in the evening and repeat 1/64 of a grain in one or two hours This drug has been given orally and rectally in 1/20-grain doses

During the past year approximately 100 patients with intractable asthma have been treated with demerol instead of dilaudid as an aid to the program of bronchial relaxation The value of demerol is, first, its almost complete freedom from the danger of physical addiction, and second, the fact that it is not a depressant to respiration The dosage of demerol by hypodermic administration is 100 mg but in some instances this provokes nausea and vomiting It has, therefore, been found an advantage to divide the dose in two parts and, as in the administration of dilaudid, give one half the dose and repeat the second 50-mg dose one or two hours later The development of nausea, as in the case of aminophylline, is much less likely to take place if the patient does not move for one hour and preferably is in a reclining position Demerol is given under these circumstances twice a day in a period of four to five days in which the program of bronchial relaxation is carried out In addition, potassium iodide, 1 cc three times a day, is administered Phenobarbital has seemed to us the sedative least likely to create irrational states and is given by mouth in dosages of 0 1 to 0 2 Gm or by hypodermic in the form of sodium luminal

The termination of the helium-oxygen administration is generally on the fifth day, when it is expected that a substantial improvement has taken place If the patient is not obviously getting better at this time, helium-oxygen therapy is abandoned and additional measures employed, such as rectal or inhalational administration of ether, fever therapy, or other procedures

Positive Pressure, with Oxygen or Helium-oxygen Mixtures

The application of positive pressure in inhalational therapy has the purpose of gently forcing an oxygen or helium-oxygen atmosphere into the lungs of a patient who has either obstructive dyspnea or pulmonary edema [16–18] In addition, positive pressure tends to diminish constriction of the bronchial passageway during expiration [19] Positive pressure has been administered by hood and also by a mask which provides pressure during both inspiration and expiration [20 21] It should be pointed out that the mask which was designed to give positive pressure during expiration was suggested for the treatment of pulmonary edema [22 23] Short periods of breathing against positive pressure may be useful in increasing intra-abdominal pressure, raising the diaphragm, and increasing expiratory emptying of the lung This procedure is especially valuable in pulmonary emphysema, three to five minutes breathing against 4 cm. water pressure three to five times daily may be employed As a result of investigations during the war, the demand regulator with provision for positive pressure will make possible the inhalation of oxygen under intermittent positive pressure, which may be of special value in overcoming obstructive dyspnea *

Filtered Air

The use of filtered air is at times of crucial value when other measures fail completely In cases of intractable asthma due to pollen the employment of a room in which dust and pollen are removed may terminate a state of persisting bronchial spasm in a few hours In other cases, however, the results of chronic respiratory obstruction, bronchial mucous-membrane edema, and functional pulmonary emphysema may require two to three days for relief In one case of this kind a state of chronic asthma had persisted for two months, during which time the patient developed a low-grade bronchopulmonary infection that was treated finally by inhalation of penicillin The most comfortable and effective method is the construction of an air-conditioned room in which the filtering apparatus is in an adjoining chamber [24 25] When filtered air is administered at home, various types of commercial window filters are available, but they have often had the disadvantage of supplying an insufficient amount of outside air to provide an atmosphere hygienic in terms of temperature, humidity, and air motion A combination air-conditioner and filter would be more suitable for the periods in which filtered air is most apt to be required, namely, in the summer, if efficient filters were also provided In the early Spring window filters without air-conditioning cabinets

* A practical and at times valuable procedure for increasing intra-abdominal pressure and thus raising the diaphragm is to manually compress the abdomen below the lower ribs during the latter half of the patient's expiration By pressing the hands inward and upward on the patient's abdomen just before the conclusion of expiration, the leaves of the diaphragm are raised and the pressure within the abdomen is elevated This results in forcing from the lungs a good deal of air that is trapped within the alveoli. The procedure is especially valuable not only in patients with organic pulmonary emphysema, but in patients with chronic bronchial obstruction due to asthma in whom an over-distended condition of the lungs is frequently present. In 15 patients in whom manual compression of the abdomen was performed for 3 minutes graphic records of the vital capacity indicated a rise of from 200 to 1000 cc In some instances there was quite marked subjective as well as objective improvement in breathing This exercise may be performed by the patient after brief training. It is in some cases of considerable help In the majority of cases of asthma with persistent obstruction, trapping of air will take place again with recurrence of pulmonary distention. The procedure, however is of considerable importance not only as an exercise, but also as an emergency measure in individuals who may not respond to bronchial relaxation because of acute, severe, although functional, pulmonary over-distention.

may be more comfortably employed In the treatment of a patient in whom inhalant pollen asthma is considered to be present, the room should be cleaned for a period of three to four hours before the patient enters it In some instances residence for four to five days in the filtered-air room, with continuous operation of the motor-blower unit, is required, following which the patient may be able to be in the outer atmosphere for several hours during the day without recurrence of severe asthma.*

Nasal filters have been employed with variable success The degree of cooperation required is considerable and a moderate amount of time must be spent in training patients to use them correctly In the first place, nasal congestion may interfere with the patient's breathing through the nose. In that case, drops of a vasoconstricting solution may be at first employed, but the effort should be made to abandon the use of solutions which cause vasoconstriction of the mucous membrane because of the secondary vasodilatation that often takes place The filtering medium of cotton or wool is best used plain and not after wetting with the solutions that generally come with the nasal filter The patient must learn to inhale through his nose and exhale through either the mouth or the nose. In one case in which sensitivity to horse dander was present, the skillful use of the nasal filter enabled the patient to stay in Bermuda for a period of six months.

During the winter the use of a filtered-air room is only very infrequently of special advantage The patient with asthma due to inhalation of dust may at times develop intractable bronchial spasm by exposure to dust in trains or cars, but most frequently, in our experience, it is due to the circulation of dust accomplished by boxed-in radiators when the cold weather sets in An investigation of boxed in radiators which we made revealed that many of them had not been cleaned for two to four years, and others not since the date of installation In a patient whom we treated a year ago in the filtered-air room, complete freedom from all symptoms of asthma took place during a period of ten days After returning home he was well until the steam heat was turned on one week later During the following twenty-four hours he developed increasingly severe asthma and in four days returned to the hospital in status asthma, he was again put into the filtered-air room and became free from symptoms. When the patient's wife was directed to inspect the boxed-in radiator, she found that $^2/_8$ inch of dust was deposited over the radiator This was thoroughly cleaned before the patient returned home and except for a mild amount of wheezing three weeks later, the patient was free from asthma for almost one year He spent three months of this time in Florida Open radiators are apt to be cleaned, since the dust is visible, but boxed-in radiators, which are considered to be more esthetic to the eye, have the menace of accumulating house dust, since they are often extremely difficult to open by removing the top and sides Hot-air heating may also circulate dust through pipes that are difficult to clean

During the past fifteen years in which our filtered-air room has been in operation the value of it has been proved from time to time in the circumstances that have just been reviewed, but in many cases of status asthmaticus due to dust sensitivity no dramatic or significant improvement has taken place Ultimately, the treatment of inhalant allergy is either removal from the source of the allergen, such as in cases of horse dander, feathers, and the hairs, or in the case of dust and pollens, desensitization Much smaller desensitizing dosage than usually recommended seems better for patients with severe asthma. In addition, it would seem that desensitization therapy, when successful, should not be stopped but continued at monthly intervals, since cases have been observed in which recurrence of progressively severe asthma took place one, two, and three years after allergically directed therapy was discontinued The aim of treatment would appear to be the maintenance of a monthly injection for an indefinite period of time. The cooperation of the patient is at times lost by both too frequent and too large injections.

Inhalation of Nebulized Solutions of Bronchodilator and Bronchovasoconstrictor Solutions

Inhalation of nebulized solutions of epinephrine and neosynephrine have certain advantages as well as disadvantages. In the majority of cases which are under moderately good control by effective aminophylline dosage, the inhalation of epinephrine with a nebulizer that produces particles the majority of which are less than 1 μ in size is of considerable convenience *

Inhalation of 1 per cent neosynephrine was not recommended as an efficient bronchodilator, but for its bronchovasoconstricting properties This substance has its chief value in the treatment of patients whose predominating disease is that of emphysema rather than bronchial asthma.[1,2] The advantage of its use is that refractoriness rarely develops to this drug In patients with status asthmaticus in whom congestion in the

* The very efficient Precipitron filter made by Westinghouse may be available soon as a window filter This seems to the author far superior to other types of air filters.

* The nebulizer made by the Vaponefrin Company Upper Darby Pennsylvania, satisfies this requirement.

tracheobronchial passageway is present, inhalation of 1 cc of 1 per cent neosynephrine by nebulizing it with an oxygen stream of 5 to 7 liters per minute may be employed three or four times a day in conjunction with the inhalation of 1 per cent epinephrine either by continuous nebulization with oxygen, such as 0 5 to 1 0 cc three to five times a day [26] It must be borne in mind that when the patient is refractory to hypodermic injection of epinephrine the inhalation of the nebulized sprays, either of epinephrine or neosynephrine, may be of little or no value The convenience of the hand-bulb nebulization of epinephrine for attacks of mild or moderate asthma is real and has a proper place in the treatment of many patients with severe, chronic bronchial asthma [27]

In patients in whom pulmonary emphysema predominates the clinical picture, with mild or moderately severe bronchial spasm also present, inhalation of a 50 per cent mixture of 1 per cent epinephrine and 1 per cent neosynephrine, nebulized by the hand bulb in the morning, late afternoon, and in the evening, is apt to add to their ability to walk without dyspnea A caution against the overfrequent use of nebulized epinephrine should be emphasized When the state of refractoriness to epinephrine begins, the patient generally uses the inhalation of the spray more and more often until large quantities of the solutions are employed with less and less relief At this point the use of epinephrine must be abandoned and other measures, especially aminophylline in effective dosages, adopted A program of progressive bronchial relaxation referred to under the section on administration of helium-oxygen mixtures, with aminophylline, dilaudid, demerol, and potassium iodide,[5,6,8–10] or other procedures may be used

When a remission has been obtained in the intractable asthmatic state the inhalation of epinephrine may be resorted to again

Inhalation of Nebulized Solutions of Penicillin and Sulfonamides

Inhalation of penicillin for the treatment of bronchial asthma has been under special investigation in our clinic during the past year and a half The physiologic basis for this procedure rather than the intramuscular injection of penicillin is that (1) a high local concentration may be obtained in cases in which infection exists in the bronchial wall and in the lung parenchyma, (2) penicillin is active locally in high dilutions, and (3) penicillin aerosol has been demonstrated to penetrate to the bronchi and alveoli [28,29] The best results have been obtained in cases of bronchial asthma in which an acute infection was present, due to the pneumococcus or hemolytic streptococcus organism. In a small percentage of cases with chronic bronchial infection an unquestionable remission has been obtained by the inhalation of penicillin nebulized by means of an apparatus which provides rebreathing of the nebula [29,32] The employment of penicillin in cases of intrinsic asthma, in which bacterial infection is assumed to be the causative agent in the disease, is disappointing in a considerable number of patients This may be in part due to failure in technic, in part to the relative insensitivity to penicillin of organisms such as the streptococcus viridans, which is often found in the culture of the sputum, and perhaps to a great extent to the fact that recurrence of infection in the bronchial wall is common In many cases of bronchial asthma the development of an allergic reaction to penicillin has interrupted therapy at a time when apparently favorable results were being obtained Although urticaria is not apt to take place in more than 3 to 5 per cent of nonallergic patients during the administration of penicillin, the development of this complication is far more frequent in patients with bronchial asthma. The administration of larger doses by intramuscular injection has appeared to make this complication more likely For that reason a combination of orally administered penicillin[30] as an adjunct to the inhalation of penicillin was adopted for a time, but the present plan is to use inhalation of penicillin nebulin in moderate doses for a longer period than formerly employed, one to three months rather than one to two weeks A better response to the treatment of bronchiectasis by this program has prompted us to employ long-continued inhalational therapy rather than intensive short courses

Although Hampton[31] noted little benefit with his method of inhalation of penicillin, very favorable results were reported by Vermilye,[32] who employed our technic of administration Definite clinical improvement after intramuscular injection of penicillin in cases of intractable asthma has been observed by Schonwald and Deppe[33] and Leopold and Cooke [34] The good response to penicillin aerosol in cases of bronchiectasis[29,35,36] leads to a justifiable expectation that some cases of infectious asthma may be aided by control or elimination of bronchial infection

A method of introducing penicillin aerosol into the sinuses by intermittent negative pressure[37] has been found of value in the treatment of infectious asthma by eliminating or reducing the infection in cases of chronic sinusitis

The indications for the use of penicillin in bronchial asthma at present appear to be, first, exclusion of an extrinsic factor as cause of the disease, second, demonstration of an organism sensitive to penicillin, and third, the oppor-

tunity to use the drug in a satisfactory prolonged program The demonstration that penicillin, when given for one or two days in an upper respiratory infection, is generally followed by recurrence of a more severe form of the respiratory infection five or six days afterward introduces a note of caution into the use of penicillin for short periods. In four patients who were given a single injection of penicillin for various types of bronchopulmonary infection a chill with a fever of 103 to 104 F was observed This phenomenon did not take place in 100 patients who were continuously treated with the drug Recurrence of symptoms of infection may take place when penicillin is stopped, even after a course of ten days to two weeks. The management of chronic bronchial infection obviously requires further study It may be that maintenance doses of penicillin by either inhalation or mouth should be prescribed for a longer period A probably desirable course may be to institute injections of a stock vaccine during the inhalation of penicillin to maintain an immunity that may be lost during the time of penicillin administration Two patients have been encountered who developed pneumonia two weeks after cessation of treatment, in one case after inhalation and in the other case after intramuscular injection of penicillin

The occurrence of sore throat and laryngitis after inhalation of epinephrine with nebulizers that produce a coarse spray was observed by us years ago Although this does not take place with nebulizers that produce an aerosol of fine-particle size, the fact that it was a complication of nebulization therapy presented a caution in the administration of penicillin by inhalation In some patients treated by inhalation of penicillin aerosol a sore throat and sore tongue, as well as (rarely) substernal soreness occurred when concentrations of 50,000 units per cc. were employed Rinsing the mouth and gargling the throat with tap water after each inhalation tends to prevent this complication, but concentrations of 40,000 units per cc may be preferable For this reason a dosage of 150,000 to 200,000 units per day may be given in a concentration of 40,000 units per cc dissolved in normal saline

The apparatus includes a mouthpiece or a mask with a nebulizer provided with a rebreathing bag, a rubber tube that has a Y-tube inserted in it, so that nebulization may take place during the inspiratory cycle, and a calibrated regulator on an oxygen cylinder [21,39] A common procedure is to administer 1 cc of a solution of 20,000 units per cc of penicillin in normal saline five times a day The calcium salt is less apt to be irritating than sodium penicillin When patients manifest an allergic reaction to penicillin the treatment should be stopped immediately and ephedrine or adrenalin used until the symptoms disappear

Other drugs that have been used in the treatment of bronchopulmonary infection include sulfadiazine, 2 5 per cent, in ethanolamine solution, neosynephrine-sulfathiazolate, promin, and sodium sulfathiazole in 1 to 5 per cent solution The inhalation of sodium sulfathiazole is perhaps the best of these, since it is a readily soluble drug and has not been found to be irritating [21-41] If a 1 per cent solution is used it is made up in normal saline, if a 5 per cent solution is employed it is dissolved in distilled or tap water A daily dosage of 0 1 to 0 5 Gm. during the twenty-four hours is being investigated and in the absence of allergic skin reaction this drug may be an effective therapeutic agent in controlling chronic bronchopulmonary infection It must be borne in mind that an exfoliative dermatitis may take place from sulfathiazole and treatment should be interrupted promptly under these circumstances However, a high local concentration of the drug may be obtained with a minimal or no demonstrable blood level The rebreathing bag should not be used with sodium sulfathiazole, since the exhaled carbon dioxide may precipitate the drug by lowering the alkalinity of the solution

Anesthesia with Ether

When patients become refractory to epinephrine, the bronchial relaxation programs referred to above may result in a long-maintained remission. However, in some cases more or less complete refractoriness to aminophylline develops and intractable asthma of a severe type sets in. Aminophylline may then be stopped and anesthetic doses of ether employed to obtain a remission Ether and oil may be given rectally for the same purpose [42] Oxygen inhalation during and after the anesthesia is often desirable At times, deep anesthesia by a skillful anesthetist will result in a remission, followed by a response to the usual measures

If symptoms still persist, an infusion containing typhoid vaccine may be tried, according to the method of Solomon and Somkin,[43] or fever therapy by a box may be used

Summary

The contemporary use of inhalation treatment in bronchial asthma includes the following procedures

1 Administration of oxygen
2 Inhalation of helium-oxygen mixtures
3 Positive pressure
4 Filtered air
5 Nebulization of bronchodilator and bronchovasoconstrictor substances
6 Inhalation of penicillin and the sulfonamide aerosols

7 Anesthesia with ether

The physiologic basis of these therapeutic programs and the clinical technics employed are briefly described

THE QUEER DOCTOR

"He's got a lot of queer ideas—never amount to much as a surgeon." That was the 1865 opinion of a young Glasgow University professor of surgery, *Joseph Lister, born April 5, 1827* Professor Lister did have a great many impatient thoughts—about compound fractures, for one thing Why didn't a compound fracture heal the way a simple fracture did? Finding the right answer seemed to be Lister's obsession. He talked his questions to his colleagues, to his father-in-law, the then-noted Dr James Syme, and wrote them to his father, an English optician. (Incidentally, it was the elder Lister who discovered the fundamental principle of the modern microscope) Finally, it was a Glasgow chemist who gave Lister the first hint of solving the problem of healing This man felt that Lister was thinking along the same lines as "a crazy Frenchman—a chap named Pasteur," and he gave Lister copies of Pasteur's papers

Next, a visiting medico told Lister about cleaning up a sewerage system with the aid of carbolic acid. Lister started to use carbolic aid on his compound fractures Also, the young surgeon was asking for clean boiled bandages—an astounding request in the days when dressings were made from old linen sent to the hospital by the town's housewives—linen not even washed before applied to wounds

Even more of Lister's "queer" ideas began to crop up He washed his hands before an operation instead of afterward. He wore a clean apron while operating instead of the soiled black frock coat which was then the doctor's uniform He invented a way to sterilize ligatures instead of simply sticking his needle and thread in his lapel until next needed And these ideas had wondrous results—gangrene virtually disappeared from Lister's hospital.

In the early 1860's, gangrene was so frightfully prevalent in infirmaries that debaters argued seriously whether to burn and close every hospital in England In 1867, Joseph Lister read a paper "On the Antiseptic Principle of the Practice of Surgery" to the British Medical Association He was still ahead of his time Only a few of the group believed, and it was not until 1890 that hospital cleanliness found general acceptance.

Joseph Lister was called First Baron Lister of Lyme Regis by a grateful nation, and founder of antiseptic surgery by a grateful world

A REPORT ON POLIOMYELITIS CASES FROM THE HOSPITAL FOR SPECIAL SURGERY OF NEW YORK CITY

K. G. Hansson, M.D., and L. Ramsay Straub, M.D., New York City

THIS is a report of 158 unselected poliomyelitis patients referred to the Hospital for Special Surgery, New York City, during the last four months in 1944. Much unfair advantage has been taken of statistics in poliomyelitis epidemics, especially in reference to one treatment being superior to another. So much publicity has been given to poliomyelitis in the press, on the radio, and on the screen that the public is up to date on every development and thus the medical profession has been obliged to deal with public opinion in poliomyelitis. Public interest in a disease makes it easy to raise public funds. With large public funds available the foundation is laid for better control and possible eradication of the disease.

Many research institutions, specialists, and hospitals are devoted to the prevention, cure, and management of poliomyelitis. Too much emphasis has been placed on the late manifestations of the viral invasion when damage to the cells has already occurred. We have had too many arguments on the effectiveness of one treatment over another. These arguments will disappear when in the future we will have a virucide available as specific treatment for poliomyelitis or possibly a vaccine as a preventive measure. Lacking both for the present, we must deal with the aftereffects of poliomyelitis, be they muscle spasm, paralysis, or deformity. Let us emphasize the fact that acute poliomyelitis should be considered an invasion of the spinal cord by a virus, as pneumonia is an invasion of the lungs by pneumococci. Complete restoration is the rule.

In pneumonia, however, a few patients develop complications in the course of the disease, just as in poliomyelitis a few patients develop a permanent paralysis. This group forms a small percentage of all persons infected, as it is our belief that in most cases the disease is mild, and is frequently undetected or undiagnosed. Assuming this, we should not credit the 60 to 80 per cent of cures to any specific treatment, but be frank and admit that they and probably a great many more unseen cases, "cured" themselves spontaneously. The remainder of the patients are not as fortunate and show some residual paralysis or weakness.

It is the latter group with which this report is concerned. It is not an attempt to claim advantages for accomplished cures. It is intended merely as a report on the management of the aftereffects in poliomyelitis.

Source of Patients

The Board of Health of New York City has decreed that any general hospital can receive poliomyelitis patients. Quarantine has been relaxed, but poliomyelitis patients are still isolated two weeks and the stools of patients treated similarly to stools of typhoid patients.

Most of our patients were received from Willard Parker Hospital, where they had been expertly diagnosed, carefully watched for complications, and given some form of treatment. Twenty-one other hospitals in Greater New York referred one or more patients. Forty-one patients were treated as inpatients. One hundred and seventeen received treatment from the outpatient department.

Diagnosis

Pathologic conditions simulating poliomyelitis complicate diagnosis. Poliomyelitis being a virus disease, the onset is similar to other virus infections, outstanding among which are septic throat infections. This fact caused much confusion in the early diagnosis in this epidemic, as in others that we have observed. At least three definite poliomyelitis cases in this series were treated at first with sulfadiazine and one with penicillin.

Two cases were diagnosed as appendicitis, had appendectomies, and developed paralysis later. One case was diagnosed as poliomyelitis and was found to be mumps, one was treated for poliomyelitis and further developments revealed that the patient had rheumatic fever. Another patient had been treated for poliomyelitis and, because of persistently rigid lumbar spine, was x-rayed and found to have a cord tumor. She was operated upon and a dermoid cyst was removed.

The muscle spasm that we have observed so frequently during the last years in our poliomyelitis patients makes one suspect that we sometimes deal with Guillain-Barré syndrome. This form of neuroradiculitis was first described in 1916. The onset is very similar to poliomyelitis but paralysis is more commonly bilateral, both motor and sensory nerves are involved, and the facial nerve is usually paralyzed. Guillain-Barré syndrome is characterized by a hyperalbuminosis in the spinal fluid and a normal cell count. It is usually of six weeks' duration with complete recovery. We had one definite case of this syndrome and several suspicious cases sent to us as poliomyelitis.

Spinal taps were done on 81 per cent of our patients at twenty-two different hospitals Only those showing an increased leukocyte count and an elevation in protein content, as shown directly or by the Pandy test, were considered positive On this basis, the findings were positive in 77 per cent of those tested

Muscle Spasm

Muscle spasm has been present in nearly all our cases In some it has been slight and disappeared early, in others it has persisted ten months In many cases it has been the most persistent symptom The most commonly involved muscle groups have been the posterior neck muscles, the erector spinae, and the hamstrings Most of the spastic muscles will respond to hot packs, but when this has failed we have tried plaster splintage and prostigmine, orally, intramuscularly, and by iontophoresis We have tried bed rest and mobilization in the therapeutic pool We have found no specific remedy for muscle spasm. However, getting a patient out of bed into a wheelchair, on his feet, even when braces and a walker must be used, seems to have better effect than long-continued bed rest In this series 76 per cent of the 158 cases reviewed had muscle spasm at the onset of disease Twenty-one of the patients still had varying degrees of spasm eight months after the acute illness

Muscle Paralysis

Of the total series, 35 per cent showed no paralysis at any time Distribution of the paralysis was found to be lower extremity, 40 per cent, upper extremity, 20 per cent, head and neck, 18 per cent, trunk, 13 per cent, extensive paralysis involving the whole body, 9 per cent In the lower extremity, the tibialis anticus, the gastrocnemius, and quadriceps are most frequently paralyzed, while in the upper extremity the deltoid is the most commonly isolated involvement, with the opponens pollicis a close second

Most of the cases recorded as "head and neck" in the table were bulbar in type of involvement There was only one patient with true extensive facial weakness Trunk involvement is often difficult to detect Abdominal weakness was seen more frequently than paralysis of the back musculature The involvement of the latter, however, was extreme in some cases

Treatment

Seventy-seven per cent of the patients in this series were treated by hot fomentations or similar methods using heat This includes treatments given in many other hospitals, clinics, and in the homes The quality, frequency, and duration of such therapy varied in the extreme, thus precluding any honest statistical evaluation Twelve per cent of the patients had only muscle reeducation and similar therapies, 11 per cent of the patients had no treatment of any kind This latter group consisted of mild cases that made complete recovery or had no paralysis at any time Forty-three per cent had some residual weakness or paralysis after six months to a year of treatment In most cases this paralysis was of little clinical importance, as it was so mild as not to effect function

For real clinical evaluation we have made four arbitrary groupings in relation to general function and including muscle spasm as well as paralysis

Group 1—11 per cent show no function or improvement, and require support, prognosis is poor

Group 2—11 per cent show slight improvement, and residual weakness which may require support, prognosis is fair

Group 3—19 per cent show definite improvement, require no support, prognosis is good

Group 4—59 per cent return to normal, require no support

Deformity

Deformities were not common, as most of these patients had been closely observed and corrective steps taken early Equinus deformities were present in 3 patients in a degree severe enough to require correction with wedging casts and application of braces Response in all was satisfactory Contracture of adductors of the shoulder were commonly seen in respirator cases These disappeared with treatment One patient retained a persistent adductor contracture of the shoulder at the end of the present period of observation He had not been in a respirator, nor had he had any close observation Scoliosis was noted in seven ambulatory patients In six it was very mild and was of only academic interest

Complications

It has been estimated that 400 to 500 poliomyelitis patients are treated in respirators yearly in the United States We know that patients with paralysis of the diaphragm and intercostal muscles are often saved by the respirator What happens to these patients afterwards? They form an interesting group because if the diaphragm and intercostals are paralyzed, there is also extensive paralysis often involving both lower and upper extremities We had 8 patients who spent from three days to four weeks in respirators We made three definite observations on these cases First, the paralysis was very extensive both as to degree and extent Second,

the debility and emaciation of these patients was very striking, and return to normal nutrition was a slow process, requiring from six to ten months. Third, the persistent adductor contraction in the shoulders prolongs convalescence. After our experience with frozen shoulders in respirator cases it seems only rational to insist on either a new construction of respirator, such as the Curass type, or special attention to shoulders in the respirator, such as change of arm position or occasional abduction exercises out of the respirator

Urinary retention is rather common In adults it often becomes a most annoying symptom In one of our patients a woman of 35 it lasted for two weeks. In a man of 30, it persisted for four weeks though treated with sulfadiazine, prostigmine and tidal drainage

One of our patients, aged 27, was taken sick with poliomyelitis on August 16, 1944, and notwithstanding the paralysis of the upper and lower extremities and abdominal muscles, she delivered a normal full term baby on August 27, 1944

Lateral curvatures of the spine are not common under our present treatments during the first year of poliomyelitis We have seen a bad triple curve of the functional type in a patient who had had no treatment She presented a left lumbar, right dorsal, and left cervical curve, and the spinal muscles felt lumpy She had prone packs, reeducation exercises, and convex frame at night, and was discharged in May wearing a reinforced corset. She was much improved and is continuing her exercises in the Outpatient Department Two patients had complete paralysis of the right rhomboid muscles Both developed a dorsal curve while in bed In one, the convexity was to the left In the other, the convexity was to the right This would indicate that the muscular pull or lack of pull of the larger muscles of the back is not solely responsible for the curve It is too early to prognosticate about future scoliotic development, but there are indications that close observation of all patients with abdominal muscle imbalance would be desirable.

If a recumbent patient is suddenly put on his feet, he often complains of pain in the longitudinal arch. This can be prevented by strapping the feet with adhesive tape in mild inversion and the application of inner heel wedges and scaphoid pads We have noticed ingrowing toenails frequently in patients who have long periods of bed rest, presumably from the pressure of the bed clothes on the toes The use of footboards removes this pressure and has proved effective in our present bed patients When the bed patient puts on shoes and begins weight bearing he may develop ingrowing toenails We had 5 cases which occurred in this manner which were treated successfully with wet dressings and packing We found that proper attention to shoes and shortened periods of weight bearing were adequate preventative measures

Management of Inpatients

We had 41 inpatients treated on two wards set aside for this purpose The doors to the wards and rooms were kept closed, visitors were allowed to see children once every two weeks. All visitors were masked and gowned The rooms were exposed to ultraviolet radiation Whether the management was responsible or not is not known, but we had no serious infections or colds over a period of ten months Teams of three nurses' aides were organized for packing The muscle re-education was done by two physiotherapists Daily visits were made by the house staff, and weekly rounds by the orthopedic surgeon, the director of physical medicine, the house staff, nurses, and physiotherapists The consulting staff was freely used whenever necessary The pediatrician made regular visits, the neurologist checked all doubtful cases, the internist helped with the nutrition problems, the nose and throat department was often consulted, also the genitourinary surgeon, the general surgeons, and the orthopedic staff With such a staff available, the best care of the patients is assured It is our belief that the extensive and constant nursing care and attention of the physiotherapists is probably responsible for the maximum result obtained in each individual patient.

The feeding of the patients has received special care and presents many problems We usually deal with extremely emaciated patients, many of them children and young adults who are still growing and in addition must build up muscle tissue A high calorie diet is usually supplied with special attention to the normal protein metabolism which is maintained by addition of amino acids to the diet

Outpatient Department

A properly organized outpatient clinic is essential to the proper management of patients suffering from subacute and chronic poliomyelitis It is here that general over-all supervision of, and prescription for treatment is given This clinic should be staffed by an attending orthopedic surgeon, nurse, social-service worker, and a secretary This clinic should work at all times in close cooperation with the Department of Physical Medicine, and should also have readily available consultation services. Such a clinic provides an ideal opportunity for orthopedic training of both doctors and nurses. The type of

Spinal taps were done on 81 per cent of our patients at twenty-two different hospitals Only those showing an increased leukocyte count and an elevation in protein content, as shown directly or by the Pandy test, were considered positive On this basis, the findings were positive in 77 per cent of those tested

Muscle Spasm

Muscle spasm has been present in nearly all our cases In some it has been slight and disappeared early, in others it has persisted ten months In many cases it has been the most persistent symptom The most commonly involved muscle groups have been the posterior neck muscles, the erector spinae, and the hamstrings Most of the spastic muscles will respond to hot packs, but when this has failed we have tried plaster splintage and prostigmine, orally, intramuscularly, and by iontophoresis We have tried bed rest and mobilization in the therapeutic pool We have found no specific remedy for muscle spasm However, getting a patient out of bed into a wheelchair, on his feet, even when braces and a walker must be used, seems to have better effect than long-continued bed rest In this series 76 per cent of the 158 cases reviewed had muscle spasm at the onset of disease Twenty-one of the patients still had varying degrees of spasm eight months after the acute illness

Complications

It has been estimated that 400 to 500 poliomyelitis patients are treated in respirators yearly in the United States We know that patients with paralysis of the diaphragm and intercostal muscles are often saved by the respirator What happens to these patients afterwards? They form an interesting group because if the diaphragm and intercostals are paralyzed, there is also extensive paralysis often involving both lower and upper extremities We had 8 patients who spent from three days to four weeks in respirators We made three definite observations on these cases First, the paralysis was very extensive both as to degree and extent Second,

moval of gravity it can function 1–T—Trace, where there is slight contraction of the muscle 0–0—Zero, no evidence of contractility of muscle fibers The National Foundation advocates the use of the ciphers instead of the letters in the records as less subject to error We have had the same technician do all muscle tests and they have been repeated about once a month during the first six months or whenever indicated

Muscle Re-education

We believe that muscle re-education is the most important part in the treatment of acute poliomyelitis patients Marked improvement is readily noted when an untreated patient is hospitalized and given daily exercises Patients treated at home with packs but without proper muscle re-education develop substitution movements which favor the stronger muscles and lead to deformities

We use three stages of muscle re-education, given by specially trained physical therapy technicians. They are carried out daily on the inpatients and every other day on the outpatients

1 *Passive Movements*—The first stage of muscle re-education is carried out with the patient in bed and consists of passive movement through normal range of all points within the limits of pain or spasm This is begun in the first few days and performed at least once daily

2 *Active or Assistive Movements*—The second stage of muscle re-education is carried out in a special exercise room where the patient is free from interruption It is composed of exercises based on four points (1) Brain impulse—maximum mental effort is essential and disturbing influences must be removed (2) Nerve impulse—the path of stimulation from brain to muscle is explained to the patient By repeated efforts it is possible to re-educate the neuromuscular impulse pattern and prevent substitute movements (3) Leverage—exercises are based on normal kinesiology of the joints and a thorough knowledge of the physiology of motion (4) Gravity—when the musculature is weak, it is encouraging to the patient to work with gravity and, by change of position as strength improves, to attempt to overcome the pull of gravity Whenever intelligence allows we teach the patient anatomy with emphasis on the origin, insertion, and action of the muscles involved They take great interest in their medical knowledge

3 *Applied Exercises*—As the inpatients progress with their muscle re-education, functional exercises are added The patient may be allowed to sit up and later stand up Then steps are attempted in a walker and later with crutches Some patients with weak shoulder-girdle muscles and good leg support do best with Canadian crutches. Patients with weak leg and hip muscles do better with crutches that come to the axilla Careful instructions in crutch walking are given Functional exercises may take the form of underwater treatment. For badly paralyzed patients who cannot sit up after six months, the therapeutic pool is essential They learn to stand and walk in the water and soon regain their morale. Occupational therapy is of great importance as functional applied exercises It is most important in upper-extremity paralysis and especially in hands with opponens weakness The younger children are usually given one hour in the afternoon for play and relaxation

Braces

One of the most difficult problems that confronts a poliomyelitis patient is the prospect of wearing braces One can hardly blame him for this because of their ugly appearance and clumsy construction Everything in medicine has progressed during the past hundred years except orthopedic braces They are still constructed of the same material and on about the same principle as in the last century They are unsightly and cumbersome, and often harmful because of pressure from the crossbars We have been experimenting with new principles and new material Encouraged by the excellent prostheses developed during the war for our amputees, we have applied some of these principles in new braces for poliomyelitis patients A well-fitting shell is constructed on a plaster mold of the patient's extremity This conforms to the individual shape with suitable joints at the knee and ankle This kind of support equalizes the pressure on the whole extremity It is much more comfortable than the old type of brace made of two vertical steel bars and crossbars at the thigh and calf This new support has the additional advantage of being constructed so as to make up for any deficiency in the size of the extremities Similar support can be made for the upper extremity When the biceps is paralyzed, the arm is useless even with a normal hand. By using a strap from a forearm shell, running back of the neck to the opposite shoulder, flexion in the elbow can be performed as in prosthetic appliances. We have been using celluloid for these braces but have experimented with various plastics. Bakelite, celastic, and vinylite hold some promise and with the enormous advance in plastics it seems rational to believe that we may soon have a strong, light, resistant, and flesh-colored plastic for this new type of brace The progress of artificial limbs offers a challenge which we must meet in order that we may be able to give the patient with a paralyzed limb at least the same chance we now give to a patient with an amputation stump

Future Needs

At the present time, in our community there are two outstanding needs for polio patients One is a poliomyelitis hospital, devoted entirely to the aftertreatment of infantile paralysis At present the majority of the patients, after the quarantine, are cared for by our orthopedic hospitals This is far from adequate and many patients have difficulties in getting accommodations This is especially true of the patients who need hospitalization They often require a long stay in the hospital, and an active surgical service cannot have its beds occupied for months and sometimes years by the same patient A poliomyelitis hospital requires special equipment, such as respirators, special gymnasium, walking facilities, therapeutic pool, recreation, etc However, such a poliomyelitis hospital needs the intimate control and guidance of an orthopedic service A complete orthopedic and consulting staff is needed. Brace shops are necessary, plaster rooms, facilities for surgery, schooling, occupational therapy, physical therapy, social service, etc Instead of duplicating many of these features a poliomyelitis hospital should be associated with an orthopedic hospital, close by and under the same management Such an institution could see a patient through his whole convalescence, new treatment could be tested, a complete rehabilitation program could be carried out, and vocational training could be offered It should also serve as a teaching hospital for doctors, nurses, and technicians

The second great need that confronts us is a camp for poliomyelitis patients After a patient has spent eight to ten months indoors he needs fresh air, sunshine, and planned recreation At present we have some facilities for sending children to summer homes, but it is mostly for custodian care, and adolescent or adult patients are not accepted The regular summer camps will not admit patients with residual paralysis, although these patients need the benefit of a camp more than anybody else

Late statistics seem to indicate that we are having more and more adolescent and adult patients. Such a camp should be near New York City, preferably by the sea, where water sports and other recreations can be practiced, and under such supervision that treatments can be carried out when necessary Such a camp can operate most of the year and will restore a poliomyelitis patient's general health, which is often neglected With such a triple combination, an active orthopedic hospital associated with a special poliomyelitis hospital or annex that has a country or a seashore branch, New York City could offer its poliomyelitis patients everything in modern therapeutics and be the world center of work in poliomyelitis

Summary

This report is a general survey of 158 patients afflicted with poliomyelitis in 1944, and treated at the Hospital for Special Surgery, New York City

A Results of treatment are as follows Group 1—11 per cent show no functional improvement, require support, prognosis poor Group 2—11 per cent show slight improvement, residual weakness which may require support, prognosis fair Group 3—19 per cent show definite improvement, no support, prognosis good Group 4—59 per cent show return to normal, no support This gives a functional return to normal of 78 per cent

B Complications included respirator contractures, bladder dysfunction, pregnancy, some skeletal deformities, and static foot disorders

C A general survey or management of both in- and outpatients recommends close cooperation between orthopedic, pediatric, neurologic, and medical staff, department of physical medicine, nursing staff, and social-service department

D Suggestion is made of the great need for a poliomyelitis hospital in close association with an active orthopedic hospital, a summer camp for poliomyelitis patients, and the development of a new type of brace

---

COMPENSATION MEDICINE

Under the title *Compensation Medicine*, a new monthly publication has been launched, devoted to "diagnosis, treatment, and rehabilitation of industrial injuries and diseases." The journal is issued under the sponsorship of an editorial council of well-known medical men, and will present in each number several original articles as well as abstracts from the literature dealing with the field of compensation medicine

The managing editor is Barnet S Fox, of 270 Broadway, New York. The new venture should prove of value to those interested in the subject

THE PROGNOSTIC VALUE OF THE SODIUM AMYTAL TEST IN HYPERTENSION MANAGED BY THORACOLUMBAR SYMPATHECTOMY

J WILLIAM HINTON, M D , and JERE W LORD JR , M D , New York City

ONE of the greatest problems in the surgical treatment of hypertensive patients is their proper selection for thoracolumbar sympathectomy A method which will estimate reliably the probable degree of postoperative fall in the blood pressure is most desirable Several tests have been proposed but the one which is most commonly used is the sodium amytal "sleep" test It is safe, simple to perform, and as will be shown below, is of moderate prognostic value. Other tests include the cold pressor, continuous caudal anesthesia, and intravenous pentothal These will be discussed briefly later

The sodium amytal test is ideally performed by having the patient in a single room and the blood-pressure observations made by a trained technician. Three grains (0.2 Gm) of sodium amytal are administered at hourly intervals for three doses, and the blood pressure is taken before the first dose and at thirty-minute intervals thereafter for four to six hours There are many factors which may alter the value of the test, some of which are (1) it may be necessary for the patient to be on the ward with its attendant distractions, (2) poor absorption of the sodium amytal from the gastrointestinal tract with associated low blood levels, (3) variation in individual tolerance to the drug, (4) changing personnel in the performance of the test The majority of the patients studied in this report have been subjected to the sodium amytal test by one highly trained technician Approximately one half of the patients, however, have been in single rooms during the test

The results show that, in general, the greater the fall in the level of the blood pressure during the sodium amytal test the better the postoperative blood-pressure result. We have divided the results of the sodium amytal test into three groups (group 1 indicates a fall of 30 or more points in the diastolic pressure, group 2, 10 to 29 points, group 3, 0 to 9 points (Table 1) The postoperative diastolic blood pressure result is measured by Smithwick's[1] classification i e , group 1 equals 30 or more points, group 2 equals 20 to 29 points, group 3 equals 10 to 19, group 4 0 to 9, and group 5 increased (Table 2)

TABLE 1 —CLASSIFICATION OF RESULTS OF SODIUM AMYTAL TESTS

Group	Diastolic Fall
1	30 or more
2	10 to 29
3	0 to 9

TABLE 2 —SMITHWICK'S CLASSIFICATION OF POSTOPERATIVE BLOOD PRESSURE RESULTS

Group	Diastolic Fall
1	30 or more
2	20 to 29
3	10 to 19
4	0 to 9
5	Increased

Ninety-four sodium amytal tests have been correlated on the above basis with the postoperative blood pressure status, and the results are shown in Table 3 Two conclusions may be drawn from the above results (1) the sodium amytal test is in general, a good index of the probable blood-pressure result following thoracolumbar sympathectomy, (2) in any given case it is without absolute prognostic accuracy In each of the three sodium-amytal test groups at least one of the patients falls into every Smithwick postoperative group

TABLE 3 —CORRELATION OF SODIUM AMYTAL TEST WITH THE POSTOPERATIVE BLOOD PRESSURE RESULT

	Smithwick's Groups					
	Total	1	2	3	4	5
Group 1 Sodium amytal test	41	30	10	4	5	2
Group 2 Sodium amytal test	45	18	6	7	9	5
Group 3 Sodium amytal test	8	1	1	1	4	1

Group 1 Sodium amytal test: 73 per cent (30 out of 41) have good postoperative blood pressure results, i.e. a diastolic fall of 20 or more points.
Group 2 Sodium amytal test: 53 per cent (24 out of 45) have good postoperative blood pressure results i.e. a diastolic fall of 20 or more points.
Group 3. Sodium amytal test. 25 per cent (2 out of 8) have good postoperative blood pressure results, i.e. a diastolic fall of 20 or more points.

We have made use of intravenous sodium pentothal[2] in a few cases preoperatively, determining the blood pressure before, during, and after a brief period (ten minutes) of unconsciousness It was soon clear that the fall during anesthesia was not as great or as consistent as in the sodium amytal test, and hence we discon-

tinued its use This is in agreement with the findings of Page and Corcoran [3] The cold-pressor test is recommended[4] as an identifier of the so-called hyper-reactor group of patients, the ones in whom the nervous mechanism is largely responsible for the hypertension in contrast to the hyporeactors or renal type We have not had sufficient experience with the test to draw any conclusion

Continuous caudal anesthesia[5] has recently been recommended as an accurate preoperative method for the prognostication of the effect of thoracolumbar sympathectomy on the blood pressure of hypertensives In the series cited, 25 patients were subjected to continuous caudal anesthesia and seven of these were operated upon Correlation in the 7 cases was extremely close Our only comment on the method is the viewpoint held by Dr Milton Peterson, professor of anesthesiology at the Post-Graduate Hospital It is his feeling that caudal anesthesia is too irregular in its performance to be of clinical value in the selection of hypertensive patients for sympathectomy

Summary

1 The sodium amytal test is a safe and simple method of measuring the sympathetic tonus of the average hypertensive patient

2 In general, it is broadly indicative of the type of postoperative blood-pressure result which will be obtained following thoracolumbar sympathectomy

3 Specifically, in any single instance the sodium amytal test may be totally inaccurate

INDUSTRIAL DOCTOR PLAYS BIG ROLE IN ACCIDENT PREVENTION

Asserting that more Americans have been killed by accidents on the homefront since Pearl Harbor than have been killed in action, Carl M Peterson, M D, Secretary of the Council on Industrial Health of the American Medical Association, says that the medical profession can play a vital role in accident prevention

Dr Peterson reports in the September issue of *Hygeia*, the health magazine of the American Medical Association, that while the field of industrial health is relatively new, "certain practices have already proved their value beyond a shadow of a doubt"

"For instance," Dr Peterson said, "suitable physical examinations before employment, coupled with periodic checkup examinations, bring about remarkable reductions in industrial accidents, because it's a foregone conclusion that certain physical defects, such as faulty vision, are likely to lead toward accidents

"Everyone can readily understand that a worker who has difficulty in seeing, or whose vision is indistinct, might get hurt But, what's more, he might hurt others! Eye defects often result in improper muscular balance Suppose the operator of one of those great moving cranes used for excavation or heavy lifting were a man whose eyesight failed to judge distances accurately Serious accidents would happen, not only to him but to many others One authority on this subject refers to the condition as visual clumsiness, which in turn produces personal clumsiness, and finally accidents and injuries"

Dr Peterson said that routine eye examinations were not new to many industries, but added "Too often they are limited to simple determination of ability to see The modern standard for judgment should go further and include depth, perception, muscle balance, and color appreciation Eye defects play a much greater role in accidents than is commonly realized"

An examining physician in an industry, Dr Peterson said, keeps watch for many bodily conditions "Any minor difficulty may be the underlying cause for nervousness or absent-mindedness due to pain or loss of sleep," he pointed out "Heart disease and abnormal blood pressure have resulted in accidents or made them more severe than they might otherwise have been And with employers scraping the bottom of the employment barrel during the war, men considered unfit for work in normal times have been eagerly sought It is important that these men be placed in suitable occupations, where they will not put themselves or others in danger"

Touching on long hours and accidents, Dr Peterson said that "as the fatigue curve rises, efficiency and production fall, and accidents increase The rate of accidents rises four times as fast as the rate of output falls Then, too, the general health condition of workers and the community in which they live have a strong bearing on accidents and safety"

PROCTOSCOPY AND BARIUM COLON STUDY IN THE DIAGNOSIS OF RECTAL CONDITIONS

ISAAC SKIR, M D , Brooklyn, New York

(From the Department of Surgery of the Brooklyn Hospital)

IT IS generally agreed that the investigation of symptoms referable to the lower bowel should include a digital examination, proctosigmoidoscopy, and an x ray study of the colon For some reason or other, be it false modesty or fear of pain on the part of the patient, or the ready availability and convenience of the x-ray, it is the *latter* which is commonly used first.

This situation is by no means confined to this country Pringle, an Irish surgeon, writes "Several cases have been referred to me accompanied by a note stating that it has been found impossible to administer a barium enema and that, consequently, a diagnosis has not been made. On examination, in each case, a growth of the lower pelvic colon was easily discoverable by the ordinary time-honoured digital examination of the rectum "[1]

Experience has shown that this practice of giving x-ray precedence over digital and proctoscopic examinations has been responsible for more harm than at first seems possible

While a barium colon study may, with advantage (because of data obtained), immediately follow sigmoidoscopy, the converse is not true It sometimes takes days, even weeks, before the bowel has been cleared of barium sufficiently to permit an endoscopic examination We have seen flakes of tenaciously adherent barium cover pertinent lesions, while trauma from attempts to wipe away barium has, at times, introduced uncertainty in the interpretation of our findings

It cannot be denied that the roentgen ray is of prime importance in the detection of disease beyond the reach of the sigmoidoscope, and is without rival in the study of mobility, caliber, contractility, position, and configuration of the colon. But roentgenologists are among the first to admit that x-ray, by itself, cannot convey detailed information as to the appearance, shape, or consistency of structures in this area, nor as to the nature of intraluminal contents—data readily obtainable through digital and proctosigmoidoscopic examinations Without the aid of these steps, the x ray may be unable to distinguish between a fecal mass, a foreign body, and a growth, or between an extrinsic mass, a rectal tumor, and an inflammatory stricture, or between a spastic condition and inflammatory changes

Most important of all, a barium colon study frequently misses small, and sometimes large, tumors of the rectum and lower sigmoid [2 3] It is well recognized that polyps which appear to be benign clinically may actually show malignant changes microscopically or, at any rate, are frequently forerunners of cancer [4-7] Since the destruction of all polypi is probably our only means of preventing cancer of the rectum, and in the eradication of carcinoma in its early stages lies our best chance of curing it, the problem of detection of small growths becomes a serious matter With regard to this problem, proctosigmoidoscopy is of the greatest aid, while unsupported barium colon study is often unreliable

Case Reports

Case 1—(Unit 112399) Mrs. E. G had a large uterine mass. A barium colon study revealed an irregular deformity of the upper rectal canal and rectosigmoid giving the impression of a carcinoma. A digital examination by the intern seemed to bear it out. Nevertheless, proctoscopy was requested by the roentgenologist. One week later, following the usual preparatory enemas, it was found that proctoscopy could not be completed because of the presence of an inspissated mass of feces and barium. Another week elapsed before proctosigmoidoscopy could be performed. It failed to show any intrinsic pathology

Case 2—Mrs. R. S complained of backache and a pressing sensation in the rectum She was known to have a fibroid uterus. A barium colon study showed evidence of pressure from without, in the region of the uterus Upon laparotomy, however, an unsuspected carcinoma of the rectosigmoid was found.

Case 3—(Unit 220688) (Service of Dr A. W Martin Marino) Mrs. J S complained of pain and bleeding, following stool. These symptoms were evidently caused by an anal fissure and hemorrhoids. A routine proctoscopy detected, in addition, two polypi which had produced no symptoms and appeared to be benign. Nevertheless upon removal, one of these showed microscopic evidence of malignant change. A barium colon study had failed to reveal the presence of either growth.

Case 4—(Unit 112207) (Service of Dr A. W Martin Marino) Mrs. L. B had noticed blood in her stools for the past year A barium colon enema failed to reveal any defect or delay in the passage of the barium The sigmoid was devoid of haustrations Although the findings suggested a diagnosis of sigmoiditis, the roentgenologist insisted on a proctoscopy This, however, had already been performed, revealing a carcinoma, 2 inches in di-

Read before the quarterly meeting of the professional staff of the Brooklyn Hospital, May 14 1945.

ameter, and attached to the posterior wall, 3 inches from the anus

Case 5—Mrs J B had had an intermittent swelling of her abdomen for ten years and rectal pain for five years During the last few months she had been suffering from a progressively increasing and exhausting tenesmus Her stools were pencil-shaped and dirty red Thorough gastrointestinal x-ray studies revealed "nervous spasm" Her symptoms, she had been reassured, were due to hemorrhoids and a nervous condition Proctoscopy, however, showed a carcinoma half encircling the rectosigmoid It is of interest that, even with this information on hand, a roentgenologist was unable to detect any sign of a growth in a barium colon study

It may well be that physicians who turn to the x-ray as the first step in their search for the source of rectal complaints are usually cognizant of its limitations, and do have every intention of following up with the direct inspection of the bowel What they fail to realize, however, is that, as far as the patient is concerned, the x-ray report is final and incontrovertible, and it engenders in him a false sense of security which, in turn, leads to prolonged neglect of conditions which can ill afford delay Thus premalignant and early cancerous growths are permitted to degenerate, extend, and metastasize It is not at all uncommon for proctologists to see patients who, having symptoms all too evident of advanced cancer, bring films of the bowel taken months previously, all of which fail to show any evidence of a growth even though it is situated frequently within reach of the finger and nearly always within reach of the sigmoidoscope

And so we find that the widespread practice of making the x-ray the initial diagnostic step in the investigation of disorders of the lower bowel nearly always leads to delay, frequently to errors, and may, through a false sense of security, deprive the patient of his one chance of survival

It seems evident that digital examination and proctosigmoidoscopy should always precede rather than follow barium colon studies

FELLOWSHIPS IN HEALTH EDUCATION

Fellowships for one year of graduate study in health education, leading to a master's degree in Public Health, are being offered by the U S Public Health Service through funds made available by the National Foundation for Infantile Paralysis

The fellowships provide a year's study in public health, a stipend of $100 a month for the entire period of academic and field training, tuition, and travel expenses for field experience Travel to and from the university at the beginning and end of training is not included

Fellowships are effective for the academic year starting in the fall of 1946, and candidates must maintain a scholastic average of "B" to retain fellowship

Men and women eligible for application must be citizens of the United States and meet the entrance requirements of the School of Public Health of their choice In addition to a bachelor's degree from a recognized college or university, courses in the biologic and/or physical sciences, sociology, and education may be required Training in public speaking, journalism and psychology, and work experience in a related field, are desirable Veterans with necessary qualifications are encouraged to apply for fellowships The subsistence allowance for veterans, granted under the G I Bill of Rights, will be supplemented by fellowship funds to bring the stipend to $100 a month

Application forms may be obtained from the Surgeon General, U S Public Health Service, Washington 25, D C Completed forms, accompanied by two recent photographs, and official transcript of college credits, and a 500-word statement of why applicant is interested in entering the field of health education, must be in the hands of the Surgeon General by June 1, 1946 Only complete applications will be considered.

Schools of Public Health include Columbia University, Harvard University, John Hopkins University, University of California, University of Michigan, University of Minnesota, University of North Carolina, and Yale University

Persons accepting fellowships will be expected to work in the field of health education for at least two years after completion of training The fellowships are not available to employees of health departments

OCCULT MAXILLARY ANTRUM INFECTION

JOSEPH POPPER, M D , New York City

(From the Lebanon Hospital)

THIS report presents 3 cases of antrum infection in which there were no symptoms referable to the antrum, indeed no symptoms referable to the nose. This subject is therefore of peculiar interest to the general practitioner who is always the first one to be consulted. It may be noted that the usual sequence of events in the average antrum involvement is an acute coryza followed by subacute persistence of discharge which gradually becomes purulent At this stage there is increasing ache or pain on the side of the face affected and very often the pain is referred to the eye. Breathing through the affected side is more or less obstructed X ray or transillumination shows a shadow over the affected side and finding pus on irrigation confirms the diagnosis

Case Reports

Case 1 —Mrs. P W , 50 years old, a housewife, came to the office to arrange for a tonsillectomy Her chief complaint was a bad taste in the mouth and a foul odor to her breath She had had these symptoms for several months Antiseptic mouth washes gave no relief She had no difficulty in nasal breathing nor did she have any discharge She was otherwise well and her family physician suggested she might have infected tonsils to account for her complaint. Her past and family history are irrelevant.

Examination of the nose showed no free pus and no other gross pathology Her tonsils were small and no exudate was expressed. Her teeth and gums appeared normal. Transillumination of the nasal sinuses showed a marked shadow over the right antrum. Irrigation of that sinus with saline produced greenish flaky and very foul pus, indeed the odor was so foul I had to interrupt the washing and leave the room for a breath of fresh air Her symptoms were much relieved after the first washing and completely cured and the antrum clean after five more irrigations.

Case 2 —E. G , 45 years old, a housewife was referred to me by her family physician for tonsillectomy The arrangement was made over the telephone and I saw the patient for the first time in the hospital on the morning of the operation. The reason for this arrangement will be evident from the history For the past seven months she had had pain and disability in her left lower limb, during this time she spent most of her waking hours in bed, being unable to walk. For several months she had been in the Joint Disease Hospital, under the care of an orthopedic surgeon, where she received all kinds of therapy without relief For many years she had been aware of having very badly infected and large tonsils and on two occasions local tonsillectomy was attempted but had to be abandoned on account of lack of cooperation on the part of the patient. Her past history was otherwise negative She had three children.

I removed her tonsils under general anesthesia. They were markedly hypertrophied and filled with purulent exudate She continued to be disabled with pain now in both upper and lower left limbs, but limped into my office a month after operation because she thought something was not right with her throat She complained of throat irritation and a bad taste in the mouth She had no complaint about her nose She had no discharge, her breathing was free and she suffered no headache. Examination of the throat showed well healed tonsillar fossae and no pathology of gums or pharynx However, examination of the nose revealed a slight amount of pus in the right middle meatus and transilluminantion showed a definite shadow over the right maxillary antrum Irrigation of the sinus with saline solution produced foul greenish-yellow flaky purulent exudate After eight irrigations, followed by instillation of 5 per cent sodium sulfathiazole solution, the antrum was clean and the throat irritation and bad taste were gone. It is interesting to note too that during the three weeks she was under my observation the pain in her limbs gradually subsided and she was able to walk almost without any limp At this report, six months later, she is practically well

Case 3 —The patient, F F , was 60 years old and a housewife Her family and past history is irrelevant She was referred to me by a consultant internist to whom she was taken for a persistent and incessant dry cough lasting six weeks. This cough was unproductive and frequently associated with nausea and vertigo As a result of this distressing symptom she lost her appetite and considerable weight. She was suspected of having some lung involvement or even pertussis. Careful examinations, however, were all negative. She had no nasal symptoms whatever

Examination of the nose revealed a slight amount of free pus in both middle meati. The mouth and throat were negative. Transillumination showed a right antral shadow Up to this point the patient was continuously coughing from the moment she entered the office Following irrigation of the antrum the cough stopped immediately The antrum contained a small amount of mucopus and was clean the following day She improved steadily after a few treatments of the associated ethmoiditis.

To summarize, 3 cases are reported of patients with varying symptoms, with no complaint directly referable to the nose and all three having latent maxillary antrum infection

1749 Grand Concourse

Read before the Society of Alumni of Lebanon Hospital, November 13 1945.

CORRECTION

In our editorial comment on an anniversary celebration of the Richmond County Medical Society, we inadvertently designated the period of its existence as one hundred years. Our attention is now called to the fact that actually, the Society has reached the ripe old age of 140 years and that Dr Smith s interesting review of the Society's minutes covered only the first century of its activities. We desire to correct herewith this false impression conveyed by our editorial.

PARA-ESOPHAGEAL HIATAL HERNIA

A Case Manifesting Gastrointestinal and Cardiac Symptoms and Presenting Itself on X-Ray as a Mediastinal Tumor

MYRON HERMAN, M D , and EMANUEL SINGER, M D , New York City

THE HERNIATION of a portion of the stomach through an opening in the diaphragm into the chest is an entity demanding increasing attention. This is true not only because of the rising frequency with which the diagnosis is made, but also because the condition simulates disease of other organs

Just what symptoms will become manifest depends on the "amount of mechanical interference with the function of the herniated abdominal viscera, on the degree of the impairment of the normal function of the diaphragm, and on the amount of increased pressure within the thorax."

Although the resulting complex symptomatology may suggest involvement of various organs, the two systems which are generally implicated are the gastrointestinal and the cardiac

In this former category, the following mistaken diagnoses have been made carcinoma of the esophagus, cardiospasm, diverticulum of the esophagus, stricture of the esophagus, gastritis, cancer of the stomach, gastric ulcer, pylorospasm, duodenal ulcer, cholecystitis, and cholelithiasis

Harrington has found that some of the unsatisfactory results following various abdominal operative procedures, "particularly those applied to the gallbladder, stomach, or appendix result from unrecognized diaphragmatic hernias "[1]

Weinberg was apparently impressed by the numerous patients with diaphragmatic hernias who were erroneously operated upon for disease of other organs and concludes "that a hernia should be a matter of consideration in all obscure cases of abdominal and thoracic disturbances "[2]

As for the cardiac system, one of the most clinically significant diseases which the hernia may resemble is the coronary occlusion. Reported cases emphasize comparable severity and radiation of pain in both conditions An extremely important observation in this regard is made in the "notes" in the *Journal of the American Medical Association* [3] "It is impossible to say what percentage of coronary pain is caused by diaphragmatic hernias, but such a cause is sufficiently frequent to warrant the search for diaphragmatic hernia whenever possible."

The following case of a diaphragmatic hernia is presented because it suggests involvement of both the gastrointestinal and cardiac systems An additional point of interest and a rather uncommon finding is that this hernia is visualized on the teleoroentgenogram as a large density, suggesting a mediastinal tumor

Report of Case

The patient, S C , a 53-year-old white man, was admitted to the hospital for treatment of a minimal pulmonary tuberculous lesion and for further observation of a "recent coronary occlusion "

Past history revealed that the patient was well until 19 years of age At that time, he experienced attacks of regurgitation after a hearty meal This regurgitation occurred practically once a day and lasted until most of the ingested food was returned It was effortless and unaccompanied by other symptoms These "attacks" would persist for three months, abruptly cease for a similar period of time and then recur again

Aberrant personality changes were held responsible for these episodes When the patient married at the age of 35, the attacks became only occasional and mild and he enjoyed moderate good health until he was 50 years old At that time, he began to experience nonradiating retrosternal pain as well as *anterior right chest pain upon exertion This disappeared* with rest The symptoms continued for approximately two years Suddenly one day the patient awoke with sharp pains in the fingertips of his right hand which radiated up the arm to the shoulder There was no concomitant precordial discomfort

An electrocardiogram was taken and a coronary occlusion was diagnosed The patient was then put to bed for three months A routine x-ray taken during this period revealed a minimal tuberculous lung lesion and the patient was transferred to our charge for further observation and care of his pulmonary as well as cardiac conditions

The physical examination revealed a well-nourished and well-developed individual in no apparent pain or distress The lung examination was entirely normal The percussion note was resonant, there were normal vesicular breath sounds and no rales were present

Heart examination showed that the point of maximum intensity was in the fifth left intercostal space inside the midclavicular line No thrills or murmurs were present There was a regular sinus rhythm Ventricular rate equalled the pulse rate at 82, blood pressure was 140/80 The remainder of the examination was noncontributory

An electrocardiogram taken shortly after admission in April, 1943 (Fig 1), shows an inversion of the T wave in lead IV A final cardiogram October 1943 (Fig 2), shows a return of the T wave to the upright position Several electrocardiograms taken in the interim are similar to the first tracing This series was submitted to Dr Janet Travell[4] who concluded that "the only significant abnormality seems to be the partial inversion of the T wave in lead IV in the first tracings, with return of T4 to the upright position in the last tracing This seems to represent a serial change of some sort The transient changes in the T wave in lead III are of no special significance If this were a case of coronary occlusion, presumably with an anterior wall infarct, it would be remarkable to have such serial changes in lead IV without any concomitant changes in the T wave in lead I Bizarre changes in the T waves can be produced by displacement and rotation of the heart It seems likely to me that the electrocardiographic changes are the result of the herniation of the stomach rather than of intrinsic cardiac pathology "

An admission chest teleoroentgenogram (Fig 3) reveals minimal scattered productive infiltrations in

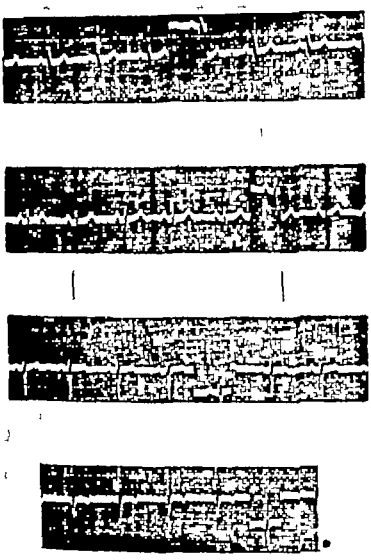

FIG 1 Admission electrocardiogram shows an inversion of the T wave in lead IV

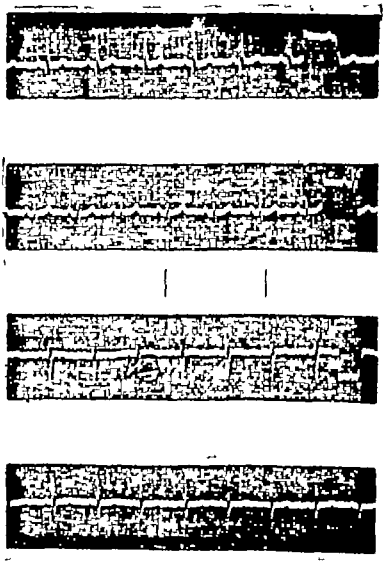

FIG 2 A final electrocardiogram six months later reveals a return of the T wave to the upright position in lead IV There has been a serial change in the tracing as contrasted to Fig 1

the upper portion of both lung fields. An old healed primary complex can be seen in the right lower lung field. A rounded density is visualized in the lower thoracic region extending from the ninth to the twelfth dorsal vertebra. This protrudes on both sides of the spine and with the cardiac outline forms a double mediastinal shadow

The two most likely diagnoses which came up for consideration were

(1) Potts disease of the spine because there was tuberculosis elsewhere (lungs)

(2) Diaphragmatic hernia because of the history of previous gastric symptoms.

A barium meal clearly illustrates that the mass in the lower mediastinum is due to the herniation of a large portion of stomach into the chest cavity (Fig. 4) An oblique view demonstrates that this herniation is in a para-esophageal position (Fig 5)

X-rays of the spine revealed no abnormality of any of the vertebra.

In an effort to reduce the hernia, a pneumoperitoneum was performed. This was done because of the observation that following pneumoperitoneum for various lung conditions, the stomach and other abdominal viscera have a tendency to be displaced downward toward the pelvis. Figure 6 disclosed air beneath both diaphragms and air in the herniated portion of the stomach Apparently, the pneumoperitoneum succeeded in causing a downward displacement of the remainder of the stomach, and in so doing permitted the food responsible for producing the tumor-like density on x-ray to gra

the body of the stomach The herniation, however was not reduced into the abdominal cavity, which indicated probable intrathoracic adhesions anchoring the hernia in the chest

The patient left the hospital shortly thereafter Follow-up reports state that occasional regurgitation is present but cardiac symptoms have entirely disappeared.

Discussion

The esophageal hiatus hernia, in the adult, is the most common kind of herniation occurring through the diaphragm Although the stomach usually is the only abdominal viscus involved in the hernia, on some occasions the colon, omentum, and even the spleen have been found in the hernial sac. Hurst[3] believes that abnormal laxness of the tissues surrounding the esophagus as it passes through the diaphragmatic opening creates an area of weakness which is susceptible to varying amounts of intra-abdominal pressure and is mainly responsible for the development of a hernia Akerlund[4] considers age accompanied by atrophic changes as playing the leading role and judges the condition so prevalent in older people as to be almost physiologic.

Weinberg[5] likens the esophageal hiatus hernia to the indirect inguinal hernia "in [illegible]th are due to a congenital weakness, but [illegible] their appearance until youth or

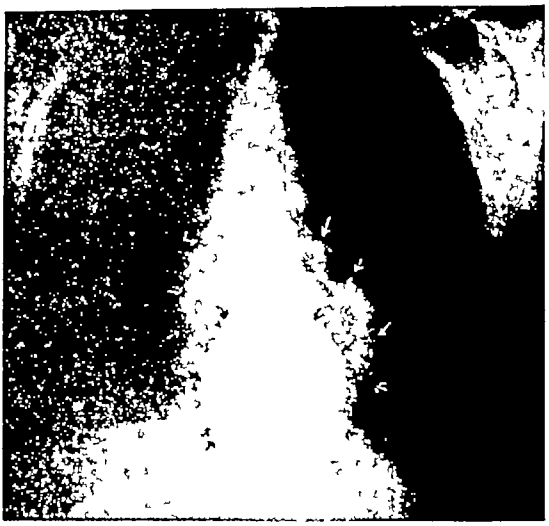

FIG 3 A double mediastinal shadow is delineated by arrows The white arrows outline the heart contour, the black, a mediastinal density The tumefaction was thought to be a portion of his stomach which had herniated into the thorax

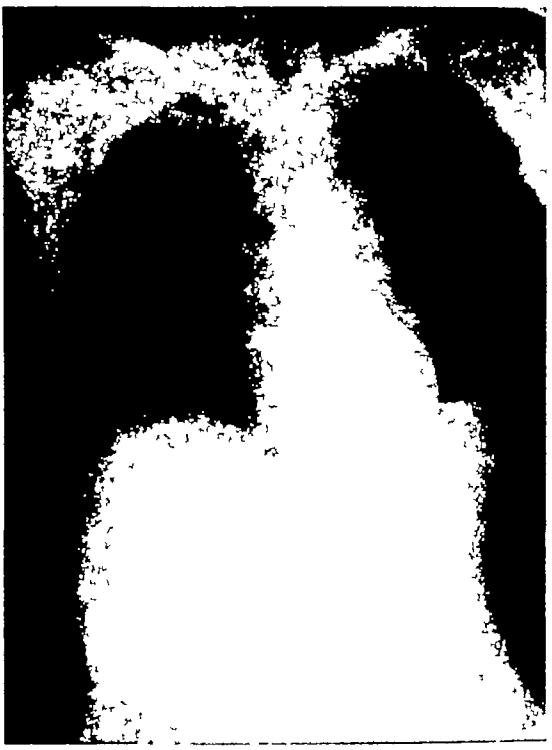

FIG 4 After a barium meal X-ray shows a large segment of stomach which has herniated into the chest cavity

An interesting observation is disclosed by Harrington[1] after examining the esophageal hiatus in the course of 500 abdominal operations In 65 per cent of cases the diaphragm was closed snugly around the esophagus and there was no appreciable space between the two structures In the remaining 35 per cent of cases one or more fingers could be placed between the esophagus and the margin of the diaphragmatic opening An occasional small hernia was found in this latter group The above author is convinced that the hernias are "congenital" For all practical purposes it is a matter of not too vital conjecture whether or not a hernia is congenital or acquired

Chief among the abdominal symptoms are pain, vomiting, constipation, and distension. In the present case the outstanding complaint from the age of 19 to 35 (16 years) was regurgitation of food This occurred after a large meal once a day, was effortless, and continued until most of the meal was returned.

Apparently, this effect was due to overdistension by food of the constricted portion of the stomach As Ornstein[8] has pointed out, a raised intragastric pressure, greater than the strength of the sphincter, will cause the sphincter to open and the contents of the viscus to be expelled

There can be little doubt that the herniation existed at the age of 19 and has persisted up to the date of this writing

The pathogenesis of the chest pain, simulating a coronary occlusion in diaphragmatic hernia, is not definitely known One explanation is that "it is really due to reflex coronary constriction"[3] Hyatt believes, however, that the symptoms are produced or aggravated by any increase in intra-abdominal pressure such as leaning forward, lying down, straining or wearing a tight abdominal garment He has observed the classical precordial distress which radiated to the left side of the neck, the left shoulder, and down the left arm

Although the occurrence of a coronary occlusion in the current case cannot with certainty be excluded as having taken place, the suggestion of the cardiologist, Dr Travell, is convincing that it would be remarkable "to have such serial changes (T waves in first and last electrocardiogram) in lead IV without any concomitant changes in the T wave in lead I and would, therefore, rule against the diagnosis of intrinsic cardiac pathology

The appearance of a mediastinal tumor on x-ray is due to the presence of food in the herniated gastric pouch As soon as a pneumoperitoneum was induced, permitting the food to drop into the body of the stomach, the density disappeared and in its stead an air bubble was visualized. Why food should remain in the hernia is explained on a purely mechanical basis, namely, the size of the opening between the hernial sac and the rest of the stomach The greater the constriction, the less opportunity for the free passage of food from the one segment to the other

Hedbloom[9] reports that 33 per cent of large diaphragmatic hernias strangulate, and therefore favors surgical intervention in this group Meakins[10] states that the treatment depends entirely upon the frequency and severity of the symptoms. The majority of cases require no treatment, but if the condition is sufficiently troublesome, operative repair may be attempted

FIG. 5 Oblique view reveals that the herniated stomach present in the chest (see Fig. 4) is in a para esophageal position

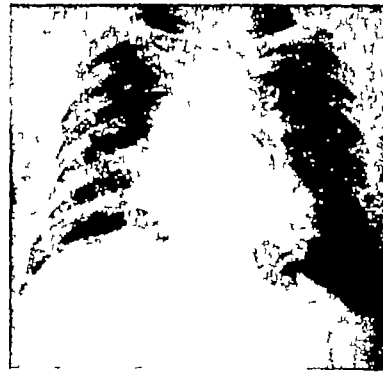

FIG 6 A pneumoperitoneum is present. Air is present beneath both diaphragms The mediastinal density is no longer visualized.

In the current case, the present symptoms were not annoying enough to warrant a major surgical operation. However we were desirous of reducing the hernia and therefore instituted pneumoperitoneum. Although our ultimate aim was not achieved in this instance, the following observations suggest that the procedure may be a valuable one

1 Because the gas did not succeed in dislodging the herniation out of the chest cavity, it is fair to assume that intrathoracic adhesions prevented this. Operation if it is later deemed necessary should therefore be done through a thoracic approach instead of an abdominal one.

2. Through pneumoperitoneum the easy passage of food from the hernial pouch to the body of the stomach was made possible.

3 It is conceivable that hernias which are not adherent to any thoracic structures may be entirely reduced by the downward displacement of abdominal viscera resulting from a pneumoperitoneum

2 The cardiac diagnosis was that of a coronary occlusion Electrocardiographic changes were suggestive but were not consistent with that of myocardial damage

3 Routine chest x ray revealed the hernia as a mediastinal tumor

4. Pneumoperitoneum was performed in an effort to reduce the hernia. Although this procedure failed in the current instance because of intra thoracic adhesions, the possibility of its being effective in nonadherent cases is promising.

969 Park Avenue 1112 Park Avenue

Summary

1 A case of a para-esophageal hiatal hernia is presented which has produced symptoms referable to the gastrointestinal as well as to the cardiac systems.

CORRECTION NOTICE

We have been asked to make the following correction in the article entitled "Pregnancy Following Treatment with Male Sex Hormone in Sterility Due to Functional Bleeding by Dr Arthur F Simon of New York City, which appeared in the April 1 issue of the JOURNAL page 743 The second line in the second paragraph is corrected to read "Thirteen years before this the right *tube* had been removed for an ectopic pregnancy the convalescence was complicated by an embolism of the lung."

OVARIAN CYST IN THE CONTENT OF INGUINAL HERNIAL SAC

WILLIAM J FUSARO, M D , Brooklyn, New York

(From the Norwegian Hospital)

HERNIA of the ovary is not a common occurrence Donald,[1] in 1940, while reporting a case of congenital ectopia of ovary and fallopian tube in the labium majus, stated that "Hernia of the ovary is rare, and 95 per cent of ovarian hernias are inguinal" Mayer and Templeton,[2] in 1941, reporting a case of inguinal ectopia of the ovary and fallopian tube in an infant, reviewed 195 such cases from the literature, excluding simple ovarian herniae McMillan,[3] in 1942, while reporting a case containing gonadal structures on each side of a bilateral indirect inguinal hernia, stated that Watson (1938), in reviewing the literature, had gathered 219 cases of hernia of the adnexa and 181 cases of hernia of the ovary, and that the earliest report of a tubo-ovarian hernia was that of Soranus, about 97 A D Kershner and Shapiro,[4] in 1943, reported 3 cases of multilocular serous cysts of the round ligament simulating incarcerated herniae Berger,[5] in 1944, reported a case of a broad ligament cyst in a strangulated hernia

Ovarian hernia and tubo-ovarian ectopia are most common in children under two years of age It is agreed by all writers that they are congenital anomalies Ovarian hernia is also found in the older age groups, where, because of intra-abdominal pressure by conditions such as pregnancy, adhesions, etc , the condition is aggravated.

The persistence of the canal of Nuck (which normally becomes obliterated toward the end of the eighth month of intrauterine life) is the causative factor in ovarian hernia When the gubernaculum of the ovary does not become attached to the cornua of the uterus, it is possible for the gubernaculum, and the ovary with it, to be drawn into the inguinal canal or the labium majus In cases of true ectopia, the tube is also drawn down with the ovary The ovary may become inflamed, undergoing cystic degeneration, or it may become adherent to the sac wall.[6]

In children, ovarian hernia should be suspected when examination reveals a small hard, rounded mass, reducible and not tender, in the inguinal canal or labium majus, which later becomes irreducible and tender After puberty, ovarian hernia should be suspected when a patient complains of a mass in the groin which increases in size and discomfort with the menses On pelvic examination, the uterus is displaced toward the involved side and movement of the uterus results in movement of the ovary in the inguinal canal.

Strangulation and torsion of the ovarian pedicle are frequent complications of ovarian hernia. There may also be an accompanying salpingitis or tubal ectopic pregnancy Sometimes the ovary undergoes malignant changes, or else the hernial sac may also contain the uterus, omentum or intestines

The treatment of choice for ovarian hernia is early surgical intervention, using a Bassini type of repair, with replacement of the ovary wherever possible, depending on the presence or absence of pathology

Case Report

L S , a 48-year-old white, widowed nurse, was admitted to the Norwegian Hospital on April 12, 1944, complaining of a mass in the right inguinal region for the past five or six days which was larger than usual and was reducible at times · The mass was tender and caused a dull ache Patient had had a hernia for over five years, but this was the first time that it had caused her any inconvenience There was no history of nausea, vomiting, or urinary disturbances She had had an appendectomy twenty years ago, a hysterectomy ten and a half years ago, and a thyroidectomy ten years ago

Examination revealed a mass about 2½ by 2 by 2 inches over the right inguinal canal which was not reducible, there was a definite impulse on coughing The mass was somewhat tender There were firm McBurney and suprapubic midline scars No costovertebral angle tenderness was present There were many superficial varicosities over the lower extremities and a small ulcer on the medial aspect of the right ankle

At operation, on April 13, 1944, under spinal novocaine anesthesia (200 mg) supplemented by Pantopon, one-third of a grain after one hour, and gas-oxygen fifteen minutes later, a direct inguinal hernia about 2½ by 2 by 2 inches through the inguinal canal and into the labia majora was found The contents of the sac consisted of a small piece of omentum and an ovarian cyst, also about 2½ by 2 by 2 inches Intra-abdominally, on the right side, was an ovarian cyst about the same size as above connected by a narrowed cystic cord to the ovarian cyst which was in the hernial sac On the left side there was another cyst about the same size involving the left ovary There were extremely dense firm adhesions between the ovarian cysts, the cervical stump, and the urinary bladder

On opening the hernial sac, a large amount of straw-colored fluid poured forth It had no urinary odor The palpating finger through the sac seemed to pass into a closed cavity not unlike the bladder To be certain it was not a diverticulum or herniation of the bladder, methylene blue was instilled into the bladder through a urethral catheter, but none was observed to enter the sac It was decided that we were dealing with an ovarian cyst The sac was ligated at the very base and transfixed under the internal oblique muscle The hernia was repaired by a modified Bassini operation

A low midline incision was then made and the abdomen opened Dense adhesive bands were carefully severed and after tedious dissection, both ovaries and cysts, as described, were resected All raw edges were peritonealized and sutured to the old cervical stump

It should be noted that failure to do a vaginal examination caused the difficulty of hurrying the operation and having to supplement the spinal anesthesia with gas-oxygen and Pantopon Had the pelvic examination been done, an accurate complete diagnosis would have been made and adequate measures taken to prepare for a longer operation, e g , fractional spinal, more detailed survey of the

patient's physiologic status preoperatively and the preparation of adequate measures (blood, plasma, etc.) if her status had been poor Fortunately, this patient's condition, in spite of age was good and she withstood the operation very well, no blood or plasma having to be rushed to her aid.

Pathologic Report.—The specimen consisted of a moderately soft oval mass 5 by 3 by 0 5 cm. On section, the tissue was yellowish-red and brown, apparently ovarian tissue. The specimen also consisted of two irregular flattened masses of greyish brown tissue, apparently opened cyst linings smooth and about 1 cm. in thickness There was also a cyst 3 by 3 by 1 5 cm., containing clear fluid

Microscopic examination showed thick walled blood vessels in dense fibrous tissue with scattered collections of round cells. Section of ovaries showed numerous hemorrhagic cysts and simple cysts.

Pathologic Diagnosis—Hernial sac, polycystic ovaries.

The patient made an uneventful recovery and both wounds healed by primary union She was discharged nine days after operation to a convalescent home for further care. She has been well ever since and has been engaged in her nursing duties at the hospital since eight weeks following her operation.

Summary

1 A brief summary of the literature regarding incidence and etiology of ovarian hernia is given.

2 A case of ovarian cyst in an inguinal hernial sac, with part of the cyst intra abdominal, and ovarian cyst also on opposite side, is presented.

3 Caution to never operate for inguinal hernia in females without pelvic examination is stressed.

A PROTEST FROM PENNSYLVANIA ON THE E.M.I.C PLAN

On January 27 1940 at a called meeting of the Commission on Maternal Welfare of the Medical Society of the State of Pennsylvania, the following Resolution was unanimously adopted

That the Commission on Maternal Welfare of the Pennsylvania State Medical Society is unanimously opposed to any legislation which will perpetuate the present E.M.I.C plan or any legislation which shall set up any similar plan for Maternal and Child Welfare.

This objection is based on the following facts

1 There exists no emergency now and there is no public need for any such legislation

2. Any such program will continue to be solely under the control of the Children's Bureau (or similar bureau) of the Department of Labor and will be centralized in Washington D C and not under the direct control of competently trained physicians.

3. The standards of obstetric care have not improved under the E.M I C plan and cannot be improved by such centralization.

4. The E.M.I.C plan or any similar plan now under consideration (as the Pepper Bill or the Wagner Murray Dingell Bill) sets up only a minimum standard of Maternal Care and at the level of the general practitioner

5 Adequate maternal care requires a maximum standard of care and this is not obtained or even approached in the requirements of the present E.M.I.C plan or the proposed legislation of maternal care as embodied in the Wagner Murray-Dingell Bill.

6 The full and thorough training of future obstetricians has been and will continue to be hampered and interfered with by such legislation. This restriction is felt not only in our medical schools, but also in our recognized, accepted, or approved hospitals.

7 The medical profession has insisted on adequate maternal care for all expectant mothers. Adequate care denotes maximum care during pregnancy at delivery and for a definite period after delivery The present E.M I C plan, or the proposed legislation, has concentrated on a minimum of care for before delivery *only*, disregarding entirely the very important phases of the problem, viz during delivery and through the period directly and for six to eight weeks after delivery (other than a six weeks' examination) These are phases in which the accidents and mismanagements make their appearance. No present (E.M I C) or proposed legislation recognizes these two important phases of maternal care, hence the whole plan is full of danger Maternal and child health depends on all these phases not on one phase alone with total disregard of one or both of the other two

All the above factors lead definitely to a lowering of adequate or maximum maternal care standards which the medical profession for the past twenty years has been teaching and practicing in an effort at reducing maternal mortality, which has been accomplished by the profession's efforts. The medical profession through its own organizations has striven to give adequate maternal care to all expectant mothers and the present E.M.I C plan, or the proposed legislation, sets up only a minimum standard of maternal care. All such legislation, in our professional opinion, eventually will lead to an increase rather than a decrease in maternal mortality, principally because the safeguards are removed and the standards of obstetric care are lowered to a degree below that which we definitely know to be maximum and necessary as adequate

Department of Medical Care Insurance

CONDUCTED BY GEORGE P FARRELL, DIRECTOR

The National Health Program

THE following is the action of the House of Delegates of the American Medical Association, taken December 5, 1945, covering the development of a specific national health program with emphasis on a nation-wide organization of locally administered prepayment medical plans sponsored by medical societies

The Advisory Committee appointed by the Council on Medical Service and Public Relations of the American Medical Association, met in Toledo, December 16, 1945, at which time recommendations were made that steps be taken by the Council on Medical Service and Public Relations to obtain the cooperation of existing prepayment medical-care plans for the purpose of coordinating their activities, and to obtain information, data, and statistics, and to make the Council on Medical Service and Public Relations the central source of information and the spokesman regarding the prepayment medical plan movement The recommendations were as follows

(*a*) A letter to the plans now in operation explaining the program of the Council and asking for specific information and data as a preliminary report, and requesting suggestions as to future regular reports

(*b*) Release of a monthly news letter on prepayment plans' activities to which all plans be invited to submit news items and articles

The establishment of a page or more, as necessary, in the *Journal of the American Medical Association* to set forth pertinent and interesting information of the prepayment medical plans

(*c*) The establishment of a public relations and press division of the Council on Medical Service and Public Relations, to supply the national press with specific items and stories concerning the various plans for prepayment care, both on national and local levels, to prepare literature, speeches, etc , for representatives on the Council.

(*d*) Publication of an official roster of medical society sponsored and approved plans, including pertinent information on each

(*e*) The adoption of a common symbol or trademark for use of the medical societies' sponsored and approved plans

(*f*) The establishment of an Advisory Service within the Council on Medical Service and Public Relations to provide speakers and technical advisors, in relation to matters of organization and administration for county and state medical societies in the formation of plans Such speakers and advisors to be designated by the Council on Medical Service and Public Relations

(*g*) To develop and recommend means for local medical care plans to cooperate with the Veterans Administration, to provide care for veterans with service-connected disabilities and such other care as they may be entitled to, either on the basis of prepayment or cost plus arrangements, to the end that the veteran may have free choice of physician in his home community

(*h*) To encourage and assist local plans in development of arrangements for care of indigents and others entitled to public assistance, to provide adequate care of good quality for such persons, with free choice of physician

It was also recommended that the Council on Medical Service and Public Relations be authorized to proceed immediately with the organization of a nonprofit national voluntary health association

On February 12, 1946, a meeting of the officers of the Medical Service Plans Council of America was called, with Mr Jay Ketchum, Executive President, Michigan Medical Service, acting as chairman At this meeting, held in conjunction with the Council on Medical Service and Public Relations of the American Medical Association, the following action was taken

The name of Medical Service Plans Council of America was changed to Associated Medical Care Plans, Inc , the work of this new corporation to be coordinated closely with the activities of the Council on Medical Service and Public Relations of the American Medical Association The following officers were nominated at this meeting, as well as six commissioners Dr Frank L Feierabend, Kansas City, president, Mr William Bowman, of the Colorado Physician's Service, vice-president, Mr Jay C Ketchum, executive vice-president of Michigan Medical Service, corresponding secretary, and Dr Norman Scott, medical director, Medical Service Administration of New Jersey, treasurer, commissioners for a period of two years Dr Herbert H Bauckus, New York, Dr Arthur J Offerman, Nebraska, and Dr Howard Schriever, Ohio, commissioners for a period of one year Mr Leslie Perry, executive director, Medical Service Association of Pennsylvania, Mr Willard C Marshall, general manager, Oregon Physician's Service, and Mr Edwin M Kingery, executive director, Iowa Medical Service

The purpose of this new corporation (Article II, Constitution and Bylaws of Associated Medical Care Plans, Inc) is "The corporation shall seek mutual joint action on a national scale by all voluntary prepayment medical-care plans

"It shall seek to develop this voluntary movement in such manner as to protect the public welfare and wholly safeguard the high quality of medical care achieved by the profession in the United States and Canada

"It shall seek to develop the autonomy and rights of local communities to evolve their programs according to local needs and practices, striving at the same time, to coordinate their methods into as uniform a national pattern as possible

"The Associated Medical Care Plans shall sponsor cooperative and working relationships with medical and allied health groups whose activities in the voluntary field coincide with the broad specific purpose of this organization "

The Board of Trustees of the American Medical Association has established, under the Council on Medical Service and Public Relations, a Division of Prepayment Medical Care Plans, with a director and the necessary administrative staff It is recommended that the Council on Medical Service and Public Relations appoint an advisory committee representing medical-care plans and other associa-

tions, and consisting of five members appointed for one year It is also suggested that the following comprise the committee Mr Jay C Ketchum, Dr Frank L Fclerabend, Dr Herbert H Bauckus, Mr William Bowman, and Mr Charles Crownhart.

The Director of the Division of Prepayment Medical Care Plans, with the assistance and cooperation of the Advisory Committee the State Medical Societies, and the Association of Medical Care Plans, Inc, shall be available to assist in developing new plans and increasing enrollment in existing plans.

The Board of Trustees of the American Medical Association believes that responsibility for the development of medical-care plans rests with state and county medical societies.

MEDICAI SURPLUS PROPERTY

To the Editor —For your information the following: Being on terminal leave after five years of active duty and in need of equipment for my office, I took the *Journal of the American Medical Association* at its word and very optimistically made a visit to the Los Angeles branches of the Smaller War Plants Corporation, the War Assets Corporation, the Office of Surplus Property RFC et al. with the following results

Page 282 of the *Journal* for February 2 gave the regional office as Pacific Mutual Building Los Angeles. Arrival there disclosed a palatial setup with high powered appearing executives, as far as the eye could reach, ensconced behind heavy plate glass and mahogany They could be seen only by appointment, I was informed by one of the young lady buffers holding forth at the mahogany barrier On learning my business however, she informed me that the *Journal* was 100 per cent wrong and that it would be necessary for me to go to another building in another part of town which specialized in surplus medical equipment. This building was situated on Seventh Street near Los Angeles Avenue.

This information was a *lift* because that was just what I was looking for, the boys who specialized in medical equipment, just like the *Journal* said.

Now this office was a letdown after viewing the splendor of the other one, but there were long lines of veterans waiting to be seen and, I thought, now we are getting some place. As I got closer to the front of the line, though, my spirits sagged as I noticed those turned away from the desk sadly shaking their heads and muttering to themselves as they filed past

I consoled myself with the thought that these poor misguided unfortunates were no doubt in the wrong place trying to buy silly things like locomotives, amphibious adding machines and bull dozers they should know that they ought to be up at the swank joint in the Pacific Mutual Building. I was now all goose pimples, I was only third man from the front, which gave me a chance to observe the gal behind the counter She looked harassed and bedraggled, but it was almost noon and no doubt the poor girl was weak from hunger But when my turn came she was still breathing, so I took a chance

Now I hate to tell you this, Mr Editor, but this gal said she didn't know where the *Journal* got its information, but there was no such thing as a listing of surplus medical equipment and, what's more, she doubted if there ever would be one. In spite of her weakened condition she was not unsympathetic and she lowered her voice to tell me that this was the way it always was and so I gathered that it was just the same old run around being given veterans everywhere. She did suggest that I could return that afternoon when a group class would be held on how to make an application and I could then apply for the items I might be interested in Then some day if they ever got those items they would notify me within the next few months.

I started to say "how the h— can I make application when I don't know what you have for sale," but I thought better of it and decided to go back to the plush carpeted office in the Pacific Mutual Building where the girls were better looking, and buy myself a tank or a small used destroyer at least.

JAY G WANNER, Lieut Col M C A U S
—*J A M A March 9, 1948*

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY TO HOLD ORAL AND PATHOLOGY EXAMS

The general oral and pathology examinations (Part II) for all candidates will be conducted at Chicago, Illinois, by the entire Board from Monday, May 6, through Saturday May 11, 1946 The Palmer House in Chicago will be the headquarters for the board. Formal notice of the exact time of each candidate's examination will be sent him several weeks in advance of the examination dates Hotel reservations may be made by writing direct to the Palmer House.

Candidates for *re-examination* in Part II must make written application to the Secretary's Office, Dr Paul Titus 1015 Highland Building Pittsburgh 6, Pennsylvania.

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL *The members of the committee are Oliver W H Mitchell, M D , Chairman (428 Greenwood Place, Syracuse), George Baehr, M D , and Charles D Post, M D*

Nassau County Afternoon Lectures

THE Nassau County Medical Society Tuesday afternoon lectures began on May 7 with Dr Emanuel Appelbaum, chief of the meningitis division, bureau of laboratories, City of New York Department of Health, speaking on "Meningitis"*

The following Tuesday, "Management of Peripheral Vascular Diseases" was discussed by Dr A. Wilbur Duryee

He is associate clinical professor of medicine, College of Physicians and Surgeons, Columbia University

Dr Edward F Hartung, assistant clinical professor of medicine, College of Physicians and Surgeons, Columbia University, will discuss "The Diagnosis and Treatment of Low Back Pain," on May 21

"Tuberculosis," presented by Dr James C Walsh, superintendent of Nassau County Sanatorium, Farmingdale, is the subject of the lecture for May 28 *

Sullivan County Hears Obstetricians

DR. JAMES K QUIGLEY, consultant in obstetrics and gynecology, University Rochester School of Medicine and Dentistry, will lecture on "Practical Everyday Obstetrics" at the Monticello Hospital, Monticello, on May 15

An illustrated lecture with lantern slides on operative obstetrics will be given at the home of Dr Harry Golembe, in Liberty, on May 22 Dr Milton G Potter, of Buffalo, will be the speaker

The series began on April 24 with "Pregnancy and the Rh Factor," by Dr Raymond J Pierri, professor of clinical obstetrics, Syracuse University College of Medicine, and Dr Robert G Schwartz, instructor in clinical pediatrics, Syracuse University College of Medicine

Dr Ward L Ekas discussed on May 8 "The Hemorrhagic States of Pregnancy" He is assistant professor of obstetrics and gynecology at the University of Rochester School of Medicine and Dentistry *

Treatment of Diabetes

DR GEORGE E ANDERSON, clinical professor of medicine, Long Island College of Medicine, discussed "Diabetes Mellitus—Its Modern Interpretation and Treatment" at a meeting of the Schenectady County Medical Society on May 7 in the Medical Library of Ellis Hospital

Dr Pfeffer Speaks to Oswego Physicians

A LECTURE on "Neuropsychiatric Aspects of Arteriosclerosis and Aging" was given by Dr Arnold Z Pfeffer, assistant visiting neuropsychiatrist, Bellevue Hospital, on May 8 at a meeting of the Oswego County Medical Society held at the Fulton Club in Fulton

Cortland County Lecture on Diabetes

His subject was on "Clinical Diagnosis and Treatment of Cardiac Arrhythmias"

* This instruction has been arranged by the Medical Society of the State of New York in cooperation with the New York State Department of Health.

Medical News

President Truman Heads New Foundation to Combat Arthritis

WITH President Harry S Truman as its Honorary Chairman, a new national foundation to combat arthritis has been formed. Mr Louis Kranitz, of St. Joseph Missouri, chairman of the National Campaign Committee declares that two and one-half million dollars is the goal being sought for the establishment of the National Arthritis Research Foundation, with its main buildings to be located in Hot Springs National Park, Arkansas.

The Foundation is being established as a national and independent center for studying the causes and treatment of rheumatic diseases.

The origin of the Foundation was described by Mr Louis Harrison, vice-president of the Leo N Levi Memorial Hospital, of Hot Springs, Arkansas He said that the hospital, a national and nonsectarian institution devoted to the free care of arthritic victims, had been contemplating the development of a research wing but it had been persuaded by medical authorities to abandon its own plans in favor of assisting in the creation of a national foundation

Endorsements of this national medical project have been received from United States Surgeon General Thomas Parran and Dr Morris Fishbein, Editor of the *Journal of the American Medical Association*, both sponsors of the Foundation. He added that complete control of research will be placed in the hands of a Medical Advisory Board made up of outstanding specialists from all over the country

Postgraduate Courses Open to Medical Veterans at New York University

FOUR hundred medical veterans, one third of whom are alumni, have been enrolled in the Post-Graduate Division of New York University College of Medicine that was organized last September

The postgraduate courses are taught in the New York University divisions of Bellevue Hospital or at other hospitals affiliated with the university It is expected that a peak registration of 500 or more discharged medical officers will be reached this year

The majority of returning alumni, Dr Clarence de la Chapelle, director of the Post-Graduate Division, said, seek hospital appointments, especially residencies. All cannot be placed in the University's divisions of Bellevue or in Lenox Hill Beth Israel, French, or Goldwater Memorial hospitals, all of which are affiliated with the College of Medicine, and it has been necessary to refer many applicants to other hospitals throughout the country

Refresher courses, of which the general review course is completely booked until July 1, are mainly channeled through the Fourth Medical Division of Bellevue Hospital, which became affiliated with the Medical College more than a year ago

The review type course is intended for officers who have been or will be entering general practice and who may be unable to continue in their fields while in military service. These courses, which include practically every branch of medicine range from two weeks to a year in duration. To accommodate officers who seek admission at various times as they are released from service, the courses are in continuous operation and may be started at frequent intervals The schedule is so arranged that a physician may review only one or two subjects or a larger number, if he desires, without waiting long periods between courses.

A second group of courses is designed for physicians whose postgraduate training was interrupted and who wish to complete requirements for certification by the specialty boards, also for those who have completed an internship or part or all of a residency These courses vary in length from one to three years and include the basic sciences as an integral part of the training

Most important from the point of view of the nation's future medical care according to Dr de la Chapelle, are members of the intern group whose medical education and internship were curtailed by the accelerated wartime program and who received too little medical training. It is planned to give this group a year or so in a hospital as interns or externs to prepare for practice or possibly a residency

Specialties which alumni in the armed forces expressed a desire to study were in order of preference internal medicine, surgery, obstetrics and gynecology, pediatrics, pathology, radiology neuropsychiatry, ophthalmology, orthopedic surgery, dermatology and syphilology, and urology

This program of retraining courses and postgraduate studies has been made possible by a grant of $50 000 a year, for three years from the W K Kellogg Foundation.

Columbia to Aid Ex Army M.D 's

COLUMBIA University's Faculty of Medicine has expanded its facilities to provide a two to six months reorientation program to aid medical officers released from the armed services. The program is limited to graduates of the College of Physicians and Surgeons or former residents in affiliated hospitals.

It is designed for those who desire a longer clinical experience than is provided by refresher courses.

County News

Chemung County

Dr Ernest E Whipple and Dr Alexander S Dowling have become associated in the practice of medicine and surgery at Dr Whipple's clinic office in Corning

Dr Whipple has been a practicing physician in Corning for many years, having established an office in this community in 1911 Previous to this, he had practiced for three years in Allegheny County following his graduation from the University of Maryland Medical School in 1908 He was one of the senior surgeons at the local hospital and was a former president of the medical and surgical staff at the hospital

Dr Dowling was graduated from the Harvard Medical School in 1930 After several years of postgraduate work in Boston and Cleveland Hospitals, he established an office in Corning for the practice of medicine and continued his practice there until volunteering for service in the U S Naval Reserve in June, 1942 He was recently returned to inactive duty after serving for three and a half years in the naval service *

• • •

Dr Leonard M McGuigan and Dr Rene H Juchli, also formerly with the Medical Corps, and residents of Amsterdam, have opened a joint office in Amsterdam.

Nassau County

The Nassau County Medical Society marked the completion of twenty-five years of active service to Nassau County at a dinner dance held at the Garden City Hotel in February

The Nassau County Medical Society came into being through a certificate of incorporation which was obtained January 6 1921

In the years which have followed, the Medical Society has achieved many of its objectives One of the most outstanding was the establishment in 1928 of the Nassau County Cancer Committee.

The Nassau County Tumor Clinic was organized by members of the Medical Society in 1933 and its work was carried on at the Nassau County Sanatorium in Farmingdale for several years until space was provided at the new Meadowbrook Hospital in Uniondale.

An active campaign was also promulgated by the Medical Society for a county hospital in the years which preceded the building of Meadowbrook It was due mainly to the efforts of members of the Medical Society that the proposition was finally presented to the voters for a decision in November, 1930, and approved by Nassau County people.

The establishment of a county health department, to replace the 68 or more local health officers and their staffs, was advocated by the Medical Society for many years before it was accomplished as a means of securing more uniform health requirements, standards and administration.

The Medical Society also cooperated with the temporary emergency relief administration in the care of the indigent and later, when this work was taken over by the county welfare department, the Medical Society set up a schedule for the care of the county's indigent people.

During the war 200 doctors went into the service from the membership of 510 in the Nassau County Medical Society and the remaining doctors not only carried on with their increased load of work, but also gave time to the civilian protection units in each area.*

Six Nassau county physicians have completed their participation in a campaign of the New York University College of Medicine alumni to raise funds for the construction of Alumni Hall, the auditorium of the university's $15,000,000 section of the New York University-Bellevue Medical Center, which will be erected in the Bellevue Hospital area

A check for $575,000, representing contributions by the Medical College Alumni during the campaign, was presented to Dr Harry Woodburn Chase, chancellor of the University, by Harvey C Williamson, president of the Alumni Association, at the recent annual alumni dinner

Nassau physicians who took part in the fund-raising campaign are Dr Austin B Johnson, Cedarhurst, Dr M Newton Jasper, Rockville Centre, cochairman of the Nassau-Metropolitan Committee, Dr Eugene Calvelli, Port Washington, Dr Robert Bogue, Lynbrook, Dr A. Walter Freireich, Malverne, and Dr Harold S Rubin, Hempstead

• • •

The following physicians announce that they are now associated in the form of a medical group with offices at the Hampton Clinic, located at the foot of Herrick Road on Old Town Road, Southampton Drs William C T Gaynor, David H Hallock, Edwin H Heller, and Herman Rubler

Patrick J Murray, M D., retired chief surgeon of the Police Department, died in Brooklyn on April 2 He was 76 years old He was graduated from Bellevue Medical College in the class of 1895

George A. Schnepel, M.D , of New York, died on March 12 He was a graduate of the College of Physicians and Surgeons of Columbia University in the class of 1903 During his career he was adjunct professor of gastroenterology and assistant gastroenterologist at the New York Polyclinic Medical School and Hospital Until his illness, Dr Schnepel was connected with the Lutheran Hospital. He was a member of the American Medical Association.

Burton T Simpson, M.D., of Buffalo, died on March 5 Until 1914, he was director of the New York State Institute for the study of malignant diseases. He was graduated with the class of 1903 from Buffalo Medical College.

Wilbur W Stearns, M D., of Yonkers was 55 at the time of his death on March 22 In 1915, he was graduated from the College of Physicians and Surgeons, Columbia University Dr Stearns was director of the obstetric service at St. John s Riverside Hospital. He was a past president of the Practitioners Club of Yonkers and was a member of the Yonkers Academy of Medicine, the American Medical Association, and the Westchester County Medical Society

William Steinach, M.D., of New York, died on February 26 at the age of 75 He was graduated in 1894 from the College of Physicians and Surgeons, Columbia University, winning the Harsen Prize He was an attending neurologist at City Hospital from 1913 to 1935 and consulting neurologist since 1935 From 1896 to 1899 he was assistant physician at Willard State Hospital for the Insane. Dr Steinach had been an assistant alienist at Bellevue Hospital, a lecturer at New York University, served as a member of the Psychiatric Unit of the United States Surgeon General s Office and was a selective service examiner during the recent war He was a member of the New York Academy of Medicine, the New York Neurological Society, the American Medical Association, and New York County and State medical societies.

Joseph N Wickham, M.D , of Flushing, died on April 7 at the age of 66 He was graduated from the College of Physicians and Surgeons at Columbia University in 1903 Dr Wickham was first assistant surgeon at Flushing Hospital in 1912, and prior to his retirement, served as attending surgeon He was a member of both the Queens County Medical Society and the Queens Borough Surgical Society

William Yarm, M.D , of Brooklyn, died on April 2. He was 58 He was formerly a member of the Cardiac Clinic of Cumberland Hospital and an attending physician at the Kingston Avenue Hospital. He received his medical degree from Cornell Medical School in 1909

Hospital News

Veteran Doctors Aid Medical Center

AN INFLUX of doctors and nurses released by the armed forces, the acquisition of the New York Orthopedic Dispensary and Hospital, the opening of a free Veteran's Rehabilitation Clinic, and continuing research work in various fields of medicine made 1945 a notable year for the Columbia-Presbyterian Medical Center, according to the annual report released in April

The war took 460 doctors and 354 nurses from the Medical Center, Mr Cooper said

Up to April 275 doctors and about 80 nurses had returned from war service

Addition of the Orthopedic Hospital to the Medical Center during the year boosted the center to first place in size among voluntary hospitals in New York, with a total of 1,404 beds

The Orthopedic Hospital, with 142 beds, will remain at 420 East Fifty-ninth Street until accommodations are provided for it at the Medical Center

A total of 27,442 hospitalized persons received 410,548 days of care during 1945, while 65,220 others were treated in 381,716 visits to the outpatient department, according to the report This total is slightly below that for 1944

The Veterans' Rehabilitation Clinic, established at the Vanderbilt Clinic last November to handle neuropsychiatric cases, met with "heartening response," Mr Cooper reported Up to December 31, 1945, 102 veterans attended the clinic, which is open each Wednesday night The number has been growing during the first three months of 1946

More than 35 research projects were in operation at the Center during 1945, including many in conjunction with the Army, the Navy, and the Office of Scientific Research and Development

Blue Cross Plan Gains 423,474 Members

ONE out of every four persons in greater New York is now enrolled in the Associated Hospital Service's Blue Cross Plan for hospitalization services, it was disclosed in the annual report of the Blue Cross, released in April

A total of 423,474 persons enrolled in the plan during the last year, bringing the overall enrollment to 2,226,523 Most of the increase was attributed in the report to more than 1,700 employers who arranged to pay for all or part of the subscription costs for their employees and inclusion of the service in the welfare programs of some unions

During the year 173,638 persons were hospitalized under the service, and their hospitalization costs amounted to $12,015,911 Ninety-two per cent of those who received care in semiprivate wards in 250 member hospitals, with the exception of maternity cases, had their hospital bills paid in full, according to the report

Childbirth and other obstetric cases represented more than 18 per cent of the total number of Blue Cross subscribers hospitalized in 1945

On the average the Blue Cross subscriber is hospitalized for a shorter time than the nonsubscriber, the report revealed

In outlining plans for continued expansion of service during 1946, Mr Louis Pink expressed the hope that the Federal and city governments would "join the State of New York and more than 400,000 employers throughout the country who are now making Blue Cross available to their employees by deducting subscription charges from their salaries"

4 of 7 Hospitals for Veterans in State Approved

FINAL approval of four of the seven new veterans' hospitals to be built in New York State at an estimated cost of $58,190,667 has been reported by O A Gottschalk, deputy Veterans Administration administrator for New York

The fully approved hospitals, for which funds have been appropriated, are those to be constructed at Fort Hamilton, Brooklyn, and at Albany, Buffalo, and Peekskill

There are already eight veterans' hospitals in New York State The new construction program is part of the biggest national hospital building project in history, to cost $448,000,000

Malcolm Head, assistant director of construction and supply for the New York region, said several sites have been proposed for the New York City Hospital but none was approved

Mr Head said bids soon will be called for covering demolition of thirty-seven temporary Army barracks at Fort Hamilton to clear the site for the Brooklyn hospital The project there will be typical of the proposed hospitals, including one large hospital unit and separate buildings containing wards, theaters, workshops, power plants, laundries and gymnasia

The two hospitals at Peekskill will be for neuropsychiatric cases The others will be general medical and surgical hospitals

Newsy Notes

Capt Solomon Sherry, alumnus of New York University College of Medicine and staff member of Bellevue Hospital, received a special award from the United States Typhus Commission at New York University College of Medicine graduation exercises in March at University Heights

A medal, with a citation, was presented to Dr Sherry by Capt John W Wieler, commanding officer of the Service Command Unit, Army Specialized Training Advanced Program, at the University's College of Medicine

Dr Sam Parker, alienist in the Department of Hospitals since 1929, has been appointed director of psychiatry in charge of all psychiatric services in the Department of Hospitals

Dr Parker will also continue as director of the psychiatric services at Kings County Hospital

Thirty-five friends and associates of the late Dr Mills Sturtevant, who founded the gastroenterology clinic of New York University College of Medicine in 1926, decided on April 17 to raise $100,000 to build, equip, and endow a new stomach clinic in his memory

The new clinic will be part of the New York University Bellevue Medical Center in the Bellevue area.

Dr Arthur M. Wright, former chairman of the College of Medicine Department of Surgery and chief of the Third Surgical Division of Bellevue Hospital, was appointed general chairman of their campaign Dr Max P Cowett an associate of Dr Sturtevant at the time the clinic was established, will be vice-chairman

Dr Sturtevant was on the New York University medical staff from 1913 until his death in 1945 and chief of the gastroenterology clinic until 1938

A gift of $1,000 has been presented to New York University College of Medicine from the board of trustees of Beth Israel Hospital, to establish in the name of their hospital a founders seat in Alumni Hall, the auditorium of the proposed New York University Bellevue Medical Center

The teaching affiliation between the New York University College of Medicine and Beth Israel Hospital, interrupted by the war has been resumed on a more extensive scale. Not only will undergraduate teaching again be carried out in various departments of the Hospital under the sponsorship of the University, but postgraduate courses will also be instituted in order to meet the increased demands for such courses. An opportunity will thus be afforded to many returning medical officers to complete their medical training and education which were curtailed as a result of the accelerated courses at medical school and the accelerated hospital internships. Short review courses, lectures, clinics and demonstrations have also been established for those physicians whose time is limited and who are desirous of refreshing in the various fields of medicine and surgery Dr William Goldring, associate professor of medicine, will act as liason between the medical college and the hospital

Plans are under consideration by the Medical Board of Beth Israel Hospital for a comprehensive educational program for resident physicians and fellows, who will be eligible for additional training in the basic sciences at the medical school Many members of the Beth Israel Hospital Staff are already on the faculty of the New York University College of Medicine, and with the further development of this affiliated teaching program, it is anticipated that this number will increase during the coming year

The Board of Directors of the New York Eye and Ear Infirmary, oldest hospital of its kind in North America, voted recently to join the New York University-Bellevue Medical Center project planned for the Bellevue area

The New York Eye and Ear Infirmary will retain its identity under the new arrangement but will occupy a section of the new University Hospital when completed. The Infirmary is now housed in a half-century-old building at Second Avenue and Thirteenth Street

The Woman's Hospital, at Amsterdam Avenue and 110th Street, making its first public appeal for funds in ninety-one years as a center for treatment of women's diseases, began on April 1, a campaign for $100,000 to help meet increased expenses.*

A campaign for $300,000 to increase the capacity of Hillside Hospital, Queens, from 88 beds to 200 began in March The institution cares for curable cases of mental illness. The drive will close on June 6 with a dinner in the Hotel Waldorf Astoria *

Dedicated to the prevention of cancer and its detection in early stages, the Queens General Cancer Prevention Clinic was opened in May in Queens General Hospital.

The new service, which will be free, will provide treatment to eradicate conditions which may lead to cancer, and for cancer which is detected early No cancer cases already diagnosed will be accepted Statistical studies of scientific facts accumulated at the clinic will be made from time to time *

The founding of Nassau Hospital in Mineola in 1896 will be celebrated the week of May 19 with the observance of National Hospital Day, it has been announced by George L. Davis, executive director of the hospital

The fiftieth anniversary program will be inaugurated with a vesper service at the Cathedral of the Incarnation, Garden City, May 19 when the annual American Red Cross memorial service in honor of Florence Nightingale will also be held.

Exhibits of the work of the various departments of the hospital will be open to the public in the auditorium on the hospital grounds May 22 and 23 A play with a hospital setting also will be given by the staff and personnel at Mineola High School May 22.*

Tentative plans for a 50-bed addition to the Norwich Hospital submitted by George Bain Cummings and Charles Conrad, architects of Binghamton, were presented at the regular meeting of the board of directors at the hospital.

The board will study these plans, perfecting them where necessary to put them into workable condition, and when materials are available a campaign to finance the project will be set up

At the present time Norwich Hospital has a 70-bed capacity, fifty available to adult patients and 20 for children. The new addition would add to the much needed adult capacity *

Sister Mary Esther Redmond, of St Peter's Hospital, was on April 8 named to head a survey of Albany Hospital needs and postwar building programs. She was appointed at a regional session of the State Postwar Public Works Planning Commission at the State Health Laboratory

The meeting the first in the Albany region, was under direction of Dr Thomas Hale medical director of Albany Hospital. It was attended by more than 100 health and hospital executives from

* Asterisk indicates that item is from a local newspaper

13 counties in this part of the state All officials expressed their belief the region is in serious need of more facilities It was stated Albany can use twice as many hospital beds as it has

The survey is to be completed by June and from the facts it will be known how much Federal assistance can be given in a building program The Federal government provides up to one-third of the cost of the expanded facilities Albany Hospital, the first to launch a postwar campaign has reached one-third of its $3,000,000 goal, Alfred Renshaw, president of the Board of Governors, announced

Albany Hospital needs a 430-bed addition to its 630 Memorial and St Peter's hospitals have plans for expansion but none has been announced *

• • •

To help Albany Hospital "expand its important and indispensable services to the people" F C Huyck and Sons, manufacturers of Kenwood wool products, has forwarded a $30,000 subscription to the hospital's $3,000,000 building fund

The building fund also has received a $5,100 gift for a memorial unit in honor of employees of Finch, Pruyn & Co , Inc , Glens Falls paper concern.*

• • •

Three meetings of volunteer workers participating in the campaign to raise $2,000,000 for an addition to the Jamaica Hospital were held recently

While the number of volunteer workers is growing day by day, several hundred more are needed in order to reach every Queens home, according to Thomas D Austin, campaign chairman.

George M Gross and Dr Charles H Vosberg, chairman and co-chairman of the memorial and special gifts committee, spoke at the Jamaica Club *

• • •

Rhoads General Hospital was highly praised recently by Maj Gen. James A Van Fleet, the new commanding general of the Second Service Command, for the "orderliness, cleanliness, and perfection" of its service and for its "splendid spirit and desire to serve the sick and wounded combat veterans"

The general addressed nearly 1,000 patients and duty personnel in the patients' recreation hall immediately after he presented to Col A J Canning, Rhoads' commanding officer, the Legion of Merit—the second Colonel Canning has won in World War II *

• • •

Three physicians in Utica State Hospital, two of whom are senior psychiatrists, and the third, assistant director, have resumed their duties after an absence of several years in the Army Medical Corps They are Maj Thaddeus T Piekielniak and Dr James N Palmer, former captain, senior psychiatrists, and Dr Duncan Whitehead, former colonel, assistant director *

• •

Despite personnel shortages the Ilion Hospital during 1945 attempted to give "sound and efficient care to patients" according to the annual report released in March by the hospital association directors through Helen C Anthony, superintendent

"Without the help of doctors as well as the help from other departments in the hospital which make up the service to patients, we would not have been able to give as good care," she said *

• • •

The Cortland County Hospital is a busy institution these days All departments, except the medical department which has long been closed, are open In April the women's ward was reopened and 14 of the 15 beds occupied Highest number of patients in a single day recently reached 124 *

• • •

Forty-two physicians who served in the military forces, some still in uniform, were welcomed home at a dinner given by the medical staffs of St Agnes and White Plains hospitals at Scarsdale Golf Club recently

Dr Alan Gregg, of Scarsdale, Director of Medical Research and Education for the Rockefeller Foundation, discussed the medical problems of Europe

Other speakers were Mayor Silas S Clark, A D Wolff, Jr , president of the White Plains Hospital Board, and Dr Daniel MacDonald, president of the St Agnes Hospital Medical Board *

• • •

Dr Joseph V Tabacco, of Albany, formerly a major in the Army who was overseas 23 months, has resumed his practice He is a graduate of the Albany Medical College and is a member of the associate staff at St Peter's Hospital.*

• • •

First full-time doctor to be assigned to handle outpatient veterans' cases in this area, Dr Carlos E Rodriguez has moved into the Binghamton Veterans Administration contact office in the Press Building

He will be available from 8 A M to 5 P M. Monday through Saturday to treat all service-incurred disabilities No appointments are necessary for treatment

In some emergency cases where a veteran's claim for service-connected injuries is still pending, Dr Rodriguez will also handle the case *

• • •

Doctors, nurses, and staff members of General Hospital in Rochester, who served with the 19th General Hospital unit heard their organization lauded recently at a dinner in their honor at the Chamber of Commerce

A citation signed by United States Surgeon General Norman T Kirk praised the hospital for its work in organizing and staffing the 19th, saying that by its experience and skill it reduced the mortality of U S troops to a record unequaled by any nation. The engraved certificate was presented to Col Lloyd F Allen, now chief of the medical service at General Hospital and formerly second in command of the 19th, and to Dr Frank C Sutton, acting medical director of the hospital

The 19th, successor to the famed Base Hospital 19 of World War I, was organized in Rochester at the beginning of the war and in July, 1942, left the city under command of Col Edward T Wentworth In August, 1943, the group was sent to England, landing at Utah Beach, France, and was later established at Le Mans *

• • •

The National Cancer Institute, U S Public Health Service, has approved loan of 100 milligrams of radium to the Genesee Hospital, Rochester, N Y

This is the sixth hospital in New York State to receive a loan of radium from the Cancer Institute,

the other five being Strong Memorial Hospital, Rochester, Albany Hospital, Albany, Vassar Brothers Hospital, Poughkeepsie, Meadowbrook Hospital, Hempstead, and Binghamton *

An extensive renovation and redecoration program is underway at the Alice Hyde Hospital in Malone with the plan to do over the entire interior of the institution within a couple of months

By National Hospital Day, May 12, Miss Isabel M Reardon, superintendent, said, it is hoped to have every room and corridor in the hospital in bright gay attire a long felt need but delayed by the war conditions when necessary materials were not available.*

The Albany Hospital Building fund has received a new contribution of $10,500 toward the $3 000,000 project to transform and expand the institution into a modern medical center, it was announced in April.

The City and County Savings bank is the donor, according to a report by Alfred Renshaw, chairman of the hospital campaign committee on corporation subscriptions *

Dr Harold McGan, who served as a lieutenant colonel in the Army, and Dr Albert Vander Veer, former Navy captain, were recently welcomed back to the Memorial Hospital staff in Albany by Dr Arthur M Dickinson, chief surgeon. Staff members welcomed returning veterans at a dinner at the De-Witt Clinton.*

The citywide drive to raise $300,000 for Mount Vernon Hospital was launched April 1 *

Work has been begun to reconvert to civilian use the $2,000,000 Lebanon Hospital building which was leased to the Army soon after its completion in July, 1943, L. Victor Weil, president of the institution's board of trustees announced. The hospital, located at Grand Concourse and 173d St. was expected to be opened early in April, Mr Weil said.

A nonprofit voluntary institution affiliated with the Federation of Jewish Philanthropies of New York, Lebanon will serve as a general hospital and will include maternity and pediatric services. It will have a capacity of 200 beds and emergency facilities for an additional 40 *

Improvements

All 17 beds on the fourth floor of the Rome Hospital are now occupied Miss Mary C Murphy, superintendent, said recently The floor was opened to patients for the first time in two years *

The nursery at the Peekskill Hospital was recently completely renovated and remodelled along the plans suggested and recommended by leading pediatricians and obstetricians.

Individual bassinettes, providing separation of all newborn infants, have been substituted for the multiple-type bassinette

There has been added an examining booth for physicians, which makes it possible for the doctor to examine newborn infants without entering the nursery No one may enter the nursery except the nurses working in it, thus eliminating the possibility of carrying diseases to the babies.

Attached to the nursery is a new and completely modern formula room

The 'newborn' nursery is equipped with the latest type germicidal lamps, recommended for use in modern hospitals by the American Medical Association. Cost of this improvement approximated $5 000, part of which came from the general operating funds and part of which was subscribed by the Mohegan Lake Park Association.

The furnishings, including individual bassinettes and drapes were provided by the Peekskill Hospital Auxiliary *

Ten food trucks have been ordered by White Plains Hospital through money contributed by the Scarsdale Woman s Auxiliary, it has been announced at a meeting of the hospital s Central Volunteer Committee at the nurses residence.*

Herkimer Memorial Hospital recently received its fourth gift from members of William Hempstead Post, VFW, Ilion, when Commander Harold Walrath and two World War II veterans, Edward Moreau and Roy Gurney, presented a wheel chair

Previous gifts included a fracture bed and a wheel chair according to George J Sluyter, hospital board president, who expressed appreciation for the fine work the Ilion VFW post has been doing for Mohawk Valley hospitals *

A walker designed to help wounded veterans regain use of their legs was donated in March to the Marine Hospital of Buffalo, by the Auxiliary of Hamburg Post 517, Veterans of Foreign Wars. Presentation was made by Mrs. Violet Milks, president, to Dr H E. Trimble, medical officer in charge of the hospital.*

The major equipment for the Corning Hospital formula room, an autoclave, was recently given by the Rotary Club It is steam-heated, with automatic control, special valving, piping, and regulating for nonpressure sterilization as well as for pressure sterilization complete with 12 six-bottle racks, and floor-stand mounting.

Also, there will be installed a refrigerator with a capacity of a day's supply of milk, and a monometal sink with built-in hot plate of stainless steel, and accessory table and chairs

Convenient both to the nursery and pediatric section, the formula room will be located in a section of the sunparlor or third floor porch in the southeast wing where the new and old buildings connect.*

The $60 000 project of completing the third floor of the new wing at Flushing Hospital has been completed.

Its completion adds rooms and facilities for 37 additional beds for medical and surgical cases, bringing the hospital's bed capacity to 358 *

• • •

A new, ultra-modern bacteriological laboratory was recently opened in the DeGraff Memorial Hospital It will add greatly to medical facilities in the Tonawandas Arthur Ranney, the new lab technician, stated that the hospital is the "best equipped institution of its size" he has seen in 15 years' experience *

• • •

Southampton Hospital has installed some new equipment, and has more on order as soon as it can be supplied Several new features are hoped for, early in 1946 A very important addition, announced after the Southampton Hospital Association's board meeting last Saturday, will be complete new equipment for an eye clinic, made possible by a special donation. A new x-ray machine is the indirect gift of Mrs George Roberts, of New York and East Hampton. The order for this machine was made possible by the gift of Mrs Roberts' Lee Avenue, East Hampton house to the hospital and its sale a few months ago *

• • •

New x-ray equipment costing $7,500 has been put in operation at the Southside Hospital *

• • •

Zachary D'Jimas, past chef de gar of the Forty and Eight, Albany county local, American Legion, in March presented a new portable x-ray machine to Childs Hospital in Albany *

• • •

Voiture Locale No 51, 40 and 8, American Legion honor society, in March presented Lafayette General Hospital, Buffalo, with a resuscitator to be used in emergency cases *

• • •

Cooperating with the Veterans' Administration, Wyckoff Heights Hospital in Long Island in March opened its clinics for the examination of disabled veterans of World War II who are outpatients of the Veterans Administration The clinics will be open for the same purpose, so long as the need persists, on Monday, Tuesday, Thursday, and Friday evenings from 6 00 to 9 00 P.M , and on Wednesdays from 2 00 to 5 00 P M *

At the Helm

Miss Alice E Snyder, R N , has taken up her new duties as superintendent of the Geneva General Hospital

Miss Snyder succeeds Miss Florence Bloomer who recently resigned after ten years' service as superintendent *

• • •

Dr Benjamin Lewis, a World War II veteran, has been named assistant superintendent of the Broome County Tuberculosis Hospital *

• • •

Appointment of Dr Albert D Kaiser, city health officer, as executive director of the new Council of Rochester Regional Hospitals, was announced in March by Thomas R White, council president

Dr Kaiser, who will continue the duties of his public office, will immediately take over the leadership of the experimental regional hospital and medical project *

• • •

Dr Carlton F Potter, widely known as a roentgenologist and orthopedic surgeon, has been elected president of Crouse-Irving Hospital in Syracuse

Dr Potter has been secretary since the hospital was founded by Dr William L Wallace in 1912 He succeeds Dr Norman J Pfaff of Rochester Dr Pfaff had held the office since Dr Wallace died in 1935

Dr Potter is past president of the Syracuse Academy of Medicine He was one of the organizers and for many years was president of the Central New York Roentgen Ray Society

Officers re-elected at the annual meeting of the board are Dr Herbert O Brust, vice-president, Dr Carl E Muench, treasurer, and Charles S Ibson, secretary *

The board of managers of the Norwegian Deaconess Home and Hospital, Brooklyn, have re-elected Peter Berge as president of the board. Mr Berge, who has been an active board worker for 38 years, was praised for his "faithful service" by Arthur Louis, who was chosen secretary to succeed himself and spoke in behalf of the other members of the group

The other officers, also re-elected, include Charles E Larsen, vice-president, Wilhelm Reimann, treasurer, and John Knutson, assistant treasurer *

• • •

Dr Douglas A. Calhoun was elected president of the Samaritan Hospital medical staff at the annual meeting

Other officers elected included Dr William Trotter, vice-president, Dr Elizabeth Palmer, secretary, and Dr Hermon Gordinier, recently returned from the service *

• • •

Dr Harry A. Pattison, of Livingston, has been appointed consulting physician at the Veterans Administration Hospital for the Care of the Tuberculous at Castle Point It is expected that he will visit the hospital once a week Dr Pattison is director of the Potts Memorial Institute at Livingston *

• • •

Dr Chauncey M Lapp, of Corning, practicing physician here since July, 1929, was named president of the Board of Directors of Corning Hospital to succeed Dr Luther A Thomas, of Painted Post *

• • •

Dr John D Carroll was elected president of the Troy Hospital staff at the annual meeting Dr

Clement J Handron was named vice-president and Dr Charles R. Lewis, secretary Dr Carroll is a veteran of World War I, past president of both the Rensselaer County Medical Society and the Kiwanis Club, and past lieutenant governor of the New York District, Kiwanis International.*

Dr Irving C Seigel, of New York City, who served 22 months overseas as a battalion surgeon with the Fifth Armored Division, has been appointed house physician at General Hospital in Utica to succeed Dr David Edelstein.*

Col Tracy Bryant, Syracuse, formerly of Sidney, has been named chief of surgical service at Valley Forge Hospital, Phoenixville, Pa

A veteran of both World Wars, Colonel Bryant commanded the 204th general hospital on Guam for ten months prior to his new appointment.*

Dr Albert W Snoke, assistant director of Strong Memorial Hospital, has been appointed director of the New Haven Hospital, in conjunction with Yale University *

Dr Paul D Shafer is the new president of the Brooklyn Hospital. He was elected at the annual meeting of the hospital trustees to succeed Adrian Van Sinderen who resigned at the end of sixteen years of service.*

Announcement has been made by the Clifton Springs Sanitarium of the appointment of Dr Bernard A. Watson as chief of the medical staff Dr Watson formerly held a similar position in the Battle Creek Sanitarium, which was taken over by the Army For the past five years he has served as lieutenant-colonel in the Medical Service.*

Dr Robert R. Cadmus of New York City, has been named director of the Vanderbilt Clinic of the Columbia Presbyterian Medical Center, it was announced recently by John S Parke executive vice-president of the Presbyterian Hospital.*

Frank B Adair has been appointed to the first administrative internship established at Sydenham Hospital, it was announced recently under its new plan of including hospital management in its program of training hospital personnel. The announcement said that Mr Adair was the first Negro to win this recognition in any voluntary hospital in the United States.

David M. Dorin, executive director of the hospital, said that Mr Adair won the appointment on the basis of his marked personnel and professional qualifications after completing six months as a fellow in hospital administration at the hospital. He is an alumnus of Morehouse College, has studied at Harvard and Langston Universities and was formerly chief business officer at Arkansas State College, business manager at Dillard University, and production manager and administrative officer at Tuskegee Institute.*

Dr Olaf J Severud, formerly on the staff of the Woman's Hospital, New York, and now on terminal leave from the U.S Navy, is now obstetrician-in-chief of Bassett Hospital, Cooperstown.*

Captain Charles B Richards, Medical Corps, Army of the United States, formerly of Oswego, now on terminal leave following his return from the European theatre of operations, has been appointed resident physician of Auburn City Hospital.*

Dr Scott Lord Smith was elected president of the medical staff of Vassar Brothers Hospital at the annual meeting of the staff Dr William E. Garlick was elected vice-president, and Dr Emil A. Stoller, secretary *

Dr Donato V Catalano, of West Brighton, Staten Island, will head the medical board of St. Vincent's Hospital for the next year, Sister Mary Ignatius superintendent, has announced. As president, he succeeds Dr Peter J Timpone Stapleton surgeon, who has served for two years, the maximum allowed under the hospital s bylaws.*

A Schenectadian, a graduate of Union College and Albany Medical School, Dr Edwin L. Crosby, has been appointed director of the Johns Hopkins Hospital, Baltimore, Maryland.*

Dr A Verne Johnston was appointed to ward surgical services and Dr Harry J Davis to ward medical services at a recent meeting of St. Luke s Hospital staff *

Dr Edward G Eschner, of Ebenezer, has been appointed chief roentgenologist at Meyer Memorial Hospital, Buffalo, by the hospital board. He served in that capacity at the 23rd General Hospital with the armed forces and was released from the service December 6 *

At the annual meeting of the Leonard Hospital Medical Staff in the Troy Club, officers for the year were chosen

Dr Edmund C Wallner, was elected president, Dr Francis Mastrianni vice-president, and Dr G Elmer Martin, secretary-treasurer The annual report was given by Dr E. A. Parras, retiring secretary-treasurer *

Dr Henry L. Turkel of the Bronx, has been appointed Chief of Allergy and adjunct Professor of Medicine at Polyclinic Medical School and Hospital, New York City *

GRADUATE COURSE IN INTERNAL MEDICINE OFFERED AT CORNELL

Cornell University Medical College is offering a graduate course in internal medicine for six months It began April 1, 1946 The teaching facilities of the Second Medical Division, Bellevue Hospital, New York City, comprising one hundred and forty-five beds, will be devoted exclusively to this work The instructors will be members of the teaching staff of Cornell University Medical College The course will be designed to give practical instruction in the subjects of internal medicine, neurology, pediatrics, and pathology

The major feature of the course will be a period of practical experience on the wards and in the out-patient department at Bellevue Hospital The first two weeks, however, were devoted to didactic instruction in the form of lectures, conferences, and demonstrations in the fields of internal medicine, and neurology

This two weeks' refresher course was attended by a maximum of fifty physicians, including those who have registered for the practical course

Registration for the complete course will be limited to twenty-five physicians The work will consist of daily bedside study of patients on the medical and neurologic wards Each physician will be assigned patients and will cooperate with the house staff and attending staff in the diagnosis and care of these patients Each week, pathologic, medical, chest, gastrointestinal, x-ray, and combined medical-surgical conferences will be held There will be an opportunity for a limited number of men to obtain special training in cardiology, hematology, diabetes, endocrinology, and gastrointestinal diseases by working in these special clinics A clinical conference in pediatrics will be held weekly by the Department of Pediatrics, Cornell University Medical College, under Dr Samuel Levine

Veterans will have preference, but doctors from civilian practice will also be accepted

Inquiries should be addressed to Dr John E Deitrick, Director, Second (Cornell) Medical Division, Bellevue Hospital, First Avenue and Twenty-sixth Street, New York 16, New York.

Woman's Auxiliary

To the Medical Society of the State of New York

New Officers Installed at Convention

Mrs. Alfred L. Maddon, of Albany, was installed as President of the Woman's Auxiliary to the Medical Society of the State of New York, at sessions held in conjunction with the State Medical Society during the week of April 28. Mrs Maddon replaced Mrs. Edwin A. Griffin, of Brooklyn

Members of the Auxiliary and other doctors wives attended the four-day sessions held in the roof garden of the Hotel Pennsylvania. Mrs. Clifton Dance was in charge of registrations.

Dr William Hale, of Utica, who took office as president of the State Society addressed the post-convention meeting of the executive board The Auxiliary held its customary luncheon and the cocktail party preceding the Annual Meeting and banquet of the State Society The luncheon was held in celebration of the tenth anniversary of the Auxiliary's founding Mrs. John L Neubert, of Nassau County, was in charge of planning this event.

Mrs. Charles R. Seymour of Binghamton, convention chairman, was assisted on her committee by Mrs. Griffin and Mrs Neubert, Mrs. Albert M Bell, Mrs. Henry J Jauch, Mrs. Albert F Andresen, Mrs. Nelson M Holden Mrs. Dance, Mrs. Morris W Henry Mrs. George H. Smith, and Mrs. Harry H Hamilton

Honored guests of the Auxiliary were Dr Edward R. Cunniffe, President of the State Medical Society, and all past-presidents These included Mrs John L. Bauer, of Brooklyn, Mrs. Luther M Kice of Garden City Mrs. Scott Towne, of Saratoga, Mrs Carlton E Wertz, of Buffalo, Mrs. Francis Irving of Syracuse Mrs Daniel Swann, of Flushing, Mrs. J Leslie Sullivan of Scotia, and Mrs. Michael Schultz, of Hollis.

County News

Kings County The annual meeting and food sale was held at St Bartholomew s Community House by the Woman's Auxiliary to the Medical Society of the County of Kings. Mrs Henry J Jauch presided.

The following officers were elected at the annual meeting president-elect Mrs. George H Smith, first vice-president, Mrs. Nelson M Holden second vice-president, Mrs. Walter J Puderbach, recording secretary Mrs. A. Von Prief Fardelmann, corresponding secretary, Mrs Harry H Hamilton treasurer, Mrs Leo Schwartz, assistant treasurer Mrs. Ottokar Tenopyr, director for three years Mrs. Henry J Jauch, and director for three years Mrs. Robert F Barber

A very successful food sale was held for the benefit of the Physicians' Home

Miss Cane, representative of the George Jensen Company silversmiths, gave a short biography of the famous craftsman his works, ideals, ambitions and success. There was a fine display of silver from the George Jensen collection.

There were eighteen new members present. The meeting was the largest and most enthusiastic in several years.

Oneida County The Woman s Auxiliary to the Medical Society of the County of Oneida met on April 2, at the Rome State School, Rome, where they enjoyed a luncheon as guests of Dr and Mrs. R. J Kelleher Twenty five members were present. Dr Kelleher gave a most interesting talk on the history and systems of the school, following this with moving pictures in technicolor showing the various activities of the school. A brief business meeting followed, presided over by Mrs Bradford Golly, of Rome. The following delegates were appointed to attend the convention at the Hotel Pennsylvania in New York, April 29 to May 3 from Rome Mrs. Golly, Miss Helen Mellon and Mrs. Frank Valone as alternate, from Utica, Mrs. Philip Turner and Mrs William Hale.

A program of vocal and piano selections followed.

The next meeting will be held May 7 in the Catholic Women's Club Utica, when the election of officers will take place

Onondaga County On March 15 with Mrs Robert D Fairchilds acting as volunteer chairman, the following members of the Auxiliary visited the County Home and Hospital Mrs. John J Buettner, Mrs Paul Clark Mrs. L W Ehegartner, Mrs. A. Carl Hofmann Mrs. J B Naselli, Mrs. R. J McNerney, Mrs. Dwight V Needham, Mrs. Edgar N Neptune, Mrs. Robert Rowner, and Mrs. John Thomson

Mrs. S W Bisgrove opened her home for the April meeting of the Auxiliary Mrs. A. Carl Hofmann, chairman of legislation, introduced the speaker of the evening, Mr J Campbell Butler, executive director of the Central New York medical plan, who discussed nonprofit medical insurance plans and proposed state and federal health legislation

The Benevolence committee met at the home of Mrs. A. C Silverman. Cochairmen were Mrs. Silverman and Mrs A. Carl Hofmann. Members present were Mrs. Albert Garofalo, Mrs Francis Irving, Mrs. George Murdock, Mrs. Dwight V Needham and Mrs W W Street. The following recommendations were made

1 Eleven camperships of two weeks each are to be given to agencies as follows two each to the Salvation Army Jewish Community Center, Catholic Youth Organization, and one each to the Neighborhood House Huntington Club, and Syracuse Boys' Club

2 In case no other benevolence is approved by May 7 1940 forty-eight dollars is to be taken from the fifty three dollars remaining in the Benevolence Fund and will be used to provide two camperships of two weeks each, one to Huntington Club and one to the Neighborhood House

The recommendations have been adopted by the Board and by the Organization as a whole.

Delegates to the Annual Meeting of the Woman's Auxiliary to the Medical Society of the State of New York, April 29-30 in the Hotel Pennsylvania, New York City, were Mrs. A. Carl Hofmann, Mrs. F R. Irving, Mrs George Hemmer, Mrs C G Murdock, Mrs J Edward Renaud, Mrs Francis Rosenberger, and Mrs. W W Street Also attending were Mrs Dwight V Needham, county president, Mrs. J J Buettner a state director Mrs. Gerald C Cooney, state legislative chairman and Mrs Edgar M Neptune state recording secretary

Books

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N Y Acknowledgment of receipt will be made in these columns and deemed sufficient notification Selection for review will be based on merit and interest to our readers

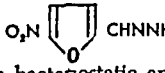
REVIEWED

An Index of Differential Diagnosis of Main Symptoms By various writers Edited by Herbert French, M D , assisted by Arthur H Douthwaite, M D Sixth edition Quarto of 1,128 pages, illustrated Baltimore, Williams & Wilkins Co , 1945 Cloth, $17

It is not often granted an editor to write a preface to a sixth edition thirty-three years after writing the preface to the first, and although he designates an old pupil and collaborator as the heir-presumptive to any future editions it is to be hoped that he will continue as the editor for many more years

This edition has nearly 800 illustrations, of which 231 are colored It requires no stretch of the imagination to appreciate the enormous task the editor and his collaborators have had to keep this extensive volume up to date The trials and difficulties created by the war were so great that "at one time it seemed impossible to bring out a new edition at all " But here it is in all its 1,128 pages, 183 of which constitute a general index This gives one an idea of the vast number of subjects covered Of course, by "subjects" is meant "symptoms," for the full title of this work is *Index of Differential Diagnosis of Main Symptoms*



The reviewer regrets that limited space prevents emphasis of the many excellent features this work presents How thoroughly each symptom is treated is illustrated by the 69 pages devoted to a consideration of pain. As an example of the excellence of the illustrations those on pages 429 and 430, showing the

Announcing

a New Chemotherapeutic Agent

The nitrofurans, a new class of antibacterials, are a recent discovery of Eaton Laboratories[1] One, especially, is highly effective This has been named Furacin

Furacin is bacteriostatic and bactericidal to many *gram-positive* and *gram-negative* bacteria, and remains effective in the presence of body fluids It is stable and low in toxicity

First Available in FURACIN SOLUBLE DRESSING

Dissolved in a bland, water-soluble base, Furacin is first presented in Furacin Soluble Dressing, for topical treatment of wound and surface infections This preparation liquefies at body temperature and is soluble in blood, pus and serum, which aids penetration to all parts of wounds It is non-irritating, has a low index of sensitization and does not interfere with healing processes

The outstanding results of clinical trials in both military[2] and civilian[3] practice indicate that it possesses important advantages in comparison with sulfonamides and penicillin used topically

Indications:

Infected surface wounds, or for the prevention of such infection—infections of third and fourth degree burns—carbuncles and abscesses after surgical intervention—infected varicose ulcers—superficial ulcers of diabetics—secondary infections of eczemas—impetigo of infants and adults—treatment of graft sites preparatory to skin grafting, and later, to prevent infection—osteomyelitis associated with compound fractures—secondary infections of dermatophytoses

[Continued from page 1044]

roseola of typhoid in one and the characteristic rash of typhus in the other, are exactly as one sees at the bedside The value of this work to the student and practitioner of medicine must prove inestimable

S R Blatteis

A Manual of Surgical Anatomy Prepared Under the Auspices of the Committee on Surgery of the Division of Medical Sciences of the National Research Council By Tom Jones and W C Shepard Quarto of 195 pages, illustrated Philadelphia, W B Saunders Co , 1945 Cloth, $5 00 (Military Surgical Manuals)

All the material for this manual was produced by the University of Illinois, College of Medicine It is one of a series developed under the asupices of the Division of Medical Sciences of the National Research Council.

The work as a whole comprises anatomic illustrations, many in color, covering the entire body, beginning with the skeleton, and the head and neck, trunk (thorax and abdomen), and the extremities

The entire book of 195 pages is constructed and arranged so as to aid the surgeon in his approach to areas of which the surgical knowledge is very common, and to other areas where the average knowledge is less common The book will serve as a splendid review medium for the operating surgeon as well as the student of surgical anatomy

Although one must presuppose an intimate knowledge of anatomy by dissection, the work of Mr Jones and Mr Shepard is so skillfully presented by drawings that many forgotten points are revisualized The text should be in the hands of military surgeons, but civilian surgeons may profit equally

Robert F Barber

Handbook of Industrial Psychology By May Smith, D Sc Octavo of 304 pages New York, Philosophical Library, Inc , 1944 Cloth, $5 00

Industrial psychology is once more in the public eye, especially since the return of a large number of soldiers to industry became imminent It is, therefore, a timely book.

It is intended to be an introduction to those who are in some way responsible for dealing with the workers, their efficiency, comfort, and safety

The effect of hours of work, the effect of the environment, of the selection of individuals for a job suitable for them, the cause and control of accidents, are all considered in the light of experimental research over the past twenty years

The author is correct in assuming that most of us know very little of the problem, but we must realize the desirability of solving it With manpower shortage and absences due to illnesses and accidents, decreased efficiency becomes an important factor in war and in reconversion. For that reason this book becomes a "must" for those who deal with the problems of labor and industry

A brief history of the growth of industrial psychology enhances the value of the book.

Joseph L Abramson

A Synopsis of Medicine By Sir Henry Lethbey Tidy Eighth edition Duodecimo of 1215 pages Baltimore, Williams & Wilkins Co , 1945 Cloth, $6 00

The eighth edition of Tidy's book continues in its tradition of being a highly satisfactory medical compendium All the useful features of previous editions have been retained and all late advances, such as the Rh factor, are also included Penicillin is mentioned only in the preface, but the reviewer agrees with the editor that it was wise to postpone discussion of this therapeutic agent at the time this edition went to press In any case, this omission will scarcely detract from the value of the book as a synopsis and *vade mecum* of internal medicine

Milton Plotz

Medical Care of Merchant Seaman. A Handbook of Ship and Aircraft Sanitation and Emergency Medical Aid By W L Wheeler, Jr , M D Duodecimo of 212 pages, illustrated New York, Cornell Maritime Press, 1945 Cloth, $2 00

The Medical Director of the Grace Lines wrote this handbook for hospital corpsmen It is designed to be placed on all merchant ships for the guidance of seamen Medical procedure on shipboard, the medicine chest, first aid, and the diagnosis and treatment of miscellaneous conditions are among the subjects discussed It is of pocket size, and contains a wealth of material The author writes concisely and very well Descriptions of diseases are clear, vivid, and complete for the space allowed The use of penicillin is more restricted than it probably will be in future editions, for this book was written when the supply was very limited This is an excellent book which should be well received

Victor Grover

A Handbook of Psychiatry By Louis J Karnosh, M D , with the collaboration of Edward M Zucker, M D Octavo of 302 pages, illustrated St Louis, C V Mosby Co , 1945 Cloth, $4 50

The medical student and general practitioner should feel particularly grateful to the authors for their compilation of such a "tidy" handbook of psychiatry The experienced psychiatrist readily senses the rich experience of whole cloth out of which each chapter is woven It is trimmed of everything except the generally accepted psychiatric understanding and treatment of the types of mental illnesses confronting the medical profession Well-selected case histories clarify various descriptions of psychiatric reaction types and thus make not only for simplification but facility in recognition and treatment The chapter on legal aspects of mental disease enhances its value

Frederick L Patry

Men Under Stress By Lt Col Roy R Grinker, (MC), and Maj John P Spiegel, (MC), Army Air Forces Philadelphia, Blakiston Co , 1945 Cloth, $5 00

The authors of the book are acknowledged leaders and teachers of neurology and psychiatry, who have done much in advancing their respective specialties, and whose textbooks are recognized as authoritative texts in these fields of medicine They have seen active service on the battlefield and in military hospitals and convalescent centers In writing the book they have given their own experience with neuropsychiatric casualties, having studied these patients with trained and experienced minds and eyes Therefore, the book is truly a most authoritative account of the war neuroses and psychoses It is written "as free from scientific jargon" as is possible, and therefore should prove of interest to all intelligent people who are interested in human beings under stress The authors have made the

[Continued from page 1046]

most of their opportunities, and have written a truly "must book," for it is a book that covers the subject thoroughly, scientifically, and most interestingly It is a book which no intelligent person should fail to read

IRVING J SANDS

The Art of Anaesthesia By Paluel J Flagg, M D Seventh edition Octavo of 519 pages, illustrated Philadelphia, J B Lippincott Co, 1944 Cloth, $6 00

The present edition has many improvements Flagg's masterful handling of the subject of general anesthesia is further enhanced by chapters on local anesthesia and regional nerve block The book is well illustrated and written in clear and concise language Practicing anesthesiologists and those learning the specialty will find valuable references when consulting this volume and it remains today, as it has been for years past, a standard textbook on inhalational anesthesia

F PAUL ANSBRO

The Art of Medicine in Relation to the Progress of Thought. By A E Clark-Kennedy, M D Duodecimo of 48 pages Cambridge (Eng), The University Press, 1945 (New York, Macmillan Co) Paper, $0 75

This little treatise of 48 pages is a lecture delivered in the history of science course in the University of Cambridge To read it requires concentration of thought and good mental digestion Its perusal leaves one with the impression that medicine is not limited to the textbooks but that its development has influenced thought in every period of history The general trend of this lecture is illustrated by the following quotations "Medicine has to deal with human personality, and human hopes, human fears, and human failings, in conjunction with the material human body A purely scientific education is inadequate for a profession which deals with so close a relationship between mind and matter" At the close the reader will feel that his medical horizon has been definitely widened

S R BLATTEIS

Anatomy and Physiology For Students of Physiotherapy, Occupational Therapy, and Gymnastics By C F V Smout, M D, and R J S McDowall, M D Octavo of 418 pages, illustrated Baltimore, Williams & Wilkins Co, 1944 Cloth, $8 00

This excellent book fills a want of long standing for the physical-therapy technician In a single volume is contained a most complete text of anatomy and physiology, such as would be required by this group Necessarily condensed, the text is surprisingly complete and presented in a clear manner, as nontechnical as possible Chapters on diet and metabolism, digestion, the ductless glands, and the effects of massage and exercise are of particular interest The chapter describing muscles in action, though brief, is complete and an excellent assay of its difficult subject The book is well written and clearly printed and illustrated. It can be highly recommended for the student as well as the advanced worker in physical therapy, and will be of considerable interest to the medical practitioner as well

JEROME WEISS

Modern Cosmeticology By Ralph G Harry, F R I C (Eng) Second edition Octavo of 432 pages, illustrated London, Leonard Hill, Ltd, 1944

In the foreword, Professor Mumford, one of England's foremost dermatologists, gives credit to the author for narrowing the wide channel between dermatology and the physicochemical problems of beautifying preparations Of the latter, many of proved value are recognized Each has much to learn from the other Here is a book written by one of the world's most famous authorities on his subject, it is a reference work of the most exceptional value to every dermatologist and pharmacologist who realizes the importance of having the fullest possible information on the composition and preparation of the many elements which enter into the applications and remedies offered our profession today As an expert microscopist and photographer, Harry has illustrated his work with many excellent colored plates The chapter on the hair, its growth and care, is well worth the price of the volume, and that on allergy and dermatitis is most instructive In the forty-six chapters, every possible angle of cosmeticology has been considered and treated exhaustively in the most comprehensive manner, and the book abounds in methods of pharmaceutic preparation and composition With such a book at hand, the dermatologist is well fortified to meet any problem arising in his determination of proper medication

NATHAN THOMAS BEERS

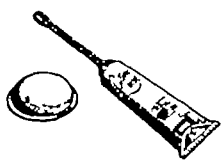
Modern Psychiatry By William S Sadler, M D Octavo of 896 pages St Louis, C V Mosby Co, 1945 Cloth, $10

This highly recommended 896-page book will bring much combined pleasure and profit to the medical reader The text is divided into four parts, namely personality problems, the psychoneuroses, the psychoses, and general psychotherapeutics The latter is particularly complete and informative, including a full discussion of shock therapy The other subjects are dealt with very well, the writer employing his some forty years of experience in a constructively critical manner The glossary provides the uninitiated with an excellent guide

As the author has anticipated, his book may fall short of satisfying some of the specialized schools of psychiatry, for example, in listing the six master urges which dominate the human personality, the sex urge is placed fourth Hypnotism is aptly described as having been enthusiastically tried and found woefully wanting, the author agreeing, at least in this respect, with Freud, who spoke of hypnotism as being merely a psychic cosmetic

LAURENT FEINIER

Psychiatry in Modern Warfare By Edward A Strecker, M D, and Kenneth E Appel, M D Duodecimo of 88 pages New York, Macmillan Co, 1945 Cloth, $1 50



This handy, inexpensive, pocket-size volume significantly culls the neuropsychiatric meat from the experiences of World War I and also that from World War II up to the present time Here the psychiatrist, general practitioner, and other interested persons can find the significant contrasts in the neuropsychiatric types of problems encountered in the two wars The authors, who write from first-

[Continued on page 1050]

CONSTANT TEMPERATURE ROOM—where Lanteen Jelly digests in huge vats until it reaches just the right consistency before going to the filling machines, typical of the modern equipment in Lanteen Medical Laboratories Control of the efficacy of its products, by latest scientific means, is the constant aim of Lanteen Medical Laboratories. Lanteen Lilac (Mensinga type diaphragm) is available *on the prescription of a physician*

Since patients are not mechanically minded, simplicity and ease of handling are prime requisites for continued use. Lanteen Lilac flat spring diaphragm is extremely simple to place—it is collapsible in one plane only No inserter required.

[Continued from page 1048]

hand experience, are eminently qualified to bring into focus the various facts and factors and their critical evaluation

Part II is devoted to "Demobilization and Return to Civilian Life" This summarizes the best opinion available in shaping our philosophy and methods of facilitating adjustments of returning servicemen to postwar status

FREDERICK L PATRY

Your Eyes Have Told Me By Louis H Schwartz, M D Octavo of 208 pages, illustrated New York, E P Dutton & Co , 1945 Cloth, $2 75

This is a book written for the lay public and contains a great deal of information which should result in a better appreciation of the importance of expert care of the eyes in cases of accident and disease, and a better understanding of the dangers of inexpert interference and advice It deserves a wide distribution It is written in an easily followed, nontechnical style A few instances of minor inaccuracies were noted, but these were of relative unimportance

CHAS A HARGITT

Dietotherapy Clinical Application of Modern Nutrition Edited by Michael G Wohl, M D Octavo of 1,029 pages, illustrated Philadelphia, W B Saunders Co , 1945 Cloth, $10

Dietotherapy is a large volume, consisting of a compilation of forty-four monographs by different contributors on various aspects of clinical nutrition It is broadly classified into three parts (1) normal nutrition, (2) nutrition in periods of physiologic stress, such as pregnancy, age, infancy, and physical activity, and (3) nutrition in disease

The contributors are all well-known authorities in their fields The book is comprehensive, up-to-date, and represents an important addition to the literature on the subject

WILLIAM S COLLENS

Technical Methods for the Technician By Anson Lee Brown, M D Third edition Octavo of 706 pages, illustrated Columbus, Dr Brown's School for Technicians, 1944 Cloth, $10

This book of over 700 pages covers in a very elementary and somewhat tedious fashion the various technical procedures used in the clinical laboratory For the most part it is primarily a collection of technical methods, many of which are not in general laboratory use at this time The illustrations are not of a particularly high order, the color plates being distinctly below the quality usually encountered in laboratory texts It is difficult for the reviewer to recommend this book to the laboratory technician, for whom it was primarily written, largely because there are many other books of more compact, complete, and modern format in the field at the present time

THEO J CURPHEY

Common Ailments of Man Edited by Morris Fishbein, M D Duodecimo of 177 pages, illustrated New York, Garden City Publishing Co , 1945 Cloth, $1 00

Laymen will find this book of considerable interest Dr Fishbein has collected a series of articles from *Hygeia* on common ailments which are of general interest They are authoritative and well written Such a book would be valuable for those physicians who give lectures for lay groups

VICTOR GROVER

Essentials of Body Mechanics in Health and Disease By Joel E Goldthwait, M D , Lloyd T Brown, M D , Loring T Swaim, M D , and John G Kuhns, M D Fourth edition With a Chapter on the Heart and Circulation as Related to Body Mechanics by William J Kerr, M D Duodecimo of 337 pages, illustrated Philadelphia, J B Lippincott Co , 1945 Cloth, $5 00

The fourth edition of *Essentials of Body Mechanics* gives a complete review of all systems in relationship to poor body mechanics The detection of body types with reference to diseases and treatment is covered

The internist, gynecologist, and orthopedist should read this manual The following quotation gives the true value of the book "Much of the gynecologic disability and long periods of weakness following some pregnancies can be explained on the theory that the compensation for longstanding faulty body mechanics has been broken by the burden of pregnancy and parturition, and that once this has occurred, the body is unable to regain its compensation and strength"

O C HUDSON

Your Hair and Its Care By Oscar L Levin, M D , and Howard T Behrman, M D Duodecimo of 184 pages, illustrated New York, Emerson Books, Inc , 1945 Cloth, $2 00

Written by two well-known dermatologists, this small but authoritative work offers the general public a valuable source of information on a subject which is of serious interest to us all It explains in simple language the most recent scientific knowledge of hair, hair diseases, and the proper care of the normal scalp Twenty pages in the last chapter of the book are devoted to a series of questions and answers which are most comprehensive and instructive Unfortunately, the few line illustrations are of little use from any standpoint, a few well-made photographs would have greatly enhanced the usefulness of the volume

NATHAN THOMAS BEERS

Periodontal Diseases, Diagnosis and Treatment, and Soft Tissue Lesions of the Oral Cavity In 2 parts By Arthur H Merritt, D D S Third edition Octavo of 256 pages, illlustrated New York, Macmillan Co , 1945 Cloth, $3 50

This edition has been prepared with the same care and thoroughness as the two previous ones The subject, which covers diagnosis, classification, histology, pathology, and treatment, has been further elaborated in a most complete and scientific manner, yet it is both pleasant and understandable reading The section dealing with soft-tissue lesions has been greatly enlarged It is fully illustrated and contains contributions from others who are interested in this particular branch of dentistry We consider it a most helpful book for the student As a reference work for the general practitioner, it is a must for his dental library

Biological Symposia. A Series of Volumes Devoted to Current Symposia in the Field of Biology. Edited by Jaques Cattell. Volume XI, "Ageing and Degenerative Diseases" Octavo of 242 pages, illustrated Lancaster, Jaques Cattell Press, 1945 Cloth, $3 00

This is certainly a welcome treatise, and an important one too Geriatrics and gerontology are no longer relegated to footnotes or entirely overlooked If one bears in mind that the life expectancy at birth in the U S in 1900 was 47 years and in 1940, 63 years and also that there are over nine million people in this country 65 years of age or over, you will realize the importance and extent of the problem, And it is this problem that is treated in a scientific and clinical manner in the course of thirteen separate chapters, each one covering a different phase of the subject The concluding chapter is a round-table discussion in which all the participants in this symposium discuss and sum up their various concepts No physician treating elderly patients can afford to deprive himself of the valuable material herein contained It is most highly recommended

S R. Blatteis

The Basis of Clinical Neurology The Anatomy and Physiology of the Nervous System in Their Application to Clinical Neurology By Samuel Brock, M D Second edition Octavo of 393 pages, illustrated Baltimore, Williams & Wilkins Co, 1945 Cloth, $5 50

This is the second edition of a text that has found for itself a very important position among books required for the understanding of clinical neurology Essentially it tends to explain signs and symptoms in the light of our present knowledge of neuroanatomy and neurophysiology There are twenty-four chapters, devoted to the description of the anatomy and physiology of certain parts of the nervous system, and to the alteration in physiologic processes in disease involving these and other parts of the nervous system It gives a dynamic approach and understanding of the different clinical signs and symptoms encountered in the different neurologic disorders It is a most valuable book for the student as well as for the seasoned neurologist, and to all others who wish to treat neurologic patients intelligently

Irving J Sands

Bacillary Dysentery, Colitis and Enteritis By Joseph Felsen, M D Duodecimo of 618 pages, illustrated Philadelphia, W B Saunders Co, 1945 Cloth, $6 00

Written by an authority, this work brings into one volume all of our present knowledge regarding bacillary dysentery Epidemiology covers every phase, from its international aspects to a consideration of its occurrence in planes and trains Nearly 80 pages are devoted to clinical aspects and another 80 pages to bacteriology and serology Therapy consumes 50 pages and covers every type of treatment Nearly 100 pages are devoted to bibliography The discussion of ulcerative colitis and regional ileitis considers all theories and contends that bacillary dysentery is the usual forerunner of these diseases. The appendix, devoted to a detailed description of methods of study of prevention, is very important. On the whole the book is an excellent reference book, but perhaps a little too detailed for the general practitioner

A F R Andresen

CONVENTION MEETING OF THE AMERICAN ACADEMY OF PEDIATRICS

The first convention since 1942, of the American Academy of Pediatrics, Region One, was held on April 2, 3, and 4, Hotel Pennsylvania, New York City This meeting brought together pediatricians from northeastern United States, including Connecticut, Delaware, District of Columbia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont, also Ontario and Quebec provinces, Canada

Convention Chairman, Dr Miner C Hill, of New York City, and his committee, planned the program to present the most recent developments in pediatrics, function as a refresher course for pediatricians released from military service, and enable physicians to consider postwar pediatric problems The three-day meeting included the presentation of a number of important scientific papers, symposiums, visits to leading medical centers in the metropolitan area where special programs were prepared under the direction of Drs Murray H. Bass, Mount Sinai Hospital, Adolph G DeSanctis, New York Postgraduate Hospital, Emmett L Holt, Jr, Bellevue Hospital, Samuel Z Levine, New York Hospital, and Rustin McIntosh, Babies' Hospital.

POSTGRADUATE COURSE FOR PHYSICIANS

A postgraduate course for physicians is announced by the Faculty of Medicine, College of Physicians and Surgeons, Columbia University, in physiologic and inhalational therapy in asthma, bronchiectasis, pulmonary fibrosis, and emphysema This course is being given at the Columbia-Presbyterian Medical Center, from March 26 to May 21, 1946, on Tuesday, 5 00 to 6 30 P M The fee is $25

To make application, or to obtain further information, address

SUGGESTIONS FOR CONTRIBUTORS TO THE *NEW YORK STATE JOURNAL OF MEDICINE*

The NEW YORK STATE JOURNAL OF MEDICINE asks its contributors to follow the suggestions listed below in the preparation of their articles In this way they will greatly facilitate the expeditious publication of the JOURNAL These suggestions have been devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles —It is earnestly desired that scientific articles shall not exceed 6 JOURNAL pages at the outside Longer articles tend to lower reader interest An average of five or six seems to be the most desirable from this point of view Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e g , twelve manuscript pages will make five JOURNAL pages

Manuscripts —Papers must be typewritten on one side only of white sheets consecutively numbered, and be *double spaced* with one-inch margins They should be prepared with great care so as to be typographically correct All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin This is imperative for rapid and accurate composition by the printers

Titles —The title should be *brief* and typed in capital letters The subtitle can be longer and should be typed in caps and lower case letters Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives Directly under his name should be the hospital or institution with which he is affiliated

Subheadings —Subheadings should be inserted by the author at appropriate intervals

References —It is the unfailing practice of the NEW YORK STATE JOURNAL OF MEDICINE to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference A list, consecutively numbered, of these references should follow at the end of the manuscript (Note that spelling in list is same as in text) The arrangement should be as follows and should include all items

a *Books*—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed , Philadelphia, Lea & Febiger, 1927, vol 5, p 57

b *Periodicals*—author's surname followed by initials, name of periodical, volume, page, month (day if necessary), year of publication Thus, Leahy, Leon J New York State J Med 40 347 (March 1) 1940

NOTE The JOURNAL does not include titles of articles

Case Reports —Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences All unimportant details should be deleted with such general negative statements as fit the case

Tables.—While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page For that reason it is urged that they be reduced as much as possible to descriptive language

Illustrations —These should be kept to the minimum necessary to make clear the points to be registered by the author In some instances they are imperative to proper understanding, in others they are merely picturesque The latter can be excluded to good effect, both as to space and the not inconsiderable cost

When illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black India ink on white paper *Do not use typewriter for lettering* The smallest lettering on 8 × 10 inch copy should be no less than 1/4 inch high Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch If finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer divisions In the case of finely ruled paper, only blue-lined paper can be accepted Lettering and all markings must be large enough to be readable after reduction Mail rolled or flat, never fold Photographs should be very distinct and show clear black and white contrasts They must be on glossy white paper Avoid round and oval photographs

Whenever possible "crop" photographs, i e, mark portion that can be excluded when reproduced. Crop marks should be on *margin* of photographs *Do not run pencil lines through photographs*

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

The scientific excellence of this work, the reconciliation of conflicting views and the true evaluation of each new method is assured through the "Comments" of the members of the Editorial Board For at the conclusion of most articles these eminent authorities present in clear, concise *post-graduate* discussions their own successful methods and bring into perspective the best work of all recognized authorities Thus, all surgeons, everywhere may safely make decisions based upon the sound premise that the combined clinical experiences of many authorities is superior to any one alone This inevitably leads to improved surgical procedure, lowered mortality rates, and, at all times, the self assurance which comes only of possessed knowledge—of knowing beyond doubt the "what to do" as well as the "what not to do" in every surgical condition

The most comprehensive presentation of current surgical data available, concisely compiled and expertly indexed, with an annual cumulative cross-reference index so that one may turn instantly to "today's last word" on every surgical topic

The Quarterly Review of Surgery is published in November, February, May and August
Annual subscription rate is nine dollars

"Over Forty Years devoted to pleasing particular people"

For National Rehabilitation

Yes, it's a fact . .

in addition to its refreshing quality and its flavor, ice cream contains many important health giving food elements It contains the following nutrients

Vitamins Ice Cream is a good source of Vitamin A and Riboflavin (Vitamin G) and contains other vitamins found in milk.

Minerals Calcium, necessary for strong bones and teeth, is supplied abundantly by Ice Cream

Proteins Ice Cream provides high-quality proteins those found in milk

All of these nutrients promote health and well being

And remember, the particular combination of nutrients found in Ice Cream is unusual This is one reason why Ice Cream is accorded such an important role in our national rehabilitation program

Specialties for Diseases of the Heart and Blood Vessels

WHENEVER

Impaired Fat Digestion

MUST BE OVERCOME

Impairment of fat digestion implies more than loss of available caloric food energy to the organism It involves the failure of absorption of the fat-soluble vitamins A, D, E, and K, together with the development of deficiency manifestations. Particularly severe is vitamin K deficiency with prolongation of the pro thrombin clotting time and the consequent hemorrhagic diathesis

Whenever impaired fat digestion must be corrected, Degalol is specifically indicated Degalol—chemically pure deoxycholic acid, a normal constituent of human bile — represents the biliary component chiefly concerned with fat digestion and absorption. Its administration in small dosage virtually normalizes fat digestion within the small bowel when lipase is not deficient, and with it absorption of the fat-soluble vitamins D, E, and K, and carotene. It is especially valuable in correcting the hemorrhagic complications of obstructive jaundice, where choleresis is undesirable. Degalol proves useful whenever impaired fat digestion is suspected, and particularly in the treatment of postprandial epigastric distress and fat intolerance not associated with chronic gallbladder disease Supplied in tablets of 1½ gr , boxes of 100 and 500

The management of hemorrhoids rests on solid therapeutic grounds when it achieves relief without resort to dangerous local narcotization or anesthetization. 'ANUSOL'* Hemorrhoidal Suppositories contain neither anesthetic nor narcotic agents and so do not mask the symptoms of more serious rectal pathology Quick, safe relief is attained by the removal of inflammatory pressure on the nerve endings. Burning and itching are soothingly abated while demulcent protection guards against the complications of bleeding and infection.

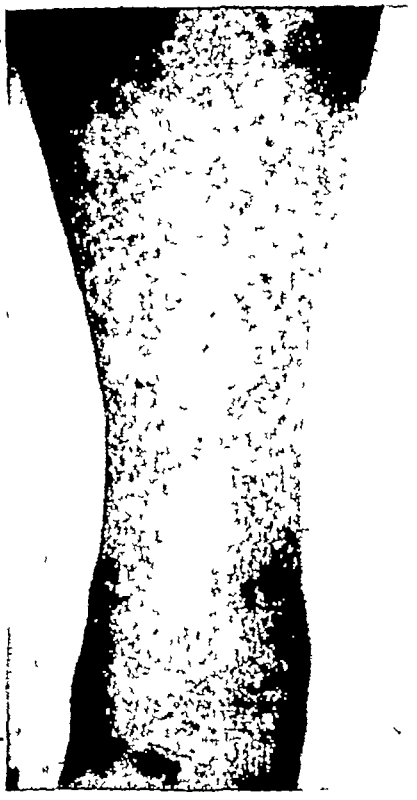
ACCEPTED AMERICAN MEDICAL ASSN
WHITTAKER LABORATORIES, INC PEEKSKILL, N Y

For management of patients with impaired carbohydrate digestion and faulty assimilation of water soluble vitamins B and C, Taka Combex Kapseals become the most logical dietary supplement

The Taka Combex story involving these patients can be told in two chapters.

1 The vitamin combination contains B_1, B_2, B_6, pantothenic acid, nicotinamide, and other components of the B complex derived from liver, plus Vitamin C

2 Taka Diastase potent enzyme with ability to liquefy 450 times its own weight in starch in ten minutes is present in the amount of two and one half grains in each Kapseal



Parke, Davis & Company

DETROIT 32 • MICHIGAN

TAKA-COMBEX KAPSEALS

One or two Kapseals three times daily is the usual dosage.

In Eczema

A CLEANER APPROACH PERMITTING OF Continuous Therapy

WHILE tar has been long employed in the treatment of eczema, the drawbacks attending its use were usually more annoying than the disease itself Unsightly, soiling to skin and clothing, and of unpleasant odor, crude tar with its objectionable features discouraged patient cooperation and frequently defeated the aims of therapy With Tarbonis, tar therapy assumes a new high in efficacy and cosmetic appeal Odorless, colorless, entirely free of staining properties, Tarbonis retains all the therapeutic properties of tar Its use in eczema, including the atopic and infantile forms, is followed by prompt relief of subjective discomfort, and by rapid resolution of the lesion itself Thus *effective* therapy may be instituted; application every few hours becomes a practical possibility, since following its application, it "vanishes" from the skin, leaving its active ingredients in intimate contact with the lesion, thus avoiding soiled clothing and bed linen

TARBONIS

REG U S PAT OFF

THE TARBONIS COMPANY

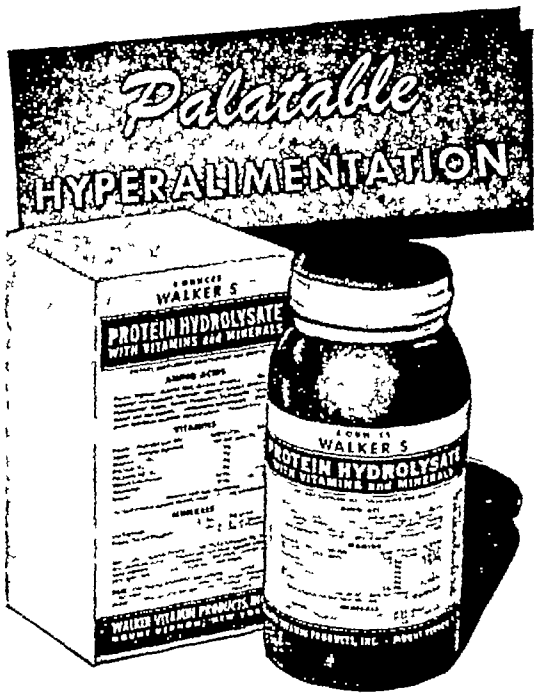
4300 Euclid Avenue, Cleveland 3, Ohio

Tarbonis is colorless, odorless, greaseless, does not stain linen or skin It contains 5% Liquor Carbonis Detergens extracted from selected tar by a unique process, retaining all beneficial factors of tar and eliminating the irritants Menthol and lanolin are also incorporated in the vanishing cream base, making for a preparation of unusual pharmaceutical elegance Specifically indicated whenever the action of tar is required

LIKE . . .

and yet unlike

• Like atropine in gastrointestinal effects, yet unlike atropine because of virtual freedom from mydriatic, cardiac or salivary actions—MESOPIN (Endo brand of homatropine methyl bromide) is especially useful for the relief of pyloro-, cardio- and biliary spasms and smooth muscle spasms accompanying peptic ulcer, constipation, flatulence, dyspepsia and irritable colon. • When central sedation is desired to supplement selective spasmolysis, MESOPIN WITH PHENOBARBITAL is highly recommended.



POTENCY: Mesopin contains 2.5 mg (1/24 gr.) homatropine methyl bromide per scored tablet. Mesopin with Phenobarbital contains in addition 20 mg (1/3 gr.) phenobarbital. Supplied in bottles of 100, 500 and 1000 tablets.

ENDO

MESOPIN

for gastrointestinal spasmolysis

PROLONGED BRONCHODILATATION plus RELAXING SEDATION IN *bronchial asthma*

In utilizing the synergistic actions of Calpurate, ephedrine and phenobarbital—EPURAL becomes a potent bronchodilator and sedative, significantly free from untoward central and cardiac side-effects.

For symptomatic treatment of bronchial asthma hay fever and allergic coryza, EPURAL offers the therapeutic advantage of providing *prolonged bronchodilatation*, and effecting *safe sedation*, which serves to counteract the natural tendency of ephedrine (when used alone) to stimulate the central nervous system.

While EPURAL may be safely administered over protracted periods, with freedom from gastric disturbances, it should be used with caution in hyperthyroidism, diabetes mellitus, and severe cardio-renal disease.

FORMULA:	Calpurate (calcium theobromine—calcium gluconate)	4 gr
	Ephedrine sulfate	¼ gr
	Phenobarbital	¼ gr

In bottles of 100 500 and 1,000 tablets.

EPURAL

For Safe, Symptomatic Relief of Allergic Respiratory Conditions

Though the Arthritic Changes
MAY NOT BE REVERSIBLE

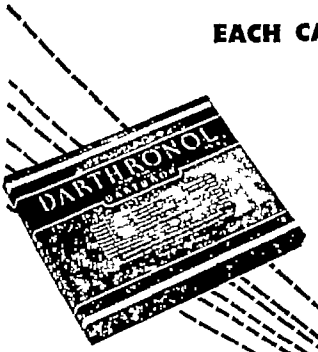
RHEUMATOLOGISTS agree that in the primary stages of arthritis, when only the periarticular or other soft tissues are affected, the pathologic changes are reversible and hence ultimate recovery is possible.

The newer knowledge of arthritis—which emphasizes the systemic nature of the disease—is the basis for a more optimistic prognosis, even in the advanced stages of chronic arthritis when the osseous and cartilaginous changes have become irreversible.

Though the roentgenologically discernible anatomic

DARTHRONOL FOR THE

J. B. ROERIG & COMPANY • 536 Lake Shore Drive



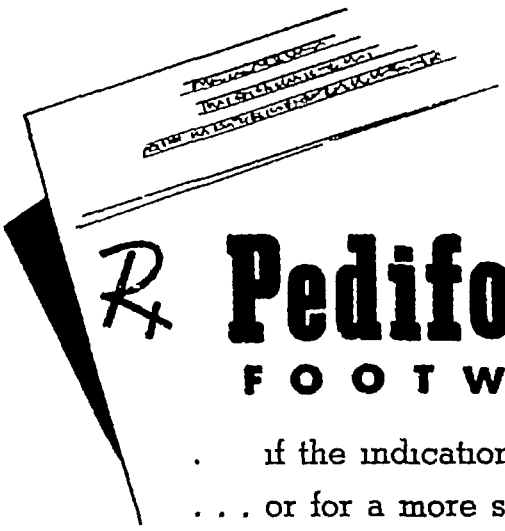
changes may be beyond repair, adequate systemic therapy, optimal nutrition, physiotherapy, and orthopedic measures can do much to prevent or correct deformities, relax painful spastic muscles, abolish pain, and restore useful function

Darthronol, because of the pharmacodynamic and nutritional influences of its nine active ingredients, warrants inclusion in the complete arthritis rehabilitation program In addition to exerting the favorable influence in arthritis attributed to vitamin D, Darthronol plays an important role in the aim to improve the general well being, to correct the multiple systemic disturbances associated with chronic arthritis, and to restore the nutritional status to optimal levels—a truly rational approach to the rehabilitation of the chronic arthritic

EACH CAPSULE CONTAINS

Vitamin D (Irradiated Ergosterol)	50 000 U S.P Units
Vitamin A (Fish-Liver Oil)	5 000 U.S.P Units
Ascorbic Acid	75 mg.
Thiamine Hydrochloride	3 mg.
Riboflavin	2 mg.
Pyridoxine Hydrochloride	0.3 mg
Calcium Pantothenate	1 mg.
Niacinamide	15 mg.
Mixed Natural Tocopherols	3.4 mg.

(Equivalent in biological activity to 3 mg. of Alpha Tocopherol)



Even when the osseous and cartilaginous changes have become irreversible a complete rational therapeutic program can accomplish much in abolishing pain diminishing soft tissue swelling and restoring useful function.

DOXYCHOL-K *comes out*

To physicians with the task of managing biliary tract disease, Breon research chemists present Doxychol-K

It washes the entire biliary tree (through the good offices of the liver) by bile that flows free. More, Doxychol-K furthers good nutrition by changing inactive pancreatic ferment to an active fat-splitting form.

The 100-200% increase in thin bile is due to the pure, oxidized cholic acid derivatives in Doxychol-K Fat digestion is initiated by the pure desoxycholic acid which forms water-*soluble*, loose molecular complexes that carry water-*insoluble* substances through the intestinal walls

Biliary stasis and defective fat digestion only summarize the field of use for Doxychol-K.

Each tablet contains Desoxycholic Acid 65 mg.
Ketocholanic Acids derived from oxidized pure cholic acid, providing approx. 90% dehydrocholic acid 200 mg.

when spasm means pain...

PAVATRINE with PHENOBARBITAL affords potent, swift, non-narcotic relief through relaxation of gastrointestinal smooth muscle

The effectiveness of PAVATRINE as an antispasmodic has now been enhanced by the addition of phenobarbital to allay the central nervous symptoms that so often accompany spastic phenomena.

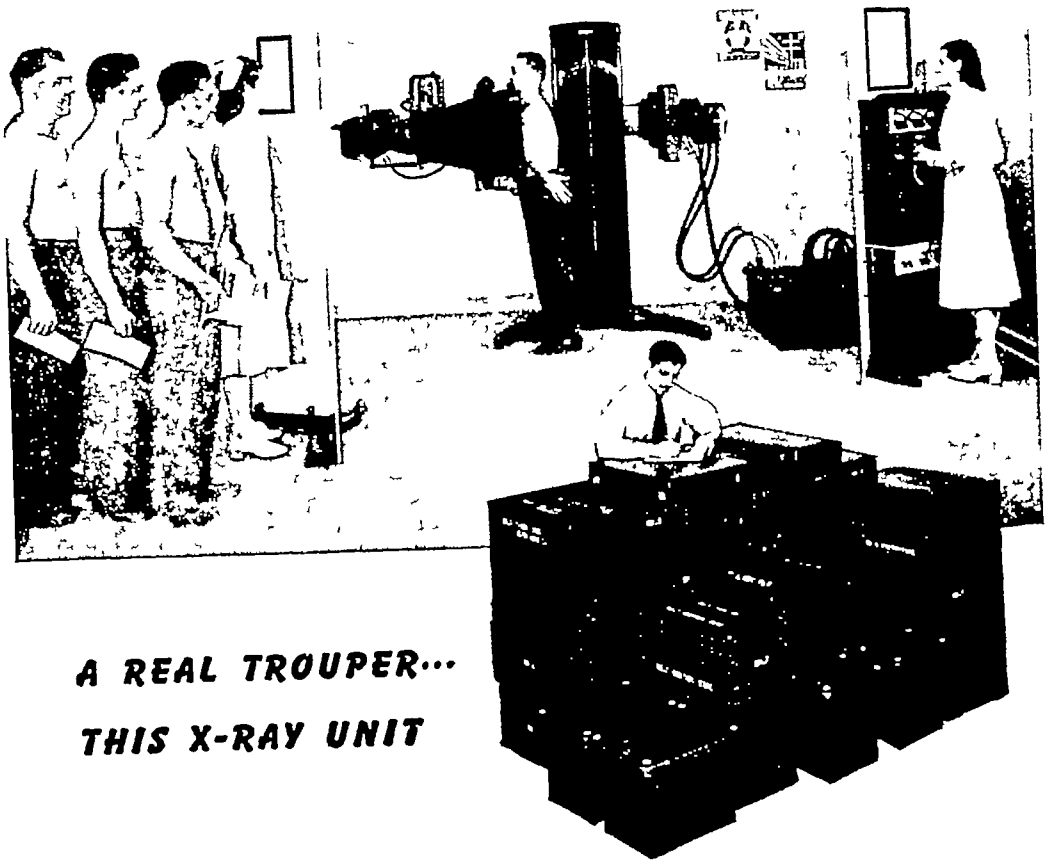
PAVATRINE with Phenobarbital

PAVATRINE (Searle) (β-diethylaminoethyl fluorene-9-carboxylate hydrochloride)	125 mg. (2 gr.)
PHENOBARBITAL	15 mg. (¼ gr.)

—the new synthetic antispasmodic which exerts both a local action on smooth muscle and a neurotropic effect on the nerve supply to the spastic muscle. Free from the toxic manifestations of the belladonna derivatives, PAVATRINE, in combination with phenobarbital, provides complete management for the distress of gastrointestinal, uterine and genito-urinary spasm.

Indicated for relief of:

Gastrointestinal spasm



Uterine spasm associated with dysmenorrhea

Urinary bladder spasm (as in cystitis, post-instrumentation spasm, etc.)

Pavatrine is the registered trademark of G. D. Searle & Co., Chicago 80, Illinois

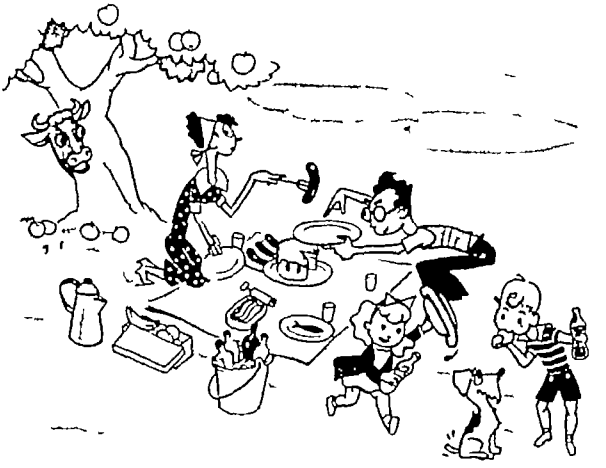
RESEARCH IN THE SERVICE OF MEDICINE

A REAL TROUPER··· THIS X-RAY UNIT



Compactly and securely packed in these sturdy trunk cases is a complete G E Photo-Roentgen Unit for mass x ray chest surveys, ready to be loaded on a light truck and transferred to its next scheduled location in the tuberculosis survey area.

In the companion picture you see this same equipment assembled and on the job—it takes two men about a half hour to set it up, or to disassemble and pack it. That's how G-E's designing engineers have provided for tuberculosis control programs which call for closely scheduled x ray chest examinations of hundreds of persons per day in various industries and institutions.

But since tuberculosis control programs vary so widely in their nature and extent, and vary accordingly in their x ray requirements, G E. X-Ray has provided other models and combinations of Photo-Roentgen apparatus, each one designed for a certain type and range of service on a most practical and economical basis.

Thus you are assured of finding in G E. X Ray's line of photo-roentgen equipment, that one combination which best meets the individual needs of your projected tuberculosis control program We shall be glad to go over the plans with your local committee, in view of offering helpful suggestions. Similar to human milk

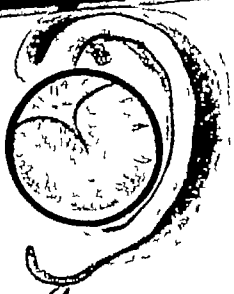
★The name is never abbreviated; and the product is not like any other infant food — notwithstanding a confusing similarity of names.

The fat of Similac has a physical and chemical composition that permits a fat retention comparable to that of breast milk fat (Holt, Tidwell & Kirk, Acta Pediatrica, Vol XVI, 1933) In Similac the proteins are rendered soluble to a point approximating the soluble proteins in human milk Similac, like breast milk, has a consistently ZERO curd tension The salt balance of Similac is strikingly like that of human milk (C W Martin, M D, New York State Journal of Medicine, Sept 1, 1932) *No other substitute resembles breast milk in all of these respects*



ACCEPTED AMERICAN MEDICAL ASSN.

A powdered, modified milk product especially prepared for infant feeding, made from tuberculin tested cow's milk (casein modified) from which part of the butter fat is removed and to which has been added lactose, olive oil, cocoanut oil, corn oil and fish liver oil concentrate. *

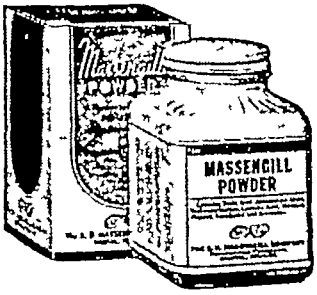
pH Control



LEFT—A pH of 3.86 to 4.45, found in the normal vagina (intermenstrual period), favors the growth of harmless Döderlein bacilli, normal inhabitants of the vaginal tract. Massengill Powder solution presents a pH of 3.5 to 4.5.

RIGHT—The pH range, 5.0 to 9.0, most favorable to the development of pathogenic organisms.

SINCE the average woman wants and needs advice regarding a proper douche, her physician is confronted by the problem of choosing an effective preparation which at the same time is safe, noncaustic and nonirritating. Massengill Powder may be recommended with assurance because it combines therapeutic efficacy, preventive action and hygienic value, with virtual freedom from irritant properties. Its particular advantage lies in control of vaginal pH.

The normal vagina is protected against the influence of pathogenic organisms by a pH incompatible with their growth. Hence restoration of a normal pH presents the simplest, most direct form of vaginal therapy. Massengill Powder, by providing the desired pH, represents a powerful antibacterial weapon.

Due to its effect upon vaginal pH and to its cleansing action, Massengill Powder solution is equally suitable for use in personal hygiene and in the therapy of a wide range of vaginal affections.

MASSENGILL
POWDER

an important word in estrogenic therapy

Estrogens are excreted by the kidney not as free chemical compounds but as *conjugates*. Equine estrogens—estrone, estradiol, equilin, equilenin and hippulin are eliminated as sulfates, the *conjugate* form.

In "PREMARIN", the *conjugated* estrogens are carefully protected against hydrolysis to retain their highly desirable characteristics—as water solubility, dependable oral activity, high therapeutic effectiveness. An extensive bibliography on "PREMARIN" attests to its comparative freedom from toxicity and to the fact that treatment is usually followed by a general feeling of well-being.

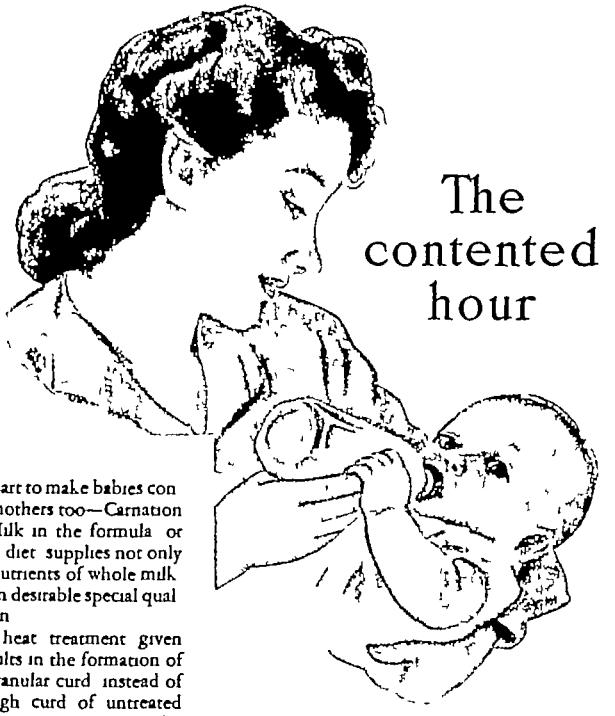
ON QUICK ENERGY *From Candies*

MEN engaged in strenuous labor instinctively turn to quick-energy foods during rest periods to replenish waning glycogen stores The popularity of candy during these "breaks" is well established by common observation For candy not only has a universal taste appeal but—more important from a nutritional standpoint—it supplies quickly-digested, energy-producing nutrients to appease the appetite and satisfy the metabolic needs of the moment. Office workers, school children, housewives, and others engaged in semi-sedentary occupations can quickly benefit from this contribution of candy Whatever the work that may be performed, candy through its nutritional contribution can lessen fatigue and increase muscular stamina.



THE NUTRITIONAL PLATFORM OF CANDY

1. Candies in general supply high caloric value in small bulk
2. Sugar supplied by candy requires little digestive effort to yield available energy
3 Those candies, in the manufacture of which milk, butter, eggs, fruits, nuts, or peanuts are used, to *this extent* also—
   (a) provide biologically adequate proteins and fats rich in the unsaturated fatty acids;
   (b) present appreciable amounts of the important minerals calcium, phosphorus, and iron;
   (c) contribute the niacin, and the small amounts of thiamine and riboflavin, contained in these ingredients
4. Candies are of high satiety value; eaten after meals, they contribute to the sense of satisfaction and well-being a meal should bring eaten in moderation between meals, they stave off hunger
5 Candy is more than a mere source of nutriment—it is a morale builder, a contribution to the joy of living
6 Candy is unique among all foods in that it shows relatively less tendency to undergo spoilage, chemical or bacterial

Editorial

Will England and the United States Nationalize Medicine?

On March 21, 1946, the Minister of Health presented to the Parliament of England a bill for nationalizing the medical profession in all its branches and making available "free" (but tax paid) medical, hospital, and nursing service for all in England and Wales

Says the *Herald Tribune*[1]

> The program would go into operation early in 1948 and would cost an estimated £152,000,000 ($608,000,000) a year, or about $15 a person. A similar bill to cover Scotland is to be introduced later
>
> Everything from major operations to household medicines would be supplied free, without distinction of age, sex, or income of the patient. All fees, salaries and other expenses involved would be met by the government, but patients would be allowed to buy extra comforts or pay independent doctors if they wished to do so

The British Medical Association considers the bill contrary to the public interest, and will endeavor to defeat or modify it if public support of its point of view can be obtained The British Medical Association claims that, although it was consulted during the drafting of the bill, few of its recommendations were accepted Mention is made of the possibility of a boycott of the national health program by physician members of the British Medical Association who would by this maneuver offer their services to the public independently

Dr Guy Dain, chairman of the Council of the British Medical Association, said that although doctors under the proposed law would have a right to do this

> in practice a boycott would be difficult if the national health program is accepted generally by the public Patients would be reluctant to pay fees for medical services which they were entitled to receive without fees, especially since they would be paying for them through taxes Hence the "fighting fund" would be used to support doctors receiving neither fees from patients nor salaries from the government

Now, reference to Legislative Bulletin, Number Seven,[2] discloses the fact that the United States Senate Committee on Labor and Education began, on April 2, hearings on the Wagner-Murray-Dingell Bill postponed from March 11 Thus, both in Parliament and in the United States Senate, measures proposing the socialization of medicine, or a reasonable facsimile thereof, are being considered simultaneously Both in England and in the United States the medical profession is overwhelmingly convinced that

[1] March 22, 1946.

[2] Legislative Bureau, Medical Society of the State of New York March 11 1946.

such socialization is not in the public interest Our own view is that it is discriminatory and unjustly discriminatory at that Why should medicine be socialized when all else remains on a free enterprise status? Why medicine and not farming? Why medicine and not mining? Why medicine and not railroads, banking, and any other private enterprise you like to name?

True, medicine maintains no political lobby, true, physicians constitute a relatively small minority of our some 140 million population, true, medicine serves all classes of the population, false, that it alone should be singled out for a miserable homeopathic dose of socialization, a thin device for extension of Federal price control under another name, and a shoddy pre-election device for the building of a huge, outlandishly expensive Federal bureaucracy, a fathomless pool of patronage

England, at least, is frankly socialistic as to its present Administration President Truman's recent message to Congress demanding a national health program, in effect the socialization of medicine, differs not in the least from the proposals of the English Minister of Health Both propose a "free" tax-supported program with government paying the doctors. Let us at least be honest about it, that's what it is, come hell or high water

Will the public accept such a program? It is not inconceivable, but it will surely be expensive and certainly is unjustly discriminatory However, the taxpaying public is the customer and—the customer is always right behind the eight ball

It is politically easy to pick on a minority group for socialization, or the exercise of tyranny, or for any other political purpose Bismarck did it, Lloyd George did it, Hitler overdid it, to name a few It is a well-known technic Bismarck, Lloyd George, and Hitler are gone to their several rewards, if any, but the evil that they did lives after them

Socialization has involved one minority after another on the continent of Europe and in the British Empire Other minorities were content to have it so as long as they were not involved

But socialization or tyranny or expropriation of rights or property does not stop with one successful try It spreads

It seems to be time, and past time now, for the medical profession to advise the public of this country to consider the plight of the doctors in New Zealand, in Germany, in France, and in England, to consider the kind of chaos, lower standards of living, poor medical service, now rampant in those countries, before it becomes necessary in this country for the doctors to consider the boycott of a putative national health program

The Answer Is Up to Us

In an editorial entitled "Doctors on Trial?" the March *Journal of the Oregon State Medical Society* says, forcefully, and we quote in full

> Oregon physicians, who may be inclined to view with a certain satisfaction or, possibly, smugness the recently announced signing of a contract with the Veterans Administration, for care of Oregon veterans by their home-town doctors, may be a little surprised to find that the occasion calls for some deep soul searching and much alertness The responsibilities are great The implications are nothing, if not tremendous The risks involved and the evaluation of these risks, must be realized by all doctors
>
> The plan must not fail
>
> Doctors, one and all, must know that this is no plum which has fallen of its own weight into their out-stretched hands Not for a single instant should those of our number, who may incline to be grasping and greedy, riding for what the traffic will bear, be permitted to forget this This joining of government bureau and private medical practice to do a job did not just happen Least of all did it take place because the social planners and bureaucrats may have planned it that way Despite the recognized sincerity in Major General Hawley's repeated remarks and efforts to get the best possible job of medical work done for the veterans, there are ample indications that some, who may favor social planning and

bureaucratic methods, may not be in accord with present trends in the Veterans Administration, although they seem powerless, at least for the time being, to alter these trends The usual tactics under such conditions, and tactics should not be confused with strategy, is to make what virtue one may of necessity, while biding more opportune time or circumstance The present situation could be no exception

It seems fairly obvious that General Bradley and his aides, such as Major General Hawley and Colonel Harding, are determined, if at all possible, to see that veterans have adequate and competent medical care, and have it as soon as possible Coincidentally, it has been said that those, who ordinarily might be expected to inject political and pork-barrel practices or social planning efforts into this situation are alarmed and are somewhat in retreat, though not in rout, in the face of this determination of military and the added mounting criticism of the past job done under completely bureaucratic auspices Powerless to oppose at the moment, it has been said these hopefuls are rolling with the punch while waiting around to pick up the pieces.

The program must not fail

Doctors, not necessarily at their own request, have been handed and have accepted a momentous task. Simultaneously they have accepted a challenge The showdown is at hand If, despite its confusions and complications, and these are many, the program of cooperation between the Veterans Administration and the private medical profession bogs down or fails, the result which will follow should surprise no one

Our enemies can be expected to say, and will say, "See! We have given private medical practice a free hand in solving a problem, and a miserable failure has resulted Only we have the means and ability to do this thing. We must take charge immediately"

Each and every doctor has an individual responsibility

The program must not fail

This succinct presentation of a current medical service problem, thus put squarely up to the physicians of the Nation, deserves careful and thoughtful reading Any reasonable plan for the provision of medical care has its proper uses and, unfortunately, its inevitable abuses The abuses may arise from misunderstanding, from carelessness or indifference, or from greed and avarice. Thorough explanation of the needs of the Veterans Administration and thorough understanding of the medical societies' plans to meet those needs may be the means of eliminating some errors and possibly unintentional abuses. What can be misunderstood will be misunderstood It is, therefore, apparent that the informational and educational functions of the Veterans Administration and the state medical societies must be exercised to the fullest extent possible and without loss of time.

The participating physicians should be informed by the Veterans Administration of exactly what is required of them, of what constitutes service-connected disability by Veterans Administration standards in general terms Most physicians in this state have had some experience in workmen's compensation practice, but few have yet had the opportunity to examine claimants alleging service-connected disability Many of these claimants will be seen for the first time by local physicians at a period far postdating the time when the original injury or accident or illness is alleged to have occurred. Reasonable allowance for error must, therefore, be made by the Veterans Administration, and, on the other hand, physicians must be tolerant of certain delays, always irksome, but usually inherent in the mechanism of processing a huge number of claims

The state medical societies which will function contractually with the Veterans Administration on behalf of the physicians of the respective states, should also use at the earliest possible moment the mechanisms of their committees on education to supplement the educational and informational activities of the Veterans Administration Let us face the fact squarely, that a job of the magnitude of this one carries with it enormous responsibilities It is a job that is being undertaken by arrangements made at the highest levels, state societies and the Veterans Administration Information and knowledge of these arrangements will not be in the possession of the profession generally, at least in this State, until it has filtered down by publication and meetings at the county level, and thence through hospital staff-room bull sessions, to the doctors who have neither read the publications of the state and/or county societies, nor attended the meetings.

While we agree with the Oregon State Medical Society's editorial, that the pro-

gram must not fail, we foresee that reasonable time must be allowed for the establishment of a real comprehension of the magnitude of the job, for the setting up of carefully planned mechanisms to carry it out, for education of the doctors who must service the program, and for tolerance on everybody's part—including the veterans—of unavoidable errors, for some inevitable delay in obtaining authorizations, in payment of just claims for medical service, some misunderstandings and irritations An enormous collective effort of this sort in which everybody is to some extent inexperienced has its difficulties

With patience and good will it cannot fail

Journal of the History of Medicine and Allied Sciences

An addition to American periodical literature is the new *Journal of the History of Medicine and Allied Sciences*, published by Henry Schuman, of New York, of which Dr George Rosen is the editor It is a timely publication History is one of the most powerful driving forces in human development, and the historical approach is invaluable in comprehending and, perhaps, in solving some of the problems of the present day

As is well stated in Dr Rosen's introduction to the first number, the medical profession in large part has turned away from the history of medicine because of the change in the total outlook of society, the increasing specialization, and the changes in education This trend has resulted in a serious loss for a profession which, by implication, still acknowledges the importance of the historical approach every time it writes or speaks of the *case history* Medical history, as Dr Rosen aptly states, should not be cultivated as a search for antiquities, as a search for curios, but rather as a vital, integral part of medicine itself

As the individual is the product of his ancestry modified by the environment and circumstances of his life, so the present institutions of medicine are the inevitable, inexorable, and logical result of its origins and subsequent evolution The real history of medicine should be at least as well known to every practitioner of the art and science as his own ancestry—nay, better, because that history stands behind him as a guarantee of his integrity, as evidence of his discipline He stands in the lengthening shadow of the obligations history imposes upon him, inescapable as death itself

To be ignorant of those obligations, of the nobility and the daring of those who have gone before is to invite oblivion We desire to extend the hand of welcome to this recruit to the ranks of American periodical literature

Our Diabetic Population

The growing importance of the diabetes problem in our country is made strikingly evident in a study by Spiegelman and Marks,[1] statisticians with the Metropolitan Life Insurance Company They estimate that about four million persons in our 1940 population were actual or potential diabetics New cases of diabetes are presently arising at a rate of at least 50,000 annually Deaths among diabetics occur at a rate of about 40,000 each year Our total existing diabetics numbered well over 500,000 in 1940 Of the total, one quarter were under age 50, another quarter were between 50 and 60, and the remaining half were over age 60

From this picture of the current situation, the two statisticians proceed to an examination of future trends It is expected that, in coming decades, the number of diabetics will increase at a greater rate than that for the total population By 1950, the number of diabetics will be 18 per cent above that in 1940, while the total population is expected to increase by only 9 per cent Be-

[1] Spiegelman, M , and Marks, H H Am J Pub Health 36: 26 Jan (1946)

tween 1940 and 1985, when from present indications the population of the United States will reach its maximum, the total population is expected to grow by 22 per cent, but the diabetic population by 74 per cent Two factors contributing to this rapid rise in the diabetic population are, first, the increasing proportion of persons at the older ages, and, second, the more than rapid increase in the number of females than of males at the older ages The estimate of growth of the diabetic population takes no account of their increasing longevity or of increasingly efficient case finding in diabetes Selective Service studies[1] show that even at young adult ages, there are considerable numbers of undiscovered diabetics

The authors found that diabetes onset rates (that is, the probability of becoming diabetic within a year) rise rapidly with increasing age up to about 55 years and then more slowly to a maximum at about age 65 This rise was greater for females than for males, so that at age 55, the onset rate for females was nearly double that for males The average age at onset was found to be 54 years

The chances for a nondiabetic to eventually acquire the disease are greater than is commonly realized Under age 50, these chances are four in one hundred for females and two in one hundred for males These chances are, of course, greater among persons with diabetic relatives and among those who are overweight

This impressive set of figures clearly indicates the importance of diabetes as a medical and health problem in the years ahead They point out the necessity of providing suitable facilities for the efficient care of diabetics, as well as for continued fundamental and applied research in the causes and therapeutic management of this disease

Congratulations on a Job Well Done The March 19, 1946 issue of the *News Letter* of the Council on Medical Service and Public Relations, American Medical Association, contains the following "Congratulations to the Medical Society of the State of New York for an outstanding public relations job in the 'Antiscience,' antivivisection battle in that state Write to office of the New York State Society, 292 Madison Avenue, New York 17, New York, for a folder of the material used in this campaign It's worth having"

It must be acknowledged that the Medical Society of the State of New York, together with the other participating agencies in the fight to prevent reasonable and proper use of animals for medical research, has done a truly outstanding job It is necessarily a continuing job, since it is not to be expected that those who did try to prevent the use of animals for such legitimate purposes will discontinue their activities

The Friends of Medical Research, an organization now set up on a national basis, seems to us decidedly a step in the right direction The JOURNAL would like to add its congratulations to the Public Relations Bureau, to Mr Dwight Anderson, and his associates who worked so long and arduously on this campaign

Public Relations The *News Letter* of the Council on Medical Service and Public Relations, of the American Medical Association, of March 19, 1946, stresses increasing interest in the subject of Public Relations in Medical Circles The *Letter* says that many societies now have active public relation committees and newly appointed public relations experts, consultants or directors on a full-time or part-time basis The same *Letter* stresses the need for an acceptable definition of public relations

This latter request should not be too hard to comply with May we suggest that a reasonably good and short definition might be "An honest presentation of facts by a responsible source, put in plain understandable English" This at least could be outlined as a guide by all the units of organized medicine in presenting to the public and to each other, the status and facts of modern medicine and medical practice

Dogs Essential to Medical Research At its regular meeting on January 18, the Public Health Council of New York State adopted the following resolution

Whereas, further advances in medical science are essential to continued improvement in the public health, and

Whereas, such advances in the future, as in the past, will be dependent largely upon animal research, and

Whereas, the choice of the most suitable animal for purposes of research must be dependent on the judgment of the investigator, and

Whereas, many of the great discoveries of curative and preventive medicine such as the discovery of insulin, the cure of pernicious anemia, the recent advances in the treatment of shock, the prevention and cure of blacktongue in dogs and of pellagra in man, and the prevention of rabies in dogs and in man, could only have been accomplished by scientific research (so-called vivisection) on the dog,

Be it therefore resolved, That it is the opinion of the Public Health Council that scientific research on the dog is essential for the advancement of medical knowledge and the protection of the public health, and furthermore that medical investigation should not be hampered by restrictions placed on the choice of the lower animal to be used [1]

Dr. Walter Reed Elected to Hall of Fame Physicians will derive much satisfaction from the recent election of Dr Walter Reed to the New York University Hall of Fame for Great Americans He is the first doctor of medicine to be so honored because of his contribution to medical knowledge He did not need this most recent honor to assure his place in the minds of medical men nor will it increase his stature It does, however, bring for the second time a recognition by the College of Electors of men who have contributed greatly to medical knowledge or procedure [2]

Dr Reed, born in Virginia, graduated from the University of Virginia at the age of 17 He then entered Bellevue Medical College, and after another year took a second degree, graduating in the class of 1873

To assure himself a certain future and a scientific career, Dr Reed joined the United States Army, receiving appointment as Assistant Surgeon with the rank of First Lieutenant During the Spanish-American War when typhoid fever in the camps in the Southern States and Cuba was more deadly than the military foe, he was placed at the head of a commission for study The famous report disclosed the parts played by flies, contact, and polluted water in the spread of the disease

In the spring of 1900, when Yellow Fever was raging among the troops—resisting all attempts at control—Major Reed headed the Yellow Fever Board and was sent to Cuba Long suspecting the mosquito, he, with the help of volunteer human guinea pigs, undertook a long and painstaking experiment to prove that the mosquito was and did serve as an intermediate host for the parasite of yellow fever—becoming infected only if it bit a patient during the first three days of the disease

Major Reed died in 1902 and was buried with military honors in Arlington cemetery The Walter Reed General Hospital in Washington was named for him [3]

Says Industrial Medicine.[4] "Metropolitan Life Insurance Company announces that the tuberculosis sanitorium which it has maintained at Mount McGregor, New York, since 1913 for treatment of its tuberculous employees was closed on September 1, 1945 Although a total of 3,570 Metropolitan employees have received treatment for tuberculosis since the sanatorium was opened, it was pointed out that the number of patients and the period of treatment have been reduced to a point which no longer justifies the maintenance of an institution of this size 'The company feels great pride and satisfaction in thus announcing the successful achievement of the purpose it set out to accomplish in 1913 At that time tuberculosis was the "white plague" and was causing great loss of time and life, large numbers of persons sick with the disease awaited their turn to be placed under sanatorium care, and so many patients came under treatment in advanced stages of the disease that cures were relatively infrequent Recognizing the seriousness of the situation, and with vision and courage not common in industrial medicine at the time, the officers, with the full support and authority of the board of directors, built the sanatorium and opened it on November 24, 1913

According to a recent report this institution has been acquired by the State of New York as a rest home for returning veterans

MANAGEMENT OF ACUTE CONGESTIVE HEART FAILURE

HARRY GROSS, M D , F A C P , and ABRAHAM JEZER, M.D , New York City

(From the Medical Service of Montefiore Hospital)*

IT IS the purpose of this communication to consider the treatment of acute congestive failure This type of failure usually follows inflammation in the heart such as the persistence of rheumatic activity and the engrafting of subacute bacterial endocarditis, or a severe extracardiac infection especially in patients with pre-existing heart disease or coronary artery disease Acute myocardial damage, secondary to coronary closure or impairment of coronary flow from tachycardia or shock may also result in congestive failure, especially if the heart is already enlarged

Acute right heart failure occurs in pulmonary infarction, cardiac infarction secondary to infection, such as pneumonia, especially in patients with underlying heart disease, cardiac tamponade and paroxysmal tachycardia

The physiologic causes of acute left heart failure may be either sudden failure of the left ventricle to propel a normal minute volume of blood from sudden myocardial weakness or from acute myocardial damage Another cause is mitral stenosis

As a result, there is an increase of pressure in the left auricle, the pulmonary veins, and in the intrapulmonary capillaries Following the increase in volume of the pulmonary vascular bed, less air space remains for the alveoli and a more rigid lung results, causing the appearance of the Hering Breuer reflex These factors, when continued, cause a disturbance in exchange of gases which results in anoxemia of the capillary walls Simultaneously, the increased rigidity of the pulmonary bed and the increased vascular bed interfere with lymphatic drainage Exudation of fluids then follows and pulmonary edema results

Left ventricular insufficiency must be recognized at the earliest moment since the immediate prognosis may depend upon the speed with which therapy is instituted The recognition of heart failure depends upon the realization that dyspnea or a few rales at the bases may be the earliest manifestations of this serious condition If untreated paroxysmal dyspnea and acute pulmonary edema may quickly follow

Acute left ventricular failure is very dramatic in its onset The patient is usually extremely dyspneic and orthopneic, the neck veins distended, the lips cyanotic, and his appearance that of apprehension of imminent death

Peripheral circulatory collapse frequently develops following acute cardiac infarction It may also result from infection in or outside of the heart Many of the features of shock such as a fall in blood pressure, small pulse, tachycardia, cold skin, and sweating are present Strictly speaking this reaction of the peripheral circulation falls into the category of clinical shock but not of true shock since there is no reduction in the circulating blood volume and there are no irreversible changes in the peripheral vessels Similar compensatory reflexes develop both in true shock and in collapse due to cardiac infarction, namely vasoconstriction in the viscera muscles and skin Though helpful in shock, these reflexes add to the burden of the heart in cardiac infarction by increasing blood volume

The following cases illustrate several principles in the management of acute congestive heart failure

Congestive Failure Induced by the Onset of an Arrythmia Following Myocardial Damage in a Patient with Rheumatic Cardiac Disease

Case 1—M G a 38-year-old engraver, with rheumatic mitral stenosis and insufficiency known since the age of 20 was well until September 28 1943 when he was awakened with burning of the eyes, coughing, choking and a sensation of weight on the chest following accidental inhalation of sulfur dioxide fumes. The following morning he noticed dyspnea on walking short distances fatigue and mild precordial pressure Two days later, he collapsed while walking For the next ten days he remained in bed. Thereafter he had dyspnea on walking short distances

Examination showed signs of mitral stenosis and insufficiency The rhythm was regular, the rate 88 per minute and there were no signs of myocardial insufficiency An electrocardiogram taken the day after the accident showed merely a slow regular sinus rhythm

Several days later, the electrocardiogram showed significant changes from the first, with R-T depression in lead I, low voltage of the T waves in leads I and II and left axis deviation Four weeks later he had a rapid heart rate with auricular fibrillation Electrocardiogram then showed prominent S waves in leads II and III and negative T waves in leads I and II About ten months after the onset of symptoms he had a sudden onset of dyspnea and palpitation lasting one hour, for which he was given digitalis and kept in bed for one week later he complained of tiredness, we and dyspnea, and collapsed He fatigue on doing sedentary work and walking uphill or quickly The

* Service of Dr Louis Leiter

was precipitated by two factors (1) the acute myocardial infarction, and (2) the irregular heart rhythm and rapid ventricular rate

Morphine was indicated for relief of anginal pain and distress and oxygen to lessen oxygen unsaturation of the blood, thereby increasing the efficiency of the heart.

For the reduction in the ventricular rate which was contributing to failure by increasing the inefficiency of ventricular contraction, two methods of approach were possible (1) the use of digitalis to diminish the ventricular rate and to increase the contractive power of the heart, and (2) the use of quinidine to convert the irregular to regular rhythm and to slow the heart rate. The presence of acute heart failure made it advisable to use digitalis at once and quinidine later in case irregular rhythm persisted. On account of the left ventricular failure mercupurin was given at the same time to reduce the lung volume and to decrease blood volume simultaneously and swiftly

Ventricular Tachycardia

Case 4—M. R., a 58-year-old baker, complained of pain over the anterior chest of increasing severity, becoming agonizing thirteen hours after the onset and relieved by morphine. At this time, rales were heard at the bases, the blood pressure was 110–114/80, the heart rate was 100 beats per minute, and the electrocardiogram showed the Q2–Q3 pattern of posterior wall infarction with RT elevation and fusion. Pulmonary congestion increased and the liver became enlarged. One-half cc. of mercupurin and 1 Gm. of digitalis were then given. The next day there was moderate diuresis, the patient was more comfortable and 0.4 Gm. of digitalis was given. Twenty-four hours later, dyspnea again increased and 2 cc. of mercupurin was then given intravenously

About thirty seconds after the injection was given, the patient complained of severe constricting pain in the chest, became pale sweated, and the pulse became rapid and thready The heart developed paroxysmal episodes of ventricular tachycardia. Quinidine 0.2 Gm., was given followed by 0.4 Gm. each hour At the end of the third hour sinus rhythm returned, the patient became more comfortable and the signs of peripheral collapse disappeared. The liver edge, however was found to have extended for four fingerbreadths below the costal border Quinidine, 0.2 Gm., was then given four times each day for a period of two days when it was discontinued.

Four days later the signs of congestive heart failure further increased despite digitalis and intramuscular mercurials. Throughout this period, the patient was kept comfortable by the administration of opiates and oxygen.

One month after the initial attack, his condition improved and signs of failure began to subside.

This case demonstrates (1) the specificity of quinidine for the treatment of ventricular tachycardia, (2) the onset of ventricular tachycardia following the administration of mercupurin, (3) the failure of digitalis and (4) the rare instance in which mercurials fail to relieve congestive heart failure in acute myocardial infarction when the heart muscle has been severely damaged. It should be noted that mercurials were given subsequently without untoward effects.

Acute Heart Failure Following the Onset of Paroxysmal Tachycardia During Mild Rheumatic Activity

Case 5—S. K., a 19-year-old white girl, with frequent recurrences of acute rheumatic fever since the age of 3, had episodes of paroxysmal tachycardia possibly due to auricular flutter and signs of mitral stenosis and aortic insufficiency Although she was fully compensated between attacks she became decompensated in attacks lasting more than twelve hours. The liver and the lungs became congested, and she complained of wheezing respirations. Eyeball pressure frequently stopped the attacks, though quinidine digitalis, and mecholyl did not. Acute attacks were treated with morphine and mercurials.

Thyrotoxicosis with Acute Failure

Case 6—R. K., a 65-year-old woman, complained of palpitation of the heart and tremor of the hands of about two weeks' duration in November 1939. Examination showed a large thyroid adenoma with a heart rate of 100 per minute, and a loud systolic murmur over the apex and left sternal border The basal metabolic rate was plus 55 per cent, blood pressure was 130/80. With Lugol's iodine and sedation, the palpitation disappeared, there was a gain in weight, and the patient returned to work. In August, 1940 thyrotoxicosis recurred. Two months later, paroxysmal auricular fibrillation, which did not respond to digitalis developed and disappeared after five doses of 3 grains of quinidine at two-hour intervals. The basal metabolic rate remained elevated and on June 12, 1941, subtotal thyroidectomy was performed. She [illegible] returned to work, and one year later the basal metabolic rate was plus 11 per cent. From [illegible] to February 1945 she had minor recurrences of Graves' disease. In February, 1945 she again had an episode of palpitation, found to be due to auricular flutter with a rapid ventricular rate. Shortly thereafter, dyspnea and edema of the legs and slight jaundice developed. A salt-poor diet, fluid restriction, and repeated mercurials were prescribed, but the patient continued bitterly of palpitation, dyspnea, weakness, and cramps in the legs after the mercurials. She became increasingly weaker and could [illegible] She was advised to continue the mercurials [illegible] at five to seven day intervals.

Examination on April 1 [illegible] showed the patient to have a weight of [illegible] a goiter, exophthalmos, a large adenoma in the left lobe, regular heart rhythm, a ventricular rate of 90 per minute, blood pressure [illegible] and pretibial edema. Fluoroscopic examination of the heart showed no evidence of chamber enlargement. The basal metabolic rate was plus 50 and [illegible] per cent. [illegible] was normal, [illegible] mm B complex and [illegible] vised. With [illegible] subsided, the [illegible]

palpitation became milder Three weeks later, dyspnea and palpitation had completely disappeared and the patient was up and about after being incapacitated for four months All evidence of heart failure had disappeared, the ventricular rate was 60-70 per minute, the blood pressure 170/74, and the weight had increased to 117 pounds Improvement and gain in weight have continued on Lugol's iodine and digitalis

This case shows (1) that heart failure due to Graves' disease can be effectively treated only by iodine, or thyroidectomy, and (2) that mercurials are only temporarily effective in relieving some of the distress, but do not relieve the dyspnea and edema to the same degree as in other forms of heart failure Thiouracil should be as effective as iodine

Acute Peripheral Collapse and Congestive Heart Failure Following Acute Myocardial Infarction and Pulmonary Infarction

Case 7—A R., a 61-year-old white man, with peripheral vascular disease since 1939, and an anginal syndrome since 1943, developed cardiac infarction on February 20, 1945, with a fall of blood pressure from 160/100 to 120/90 The electrocardiogram showed auricular fibrillation, RT 1 and RT 4 depressed, Q 2 and Q 3 waves present, T 2 diphasic, T 3 inverted Four days later sedimentation rate (Cutler) was 23 mm in one hour One week after the onset, he had severe precordial pain and faintness, a fall in blood pressure to 90/70, periodic breathing, profuse sweating, and vomiting. In addition, the lungs became congested, the liver edge extended two fingerbreadths below the costal border and pretibial edema was present Twelve hundred cc of 5 per cent glucose and saline were given intravenously in eight hours After six hours, the vomiting stopped, the patient was able to take fluids by mouth, the sweating subsided, and the blood pressure returned to 110/70 The following day hemoptysis developed, associated with peripheral failure for which morphine, oxygen, and 4 cc coramine every 30 to 60 minutes were given. After the acute phase subsided, digitalis and mercurials were administered.

This case shows the advisability of treating peripheral failure following acute cardiac infarction by giving parenteral fluids cautiously In another patient similarly in peripheral collapse and myocardial infarction, plasma given intravenously was beneficial

Discussion

General measures in use in the treatment of acute congestive heart failure are to be discussed These include morphine, oxygen, digitalis, quinidine, phlebotomy (aminophyllin), and fluids

1 *Morphine*—Morphine is the first drug to be administered in coping with the acute cardiac emergency It is equally effective in acute cardiac and pulmonary infarction, left ventricular failure, and paroxysmal tachycardia. It acts principally as a depressant to the central ne system, slows respiration by direct action c respiratory center, allays anxiety, and hel abort peripheral collapse

This drug is administered subcutaneous intravenously The intravenous route i frequently utilized because of the dang respiratory depression, especially in pat with marked cerebral arteriosclerosis. Act however, this route offers great advantages absorption is certain and a dose of $^1/_{12}$ to $^1/$ grain is more quickly effective than a larger given by the subcutaneous route in quieting and allaying anxiety, especially in perip failure where subcutaneous absorption ma poor

The peak of its analgesic effect is past, ninety minutes, and repeated doses in pat with cerebral arteriosclerosis should be t with this peak so as to avoid excessive mor depression Repeated doses of $^1/_{12}$ to $^1/_{10}$ grain may be administered after fifteen to t minutes when cerebral arteriosclerosis is suspected

In acute heart failure, morphine depresses Hering-Breuer reflex in the lungs as well as respiratory center. Together, the two ef cause the respiratory rate to fall promptly the easing of the dyspnea and the allayin anxiety, the heart work diminishes and paroxy dyspnea often subsides When pulmonary ed is also present, morphine may not always c pletely control the acute heart failure U such circumstances, phlebotomy may be d and oxygen and intravenous digitalis may als given

In pulmonary embolization, morphine poss offers an additional beneficial effect in depres the cardiac reflex [2] The effect of depressio this reflex may be similar to inhibition of p sympathetic impulses and thereby diminish likelihood of focal hemorrhages in the car muscle When oxygen is combined with m phine in the treatment of pulmonary infarct the likelihood of myocardial damage is furt reduced Care must, however, be exercised treating elderly patients and those with vanced cerebral arteriosclerosis, so that o minimal doses of morphine are given, on acco of the danger of increased anoxemia from dep sion of the respiratory center and other cereb cells

Likewise in patients with marked empl sema there is great danger of increasing puln nary stasis following morphine In such patie the drug may cause death. In severe emphyse and in elderly patients, barbiturates and paral hyde given intravenously may control symptom

2 *Oxygen.*—Every acute cardiac emergen

must be treated for anoxemia which is easily recognized when cyanosis is present, but may not be recognized when localized or limited to a specific tissue The failure to recognize the severe anoxemia which is part of coronary insufficiency, coronary occlusion, pulmonary embolization, acute peripheral collapse, and acute heart failure, may contribute to the failure of treatment Oxygen should be given to all patients who continue to complain of precordial pain or dyspnea, or show signs of peripheral collapse after morphine has been given, even in the absence of any cyanosis

When oxygen is administered, care must be taken that the concentration is adjusted to the needs of the individual patient In the presence of severe anoxemia, concentrations of 95 to 100 per cent should be given continuously, for a period varying from several hours to as long as three to four days [3] As Evans[4] has pointed out, the danger of administering such a high concentration has never been proved in the presence of anoxia

Barach's[5] report on the effect of oxygen given under 4 to 5 centimeter water pressure is very impressive and the method is worth trying It is not certain whether the increased oxygen tension alone is responsible for the relief of dyspnea as maintained by Barach, or whether the increased oxygenation of the alveolar blood improves the metabolism of the cardiac muscle and of the cerebral cells, and thus indirectly improves the cardiac status and eases dyspnea It is likely that the marked increase in oxygen tension of the blood may be life-saving, and that the treatment of pulmonary edema in the future will consist very largely of morphine and oxygen under pressure

3. *Rest*—Complete bed rest should be obtained following an attack of acute heart failure Adequate sedation should be given to insure such rest While rest should be absolute to obtain maximum healing of the underlying condition responsible for the attack of heart failure, it should not be prolonged indefinitely

The acutely sick individual accepts his bed without difficulty, especially if rest is fortified with sufficient amounts of sedatives The added natural apathy of acute sickness makes the problem still easier As he improves enough to become circumspect of his predicament, the patient often becomes anxious A person recovering from mild rheumatic carditis, or one, three or four weeks after uncomplicated cardiac infarction, probably obtains little benefit, if any, from further absolute bed rest especially if he is restless and apprehensive

One must then evaluate a clinical equation in which the possible benefits of added enforced rest are weighed against the harm resulting from such a regime There are additional circumstances mitigating the boon of prolonged rest, since absolute bed rest may actually augment the work of the heart and even produce serious hazards Levine[6] and Dock[7] have called attention to these facts Levine[6] pointed out that in recumbency the work of the heart may become greatly increased by a shift of blood from the extremities with the production of pulmonary congestion and paroxysmal left heart failure, as well as failure of the right heart at times In recumbency in a patient with tight mitral stenosis, increased left intra-auricular pressure may also result in acute left ventricular failure Furthermore, in obese people in whom a large abdomen may press on pelvic veins and enhance the effects of stasis in an already slowed circulation from a failing heart, recumbency greatly increases the danger of pulmonary embolization This danger may, in part, be overcome by active and passive movement and by massage of the patient's legs as well as by elevating the head of the bed with shock blocks

The patient who has recovered from the active phase of rheumatic carditis is often mildly ill and has no dyspnea or congestive failure and he, too, may be given modified bed rest despite the presence of slight fever The boost to the patient's morale from the privilege of taking one or two meals a day with his family may greatly improve his entire outlook and cooperation As improvement continues, greater periods of activity should be allowed If congestive failure develops after the patient is allowed out of bed, the period of bed rest is increased until the signs of acute failure have disappeared When, however, it is evident that maximum improvement has occurred, but failure has persisted, it is advisable to allow the patient activity consistent with freedom from precordial pain or dyspnea, and failure is treated vigorously with diuretics One should insist on twelve hours of bed rest at night and two to three hours of bed rest during the day When possible, such patients should subsequently be encouraged to accept employment in sedentary occupations Such management of failure enables the patient to retain his self respect by resuming his place in society and diminishes the possibility of his developing a cardiac neurosis

It appears reasonable to permit patients following pulmonary infarction or acute left ventricular failure not due to recent cardiac infarction, some privileges out of bed the second or third day following the subsidence of lung rales providing the temperature is normal

4 *Digitalis*—The place of digitalis in the treatment of heart failure is well established

Some have found that the drug will increase cardiac output while others are unimpressed with this effect Some observers have felt that not only congestive failure, but that cardiac disease, per se, is adequate indication for digitalis [8] Though this view has laboratory support,[9] the transposition of experimental laboratory evidence to clinical practice is, however, open to question On the other hand, other observers have felt that the indication for digitalis is auricular fibrillation and then only if the ventricular rate is rapid [10] Clinical experience has shown that the truth lies somewhere between these extreme points of view Katz and his coworkers[11] are aware of the limitations of digitalis, but insist that it is of value in preventing recurrences of congestive failure, even in sinus rhythm But, they state that as the cardiac reserve is diminished, a stage is ultimately reached when digitalis is no longer effective in preventing recurrences of more than mild failure

Digitalis is of little value in the treatment of heart failure due to acute infection, whether of primary cardiac or extra cardiac origin, as well as in failure due to Graves' disease, emphysema, and constrictive pericarditis

There are, however, two types of acute congestive failure in which digitalis is often very effective These are (1) failure following cardiac infarction in which digitalis may slow the heart and clear failure, and (2) failure following paroxysmal auricular fibrillation or flutter, usually in a damaged heart In the latter, digitalis finds its greatest indication and is undoubtedly far superior to any other drug One occasionally encounters a case of auricular fibrillation with a rapid ventricular rate in which digitalis is ineffective, whereas, quinidine slows the heart, restores regular rhythm, and with these effects, congestive failure clears up When it becomes apparent that digitalis is not beneficial, this drug should be stopped and quinidine administered

Digitalis may be given parenterally, by mouth or by the rectal route The parenteral route was the method of choice in the clinics abroad Although there is great value in the quick response to the drug by this route, in acute left ventricular failure or in paroxysmal auricular fibrillation, there always is the danger of overdigitalization since many patients frequently do not know the amount of the drug that they have recently taken Strophanthin and ouabain, like digitalis, may be given parenterally with dramatic results when it is certain that digitalis has not been administered for some time

Much safer is the administration of digitalis by mouth or by rectum In the presence of acute heart failure after morphine and oxygen have been administered, 0 7 to 1 Gm may be given by mouth or, if necessary, by rectal infusion in a starch paste enema even when the patient is vomiting Altogether, 12 to 18 U S P units (1 2 to 1 8 Gm) are given to digitalize fully If morphine and oxygen are not completely effective, it may be advisable to administer mercurials at the same time that the digitalis is given

The dangers of mercurials are well known, but few appreciate the dangers of digitalis DeTakats[12] observed hemorrhage in the myocardium following the administration of this drug Master[13] and his collaborators found that the mortality rate of acute myocardial infarction was higher when digitalis was given than when this drug was omitted The danger of ventricular tachycardia and fibrillation from excessive doses of digitalis should also be borne in mind When a patient receiving the drug in adequate amounts develops an acceleration of the heart instead of slowing, the possibility of digitalis toxemia should be considered and the drug either curtailed or cut out In case of doubt, an electrocardiogram may be helpful in establishing or excluding digitalis toxemia While RT depression and negativity of T waves are regarded by some as evidence of digitalis toxemia, these are pharmacologic and not toxic effects of the drug Tachycardia may produce similar effects The only pathognomonic criteria of digitalis toxemia are multiple premature beats and ventricular tachycardia [14]

Gold and his coworkers[15] have urged the use of digitoxin and advise this digitalis body, especially for rapid digitalization The practice of rapid digitalization with digitoxin or digoxin is not desirable since toxic effects of overdigitalization are more apt to occur when digitalis has previously been taken and the beneficial effects are no better than when the whole leaf is given Digitoxin or digoxin may be given with benefit when the whole leaf is not well tolerated

Following acute cardiac infarction, mild congestive failure manifested by basal rales and slight enlargement of the liver is very common However, in the course of a few days the rales disappear and the liver returns to normal size If dyspnea is present or develops, digitalis should be given When dyspnea and rales persist despite morphine, oxygen, digitalis, and mercurials should be added to the therapy

5 *Quinidine*—Quinidine acts by lessening conduction and prolonging the refractory period and should be given for the treatment of ventricular tachycardia and of auricular flutter when digitalis is not effective The use of this drug should be avoided in other types of heart failure because conduction is delayed and contraction weakened

This drug is indicated in acute coronary occlusion with multiple extrasystoles or supraventricular tachycardia without failure, and ventricular tachycardia with or without congestive failure following cardiac infarction It should be administered by the oral method, first giving a probatory dose of 1/2 grain followed by 3 grains every two hours Should regular rhythm not be restored after five doses, the same dose is repeated every hour If ineffectual, five more doses, 3 grains each, are given each hour followed by five doses of 7 1/2 grains each hour until regular rhythm is restored

In one patient desperately ill with ventricular tachycardia following myocardial infarction, quinidine was effective in 9-grain doses by rectum, since the patient was vomiting and could not retain the drug by mouth

In ventricular tachycardia the dose may be increased to 1 Gm every hour In a desperate situation, quinidine lactate may be given intravenously While quinidine is a cardiac poison, it may be given in heroic doses for its effect in stopping this ectopic rhythm, since the outlook is very grave if the condition is not treated vigorously

It is important that no time should be lost with digitalis which is useless in this arrhythmia

6 *Phlebotomy*.—Phlebotomy by the tourniquet method,[16] or by actual removal of blood, causes a reduction in the circulating blood volume, the venous pressure, and in the intra-auricular pressure As a result, the distention in the pulmonary veins lessens, stasis in the lungs diminishes, and dyspnea and cyanosis are greatly relieved Pulmonary edema when present may disappear very quickly with lessening of pulmonary venous pressure

Phlebotomy by venesection is carried out by removing 300 to 500 cc. of blood quickly with a needle of large bore It is important to perform the procedure quickly since relief is contingent upon the amount of blood that is removed and the speed with which it is effected In many patients in whom other methods do not produce relief of symptoms, this procedure results in prompt relief of dyspnea and pulmonary edema.

Bloodless phlebotomy is done by the application of soft rubber tourniquets to all four extremities As soon as the patient has obtained some relief, one should be removed and the other three left on, the others then removed one by one if symptoms do not recur Should symptoms recur, they are re-applied No tourniquet should be left on longer than twenty minutes on account of the danger of damage to tissues from anoxia Frequently, this method brings dramatic improvement There is, however, the danger of recurrence of dyspnea or pulmonary edema with removal of the tourniquets If dyspnea or pulmonary edema persists despite morphine, oxygen and adequate rapid digitalization, when digitalis had not been previously given, phlebotomy by venesection should be performed

7 *Mercurials*.—Much work has been done, especially in recent years, to clarify the mechanism of diuresis It has been shown that diuresis occurs either by increased glomerular filtration, or by decreased tubular reabsorption[17] By studying the concentration of creatinine in plasma and urine, it is possible to determine the amount of glomerular fluid[18] The amount of reabsorption in the tubules is determined by deducting the urine volume from the glomerular filtrate Such determinations have been made for euphyllin, salyrgan, and other drugs It has been shown that euphyllin causes diuresis by increasing glomerular filtration and decreasing tubular reabsorption, while salyrgan causes diuresis by decreasing tubular reabsorption

With mercurial diuresis there is an initial dilution of the blood due to either passage of water from tissues to the blood or to a lessened output of water by the kidneys, which becomes maximum within the first three hours Shortly thereafter, there is a swing in the opposite direction so that for the greater part of the period of diuresis there is actually hemoconcentration The fact that there is hemoconcentration during the period of diuresis suggests that the kidneys do not merely remove excess tissue fluid from hydremia but take an active part in the process[19]

The mercurial diuretics produce an absolute increase in the amount and in the concentration of chlorides in the urine, which has been shown to increase from 50 millimols before, to 315 millimols after an injection of novasurol Both the plasma chlorides and the blood proteins fall after mercurials[20]

Excluding (1) acute congestive failure due to paroxysmal auricular fibrillation or cardiac infarction which respond to digitalis, (2) acute congestive failure due to a ventricular tachycardia which responds to quinidine, and (3) the rare instance of paroxysmal auricular fibrillation with failure which responds to quinidine and not to digitalis, the mercurials are the drugs of choice in the management of acute congestive failure Often too much time elapses before mercurials are given, during which irreversible damage to vital structures from severe stasis occurs

Within one day after a probatory dose of 0 5 to 1 cc of a mercurial, 2 cc. may be given intramuscularly or intravenously

The only contraindications to mercurials are acute nephritis and severe renal insufficiency The dangers of ill-effects have been greatly overestimated Death does not occur except in patients who have previously had mercurials and then only when 2 cc are given by the intravenous

route [21] When one weighs the uncommon incidence of ill-effects and the rare death from mercury against the benefits that tens of thousands of cardiac patients are receiving from these drugs, it is but unavoidable to regard these drugs as the first line of defense in heart failure of all types

Ammonium or calcium salts may be given for a period of two days preceding and following the mercurial Dosage varies, but need not exceed 4 Gms per day, and as a rule, 3 Gms are sufficient Many patients do not tolerate administration of ammonium chloride and complain of abdominal pain and dyspepsia Sometimes x-ray examination discloses the presence of many pellets of these enteric-coated tablets in the intestinal tract unabsorbed Instead of ammonium chloride, 15 to 30 drops of diluted hydrochloric acid may be given three to four times a day for one to two days before the mercurial is given Many patients show good mercurial diuresis when the ammonium chloride or hydrochloric acid has not been taken As long as the mercurials are not given frequently, these drugs may be omitted

8 *Iodine and Thiouracil*—In Graves' disease iodine or thiouracil may clear up congestive failure while digitalis does no good and mercury is only temporarily of benefit Thiouracil in adequate dosage in one case caused a subsidence of failure, slowing of the heart rate, and a return of the dilated heart to normal size Similar results were obtained with iodine The presence of persistent tachycardia, auricular fibrillation of obscure origin, normal circulation time despite failure, and a large heart or a basal metabolism out of proportion to failure should make one suspicious of Graves' disease, and thiouracil or iodine should be given as a therapeutic or diagnostic procedure

9 *Fluids*—Although conservative treatment of congestive heart failure consists of deprivation of salt and fluids, most patients frequently are very dry and complain of thirst It has been shown that providing salt intake is 2 Gms or less in twenty-four hours, fluids may be given more liberally When so given, fluids as a diuretic[22 23] and less frequent administration of mercurials is required

Schemm[23] showed that as long as the sodium ion was very low in the diet, water was not bound to the tissues Accordingly, he gave an acid-ash residue diet to mobilize sodium, and forced fluids in severe congestive heart failure Cases of edema due to acute nephritis and to congestive failure following recent cardiac infarction were treated by this method

With this regimen he reported that patients no longer were thirsty despite marked loss of edema fluid Failure due to acute cardiac infarction, myocarditis or severe nephritis responded excellently when fluids up to 12 liters a day were given, in large part, by the intravenous route He reported failure with this regimen in only 6 per cent of more than 400 patients with severe heart failure

The problem of using water as a diuretic is complicated by the fact that both at home and in hospitals it is difficult to obtain a diet containing so little sodium that it will not bind water In addition, patients find this regimen difficult and are afraid to take large amounts of water The method is, however, worthy of further trial

In acute infections it is wise to give up to 3 or 4 liters of fluid without salt in twenty-four hours to cardiac patients with congestive failure If necessary, the fluid may be given by vein to combat peripheral failure The danger in most cardiac patients with severe infection is not central but peripheral failure Peripheral failure may cause an increase in central failure Fluids, glucose, serum, and blood plasma serve an additional purpose in also maintaining blood volume Liberal amounts of fluid are of value also against toxemia which increases peripheral failure When congestion of the lungs or liver develops, mercurials should be given simultaneously with fluids

It should be recalled that the water balance demonstrated by Newburgh and his collaborators shows an exchange of about 2,000 cc under normal circumstances When the patient does not eat regularly, as is frequently the case in acute infections, the 1,000 cc of fluid usually taken as part of even a dry diet should be added to the fluid intake of 1,200 to 1,500 cc ordinarily allowed in heart failure A total intake of 2,200 to 2,500 cc is thus indicated, even in the absence of fever When fever is present, vasodilatation causes an increased loss of fluid through the skin in addition to the increase in fluid lost by the elevated cellular metabolism due to fever The intake must then be increased to balance the water needs Thus, 3 to 4 liters of fluid per day is not excessive in the presence of moderate fever

As improvement follows in the clinical course of heart failure and infection, the fluid intake may be diminished, especially when the patient begins to eat better As the improvement continues, the regimen described in the treatment of chronic heart failure may then be followed

Kempner[24] prescribed a diet consisting of rice, sugar, fruit, and fruit juices containing 2,000 calories for hypertensive disease This diet is difficult to take and patients object to its prolonged use The virtue of this diet is again the low sodium content—0 25 to 0 45 Gms It is also severely deficient in proteins and fats

Likewise, the Karrell diet is really a salt-poor neutral to acid-ash fluid-restricted diet. The total intake is about 1,200 cc., when output is ordinarily about 2,000 cc. (The output includes urine, insensible perspiration, vapor lost through the lungs, and the fluid lost through the stool.) The excess output over intake is made up by clearing of extra cellular fluid.

Peripheral Failure

The treatment of severe peripheral failure should not be influenced by the presence of congestive failure since death may occur as the direct result of peripheral failure. The important measures in the treatment of peripheral collapse are (1) morphine, (2) the administration of adequate fluids, parenterally when necessary, (3) oxygen—95 to 100 per cent concentration, and (4) other drugs which are worthy of trial, such as coramine and adrenal cortical hormone.

There is no controversy as to the advantages given the patient by the use of morphine and oxygen. There has, however, been controversy as to the administration of parenteral fluids in the presence of congestive heart failure, and the use of coramine and adrenal cortex. Henstell and Gunther[24] showed the direct effect of coramine on muscle tone as measured by intramuscular pressure. They also showed that intramuscular pressure declined long before venous pressure fell in the presence of surgical shock. With large doses of coramine they reported success in elevating the intramuscular pressure and improving the condition of the patient suffering from peripheral collapse.

From time to time we have also observed encouraging results from repeated doses of 3 to 5 cc. of coramine in patients suffering from medical shock. The degree of congestive heart failure was not, however, altered. The mechanism which permits the pressor effect in the muscles to combat peripheral collapse is not established.

Adrenal cortical extract showed great promise in the reports of Perla[25] and his collaborators. More recent investigators however do not find any definite relationship between the adrenal cortical hormone and lessening of peripheral failure. In several instances in this material, it appeared that this hormone was temporarily beneficial in combating peripheral failure brought on by severe pneumonia in the presence of congestive heart failure.

All that one can say at present is that the most important treatment for peripheral collapse is the administration of fluids. Salt should be included in these fluids when vomiting or sweating is severe. It is necessary to maintain blood volume after cardiac infarction when heart failure is increased by severe peripheral failure. This can be accomplished by parenteral administration of fluids. Care must be taken in giving fluids so as not to produce acute left ventricular failure, by giving fluids slowly (not over 30 drops per minute).

Conclusions

1. Acute congestive failure may be treated by digitalis, mercurials, fluids, quinidine, oxygen, and opiates, depending upon the underlying mechanism and the severity of failure.

2. The indications for digitalis are limited to (*a*) failure due to acute cardiac infarction with or without regular rhythm, (*b*) permanent and paroxysmal auricular fibrillation with a rapid ventricular rate. Here digitalis is probably superior to any other drug.

3. Reliance should not be placed solely on digitalis in acute congestive failure due to extracardiac or intracardiac infection, especially in previously damaged or greatly enlarged hearts. Experience has been that such cases also require mercurials.

4. In massive acute failure from any cause it is wise to give mercurials to prevent pulmonary fibrosis and permanent invalidism from chronic pulmonary ventilation deficiency.

5. Recurring left ventricular failure despite the administration of digitalis requires mercurials especially since such episodes are frequently fatal.

6. Mercurials are indicated in the treatment of central failure with dyspnea even in the presence of peripheral failure.

7. The only contraindications to the mercurials are (1) acute nephritis, and (2) severe renal insufficiency.

8. In acute infection with combined central and peripheral failure, fluids should be given liberally, without salt, up to four liters a day.

9. In uncomplicated acute congestive failure, fluids may be given ad lib without salt, together with mercury or digitalis, or both. When severe it is advisable to give mercury for prompt effects.

10. Quinidine is indicated (*a*) in paroxysmal auricular fibrillation when digitalis is ineffective in restoring regular rhythm, (*b*) in multiple premature beats following acute cardiac infarction and (*c*) in paroxysmal ventricular tachycardia.

Given early and in large enough doses it may prevent irreversible damage and be life-saving in desperately sick patients with ventricular tachycardia following acute myocardial infarction.

11. Thiouracil and iodine may slow the heart rate and clear up congestive failure in Graves disease, while digitalis produces no response. [illegible] undifferent one and mercurials are only

pornrily effective in relieving left ventricular failure

THE STARVING DOCTOR

Dr James Gregory, author of *Conspectus Medicinae* and professor at the University of Edinburgh, was known as a "starving doctor"

Not long after he died, April 2, 1921, there appeared in print an anecdote illustrating part of the learned man's character The story relates how a Glasgow merchant, concerned about "a pinkling in the stomach," called on the doctor The physician asked about the merchant's mode of life, diet, etc , and was assured that "all was carried on most moderately"

For instance, when asked what he took for supper, the merchant answered "I canna be said to tak' supper, just something before going to bed a rizzer'd haddock, a toasted cheese, half a hundred oysters, or the like o' that, and maybe, two-thirds of a bottle of ale, but I tak' no regular supper"

The doctor gave his diagnosis "Now, sir, you are a pretty fellow, indeed You tell me you are a moderate man but, by your own shewing, you are a vocarious glutton Your breakfast would serve a moderate man for dinner And, from five o'clock afternoon, you undergo one almost uninterrupted loading of your stomach until you go to bed. This is your moderation!

"You said you were a sober man, yet, by your own shewing, your are a beer swiller, a dram-drinker, a wine-bibber, and a guzzler of Glasgow punch You eat indigestible suppers and swill toddy to force sleep I see you chew tobacco Now sir, what human stomach can stand this? Go home, sir, and leave off this riotous living Take some dry toast and tea to your breakfast, some plain meat and soup for dinner without adding anything to spur on your appetite. You may take a cup of tea in the evening, but never let me hear of haddocks, toasted cheese and oysters, with their accompaniments of ale and toddy Give up chewing that narcotic, and there are some hopes that your stomach may recover its tone and be in good health"

There is no record of whether the merchant took the advice The story says merely that he looked dumfounded, but that may have been because the physician refused any pay for his deductions "Do you think I'll take a fee for telling you what you know as well as myself? Though you are no physician, sir, you are not altogether a fool. You have read your Bible, and must know that drunkenness and gluttony are both sinful and dangerous Go home, sir, and reform!"

TIME-DOSE RELATIONSHIP IMPORTANT IN PENICILLIN TREATMENT

Penicillin, given in large doses over a relatively long period, is the only effective treatment of the once fatal disease known as subacute bacterial endocarditis, according to an article in the December 22 issue of *The Journal of the American Medical Association*

Arthur L Bloomfield, M D , and Richard M Halpern, M D , of the Department of Medicine, Stanford University School of Medicine, San Francisco, wrote that at the present time the best treatment seems to consist of four to eight intramuscular injections of penicillin every twenty-four hours, with a total daily dose of at least 200,000 units continued over a period of two months

The doctors emphasized the importance of the time-dose relationship because otherwise the patient may lose the advantage gained by an early diagnosis By the time a relapse occurs, due to inadequate dosage in the initial treatment, the infecting bacteria may develop increased resistance to penicillin

Subacute bacterial endocarditis usually attacks valves of the heart that are already damaged In several of the patients, heart failure occurred after the disease was under control The authors explained that unless treatment is started early, irreversible damage to valves may occur even though penicillin eradicates the infection.

BILIARY DISEASE IN THE ELDERLY AND CHRONICALLY ILL PATIENT

ELMORE MITCHELL ARONSTAM, M D , New York City

(From the Surgical Service, Third (New York University) Division, Goldwater Memorial Hospital Department of Hospitals New York University)

DISEASE of the biliary system is common in the age group in which most of the more noted chronic illnesses fall Consequently, surgery is considered with more trepidation than in the younger and otherwise healthy adult In fact, many authorities are strongly opposed to surgery in these patients [1] The management of these cases presents a wide variety of medical and nursing problems which must be overcome before any kind of successful surgical result can be achieved. On this service, elective surgery for biliary is infrequent, however, frequently circumstances preclude nonsurgical management, and operation must be undertaken

Presentation of Data

The substance of this paper is a report of 38 patients operated upon in sequence Four of these cases were elective Thirty four cases presented symptom complexes which made surgery obligatory Criteria, necessary before operation was considered, are listed in Table 1 There were eighteen men and twenty women in this series, the oldest being 79 years and youngest, 33 The average age was 59 and $^{9}/_{12}$ years All but 2 cases had a multiplicity of disabling disorders which rendered them poor surgical risks. The frequency of these diseases is seen in Table 2 The illnesses have been deemed sufficient contraindications to elective surgery Thirty-four of the 38 case histories gave evidence of symptomatology lasting over a period of several years

As far as was possible, a diagnosis was reached by gallbladder series, liver chemistry, and duodenal drainage Pulmonary, renal, cardiac and blood studies were made routinely on all patients with the exception of a small number in whom the acuteness of the problem forbade delay in performing a laparotomy

Preoperatively, each patient presented an individual problem, not only in preparation but in choice of anesthetic The chronically ill are frequently poor eaters and often are emaciated, commonly suffering from subclinical hypovitaminosis The improvement of nutrition and hydration particularly in short periods of time, was often imperative and difficult The longer the preoperative period available, the better was the preparation Parenteral glucose, amino acids vitamin concentrates, including K, and blood and plasma transfusions were employed where needed to supplement oral treatment Adequate digitalization and compensation in patients with cardiac complications were assured Diabetics were permitted to spill one to two plus sugars (Benedict) in their urines prior to operation In other conditions attention was directed toward maintenance of treatment of those conditions as far as was possible without conflict with operative management.

Diverse forms of anesthesia were employed according to the judgment of the attending surgeon Cyclopropane has been the most often used anesthetic. One possible anesthetic death is reported with cyclopropane. In this case the patient was a marked hypertensive with some degree of myocardial fibrosis The patient had suffered from recurring attacks of excruciating biliary colic Death occurred as the operative incision was about to be made Postmortem examination disclosed the above-mentioned myocardial fibrosis and chronic cholecystitis with pericholecystic adhesions However, cyclopro-

TABLE 1 —CRITERIA NECESSARY FOR OPERATIVE INTERVENTION

pane has been used on many similar cases with uniformly good results in this hospital Pneumonia has been seen twice with cyclopropane Atelectasis occurred in one case operated with local, novacaine anesthesia Spinal and ether anesthesia have been used in a fewer number of cases with excellent results

A third of our group of cases were either acute, severe infections, or complicated surgical problems Beyond this, in view of the momentary condition or pathologic background of our patients, the surgeons were occasionally forced to the dictum of executing the most conservative of procedures which would give the patient a maximum of benefit, even though that benefit, in view of the pathology, would be of short duration In Table 3 are listed the various pathologic diagnoses and the number of cases with each pathologic condition Operative mortality and causes of deaths are found in Table 4 The most common pathologic condition was chronic cholecystitis and cholelithiasis These cases did well uniformly However, cases with acute gangrenous cholecystitis did poorly because of advanced age, severity of infection, and the weakened condition of the patient Carcinoma of the gallbladder was seen once, carcinoma of the head of the pancreas, twice Acute gangrenous cholecystitis and cholelithiasis occurred once with carcinoma of the head of the pancreas One case of chronic cholecystitis and cholelithiasis was seen superimposed on Laennec's cirrhosis Both of these cases did well as far as the benefit of the immediate operation was concerned

The postoperative period in elderly or chronically ill patients is probably more important than either the operative or preoperative periods It would seem that when a patient has been weakened by anesthetic poisons, and when normal body physiology has been impaired by abdominal manipulation, loss of fluids and narcosis, the effects of age and basic pathologic conditions are enhanced

The patients must be turned regularly, deep breathing must be encouraged periodically We have employed the oscillating bed to prevent stasis in some cases In the event of postoperative pneumonitis, we prefer the use of penicillin in the elderly and chronically diseased patient We have observed alarming blood sulfa levels, hematuria, and renal shut down when only small doses of sulfa drugs were administered to some of our patients Nutrition and adequate fluid balance must at all cost be maintained parenterally until the patient begins to take nourishment by mouth Ground lost early in the postoperative course frequently cannot be regained Careful aseptic technic in changing dressings is patiently necessary Mobilization of our patients has generally been delayed because of basic pathologic conditions Careful check on diabetic divided urines is routine Sufficient intake and output in all patients with renal disease is the only way to prevent shutdown of the kidneys Chemotherapeutic prophylaxis against recurring pyelitis should be undertaken Daily evaluation of the cardiac and chest status has been routine

Discussion

It is apparent that in the elderly age group seen in a hospital for chronic disease many factors are at hand which at once establish these patients as "bad risks" for surgery Not only is there the age factor but complicating disease and the poor nutritional status engendered by it For these reasons, it has long been the custom of internists and surgeons to avoid surgery in these patients, particularly elective surgery We have observed that 34 of 38 patients have symptomatology of two or more years' duration The majority of patients in this small series were operated upon out of dire necessity, and the pathology in many cases was extremely advanced and untoward It is easily understood how the mortality in this series is considerably greater than in younger and healthier subjects This suggests that early elective operations for biliary diseases are indicated Certainly when a patient is younger, better nourished, and when his pathology is not advanced, surgical treatment carries much less risk

Nevertheless, surgery can be carried out effectively on these poor risk patients and on selected cases, but only with the best medical care The procedures must be, of necessity, the least traumatizing as possible The anesthesia must be compatible with the patient's basic condition and of as short a duration as possible

TABLE 4.—MORTALITY

Patient	Age	Pathology	Complicating Condition	Day of Death
J. K.	72	Chronic cholecystitis Pericholecystic adhesion	Diabetes mellitus Virus pneumonia	14 Day
K. D.	65	Chronic cholecystitis	Psychoneurosis Wound disruption	14 Day
F. M.	50	Huge distended gall bladder	Posterolateral sclerosis Acute and chronic pyelitis	5 Day
A. D.	58	Ruptured gangrenous gallbladder	Central Nervous System Lues	3 Day

T. F.	60	Mucocele of gallbladder Choledocholithiasis	Cholangitis	30 Day
A. C.	61	Chronic cholecystitis Pericholecystic adhesion	Anesthetic death Hypertensive cardiovascular disease	0 Day

Mortality 18.4 per cent
Average age of fatalities 63.0 years

Conclusion

A series of 38 elderly and chronically ill patients, operated upon for gallbladder disease, has been reported

Where possible, early operation for biliary disease in a chronically ill patient should be undertaken to avoid late obligatory intervention when the patient's inadequate physical status increases the danger of surgical procedures

Stress is placed upon the pre- and postoperative treatment which are the most deciding factors in the patient's ultimate recovery

The most conservative surgical procedures are best suited to this age group

400 East 59th Street

HOME FOR INCURABLES

The village fathers of West Farms resolved, early in 1866, to establish a refuge for those afflicted with incurable maladies. At that time facilities for the care of such sufferers were so limited that a city institution was about the only recourse of these patients. The Rev Washington Rodman was the first to interest the village group in establishing this kind of a home. And eighty years ago, on April 6, 1866, a charitable institution in the Bronx named the Home for Incurables was incorporated under the laws of the State of New York.

It was to be a home rather than a hospital, open for men and women requiring continuous care. A rented, frame dwelling formerly known as 'Uncle Daniel Mapes Temperance Home," was opened in the little village. It accommodated 33 patients, but the founders soon realized the accommodations were inadequate. Adjoining houses were obtained but these ordinary village houses possessed very few conveniences and were separated from each other by grounds or intervening buildings.

The by laws of the Home provided for a Board of Managers of '24 gentlemen' and from 1867 on, more than a hundred of New York City's outstanding men have served as members of the Board without remuneration. Furthermore, these men (as well as other men and women) gave freely of their time, endeavors, and funds that the Home might be perpetuated to serve the community

Adrian Iselin, grandfather of the present head of the Home for Incurables, became actively interested in 1869 and later was elected vice-president. In 1872 the Home received nine acres of land, a part of the original Lorillard estate near Third Avenue between 180th and 183rd Streets The following year the cornerstone of the first building on the present site was laid.

In 1874 the patients were transferred from West Farms to the new Home. In 1881, the "Ladies Association" now the Women s Auxiliary Board was organized.

During the next thirty years wings, pavilions, extensions, and chapels were added. The capacity of the Home was increased to 310 beds. In 1926, Ogden Mills (father of Ogden L. Mills) became president of the institution, a position he held for more than fifteen years. Mr Mills built and furnished completely a modern seven-story Nurses' Home on the property

About this time, the Home for Incurables leased a part of its land to the Braker Memorial Home and the latter institution erected a home for old people, and in the early 1930 s the Braker Memorial and the House for Incurables became one institution. All of the Home s outworn buildings were replaced by a modern building in 1931. Since 1880 the Home for Incurables has been a member of the United Hospital Fund.

LINEAR FRACTURE OF THE SKULL ACROSS THE VENOUS SINUSES

ARTHUR D ECKER, M D , Syracuse, New York

(*From the Department of Surgery, Syracuse University College of Medicine*)

IMPAIRMENT of the outflow of blood from the brain is generally recognized in the case of depressed fractures of the skull over the large venous sinuses Furthermore, similar cerebral passive congestion may be associated with a more common occurrence, namely, a linear fracture which crosses one of the main dural sinuses During a period of twelve months, I have observed 11 cases of blunt head injury in which either a linear fracture or a diastatic fracture of the sagittal or lambdoidal sutures crossed a major dural venous sinus, namely, the superior sagittal sinus or a lateral sinus In almost all these cases, despite the absence of depressed fragments of bone, there resulted obstruction of the venous outflow sufficient to cause prolonged mental confusion and choked disks The prompt recognition of this syndrome is essential both to avoid unnecessary intracranial exploration and to institute proper treatment with special reference to maintenance of the upright posture [1]

Illustrative Cases

Case 1 —A physician, thirty years of age, missed his step when attempting to enter a bus He fell and struck the right occipitotemporal area of his scalp, which was bruised but not lacerated He was unconscious momentarily and then remained dazed for eight hours Subsequently he suffered from headache, drowsiness, and blurred vision Neurologic examination was negative except for diminution of the left abdominal and Achilles reflexes Six days after the injury there was moderate papilledema in the right eye and slight papilledema in the left eye, as well as left homonomous inferior quadrantic hemianopsia Eleven days after injury there was no change in the papilledema Roentgenograms revealed diastasis of the lambdoid suture where it crossed the groove of the lateral sinus The diastasis was continued forward as a linear fracture into the right parietal bone There was ecchymosis over the mastoid process

The patient was encouraged to be up and around, and to keep his head elevated at all times Twenty-one days after the injury the papilledema had receded considerably Lumbar puncture was performed at this time, and revealed clear, colorless fluid under pressure of 34 cc of water Jugular compression for ten seconds and prompt release with readings at ten-second intervals revealed the following data

Bilateral 35—50—39—34
Left 34—48—39—34
Right 34—35—34—34
Right, repeat 34—35—34—34

This differential Queckenstedt test confirmed the clinical impression of impairment of the circulation of the right lateral sinus Except for the residual field defect the patient was free from signs and symptoms twenty-nine days after his injury, and returned to his normal activities

Case 2 —A young man was thrown from a motorcycle and was momentarily unconscious General physical and neurologic examination was negative except for minimal stiffness of the neck On the following day he began having severe headaches, dizziness, and recurrent projectile vomiting Bilateral choked disks developed X-ray films revealed a linear fracture through the left side of the occipital bone which extended across the groove of the left lateral sinus The spinal fluid pressure responded promptly to pressure on the right jugular vein, with a rise to 40 cm., but rose only to 30 cm when the left jugular vein was compressed This test confirmed the impression of obstruction of flow in the left lateral sinus

The patient was treated without surgical intervention, and was allowed out of bed The papilledema gradually subsided and upon discharge from the hospital ten days after injury, the patient was free from signs and symptoms

The Queckenstedt tests do not *in themselves* prove that there was traumatic obstruction of the lateral sinuses in these cases because congenital variations of the sinuses must be considered However, when these tests are considered, together with the clinical course in these cases, there results overwhelming evidence that traumatic obstruction did take place

Discussion

A linear or diastatic fracture of the skull may cross an underlying lateral or superior sagittal sinus without in any way being accompanied by impairment of the flow of blood through the sinus However, as in the cases here reported, there may be associated obstruction of the flow of blood through the sinus Such obstruction is due to the original injury and may be effected by trauma to the intima of the sinus and subsequent thrombosis with more or less occlusion of the lumen of the vessel There may be an epidural hematoma at the site Again, as in one case observed at necropsy, there may be an intradural hemorrhage, namely, between the layers of dura and overlying the sinus sufficient to impair the flow of blood through the sinus but without causing complete obliteration of the lumen of the vessel

In venous congestion of the brain, the cerebral veins are engorged and there results increased intracranial pressure, which is usually marked by papilledema Drowsiness and mental confusion

may be caused or prolonged by the increased pressure When these signs occur after trauma to the head, it is logical to suspect the presence of intracranial hemorrhage and to attempt to localize it by ventriculography However, in cases of venous congestion of the brain, ventriculography is difficult because the ventricles tend to be small and the injected air is often forced out of them into the subarachnoid space

Summary

A simple linear or diastatic fracture of the skull which crosses one of the main venous dural sinuses is frequently followed by impairment of venous outflow from the brain Such passive congestion is marked by increased intracranial pressure with headache, choked disks and, occasionally, the persistence of mental confusion The prompt recognition of the condition here described permits recovery under conservative management with special reference to upright posture Anxiety is minimized and unnecessary surgical intervention, such as ventriculography or burr hole exploration, is avoided

UNITED MEDICAL SERVICE, INC BROADENS SERVICE

United Medical Service, Inc 370 Lexington Avenue, New York City, has liberalized its enrollment regulations for persons desiring surgical and medical care in hospitals and has made provision to pay for minor surgical operations performed in a doctor's office, it was announced on March 6 by Rowland H George president

Small employed groups and individuals not affiliated with groups may now subscribe to U M S under regulations similar to those in New York s Blue Cross Plan, Associated Hospital Service of New York.

According to Mr George the current regulations affect some 300,000 persons heretofore unable to obtain maternity benefits under U M S These individuals, originally enrolled in the Blue Cross hospitalization plan in groups, subsequently left their places of employment and continued their subscriptions on a nongroup basis. Under the U M S family contract they may now obtain surgical indemnity in hospitals including maternity benefits, ordinarily granted only to those who enroll directly through groups

The provision, covering indemnity for minor surgical operations performed in a doctor's office, was adopted by the Board of Directors of U M S as a result of the current shortage of hospital accommodations, Mr George declared He stated that U M S is receiving an increasing number of claims from persons given surgical care in doctors' offices because hospital accommodations are not readily available

More than 175 000 persons in Greater New York now subscribe to the three plans offered by U M S Approximately 10 000 physicians cooperate in the service which is sponsored by the Medical Society of the State of New York and 17 county medical societies.

COURSE IN GYNECOLOGIC AND OBSTETRIC PATHOLOGY

Starting April 17 1946 the Israel Zion Hospital held its eighth annual postgraduate course in gynecologic and obstetric pathology This course is given under the auspices of the Joint Committee on Postgraduate Education of the Long Island College of Medicine, The Medical Society of the County of Kings, and the Academy of Medicine of Brooklyn

Dr J M Ravid and staff will conduct this course. Further information may be obtained from the Registrar, 1313 Bedford Avenue Brooklyn, New York.

A NEW HEMOGLOBINOMETER

A No-Blood-Drop Method, Using the Principle of Transillumination

WILLIAM L GOULD, M D., Albany, New York*

THERE are, basically, two methods of hemoglobin determination, one using undiluted blood, while the other employs blood diluted with various reagents I beg to submit a third method, one that requires the taking of no blood specimen

The hemoglobinometer I devised, takes the determination in vitro by the principle of transillumination A light shining through the finger produces a red hue that is compared to a standardized hemoglobin chart The use of transillumination in medicine is old Its most frequent use has been with cavities and sacs, as sinuses and hydroceles However, the literature does not show this particular use of transillumination in hemoglobinometers.

The hemoglobinometers that determine the hemoglobin with undiluted blood are, for example, those of Tallquist, Dare, and others The hemoglobinometers that use diluted blood are those of Sahli and others

There are many kinds of hemoglobinometers They vary from the simple drop-of-blood-on-blotting-paper type to the self-recording photocell meter While the tendency is toward more technical and more involved meters, that presented here tends the other way, toward simplification, not only of structure, but also of procedure

The hemoglobin on the colorimeter is determined in percentages, ranging from 10 to 100 or more mgm per 100 cc of blood The fact that there are many methods of determining hemoglobin, necessarily gives many variations in the results Some register proportionately higher, and vice versa For example, Sahli averages about 10 per cent higher than Tallquist The device here described has been standardized to the improved Sahli-Wert, where 100 per cent equals 14 5 Gm per 100 cc of blood In the original Sahli or Gowers' method, the 100 per cent mark corresponded to 17 3 hemoglobin per 100 cc However, this is believed to be higher than normal, since the normal for men and women is usually considered as 14 and 13 Gm , respectively As an example of the differences, there are many concerns making Sahlis, each with its own standard In the Tallquist method, the 100 per cent mark corresponds to the color which a normal number of red cells (4,500,000) registers [1]

In the Haden-Hausser type, 15 Gm equals 100 per cent Simon states that 100 on the scale of the von Fleischel instrument is equivalent to 13 77 per cent solution hemoglobin [2] In Van Slyke's, 15 6 Gm equals 100 per cent, while in Dare, 13 77 Gm equals 100 per cent Tallquist is the simplest but has an error of from 15 to 30 per cent

The average oxygen capacity of the blood in healthy adult men is 18 5 per cent, in women, 16 5 per cent, and in children, 16 1 per cent [3]

The variables are not only with the standards, but also with the technics, the operators, and the apparatus

Hemoglobin determination is important in medicine, as well as in surgery

Because hemoglobinometers vary, it is difficult to decide which is the most accurate Each technician has his or her own choice Each one may read the same blood specimen differently It happens, too, that examiners reading the same specimen at the same time may give different percentages For example, with the same Sahli instrument, several examiners would read the same blood specimen as much as 20 per cent apart

As part of my experimentations, I secured a number of Tallquist charts made by different concerns I found the colors vary, not only with the different companies, but the same concern itself, with new issues showing variations from the preceding ones The hue would be different or the amount of dullness or glossiness would vary

The question of when to read the drop-blood method, as the Tallquist and Dare, is important. It should be read as soon as the blood stain loses its gloss, yet, before it coagulates The difficulty of doing this at the exact instant before there is a change in the hue of the blood is well known by all those attempting this technic

The method of getting the blood specimen involves many factors which may alter the results the thickness of the drop, how quickly it is taken, how readily it comes out, and whether squeezing or pressure is necessary

Sometimes, there is a turbidity of the blood due to leukocytosis Dirt and faded or disturbed color in the standard may vary it

Pipettes and tubes differ so much, not only in bore, but also in their technic of use Calibrations on them are at times found to be not exacting or constant The color and the quality

* Formerly Health Director of Schools of City of Albany and in charge of Heart Clinic at Memorial Hospital, Albany

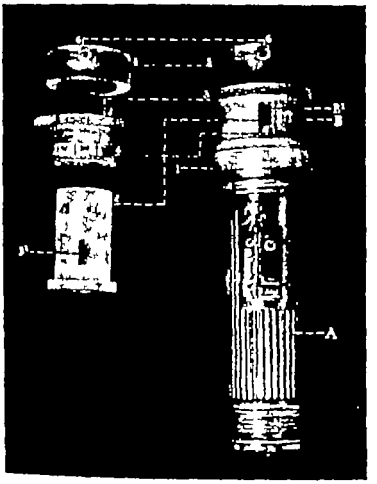

FIG 1 The hemoglobinometer assembled and disassembled It consists of a battery handle (A) and its adapted head (B) The plastic head is made up of an outer shell (1), an inner well (2) a rotatable sleeve dial (3), a color band (4), and a ring (5) There are two windows, B^1 and B^2

of the glass may tint the standard solution unfavorably The stability of the test solutions has at times proved troublesome.

There are many variables in hemoglobin determination That described avoids a number of them, because no blood per se is used There is no technical laboratory procedure required It does not need as skilled an operator, its technic being so simple The readings are rapid and accurate For example, the Sahli test took five to fifteen minutes each, while mine could be determined in a matter of seconds

Description of Apparatus

The apparatus (Fig. 1) consists of a battery handle (A) and its adapted hemoglobin head (B) (see photographs) The plastic head is made up of an outer shell (1) that screws onto the handle and an inner well (2) into which the finger fits, a rotatable sleeved dial (3) that fits between shell and well and on which is mounted the color band (4), the dial being held in place by a ring (5) There are two approximating windows B^1 and B^2, one in the outer shell and the other in the inner well. The finger fits into the inner window so that when transilluminated, its red hue shines through the outer window alongside the matching strip of the color band

FIG 2 The examiner stands between the light source and the patient, so that the light rays do not directly strike the meter

Before the test, the light source may be standardized in a very simple manner As the batteries run down the results necessarily vary This may be readily noted and corrected by the examiner who has previously had his or her own count taken For example, if the examiner reads 70 per cent and his standard is 80 per cent, he knows that the batteries are running down and should be replaced by new ones A rheostat was installed in one of the test models to standardize the chart, but this was not considered necessary when such a simple standardization by the operator himself is so readily made

Procedure

In using the hemoglobinometer, one should stand so that the direct rays of light—daylight or artificial—do not strike the color chart of the meter A simple way to do this is to have the examiner stand between the patient and the light source (or vice versa), as illustrated in the accompanying photograph (Fig 2) Total darkroom effects, as with the Dare, instrument, are not necessary Light may be controlled, too, by the window shades. The reading may even be taken shielded by the examiner's coat.

The index finger is inserted as far as it will go into the well so that its volar aspect is firmly pressed into the window To steady the finger, the thumb is pressed over the screw mark (6) on the ring When nail polish is present, the side of the finger instead of its volar aspect is placed at the window

Now the dial is turned until a red hue of the color strip matches the transilluminated color of the finger and the reading is noted The end of the finger tip overlaps the outer border of the color strip, darkening this portion The rest of the color strip remains light and transilluminated It is this latter portion of the color strip that is read

The regular color charts could not be used because they were standardized to actual drops of blood In this device, new charts were made,

standardized to the hue of transilluminated blood Over a period of three years and with over a thousand cases, many charts were made The first of these had an error of 30 per cent to 40 per cent compared to Sahli (Wert). This error was gradually reduced so that the readings are now the same as the Sahli

Summary

Hemoglobin determination is important, not only in a doctor's office and laboratory, but also frequently at home This hemoglobinometer may readily be used anywhere Even for emergencies, it can make an "on the spot" hemoglobin determination to assist in diagnosing internal hemhorrage, in giving plasma, in operations, etc

Its construction and technic of operation are simple It employs the principle of transillumination so that no blood need be drawn

It is labor- and time-saving, light, and portable Hemoglobin determination with it takes seconds, rather than minutes Cleaning and drying pipettes and tubes can be discontinued The frequently disagreeable task of taking the blood specimen with pipettes and the possibility of contamination are eliminated The errors that may be made in taking the drop of blood are done away with to a considerable extent

Methods of precision, which are so readily carried out in the hospital, laboratory, or office may not be possible under many other circumstances Because of this, hemoglobin determination is not made as often as it should be This method of transillumination is so simple that it encourages the taking of this test

This hemoglobinometer may be used as a regular flashlight Most physicians carry flashlights in their handbags, so that this combination, hemoglobinometer and flashlight, requires no extra space

The use of rheostat standardization control (as in otoscopes and ophthalmoscopes) and photocell readings were included in the experiments However, the device as it is, without these, is simple and practical

THE BIRTH OF QUACKERY

An old British newspaper, *The Gazette of April 14, 1684*, contained an order suppressing all mountebanks, rope dancers, ballad singers, who had not taken a license from The Master of The Revels. The actors decided that if they were to pay for a license they would add something more to the act and get their money back. So, they added pills, old wives cures, advice, "snake oil" remedies And Quackery was born.

In a pamphlet on quackery, published in 1805, it is stated that a certain Katerfelto practiced on the people of London in the influenza of 1782, "that he added to his nostrums the fascinations of hocus-pocus, and that with the services of some extraordinary black cats he astonished the vulgar " Katerfelto's performances were done, in the daytime, with a microscope, in the evening there were electrical experiments with black cats These cats were named "The doctor's devils," and tricks of legerdemain concluded the entertainments

Katerfelto did mix up his quackery with some real science

By the aid of the solar microscope he astonished the world with insect wonders One of his advertisements promised that with the aid of his microscope "the insects on the hedges will be seen larger than ever, and those insects which caused the late influenza will be seen as large as a bird. In a drop of water the size of a pin's head there will be seen about 50,000 insects, the same in beer, milk, vinegar, flour, cheese, etc " Katerfelto declared himself "the greatest philosopher in this kingdom since Sir Isaac Newton "

A still more famous quack flourished about the same time—a Mr Graham He operated a so-called "Temple of Health," and claimed he could explain the secret of "living with health, honor, and happiness in this world, for at least a hundred years " A means for insuring this was the frequent use of mud-baths

Graham's assistant was a lady called "Vestina, the Goddess of Health " She sat chin-deep in mud while Graham, elaborately gowned and wigged, expounded on the advantages of beauty and vigor One old historian infers it was the facial loveliness of Vestina that attracted devotees to mud rather than the results accomplished by it, and then he goes on to state that Vestina later "became celebrated as the wife of Sir William Hamilton, and the great counsellor and friend of Lord Nelson "

BENZYL BENZOATE TREATMENT OF SCABIES IN A STAGING AREA

SEYMOUR L. HANFLING, Maj ,(MC),AUS, and A ALLEN GOLDBLOOM, Lt Col ,(MC),AUS*

(From the Medical Service, Station Hospital, Camp Kilmer New Jersey)

FROM its inception in June, 1942 to December, 1944, this Staging Area Station Hospital had treated all cases of scabies by hospitalization and the long-accepted 15 per cent precipitated sulfur ointment routine The ointment was applied twice daily for at least three days During this period of over two and one half years, 723 cases were treated with a loss of over 2,000 man-days and an incalculable loss of time due to disruption in unit processing In addition to these hospitalized cases, many alerted cases of scabies were given four ounces of this ointment, printed instructions, and allowed to proceed with their units Whether these completed their course of treatment will never be known.

In the Fall of 1944, one of the authors (S L. H.) having worked with the British and having seen the results of scabies treated with benzyl benzoate which was first introduced by Kissmeyer,[1] of Denmark, in 1937, decided to investigate the possibilities of this form of therapy The literature was checked for technic and results of treatment,[2-6] and permission was obtained to use benzyl benzoate in the treatment of these cases

The liquid was obtained in a 23 per cent alcoholic solution and treatment was begun on December 1, 1944 In the nine months since then, 1,266 cases have been treated with a liquid spray of benzyl benzoate with a saving of over 3,700 man days in hospitalization, plus other advantages to be described later

The technic employed was as follows The area dispensary surgeons and the medical processing officers sent all questionable cases of scabies to the Dermatology Ward for consultation Here, all cases other than scabies were weeded out Those with established diagnoses were then directed to an adjacent building where a trained attendant was on twelve-hour duty and twenty-four hour call The patient showered and scrubbed himself thoroughly While this was being done, all the patient's cotton clothing, soiled linen, and whenever possible, blankets were steam sterilized If wearing woolen clothing, he was advised to have them dry cleaned at once. The patient was then sprayed from chin to toes by means of a continuous pressure hand spray, particular attention being paid to the more heavily infected areas The patient had his face covered during this procedure to protect his eyes. He was instructed not to bathe until the following day when he was to return for a second spray treatment At that time, the entire treatment was repeated and the patient instructed not to bathe for at least twenty-four hours Upon the patient's return for his second spray, he was questioned as to the relief of symptoms and a complete record was kept of results

The liquid used originally was a 23 per cent solution in alcohol When DDT became available, this was added to the solution in the following formula

Benzyl benzoate	10 per cent
DDT	1 per cent
Procaine hydrochloride	2 per cent
Alcohol, ethyl, q s, ad	4,000 cc.

This formula has the incidental advantage of being practically 100 per cent effective in one application in the treatment of pediculosis pubis

During the initial month of this therapy, all cases were admitted to the hospital to determine the efficacy of our treatment Sixty-seven cases were followed for at least seventy-two hours after the second spray Of these, 65 were relieved of all complaints and cleared of all lesions prior to discharge The 2 remaining cases were improved but not cleared and so were discharged to their units on an ambulatory status to continue treatment with 15 per cent precipitated sulfur ointment

Following this series, which proved to us the efficacy of benzyl benzoate in the treatment of scabies, all cases, except those with decided secondary infection, were treated on an ambulatory status. Since initiating this therapy, 1,266 soldiers were sprayed (See Table 1) Functioning as a Staging Area Station Hospital until V-E Day and as a Disposition Area Station Hospital for returning troops since then, there has been little opportunity to follow up these cases However, almost 40 per cent were in camp twenty-four hours after the initial spray and returned for a second treatment These were all questioned and over 97 per cent reported complete relief of the itching at night previously present, which verified the results of our original series of 67 cases.

TABLE 1

Period of Treatment	Cases Sprayed Once	Cases Sprayed Twice Improved	Cases Sprayed Twice Unimproved	Percentage Improved of Cases Sprayed Twice
Dec. 1 1944 to Sept. 1 1945	1,266	459	12	97 4 per cent

* Dr Goldbloom and Dr Hanfling are now in practice in New York City

The advantages of this form of treatment over precipitated sulfur ointment or any other sulfur preparation are many The saving of time in hospitalization is obvious and of prime importance Instead of a minimum of three days in the hospital with the associated disruption of routine to the unit and the soiling of a complete set of personal and bed linen, the latter at the estimated cost of seventy cents per patient, all patients can safely be treated on an ambulatory basis Because of the simplicity of the treatment, patients will return whenever possible to complete the therapy The total time lost, including the traveling to and from the barracks on two consecutive days, is less than three hours The messiness of the sulfur ointment therapy on an ambulatory basis makes any effective volatile liquid spray preferable

A second advantage of the benzyl benzoate therapy was the absence of secondary dermatoses so commonly seen after twenty-four to thirty-six hours of sulfur treatment No soldier in this series complained of more than a temporary local burning in the areas of excoriation, despite the fact that benzyl benzoate has been seen to cause a severe dermatitis when applied too freely or too frequently Cases have been seen in this Dermatology Clinic of severe reactions following self-treatment The total absence of reactions in our cases is undoubtedly due to the proper application of the solution, not more than twice by a trained technician

The question of sterilization of clothing and blankets is one frequently raised and of primary importance Opinions among the British vary There are some who regard it as unnecessary[2,10] and a waste of time and money, while there are others that feel that fomites, and not direct contact alone, can cause a spread of this infection [4 5 11] Our opinion is that without spread by fomites the Army would not have the high incidence it has There is not enough direct contact to explain it On the other hand, there is a routine story of the use of unclean blankets and a week or so later, developing an itch This Dermatology Service does steam-sterilize all cotton clothing, linen and blankets and, advises that wools be dry cleaned These precautions should eliminate any possibility of reinfection

Summary

1. From June, 1942 to December, 1944, 723 cases of scabies were hospitalized and treated with 15 per cent precipitated sulfur ointment, resulting in the loss to the Army of over 2,000 man days

2 In December, 1944, the ambulatory treatment of scabies with a spray of an alcoholic solution of benzyl benzoate was inaugurated In the nine months since then, 1,266 cases were treated, 471 cases were checked, and 459 or 97 4 per cent showed disappearance of symptoms in twenty-four hours

3 The first 67 cases were followed in the hospital for at least three days after completion of the treatment Sixty-five were discharged cured after two applications

4 Over 3,600 man-days were saved by this ambulatory treatment

5 Attention is called to the advantages of this therapy in the saving of hospital linen and the absence of secondary dermatoses

Conclusions

1 An efficient and nontoxic form of treatment for scabies is a 10 per cent alcoholic solution of benzyl benzoate applied with a spray gun on two occasions, twenty-four hours apart

2 Clothing may or may not be sterilized but we believe it advisable

3 Treatment is over 97 per cent successful.

4 The final formula used has the incidental advantage of being practically 100 per cent effective in one application in the treatment of pediculosis pubis

5 In view of the simplicity of the application of this liquid by means of a spray gun or a soft paint brush, we believe this therapy can be employed to advantage, not only by the Army Medical Corps, but also by the civilian medical practitioner

WASHINGTON INSTITUTE PUBLISHES TWO NEW JOURNALS

The *Quarterly Review of Psychiatry and Neurology* and the *Quarterly Review of Urology* are two new publications to be issued shortly by the Washington Institute of Medicine

They are sponsored by boards of well-known specialists of which Dr Winfred Overholser, of St Elizabeth's Hospital in Washington, heads the former and Dr Hugh J Jewett, of Johns Hopkins, the latter The publication office is at 1720 M Street, Washington, D C

POSTURAL HEADACHE AND ATTACKS OF LOSS OF TONE IN A CASE OF CALCIFIED SUPRASELLAR TUMOR*

ALFRED GALLINEK, M D , New York City

(From the Department of Neurology of Columbia University, College of Physicians and Surgeons, and the Neurological Institute)

THE patient, a 36-year-old white man, married, American-born, was first seen at my office on October 25 1944. He was admitted to the Neurological Institute on November 8, 1944, and discharged on November 14, 1944 He was in his usual good state of health until 1941, when he developed the first of a series of attacks of headaches which have occurred intermittently up to the present time Prior to his admission to the Neurological Institute in November, 1944, the maximum frequency of the headaches had been twice per week. Recently, on occasions, they have been more frequent. All headaches usually begin late in the afternoon or early evening and the patient soon after having experienced the headaches for the first time, discovered that he could eliminate the headaches by lying down. He also noticed that he could aggravate the headaches by bending over or stooping. The localization of the headaches is always bifrontal, in the orbits behind the eyes, and across the bridge of the nose. The quality of the pain is described as nagging and annoying occasionally with a throbbing component. During the last year 1945, there have been several episodes of nausea and vomiting, relieved by lying down. Since 1943 there has been occasional photophobia, blurring of vision, and occasional urinary urgency There has been no tinnitus, vertigo deafness, diplopia, nor somnolence.

In 1942 the patient experienced the first of a series of weak spells. These spells occurred very infrequently in the beginning—only one spell in 1942, two spells in 1943, none in 1944, and seven in 1945

The first so-called weak spell occurred while the patient was walking down the street at the end of his day of laborer's work, no more tired than he usually was at this time He first noticed numbness of the forehead and both sides of the lower face This was followed by flushing and sweating in these areas and a sense of heat across the waist. Intense weakness then appeared in the back and legs, and in about one minute after onset of the initial numbness, he fell to the ground with perfect preservation of consciousness. He was assisted to his feet and immediately walked away without difficulties He had no headache

The second spell occurred while he was hanging clothes in a closet. He suddenly felt weak in the legs, began to sag a little, and about a minute later fell to the floor with preservation of consciousness There was no accompanying weakness of the arms The vasomotor symptoms of the first spell were not present. He arose unassisted almost immediately and sat down for several minutes. He was then able to resume his duties.

On two occasions while walking, he felt numbness in his face and weakness in his legs, but succeeded in preventing collapse by sitting down. After resting for several minutes, he was able to resume walking.

Several of the subsequent attacks of loss of tone were preceded by headache in addition to numbness in his legs. During the last year, the duration of attacks of loss of tone has been about five minutes from the onset of the first symptoms, until the moment when he is able to resume standing or walking

The character of the headaches has not changed materially The patient always emphasizes their localization as "going through or behind the eyes." Invariably they have been completely relieved by resting in a recumbent position for about fifteen to thirty minutes. Almost without exception they have occurred only in the evening. They never have prevented the patient from working full time Until recently, he worked nine hours as a stock clerk spending considerable additional time commuting. Now he has changed to a somewhat less strenuous job, working eight hours a day

At the age of six the patient fell out of a tree hitting his head on a rock. He had twenty stitches in his scalp He does not remember any details, but remembers that he did not have to be hospitalized At nine he had an operation for strabismus. Some time during his childhood he was treated in a hospital for diphtheria and during that period developed malaria. Otherwise, his past history is entirely noncontributory He has no sleep disturbances, his appetite is unchanged During the period of observation, which means for the last thirteen months he has lost about ten pounds There is no history of polydipsia, or polyuria. His sex life is normal

On examination this 36-year-old patient weighed 125 pounds and was five feet six inches in height. He was of slight body build. There were no abnormalities on general examination He was right handed. The left eye showed poor convergence and the left palpebral fissure was slightly wider than the right. These changes were probably due to the aforementioned operation

Both disks showed slight papilledema (O.D ½ diopter, O S. 1 diopter) with blurring of the nasal margins and a moderate temporal pallor There was a marked constriction of both visual fields. The visual acuity, after correction of compound hyperopic astigmatism, was 20/30 bilaterally There was hippus and slight nystagmus at left lateral gaze

Otherwise, the cranial nerves were normal except for a slight rigidity of the facial expression and vague asymmetry in the innervation of the left mouth, which might or might not represent a minimal left central facial weakness. Slightly rigid posture was noticeable particularly on walking. Muscle status, strength coordination, and tendon reflexes in the upper extremities were normal tendon reflexes in the lower extremities were very active and equal, there was no clonus. An inconsistent tendency toward dorsal flexion of the big toe has been occasionally observed in the left foot, also some fanning There was a downward drift in the left upper extremity with convergence and pronation in the right upper extremity The sensory system was normal in all its details.

The initial spinal fluid pressure was 200 mm. the final pressure, after withdrawal of 10cc., was 170 mm. On readmission in May, 1945, the initial pressure was

* Presented at a Combined Meeting of The New York Neurological Society and Section of Neurology and Psychiatry of the New York Academy of Medicine, December 11 1945.

130 mm , and on second readmission in June, 1945, the initial pressure was 140 mm , and the final pressure, after withdrawal of 10 cc , 70 mm

Blood Kline test was negative, urine analysis, negative, spinal fluid total white blood cells, 3, total protein, 160 mg per cent, colloidal gold, 1100000000, Wassermann test, negative

Glucose tolerance blood sugar fasting, 90 mg per cent, glucose, one-half hour, 129 mg per cent, one hour, 126 mg per cent, two hours, 104 mg per cent, three hours, 89 mg per cent, four hours, 92 mg per cent

Anteroposterior and left lateral stereos of the skull showed a very large circumscribed shadow of calcium of almost bony density, within the cranial cavity, lying in the midline in the suprasellar region The inferior margin was relatively straight A small calcium shadow was seen posterior to this large mass, apparently the posteriorly displaced pineal gland The sella turcica was slightly enlarged The posterior clinoid processes were definitely atrophic The bones of the vault showed no definite abnormality

A 16 lead electroencephalogram with monopolar and bipolar recording was essentially normal There were no focal signs, the basal metabolic rate was 14 per cent, x-ray of the chest, normal, audiogram, normal

Analysis of Symptoms

In analyzing the clinical symptomatology of this case, there are the following symptoms In the first place, the headaches to a great extent are dependent on and relieved by changes in posture They are of intermittent character Second, we have the attacks of loss of tone in the lower extremities The third symptom group is represented by the moderate papilledema, constriction of the visual fields, and resultant difficulties in vision In addition, there are slight Parkinsonian features and a moderately low basal metabolic rate

It certainly, at first glance, is surprising to find only this comparatively meager group of symptoms in a lesion of such unusual size This tumor certainly must occupy most of the region of the third ventricle and its adjacent structures Tumors in that region are known to have scanty symptoms Wilson[1] stated that there is no distinctive syndrome of the third ventricle and Dandy,[2] in discussing benign tumors of the third ventricle, stated that "not the least reason for suspecting a tumor of the third ventricle is their silence" However, he stresses the intermittent character of headache, dizziness, visual disturbances, and their dependency on posture He also mentions intermittent attacks of weakness of the extremities

Wilson, as well as Dandy, refers only to tumors inside of the third ventricle, not to tumors involving the ventricle as well as adjacent structures For the latter type Fulton and Bailey[3] have enumerated not less than nine syndromes the infundibular syndrome (polyuria, adiposity), hypersomnia, thalamic syndrome, extrapyramidal syndrome, decerebrate syndrome, Parinaud syndrome (paralysis of conjugate vertical ocular movements), syndrome of the body of Luys (hemichorea), hypopituitary syndrome (infantalism, hypotrichosis, lowered metabolism), and the uncinate syndrome Of this manifold and varied series of syndromes, only two items are faintly distinguishable extrapyramidal features and a moderately low basal metabolic rate Cerebellar symptoms, also described as occurring in suprasellar tumors involving the region or neighborhood of the third ventricle (Allen and Lovell, Bailey[4]), are missing and so are disturbances of the heat regulating mechanism observed in lesions of the periventricular zone (Strauss and Globus[5])

In a recent paper Wilfred Harris[6] has stressed the importance of paroxysmal and postural headaches as pathognomonic of intraventricular cysts and tumors He described two cases of colloid cysts In addition to paroxysmal headaches with sudden onset and sudden disappearance depending on posture, he also described in his cases, sagging of the legs as seen in this case One of his two patients could voluntarily terminate his headaches by throwing his head backwards. The symptom of postural, paroxysmal, intermittent headache, has been known for a long time and is described in the older literature under the name of "Brun's symptom" (Henneberg[7]) Oppenheim[8] described intermittent headache with nausea and dizziness precipitated by movements of the head as pathognomonic of Cysticercus of the fourth ventricle or occlusion of the aqueduct of Sylvius We now realize that they probably can be caused by obstruction anywhere in the ventricular system and that they are certainly more frequent in lesions involving the third than in those involving the fourth ventricle Stookey[9] described the same type of headaches as caused by intermittent obstruction of the foramen of Monro by neuroepithelial cysts He found in his cases a history of sudden, violent onset of symptoms lasting for a few hours or days, and recurring after periods of relative freedom from all signs He stressed the immediate transition from well-being to an excruciating headache and the striking relief that could be obtained by lying down or extension or tilting of the head In a case of third ventricle tumor described by Ford,[10] the paroxysmal headache was so severe that the patient had to be restrained Bailey[3] described a patient who had to lie down and sleep in order to overcome intermittent headache This patient also suffered from the effects of a colloidal cyst

Intermittent disturbances of vision and relief by change of posture were described by Weisenburg[11] in a case of a small choroid plexus tumor in the upper portion of the third ventricle which closed the foramina of Monro A similar observation was made by Schüeller [12] Pain and discomfort not only in the head but behind the eyes, as seen in this patient, have also been observed by McKenzie and Sosman[13] in their series of craniopharyngiomas

The mechanism of the intermittent paroxysmal postural headache is explained by Harris by a block of one of the foramina of Monro He believes that relief of the headaches is due to escape of the fluid from a distended lateral ventricle Considering the size of the lesion in our case, it seems likely that compression of and relief of pressure on both veins of Galen with resultant changes in the venous outflow of the choroid plexus of the lateral and third ventricle,[1 2] play an important role.

FIG 1

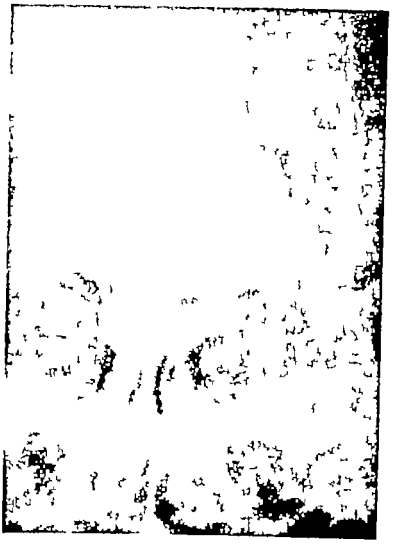

FIG 2

Attacks of loss of tone in the lower extremities as seen in our case, were seen by Wilfred Harris[6] in a case of a colloidal cyst in the foramen of Monro Harris objects to using the term cataplexy in reference to these spells. This is a comparatively unimportant question of nomenclature The attacks of loss of tone also mentioned by Dandy[2] as being observed in intraventricular tumors of the third ventricle are certainly not completely identical with the typical cataplexy seen in conjunction with narcolepsy The affective component seen in most cases of idiopathic cataplexy was entirely missing in our case.

Diagnosis

In trying to arrive at a diagnosis of the nature of the lesion, we have to remember that calcification may occur in neoplastic as well as non-neoplastic intracranial pathologic conditions, the latter group comprising hematomas, tubercles, aneurysms or abscesses, areas of meningeal disease and encephalitis, and calcified parasites.[14] Tuberculomas cause small, multiple globular calcium deposits [15] and have no resemblance to the lesion seen in our case. They are described as dense, irregular masses, measuring not more than 1 to 2 cm. in diameter [14] Parasites are usually located in the fourth ventricle and show also multiple small areas of calcification,[15] being not larger than pea-sized dense with irregular contours.[14] Speaking of non-neoplastic pathology only the possibility of a hematoma deserves some consideration, particularly since there is a history of head injury However, it seems that the appearance and shape of the lesion is much more suggestive of a calcified neoplasm, since the appearance of calcified hematoma is characterized by irregular, dense, roughly triangular shadows.[14]

The list of tumors which might calcify comprises glial tumors, meningiomas hemangiomas, cholesteatomas (epidermoids), dermoids, and craniopharyngiomas. Of these only meningioma, dermoid, and craniopharyngioma have to be discussed

The solid, dense appearance of the lesion favors meningioma. In this case the point of origin would have to be searched for in the anterior falx. The calcifications or ossifications in meningiomas, however are rarely demonstrable by x-rays since commonly they are of microscopic size only [16] In suprasellar meningiomas especially, calcifications are particularly rare Meningiomas arising from the falx usually give no roentgenologic evidence of their presence.[16]

The suprasellar localization is certainly suggestive of craniopharyngioma. Calcification in craniopharyngiomas is usually irregular appearing in streaks,[15] being of patchy, spotty, blotchy character [3] The shadows are frequently only faint, irregular and flocculent,[14] or delicate and spongy The outline of the sella is abnormal in 76 per cent, showing enlargement of the fossa with irregularity and depression of the floor [13] For these reasons, the lesion certainly cannot be considered to be a typical craniopharyngioma.

The calcifications occurring in dermoids and cholesteatomas, according to Camp may be mistaken for calcifications in Rathke's pouch tumors. Dermoids show a predilection for the neighborhood of the sella,[14] and the roentgenogram of a calcified lesion even larger than ours, situated somewhat more anteriorly, is interpreted by Camp as a dermoid The only other similar roentgenogram which could be found in the literature (Pancoast, Pendergrass, and Schaeffer[17]), is an enormous suprasellar calcified

lesion, somewhat closer to the sella than in our case with no evidence of increased intracranial pressure

The roentgenogram in our case is not a typical dermoid either, since in dermoids the calcification usually outlines only the wall of the cyst and, therefore, is exhibited in the roentgenogram as a circular shadow [14] It, therefore, has to remain undecided for the time being, whether we are dealing with an unusual craniopharyngioma, an unusual dermoid, or a meningioma.

The question came up whether the diagnosis could have been furthered by air encephalography or ventriculography It was felt that not much additional information could be expected from these tests, and that they might be dangerous

The problem of surgical approach was discussed seriously In view of the size and the localization of the lesion, there is no doubt that a surgical removal would be difficult and hazardous McLean[18] calls craniopharyngiomas the most discouraging of neurosurgical lesions A similar view is expressed by Bailey [19] The fact that the patient is able to work and able to lead a normal life certainly favors a most conservative attitude, particularly since all subjective symptoms disappear for a period of about two months after withdrawal of 10 to 15 cc of spinal fluid

The discrepancy between the magnitude of the lesion and the comparatively mild character of the symptomatology is certainly striking The case is also instructive as to the diagnostic value of intermittent postural headaches and attacks of loss of tone

Summary

The case of a patient with an unusually large calcified suprasellar lesion is described The outstanding features of the symptomatology are postural headache and attacks of loss of tone The diagnostic aspects (dermoid, craniopharyngioma, meningioma) are discussed

INTERNAL HERNIA STRANGULATED BY MECKEL'S DIVERTICULUM

Walter W Mott, M D , F A C S , White Plains, New York

THE patient, Mrs F D , age 47, was admitted to White Plains Hospital on October 26, 1945 with symptoms of partial intestinal obstruction Onset had been three days previously with pain in both lower quadrants Some gas and fecal matter were obtained with enemas until the past twenty-four hours, when distention increased and vomiting occurred

The patient had had two previous similar attacks, for several days, each time an operation was contemplated However, she continued to pass small quantities of gas with enemas and there was no fecal vomiting Finally the evident obstruction was relieved with colon irrigations and repeated enemas She had had a round ligament suspension done twenty-five years ago Her daughter, 23 years old, was operated on by me last year for signs resembling those of subacute appendicitis in lower left quadrant Meckel's diverticulum 4 inches long and 1 inch in diameter was found and removed, confirming preoperative tentative diagnosis

On admission to the hospital the patient was given 5 per cent saline with glucose, and several stimulating enemas, without passage of gas She was operated on twelve hours after admission Novocaine and pontocaine spinal anesthesia were used

A midline incision from umbilicus to pubes was made The distended coils of the small intestine were presented One loop was extruded from the abdominal cavity, and in spite of gentle handling this ruptured, spilling intestinal contents, mostly outside of the wound The rupture was repaired by a double row of fine chromic sutures The distended coils were replaced in the abdomen, and the collapsed loop of ileum was followed down deep in the pelvis to the site of the obstruction

The obstruction was found to be caused by a large Meckel's diverticulum, which had become adherent at the tip to its own loop of bowel, and formed a semicircle of 3 inches in diameter and 1½ inches radius through which a loop of ileum had prolapsed, and had become twisted and obstructed

There was no sharp band of strangulation, and the loop was easily reduced from its herniated position

The distended coils of intestine were dark red, but in no place purplish, and they had not lost their lustre. The diverticulum was freed at its tip, and amputated at the base by crushing clamp, carbolic and alcohol, and two layers of chromic suture Ten Gms. of sulfanilamide were placed in the peritoneal cavity, and Penrose and rubber tube drains placed in the pelvis. The wound was closed in layers by interrupted chromic, a w tension sutures and interrupted silk were used in the skin

The patient left the operating table in poor condition. She was given 500 cc. of whole blood postoperatively and 1/6 grain of morphine A rectal tube was inserted and Wangensteen suction started Four hours after operation some flatus and liquid were expelled via rectum Five hundred cc. of blood was given and 1 Gm of sulfadiazine every four hours. For the next twenty four hours the patient was very restless and confused and the abdomen was distended No flatus or feral matter was expelled with enemas. Prostigmine was given and repeated

The day following operation another 500 cc. of whole blood was given and 2,000 cc. of saline in glucose. For the next twenty four hours her abdomen continued to be distended and she appeared to be in a very critical condition In the following twenty four hours she voided very small quantities of concentrated urine. She belched occasionally but there was very little gas passed by rectum. The pulse gradually improved Her sulfanilamide blood level on the second day was 4 mgs. per cent. Another 1,000 cc. of saline and glucose was given on the third day The pulse was of better quality and the Wangensteen drainage was working well. Cracked ice and spoons of tea were started by mouth closing off the tube each time Peristalsis began to be felt about the third day and from then on the patient began to pass gas by rectum The Wangensteen drainage was continued for eight days after the operation She expelled large amounts of flatus. Abdominal distention subsided and the wound drained moderately and her general condition seemed satisfactory until about her seventeenth postoperative day when her temperature started to rise She complained of pain in her left lower quadrant and her abdomen became somewhat more distended Penicillin was started at this time Her temperature rose up to 103 F on the twenty-first day A decision had just about been made to explore the wound with the thought that there was possibly a collection of pus walled off in the pelvis, when the patient passed a large stool, very foul smelling and containing greenish yellow pus Apparently the abscess had ruptured into the rectum From then on the temperature subsided She had no more pain and the purulent discharge from the bowel ceased She was discharged on the thirtieth postoperative day At the time of this report she was eating well, the wound was healed, and there were no weaknesses of the abdominal wall and no distention

SENSORY AID FOR THE BLIND BEING DEVELOPED

Development of a sensory aid for the blind which operates on electronic principles akin to radar and which was first initiated at the request of the Surgeon General has reached an advanced stage according to an announcement by the War Department.

The experimental model, weighing 9 pounds and connected with a single earphone, contains a 3 watt lamp which focuses a narrow ray of light through a lens.

Any object within twenty feet of the device will reflect the light back toward a second lens, which, in turn, transfers the light to a photo electric cell, divided into five units for computing distance. The cell then produces electrical bursts of energy or sound tones and these are transmitted to the ear through a standard hearing device. The handle of the device is parallel to the direction of the first light ray, enabling the user to detect, through the position of his hand, the direction of the object

Although the laboratory model of the device has been completed and tested at Signal Corps Engineering Laboratories, it is not yet considered sufficiently perfected to be practical for use, and requires further development before being placed in production.

—Release from the Office of the Surgeon General

PNEUMONIA OF ORNITHOTIC ORIGIN

Report of Two Cases Occurring in the Same Family Following Contact with Pigeons

LESTER COHEN, M D , IRVING GRAY, M D , F A C P , and SOLOMON LONDON, M D , Brooklyn, New York

(*From the Medical Service of the Coney Island Hospital*)

THE INCREASING incidence of nonbacterial pneumonia is absorbing the attention of the clinician as well as of the laboratory investigator. Following the high incidence of psittacosis in 1934, atypical pneumonia appeared to be related to exposure to birds of the psittacine family [1] Subsequently, other families of birds, including the canary, finch, barnyard fowl, pigeons, and doves, were shown to be harbingers of the virus [1]

Reiman[2] in 1938, reported a form of atypical pneumonia in which the responsible infectious agent was a virus An instance of atypical pneumonia or virus pneumonia was reported by Stickney and Heilman[3] and proved to be transmitted by a common bird, the dove, which had been infected by the barnyard fowl Meyer and Eddie[4] reported that a random sampling of birds in pigeon lofts and barnyards containing turkeys, chickens and geese, revealed a rather high incidence of infected birds Favour[5] in 1943, reported 1 probable and 2 definite cases of ornithotic pneumonia In this communication we are reporting two instances of atypical pneumonia—in husband and wife who had come in intimate contact with pigeons The patients had had two pigeons in their bedroom for one week prior to the onset of their illness

Case Reports

Case 1 —S B (#98725), a 56-year-old man, was admitted to the Hospital on August 3, 1942 For several days prior to admission, the patient complained of weakness, dizziness, and headache These symptoms became progressively worse For several days prior to hospitalization, the headache especially became increasingly severe, and the temperature rose to 104.5 F The patient had a slight cough, there was no expectoration, he was not dyspneic, and he had no chills On examination by one of us (L C), impaired resonance and inconstant rales were found at the right base There was no evidence of any rash, and the respirations were not increased In view of the fact that the patient had fever and pulmonary signs, sulfadiazine therapy was instituted Complete blood study when the patient was first observed, revealed a normal hemoglobin and red blood cell count, white cells, 6,700, with a differential count of 72 per cent polymorphonuclear leukocytes (68 per cent segmented, 4 per cent nonsegmented), and 28 per cent lymphocytes At the end of forty-eight hours, the temperature still remained elevated. The headaches became increasingly severe, there was slight cough and occasional expectoration, sputum was typed for pneumococci and reported as negative When the patient was admitted to the Hospital, the essential findings were related to the chest There was diminished resonance over the right lower chest, with harsh, intensified vesicular breathing and showers of moist respiratory rales over the same area The patient was well nourished and well developed, and despite the high fever, did not appear acutely ill. Examination of the heart revealed normal findings except for an accentuated A-2 and signs of bradycardia The liver edge was felt one and a half fingers below the costal margin Blood pressure was 120/70 For the first forty-eight hours after admission, temperature fluctuated between 101 and 103 F , respirations were 30 There was a persistent bradycardia, the pulse rate ranged between 60 and 68 The failure of the patient to respond to "sulfa" therapy, the absence of pneumococci on examination of the sputum, and the findings suggestive of a pneumonitis in the right lower lobe indicated that the origin of the pneumonia might possibly be due to a virus disease The possibility of typhoid fever was considered because of the persistent bradycardia and leukopenia Shortly after admission to the Hospital, questioning of the patient revealed the fact that he had been presented with two pigeons, approximately a week before the onset of his acute illness, and further, it was learned that these pigeons were kept in the bedroom In view of this history, and because of the atypical character of the clinical course, a diagnosis of virus pneumonia was considered and an attempt was made to determine whether the birds might have been vectors The birds, however, had been given to a pigeon fancier, and could not be traced

Laboratory Studies —Blood chemistry and urine examinations revealed normal findings Agglutination reactions for typhoid, paratyphoid, melitensis, and proteus were all negative in dilution of 1 to 20 through 1 to 320 Blood Wassermann test was negative Blood count was red blood cells, 4,000,000 per c.mm , white blood cells, 5,500 per c.mm , hemoglobin, 100 per cent (14 5 Gms), polymorphonuclears, 77 per cent, lymphocytes, 66 per cent; monocytes, 7 per cent X-ray study of the chest on August 4 (twenty-four hours after admission to the Hospital), revealed an area of parenchymal infiltration above the dome of the right diaphragm A second x-ray study on August 11, revealed a complete resolution of the pneumonic process previously noted.

Clinical Course —For a period of six days following admission to the Hospital, the temperature ranged between 100 and 103 F and then remitted to 98 8 F on the seventh day On the eighth day, the temperature rose again to 101 F and returned to normal within four days The abnormal physical signs in the right lower chest, gradually receded and normal breath sounds were heard ten days after Hospital admission. At no time was bronchial breathing heard over the right lower lobe Exaggeration or intensification of the bronchovesicular breathing and a varying number of moist rales were heard over the right and left lower lobes during the acute illness, and these findings gradually subsided The patient was discharged as recovered on the seventeenth day

Case 2 —D B (#98724), a white woman, aged 44, was admitted to the hospital on August 5, 1942

She had given nursing care to her husband for approximately forty-eight hours after the onset of his acute illness, when she began to complain of "fever headaches and weakness." Her temperature ranged from 100 to 103 F. There were no abnormal physical signs on examination of the chest at the onset of her illness and there were no clinical signs of improvement after the use of sulfadiazine for a period of forty-eight hours. Five days after the onset of her acute illness, examination of the chest revealed diminished breath sounds and a moderate number of fine crepitant rules at the right base.

The patient did not appear acutely ill at the time of her admission, or in fact, at any time during her stay in the Hospital. The progression of her symptoms paralleled those of her husband. A blood count taken prior to Hospital admission revealed the following: Hemoglobin and red blood cell count findings were normal. White blood cells were 7,100, polymorphonuclears, 77 per cent (5 per cent nonsegmented), lymphocytes, 14 per cent, monocytes, 4 per cent, blood pressure was 130/40.

Laboratory Studies.—Blood chemistry and urine examination revealed normal findings. Agglutination reactions for typhoid, paratyphoid melitensis and proteus were all negative in dilution of 1 to 20 and 1 to 320.

Blood Wassermann test was negative. Blood count revealed the following: red blood cell count—4,640,000, white blood cell count—6,200, hemoglobin—90 per cent, polymorphonuclears—70 per cent (3 per cent segmented), lymphocytes—30 per cent. On examination of the sputum, no tubercle bacilli and no pneumococci (either by the Neufeld method or on culture) were found. X-ray examination of the chest on August 8, three days after admission to the hospital, and a subsequent film on August 10, revealed findings of a pneumonitis in the midportion of the right lower lung field. A subsequent x-ray film taken on August 28, twenty-three days after admission to the hospital, revealed complete resolution of the parenchymal infiltration previously noted.

Clinical Course.—On admission to the Hospital, the patient's temperature was 101 F., pulse rate, 76, and respirations, 24. During the first week, the temperature ranged between 99.6 and 100 F. and during the second week, between 100 and 101.6 F. Thereafter, there was a gradual decline and return to normal.

A bradycardia was present during the entire course of the patient's illness. Occasionally, the pulse was as low as 50, and never rose above 76, except on the thirteenth day when the pulse was elevated to 90 and from then on paralleled the degree of temperature.

On physical examination, exaggerated voice and breath sounds with harsh breathing and a moderate number of moist rales were heard over the right lower lobe. At no time was there any bronchial breathing. The harsh breath sounds and the moist rales persisted to a varying degree for approximately three weeks. The patient was discharged as recovered, twenty-seven days after admission to the Hospital.

Complement Fixation Studies.—Three days after the husband (S. B.) was admitted to the Hospital (August 6, 1942), the blood was obtained and the serum was sent to Dr. Lewis Thomas, of the Rockefeller Institute for Medical Research, for serologic study to determine the presence of complement fixing bodies for psittacosis or ornithosis. The report of this study was as follows:

Date	Time after Onset	Complement-Fixation Titer
August 6, 1942	10 days	1:8
August 18, 1942	22 days	1:16

Blood serum obtained from the patient (D. B.) was sent to Dr. Thomas for a complement fixation study for psittacosis and ornithosis. Report of this study is as follows:

Date	Time after Onset	Complement-Fixation Titer
August 6, 1942	0 days	1:32
August 12, 1942	15 days	1:64
September 30, 1942	2 months	1:128

In his personal communication to us, Dr. Thomas stated that "S. B. is questionable but D. B. is to be considered a proved case of psittacosis or related virus infection." The complement fixation titer increases with time, and usually reaches its maximum within two to six weeks after the infection has set in. We were unable to obtain further specimens of blood from the husband (S. B.) after he had left the Hospital.

Comment

The onset of the infection in both the husband and the wife was gradual, and initiated without the usual dramatic onset typical of pneumonia. There was no shaking chill, pleuritic pain, cough, or bloody expectoration. There was no previous history of upper respiratory infection. The severe headache was a prominent feature of the clinical picture.

The cough was not severe, and there was very little expectoration. The physical signs were meager and at no time were there the usual clinical signs of pneumonia. Both patients were in good general physical condition, and did not appear acutely ill at any time during their illness. The disparity between the x-ray findings and the physical findings was striking. Following administration of the sulfa drug there was no improvement in either the husband or the wife. The persistent neutropenia and bradycardia in both patients led us to suspect the possibility of an enteric fever. The failure of the sulfadiazine to produce either clinical improvement or a drop in the fever led us to believe that we were not confronted with the usual type of bacterial pneumonia. At no time in the clinical course of either patient were there any signs of severe toxemia or prostration. A state of well being was evident at all times. The atypical pneumonia following exposure to contact with birds of the psittacine family is well known. Emphasis should be placed upon the fact that the virus carried by the parrots is also carried by other common birds which may subsequently become vectors of atypical pneumonias. Although the complement fixation test was positive in low dilution in the husband only, it appears reasonable to conclude that his pneumonia was also of ornithotic origin in view of the contact with pigeons such as his wife had. Furthermore the clinical course, laboratory findings, and x-ray findings in both husband and wife were essentially the same.

MEDICINE'S DEBT TO PASTEUR

Fifty years ago, on September 28, 1895, Louis Pasteur died in his seventy-third year Though not a medical man he contributed more, both directly and indirectly, to the advance of medical science in the second half of the nineteenth century than perhaps any other man The first half had seen the building up of solid knowledge of the correlation between physical signs and morbid anatomy, but of the causes of disease there was, as Osler said, "Before Pasteur, Egyptian darkness" In the retrospect one is struck with the beautifully logical development of his ideas, which grew from a minor point to wider problems He was impressed by Laplace's vision of "a Galileo or a Newton arising through a series of inductions from particular phenomena to others more far-reaching," and this characterized all his work Thus, trained as a chemist, he turned to crystallography, (incidentally creating stereochemistry) and by his studies of dextrorotatory and levorotatory tartaric acids showed that only the former underwent fermentation, and that by means of living organisms—a thesis persistently denied by Liebig When asked what was the use of his more recondite researches, he retorted by repeating Benjamin Franklin's question, "What is the use of a newborn child?"—a hint which might be taken by those present-day scientists who would restrict scientific research to subjects of "social value"

Pasteur quickly showed the social value of his researches in crystallography by curing the diseases of beet sugar, wines, and beer, but what authority could have anticipated this? Moreover, he said, "What would be most desirable would be to push these studies far enough to prepare the road for a serious research into the origin of various diseases [such as] putrid and contagious ones," believing, as the far-sighted Robert Boyle had expressed it in the seventeenth century, that "he who could discover the nature of ferments and fermentation would be more capable than anyone else of explaining the nature of certain diseases" Accordingly Pasteur started the study of silkworm disease, which was devastating the industry in these worms in France, and restored it to prosperity by discovery of the parasite responsible He was bitterly opposed by the believers in spontaneous generation—a theory which it might have been supposed had been killed by Redi in the seventeenth century, but far from it, for this was the root of the opposition to the germ theory of disease To do his opponents justice, they felt, as Piorry put it, "it is not the disease, an abstract thing, which we have to treat but the patient whom we must study with the utmost care" Their mistake was to deny the germ theory entirely, if they had not done so they might have realized that Pasteur himself had presented them with a proof that the soil mattered as well as the seed when he showed that animals naturally immune to an infection lost that immunity if placed under unfavourable conditions Undeterred by opposition Pasteur went on to investigate the epidemics of "splenic fever" which were destroying valuable flocks and herds throughout France He proved that they were due to infection by anthrax and perpetuated through the action of earthworms bringing to the surface the bacilli and spores from the buried bodies of animals that had died from the disease His studies of chicken cholera led him to the important discovery of methods of attenuation of viruses and thus to the preparation of vaccines "Is it not permissible," he said, "to believe by analogy that a day will come when easily applied preventive measures will arrest the ravages of epidemic diseases?" A dictum of his that "the best proof that an observer is on the right track lies in the uninterrupted fruitfulness of his work" was now to be strikingly illustrated by the application of his principle of attenuation to the treatment of hydrophobia Early impressions persist, and one of Pasteur's childish recollections was the terror inspired in the Jura by the inroads of a mad wolf He therefore attacked the problem with great energy and, as is well known, with great success, to which the foundation of the Pasteur Institute in Paris by public subscription was a striking witness Here, with the assistance of Roux, Yersin, Chamberland, and Metchnikoff, his beneficent work continued and expanded, giving rise to similar institutes in various parts of the world But there is no institute for hydrophobia in Great Britain, for the muzzling order stamped out the disease here Pasteur's last years were rejoiced by the discovery of diphtheria antitoxin by Roux and Yersin at the Institute, and shortly after by Yersin's discovery of the plague bacillus in India But perhaps his greatest pride in his followers was for Lister, whose earlier adaptation of Pasteurian methods to the control of sepsis after operation is recognized throughout the world as one of the greatest boons to suffering humanity—a striking instance of the fruitfulness of a single idea faithfully pursued

Pasteur's work, here rapidly sketched, was the measure of the man, patient and indefatigable, remorseless in his criticism of his own findings, single-minded in pursuit of truth, and devoted to the welfare of mankind and therefore a firm believer in the internationalization of science No man can have met with fiercer or more bitter opposition than this great benefactor It is to be regretted that he spent so much time confuting adversaries who had only the flimsiest evidence to support them, but for one of his temperament it was impossible to leave the battlefield against ignorance just as it was impossible to deny pity and help to real suffering A hard hitter in controversy, he had also a gift for loyal and devoted friendship Perhaps his creed was best expressed in words from his oration at the opening of the Pasteur Institute—words which are even more relevant today than when they were spoken "Two contrary laws seem to be wrestling with each other nowadays the one of blood and death, ever imagining new means of destruction and forcing nations to be constantly ready for the battlefield, the other a law of peace, work, and health, ever evolving new means of delivering man from the scourges which beset him The latter places one human life above any victory, while the former would sacrifice hundreds and thousands of lives to the ambition of one Which of these two laws will ultimately prevail God alone knows"—*Brit M J, Sept 29, 1945*

Department of Workmen's Compensation

Conducted by David J Kaliski, M D, Director

THE difficulty inherent in the diagnosis of silicosis is apparent to all well-qualified specialists in pulmonary diseases Attention is invited to the following abstracts of discussions* which took place recently at the tenth annual meeting of the Industrial Hygiene Conference at the Mellon Institute in Pittsburgh, Pennsylvania, as indicating the need for great caution in making a diagnosis of pulmonary silicosis. Under the New York State Law, only total disability is compensable (article 4A) although a number of bills have been introduced in the Assembly and Senate to widen the benefits to include partial disability

Accurate Diagnosis of Silicosis. Possible Sources of Error

Discussion by Dr Leroy U Gardner, New York — The diagnosis of silicosis rests on three bases, a history of adequate exposure to free silica dust the demonstration of a characteristic nodular pattern in an x ray film of the chest, and a physical examination which reveals very few abnormal signs in most uncomplicated cases One's objective may make him forget that, not one, but all three of these factors are essential to the diagnosis From the lawyer or the physician representing a claimant for compensation we hear that the plaintiff must have silicosis because all of his industrial life has been spent in an industry whose atmosphere contains so many millions of particles of free silica dust. Yet a glance at the claimant s x ray films may show nothing to support the contention. From the roentgenologist or the internist of an urban medical center comes the diagnosis of silicosis because the film reveals a generalized nodular pattern and the subject reports that he has worked at a dusty job Neither roentgenologist nor internist is in a position to obtain the details of the occupational h story that will indicate whether the dust contained significant quantities of free silica.

Unless there is proof that the subject has been exposed to free silica dust for periods measured in years we have no right to assume that a nodular x-ray pattern is indicative of silicosis. Such patterns may be produced by other causes some of them the result of inhaled materials other than free silica some may be due to infections or systemic diseases which should be disclosed by a thorough physical examination

Among these conditions is the so-called arc-welder's siderosis. All substances of high atomic weight are opaque to x-ray, and in sufficient local concentration they cast shadows on a film. Examples of such substances are the compounds of barium and the rare earth minerals. On the other hand organic iron from the blood may at times cast nodular shadows which simulate silicosis

Another disease is now being recognized which superficially resembles nodulation of silicosis This is pulmonary sarcoidosis, apparently a tubercle-like infection of unknown cause This disease occurs here and there throughout the population at large but has frequently been attributed to pulmonary irritants of industrial environments. One case from a rayon mill was recalled, one from an asbestos plant and another in a graphite minor Recently, a considerable number has been found in industries using beryllium and its compounds. It has not occurred in every plant using these materials. It has not been possible to reproduce sarcoidosis with beryllium compounds in animals Much must be done before it can be concluded that sarcoidosis is an industrial disease

Many have seen or heard of the condition commonly nicknamed "Wheatena," or miliary calcification of the lungs. Here the x ray reveals nodules often scattered throughout both lungs, but these nodules are of unusual density and their distribution is not uniform It is assumed that they represent healing of some form of infection, the nature of which is still unknown It could not be tuberculosis, for these people have never been sick. The cases are most common along the Ohio River and in Missouri and Kansas

The knowledge that such conditions exist should make physicians more cautious in diagnosing silicosis, particularly in cases from industries where environmental conditions are unfamiliar or not clearly defined More progress would be made if roentgenologists would merely report a shadow pattern as nodulation with the qualification that this could be interpreted as silicotic in origin if supported by a history of adequate exposure to free silica.

Discussion by Dr A. G Crunch.—Four types of cases illustrating erroneous diagnosis of silicosis were described First was a group of men exposed to dust from milling rare earth oxides and fluorides used in core material for illuminating carbons. Occasional batches containing silica are mixed perhaps once or twice a month, but this exposure was not significant.

One case was a man 60 years old who had had influenza and chronic bronchitis. His x-ray picture was startling. An award of total disability from silicosis was made although the presence of other conditions was recognized. A young man in the same department who had been exposed for a much shorter time had a similar x ray picture following an attack of influenza. The Compensation Board decided he had silicosis but granted no compensation because there was no evidence of disability From subsequent examinations of five or six more men in this department, another similar case was found. This man had no disability and made no claim These cases illustrate conditions from inhalation of x ray opaque dust rather than the fibrosis from silica exposure.

Other cases have come up as the result of physical examinations by draft boards One man in his early twenties had had only seven weeks of plant exposure three weeks on one milling unit and four weeks on another, where he had occasion to load one or two bags of mica into the mill daily He was declared unacceptable by the draft board on account of advanced silicosis. Subsequent examinations showed decreases and reappearance of shadows. After twenty months, the x ray picture showed no evidence of nodulation or linear markings. During the

* From *Industrial Medicine* January 1946.

two years of study the boy felt well and had no clinical symptoms The case was finally diagnosed as Boeck's sarcoid

Another case was of a man 30 years old who worked in a dust-free plant The only silica used was in a filter on another floor at the opposite end of the building The x-ray picture showed widely diffuse shadows, and, although not particularly nodular, the case was declared to be silicosis After extensive study the case was diagnosed as mitral stenosis, a heart condition, the shadows were due to congested pulmonary vessels

Discussion by Dr O A Sander—The term pneumoconiosis simply means dust added to the lungs Contrary to a fairly common interpretation, it does not necessarily indicate fibrosis in the lungs Similarly, the term siderosis describes lungs in which iron oxide dust has been deposited and is without any implication so far as fibrosis is concerned This meaning is contrary to Jenkins' original use of the word in describing cases of actual silicosis with concurrent deposition of iron oxide Only two known substances, silica and asbestos, qualify as fibrosis-producing agents Others may be shown to produce secondary fibrotic action, but none is known today

Legislation Regarding Silicosis

The value of periodic physical examination is emphasized by legislation in various states as exemplified by amendments to Workmen's Compensation Laws

Michigan has amended its statute to provide that all employers subject to the provision of the compensation act "shall furnish to their employees without charge, a complete physical examination at regular intervals, but not more than one examination in each period of six months, and shall furnish to the employee a true copy of the medical report when the presence of silicosis, pneumoconiosis or other dust disease is found" This act became effective May 28, 1945, therefore, the initial physical examination of all employees must be completed by November 28, 1945

Minnesota has amended its statute by requiring annual medical examinations of employees exposed to the hazards of silicosis and asbestosis, the cost of such examination to be divided equally between employer and employee Reports of such examinations, together with x-ray films and other original exhibits, are required to be filed in the office of the Commission, making the reports a public record Upon the termination of employment, the employer may request the employee to submit to a final medical examination, by giving ten days' notice in writing, of the time and place where the examination is to be made Any employee who refuses such examination, thereby waives any right to compensation for occupational disease that later develops

---

NEW YORK'S BLUE CROSS PLAN ISSUES ANNUAL REPORT FOR 1945

A total of 423,474 persons enrolled in Associated Hospital Service, New York's Blue Cross Plan, during the past year bringing the overall enrollment to 2,226,523, or one out of every four persons in Greater New York, it is revealed in the annual report for 1945

A total of $12,015,911 22 was paid to hospitals during 1945 for the care of 173,638 persons who benefited by the service.

With the exception of maternity cases 92 per cent of those who received care in semiprivate accommodations in member hospitals had their hospital bills paid in full

The financial statement reveals admitted assets of $16,597,832 31 as of December 31, 1945, a gain of $2,990,640 11 over the preceding 12-month period Of the total assets, $14,147,000 is invested in United States Government holdings, cash on hand is $1,974,422 90, subscription charges in course of collection, $426,162 36, accrued interest on bonds, $48,839 35, and other assets, $1,407 70

Liabilities which total $10,687,383 96 include reserves for unpaid hospital claims, $2,650,000, for unearned subscription income $2,642,034 45, for deferred maternity benefits, $1,800,000, for epidemics and other contingencies, $3,365,000, for Social Security and withholding taxes, $47,405 44, and for other liabilities, $182,944 07

According to the report childbirth and other obstetric cases represent more than 18 per cent of the total number for which subscribers were hospitalized in 1945, surgical cases, including tonsillectomies, diseases of the digestive system and genitourinary system, benign tumors, and injuries and poisonings represent approximately 53 per cent, while medical cases, including diseases of the respiratory, digestive, urinary, and circulatory system represent nearly 28 per cent

The report discloses that the average hospital stay for a Blue Cross subscriber is less than for a non-subscriber

In a statement to subscribers, included in the report, Louis H. Pink, president, states "Blue Cross members who need hospitalization are less likely to delay going to the hospital They, therefore, recover sooner This bears out the doctors' contention that relief from worry has a therapeutic value all its own"

FELLOWSHIP EXAMS FOR COLLEGE OF CHEST PHYSICIANS

The next oral and written examinations for Fellowship in the American College of Chest Physicians will be held at San Francisco on June 29, 1946 Applicants for Fellowship in the College who plan on taking the examination should communicate with the Executive Secretary, American College of Chest Physicians, 500 North Dearborn St, Chicago 10, Ill

The Twelfth Annual Meeting of the College is scheduled to be held at the Sir Francis Drake Hotel, San Francisco, June 29 to July 2

Correspondence

The Wagner Murray Dingell Bill

To the Editor

I recently had my first opportunity to read the several reports of the New York State Legislature Commission on Medical Care. Considering that the commission had spent many months studying the subject estimating that to provide "free medical service to everyone in the State would cost at least $400,000,000 a year, it seemed to me that the majority acted very wisely in reporting that it was unwilling "to recommend an experiment on such an enormous scale and at such cost and risk' until there had been more experience in the field of medical and hospital insurance.

If this report is given the wide publicity which it deserves it should serve to dampen the enthusiasm of proponents of the Wagner-Murray-Dingell Bill contemplating universal medical service not for one state alone but for the entire United States.

I have been strongly opposed to that bill and similar proposed legislation, but while officially connected with the State Department of Health, did not feel free to express my views publicly The department had no declared policy in this matter and I knew that anything I said might be construed as representing department opinion. Now that I am retired there can be no such implication That my views are reasonably unbiased might be assumed from the facts that while I was the son of a practicing physician and practiced medicine myself for a few years, the last thirty years of my professionally active life have been spent in full-time public health work I have no axe to grind

I have always felt that it was unfortunate, if more or less inevitable, that the views and opinions to which the general public has been most (and almost exclusively) exposed, have been those of the extremists on both sides. These have been the active proponents who for political, humane or other reasons have been all-out for compulsory nation-wide compulsory 'health' insurance and the opponents purporting to speak for organized medicine who, for so long, flatly denied that there was any medical care problem. The public has heard relatively little from the conservative "in-between' majority of members of the medical profession

The well-to-do have no need for government-administered medical care. The indigent already have it through welfare agencies and free clinics I know from long personal observation however, that there are thousands of low income self-respecting and self-supporting families who never have adequate medical care. They cannot afford to pay for it, will not accept charity and therefore, go without. These constitute the real problem.

The necessarily limited voluntary insurance plans now being promoted by medical organizations represent a step in the right direction I doubt if even when supplemented by expanded public health services, they offer a full solution. However, if drastic, radical and politically conceived legislation can be averted and opportunity given for deliberate and adequate study, on an unbiased unemotional and nonpolitical basis a satisfactory solution should ultimately be worked out. It is another case of the longest way around being the shortest way home.

I am opposed to the idea of government financed and administered medical service, as contemplated in the Wagner Murray-Dingell bill both because of the almost prohibitive cost and because it would be practically certain to result in less efficient and, perhaps even less available medical service than we already have in normal times

I have seen the Federal government's control over state activities, through Federal financing in several fields constantly growing When the investment of Federal funds in any state or local activity has once been begun it becomes increasingly difficult to break away from it Since such funds may be used only subject to Federal regulation and direction, each new extension gives the government further control over local policies and activities I personally feel that in the public interest it is time to call a halt

It is remarkable how many people seem to have the idea that the states are getting something for nothing when they accept Federal funds The fact is of course that it is all coming from our pockets. Once in the National treasury we have little control over its use The Federal government is too far from the people What hope can there be of ever balancing the national budget and reducing taxes if curtailments in government spending are constantly offset by the launching of new multi-billion dollar projects? It certainly is no time for experiments both expensive and questionable.

The Federal Emergency Medical and Infant Care plan (wives and children of members of the armed forces) has given us our best example of the use of Federal funds in providing medical care. This has been administered by the State Department of Health, subject to regulation and control by the Federal Childrens Bureau.

On the whole and *as an emergency measure*, it has served a useful purpose, giving obstetrical and other medical care in hundreds of cases in which service of equal quality might not otherwise have been available. On the other hand it has been a more or less constant "headache' to the participating physicians and the administering agency and equally worthy cases have had to be denied such care because of their inadvertent failure to comply with details of the Federal regulations

The Childrens' Bureau regulations were minutely detailed and so frequently amended that it was difficult even for the State administering officers to keep up with the changes Yet it was difficult, and sometimes impossible to secure changes in requirements which were objectionable from the standpoints of physicians, patients, and the administering agency Health department officials had to make frequent and sometimes, protracted trips to Washington and members of the Central Office and district staffs had to devote a disproportionate amount of time and effort to the administration of this measure sometimes at the expense of other important health activities The amounts of the Federal funds allocated to the State for this project by no means represented the full cost of the service

In this matter we were dealing only with obstetrical and other medical care for a limited group. If such technicalities and difficulties were involved, even in this limited service what would the situation be if the undertaking were that of administering full medical care for all the people of the State? It is almost beyond my imagination and I cannot conceive of the results being satisfactory to any of the parties concerned.

In the light of experience with "E.M.I.C.," it is

not too far-fetched to imagine, with a system of government-administered medicine, an episode something like the following Someone being ill, a family calls its government-approved physician He says "I have already made all the calls the regulations allow me to make for that condition Before I can make any more, I will have to take it up with Albany I can't afford to jeopardize my standing on the approved list" Albany replies "We regret that we cannot approve this apparently necessary service As you know, we are bound by the Federal regulations However, we will be glad to take the question up immediately with Washington." In due time Washington writes "Further calls, under the circumstances which you describe, are not permitted under Rule 4123-A-191 Since, as you know, these regulations apply throughout the United States, we do not feel that an exception would be warranted in this instance" By this time, the need for the service no longer exists

Physicians, like other people, differ in personal characteristics and in competence In the main, they are honest, reasonably unselfish and competent Due in some measure to the nature of their work, they are inclined to be individualists and would chafe under regimentation A close patient-physician relationship is essential for satisfactory medical practice Production-line methods could not be conducive to the best type of medical service

Reference was made in one of the minority reports of the State Commission to the fact that various polls had shown large majorities of the persons canvassed to favor compulsory health insurance This may be important from a political viewpoint but throws little light on the merits of the question, since most of them had not been in a position to make reliable analyses of the problem Most people who have family physicians respect them and value their services If the people canvassed had had all of the facts, their points of view might have been quite different

I have indicated that I recognize, as I believe most physicians do, that there is a serious medical-care problem which should ultimately be solved The Wagner-Murray-Dingell Bill does not offer a practical solution. In my opinion its enactment into law would be little short of a national catastrophe

Yours in the common interest of the public and the profession,

PAUL B BROOKS, M D
Former Deputy State Health Commissioner—retired
Altamont, N Y , April 17, 1946

RAY MAY DOUBLE PENICILLIN OUTPUT

The nation's production of penicillin soon may be doubled—because two research workers trained a deadly ray of ultraviolet light on selected mold spores to see what would happen

This was announced on March 25 by the Wisconsin Alumni Research Foundation, which reported that a cubic centimeter of the new strain of mold produced an average of 761 units of the germ-killing drug, compared with 369 units from the strain which has been the basis of much of this nation's production.

The new strain, known as Q-176, has not been patented, the foundation said, and a number of major drug manufacturers are using it

Cultures have been supplied to England, France, China, and other countries

The original British scientists who produced the drug in 1940 were getting about two units of penicillin for every cubic centimeter of the broth in which the mold is cultured.

Discovery of new strains and improved production methods slowly boosted the yield to 169 units *Dr* Milislav Demerec, of the Carnegie Institution, was credited with accomplishing the first significant break in developing new strains by artificial means, the foundation said, when he produced a group of promising spore variants with x-ray treatments One of his cultures, X-1612, produced an average of 369 units in tests at the University of Wisconsin and became the basis of the nation's production

Working with funds supplied by the foundation, two members of the staff of the University of Wisconsin botany department, Myron P Backus and John F Stauffer, recently started two lines of progeny from two spores of X-1612 and exposed the second generation spores to powerful ultraviolet irradiation

The "black-light" rays killed all but 500 of the several million spores exposed. The hardy survivors were carefully screened without noteworthy result until they came to Q-176, which had produced 761 units with a high of 904.

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL. *The members of the committee are Oliver W H Mitchell, M.D., Chairman (428 Greenwood Place, Syracuse), George Baehr, M.D., and Charles D Post, M.D*

Dr Griggs Speaks to Rockland County Society

DR. LEON H GRIGGS, associate professor of medicine, New York University College of Medicine, discussed common diseases of the skin illustrated with color photography at a meeting given for the Rockland County Medical Society on Wednesday April 24

The meeting was held at the Recreation Pavilion, Summit Park Sanatorium, Pomona

This postgraduate instruction is provided by the Council Committee on Public Health and Education of the Medical Society of the State of New York.

Lecture for Oswego County

THE Oswego County Medical Society will hear a lecture on "The Treatment of Fractures by the General Practitioner" on June 5 in the Fulton Club Fulton at 9 00 P.M The speaker will be Dr Sawnie Renard Gaston, instructor in surgery, College of Physicians and Surgeons, Columbia University

Sullivan County Meeting

DR. WARD L LKAS assistant professor of obstetrics and gynecology University of Rochester School of Medicine and Dentistry, spoke on the hemorrhagic states of pregnancy at a meeting given for the Sullivan County Medical Society on May 8, at the Lenape Hotel, Liberty

Chemung County Holds Spring Teaching Day

THE Medical Society of Chemung County had a spring teaching day on April 24 It began with a lecture on recent advances in hepatitis and cirrhosis of the liver The lecture was given by Dr William F Lipp associate professor of medicine University of Buffalo School of Medicine. Dr Harold G Wolff, associate professor of medicine and psychiatry, Cornell University Medical College, spoke on the subject, "Headache."

A social hour and dinner were followed by the First Annual Elliot T Bush Memorial Lecture, which was entitled "Clinical Uses of Products of Human Plasma Fractionation" and presented by Dr Charles A. Janeway, senior associate in medicine at Peter Bent Brigham Hospital visiting physician at the Children's Hospital and assistant professor of pediatrics and instructor in bacteriology at Harvard Medical School

---

AMERICAN ASSOCIATION FOR THE STUDY OF GOITER

The annual meeting of the American Association for the Study of Goiter will be held at the Drake Hotel, Chicago, Illinois, on June 20 21 and 22. Please make your reservations early as they are limited.

No meeting has been held since 1941 due to the war The program committee request that those who desire to read a paper send the title at once to the Chairman Dr S F Haines, Mayo Clinic, Rochester, Minnesota, in order that the programs may be printed and distributed promptly This committee is planning a full and interesting program with special features on the treatment of thyroid disease. There will be papers discussing the use and danger of thiouracil in toxic goiter and on many other phases of thyroid disease.

Medical News

Plan Urged to Get New Psychiatrists

GOVERNMENT subsidizing of a $100,000,000 program to train 2,000 to 3,000 psychiatrists within the next five years was called recently by Dr Lawrence S Kubie, of Columbia University, College of Physicians and Surgeons, as the only way to break the "rehabilitation bottleneck" and keep neurotic war veterans from spending the rest of their lives in hospitals He put the cost of failure to supply enough trained psychiatrists at $6,600,000,000

Dr Kubie presented his plan before a group of the 2,000 psychologists, psychiatrists, and social workers attending the twenty-third annual meeting of the American Orthopsychiatric Association at the Hotel New Yorker and Manhattan Center

The training of one psychiatrist, Dr Kubie said, would cost $25,000—$15,000 less than the cost of caring for one neurotic veteran for life

The solution to the manpower problem, Dr Kubie said, lay in tapping the only reservoir of medical manpower—medical officers returning from duty in the armed services If medical officers are to be induced to study psychiatry, subsistence allowances must be provided to assure them economic security during the period of training, he declared

The shortage of trained personnel is paralleled by the shortage in existing training facilities, Dr Kubie said, pointing out that the United States had only about 400 recognized psychiatric training posts "and of these only about 50 to 75 per cent are of first-rate quality" A closely supervised training program, he added, would incorporate the best State and private mental hospitals, where no teaching or research are now carried on

For administration of the plan, Dr Kubie suggested that a national mental hygiene research and training institute be responsible, with States and medical schools, for selecting civilian teachers and civilian students, and cooperate with the military in choosing veteran students The coordinating agency would allocate salaries to teachers, subsistence allowances to students and funds for psychiatric research

Dr Allan O Whipple Receives Judd Award

DR ALLAN O WHIPPLE, Valentine Mott Professor of Surgery in the College of Physicians and Surgeons of Columbia University, was recently designated by the board of managers of Memorial Hospital as the recipient of the annual Judd award for having made "the greatest advancement to the discovery of a cure for cancer"

He was nominated for the award through the medical board of this institution, the basic unit of Memorial Cancer Center, 444 East Sixty-Eighth Street

The center is raising a $4,000,000 fund to accelerate its attack on the cancer problem

The citation noted Dr Whipple's special achievements in surgery in the field of cancer relating to the duodenum and pancreas, adding that his method "has established entirely new and successful opportunities for control and cure of a group of cancers previously deemed hopeless"

It pointed out also that Dr Whipple "has long been a notable American surgeon, a leader in a school of surgical thought and a distinguished citizen"

The Judd award was established ten years ago under the will of Katherine Berken Judd, of New York City, who died in 1934 and left a trust fund to provide an annual prize of $1,000 to encourage research in the causes and cure of cancer

Medical College Plans Expansion

THE Long Island College of Medicine, one of the five medical schools in New York City, has announced that a contract has been signed to purchase all but a small portion of a six and one-half acre tract of land facing Kings County Hospital in the geographical center of Brooklyn for an additional campus for the 86-year-old medical college

It is proposed that the buildings the College now utilizes on Henry Street in downtown Brooklyn be redeveloped as a clinical teaching center, in cooperation with the Long Island College Hospital, and that new basic science and other teaching facilities and research laboratories be built at the Kings County site Proposals to extend the College's activities in industrial medicine are being incorporated in the planning for the Henry Street campus

The College expects to continue its "multi-center" plan of clinical teaching in which ten hospitals and two health agencies in Brooklyn now cooperate and to extend its affiliations where definite gains in the educational, research, or service phases of the program are indicated.

Fund for Medical Study Given to Cornell

CORNELL University Medical College has announced the receipt by its Department of Public Health and Preventive Medicine, of a $200,000 grant from the Marcelle Fleischmann Foundation for a study of tropical diseases

The money, which will be given at the rate of $20,000 a year for twenty years, will be specifically used, in the terms of the gift, "to promote the study of immunologic and allergic manifestations of exotic disease and to provide for a better understanding of their prevention and treatment in relation to other allergic diseases"

Present plans call for a staff of six, headed by Dr Morton C Kahn of the faculty of the college, to investigate such fields as malaria, filaria and schistosomes

SOME ADVANTAGES

of

Campbell's STRAINED BABY SOUPS

Q *The edible solids of the meats are retained Why ?*

A While the juices of meats contain valuable nutriments, the fibrous parts contain even more. In the prepara tion of Campbell's Strained Baby Soups the meats are prepared so that *all* of the edible solids as well as all the meat juices are retained to aid baby's growth and well being

Q *The utmost precaution is used to retain natural flavors. Why ?*

A Every mother wants her baby s food to be palatable Campbell s prep aration and cooking methods have been devised to retain natural flavors as far as possible. Babies develop preferences early, accept some foods reject others Their acceptance of Campbell s Strained Baby Soups is indicated by the increasing demand for these soups wherever they have been introduced

Q *All the Vegetables get special handling. Why ?*

A Unless vegetables are prepared with the greatest of care and skill, they are likely to lose a large propor tion of their valuable vitamins Campbell s have developed a method based on the latest scientific knowl edge which retains the minerals and efficiently conserves the vitamins

A comprehensive analysis of each soup may be had upon application to Campbell Soup Company, Camden New Jersey

5 KINDS

LIVER
CHICKEN
LAMB
BEEF
VEGETABLE

All in Glass Jars

Campbell s Strained Baby Soups represent fine quality in ingredients In care and method of cooking in retention of minerals and conser vation of vitamins *and in good flavor* Every re source of Campbell s Kitchens is devoted to that aim

County News

New York County

The annual meeting of the College of Physicians and Surgeons Alumni Association was held Saturday evening, March 2, at the University Club in New York There were approximately 300 members of the Association attending

Maj Gen William J Donovan was the guest of honor and speaker of the evening He gave a stirring talk on the American Intelligence Service as it functioned during the war and as it exists today

Dean Willard Rappalye spoke on the maturing plans for the college during the postwar period Dr John H. Keating, president of the Association, was the toastmaster

The following officers were elected for the next year president, Dr B S Oppenheimer, vice-president, Dr Carnes Weeks, treasurer, Dr James A Corscaden, secretary, Dr Charles C Lieb, historian, Dr T Loyd Tyson, and librarian, Dr Martin deForest Smith

In addition to the five officers, Council members are Dr W C White, Dr Martin deForest Smith, and the retiring president, Dr John H Keating

* * *

The annual alumni reunion of the Cornell Medical College was held on March 21, 1946 This included a day session for a scientific meeting at the College, a luncheon given by the Board of Governors of the New York Hospital, and a dinner-dance in the evening at the Starlight Roof of the Waldorf-Astoria Hotel.

* * *

Peptic ulcer was the subject discussed at the March meeting of the New York County Medical Society A panel discussion was held with Dr Luther B MacKenzie as moderator Participants at the meeting were Drs Burrill B Crohn, Nathan C Foot, George J Heuer, John H Mulholland, March Sussman, and Harold Wolff

Niagara County

Dr Lyman H Wheeler, of Lockport, has been appointed to the newly-created post of medical consultant Dr Wheeler, who also is health officer of both the city and town of Lockport, was endorsed by the Niagara County Medical Society for medical consultant

Duties of the medical consultant will include weekly calls at the County Welfare Office to discuss proposed medical care with the case supervisors and the commissioner He also will check bills for medical services and make recommendations where there is a question regarding the services *

* * *

A significant discussion of the "socialized medicine" issue and an analysis of the responsibility of physicians and pharmacists to each other and to the public featured the March dinner meeting of the Niagara Falls Academy of Medicine

Dr Robert L. Swain, of New York City, editor, educator and one of the country's outstanding leaders in the pharmaceutical profession, was the guest speaker at the meeting, to which all pharmacists and medical men of this city and surrounding communities were invited.*

* Unless otherwise noted, it is to be assumed that item is from a local newspaper.

Glassful?—or Thimbleful?

As you know, Doctor, so much vitamin C is lost in cooking that one of the few practical ways to get one's daily requirement from the diet is from orange juice Most of your patients will tell you they drink a glassful every day, but what do they mean by "a glassful"?

Thimbleful would be more like it. Today especially, with oranges so expensive, the housewife feels it necessary to cut down on the daily orange juice intake Thimble-like glasses — 2-ounce, 3-ounce, 4-ounce — are the rule rather than the exception

How much orange juice does a 12 year old need for his optimal daily vitamin C requirement? How much orange juice does a grown up need? The child in health should have from 2 to 5 ounces, depending on his age. The adult in health should have 8 ounces.

When prepared at home, an 8-ounce glass of orange juice costs 12c to 17c—a cost of about $3 50 to $5 00 per person each month This is all right for your patients who can afford it but for those who must count the cost, the least expensive way is by means of synthetic vitamin C.

SODASCORBATE offers distinct advantages to your patients who are unable to tolerate ordinary vitamin C. The *first* and *only* sodium ascorbate in *dry* neutral form, SODASCORBATE Tablets permit full and frequent doses of vitamin C without the gastric irritation acid-shift or other undesired after-effects that so often result from large doses of straight ascorbic acid.

The average dose for adults and children over 12 years is one tablet three times daily, or as indicated by the condition. For children under 12 one half tablet three times daily May be dissolved in milk for babies and young children.

Supplied in bottles of 40 and 100 tablets as well as in 'hospital size' bottle containing 500 tablets. For samples and literature sign and mail the coupon

SODASCORBATE

QUININE *IS AGAIN AVAILABLE*

RESERVED exclusively for the use of our Armed Forces throughout the War, Quinine has now been released for civilian use as an antimalarial and therapeutic agent.

Merck & Co., Inc. contributed to the Wartime quinine program by supplying a substantial part of the Government's stock pile from our reserve stocks. We also expanded our production facilities and continued the manufacture of Quinine and other Cinchona Salts for our Armed Forces and essential public health needs throughout the War.

We are pleased that we can again make Quinine available to the physician for the treatment of malaria and other conditions in which it has proved so effective.

CAMP

Orthopedic Support FOR Chronic Low Back Pain

Patient of intermediate type-of-build (skeleton indrawn)

This lumbosacral support is specifically designed to limit the range of the lumbar spine bending when either the framework or soft tissues of the low back are the seat of injury or disease. Effective support is given the gluteal region, the lumbar spine and the sacro iliac and lumbo sacral joints. The adjustment about the pelvic girdle prevents undue pressure of the upper adjustments and yet the presence of the center adjustment gives relief and comfort to the patient. Provision is made for reinforcement with aluminum uprights when indicated.

CAMP

ANATOMICAL SUPPORTS

Prescribed in many types for the condition illustrated and for Prenatal, Postnatal, Post operative, Pendulous Abdomen, Visceroptosis, Nephroptosis, Hernia and Orthopedic conditions.

Dr Roe entered the U S Navy Sept, 21, 1942, as lieutenant j g He was stationed in U S Training School, Fisher's Island, N Y , for one year, as medical officer In Sept , 1943, he was ordered aboard the USS Livermore as lieutenant s g He served aboard this destroyer in European and Mediterranean waters for twenty-two months The Livermore saw action in Anzio beachhead where a landing was made by Allied forces

The Livermore engaged in the invasion of Southern France

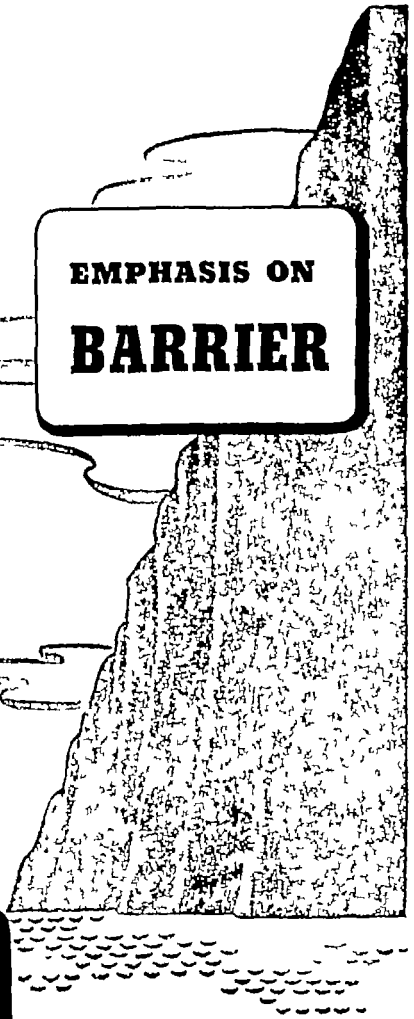
In November, 1944, the Livermore returned from the European coastal war and engaged in convoying troopships carrying U S Army men and equipment to Europe Dr Roe was detached in June, 1945, and ordered to Camp White, Oregon He was honorably discharged as lieutenant commander *

Sullivan County

Dr Edmund T Rumble, who formerly lived at Cochecton is returning to Callicoon to resume his practice

Dr Rumble was separated from the Medical Corps of the Navy on November 22 after forty months' service In the Navy he first served fourteen months aboard ship, this duty ending when the ship was lost in an enemy air attack off Guadalcanal. Five months later, in January, 1944, he returned to duty recovered from the injuries received in the action off Guadalcanal.

[Continued on page 1150]



AUTHORITATIVE clinical investigators place strong emphasis on the importance of the barrier in conception control.

In a recent comprehensive report,[1] physicians indicated an overwhelming preference for the diaphragm and jelly method (93% of 36,955 new cases).

In keeping with these expressed opinions we continue to suggest that for the optimum in protection the physician prescribe the combined use of occlusive diaphragm and spermatocidal jelly.

You assure your patient a product of highest quality when you specify *Ramses*

EMPHASIS ON BARRIER

Competent observers report:

"Jellies and creams used without mechanical devices yield relatively high protection, but studies have not proven them fully dependable to block the external os, or to invalidate all sperm."[2]

"When no type of occlusive pessary can be fitted or when the woman refuses to use one she only other reliable method is the use of the condom. With proper technic and instruction this method is highly reliable but has many disadvantages which the diaphragm method overcomes."[3]

pointed by County Executive Herbert C Gerlach as members of the Board of Managers of the Westchester County Laboratory, under the County Health Department The positions carry no salary *

Wyoming County

Dr Bruno Tryka resumed practice in January, reopening the offices in his home in Perry

Dr Tryka recently received his honorable discharge from the Army Medical Corps with the rank of major He had served in the army for four years and nine months.*

Ulster County

The Ulster County Medical Society is sponsoring a movement for the establishment of a cancer clinic in Kingston and the erection of a suitable building for diagnosis and treatment of cancer It is proposed to have the building close to the laboratory

Dr Francis E O'Connor, chairman of the Medical Society's Cancer Committee, says his committee is ready to raise the sum necessary through public subscription and he feels confident that there are many families throughout the city and county who, having had experience with the dread disease, would be willing to assist financially toward the building fund *

* * *

Dr Robert F Mosely, Jr, has resumed his medical practice at Kingston upon his return from service with the U S Army Dr Mosely was commanding officer and chief of the surgical service of the 94th Station Hospital which operated for one year in the United States and two years in India *

A COMMUNITY ACTS AGAINST SOCIALIZED MEDICINE

The Community Council in Churchville, New York, has issued the following resolution against socialized medicine

"Whereas we believe that the American Medical Profession is eminently competent to solve the medical problems of this country,

"Now Therefore Be It Resolved, that we unequivocally oppose any law, measure, plan, or scheme of socialized medicine, particularly the Wagner-Murray-Dingell bills, now being considered by the Congress of the United States, for the following reasons

1 It would lower the high standards of medicine as it is now practiced

2 It would be an unwarranted tax burden upon the American people

3 It would violate the privileged relationship between patient and physician so essential to the successful practice of medicine"

There were 80 representative people present at the February meeting of the Churchville Community Council The above resolution was adopted unanimously by the Council after a thorough presentation of the question by Drs Frederick W Dietel and E H Vail Copies of this resolution were telegraphed to Senators Wagner and Mead, Representative Wadsworth, the Senate Finance Committee, and the House Ways and Means Committee

---

HEROES IN THE MAKING

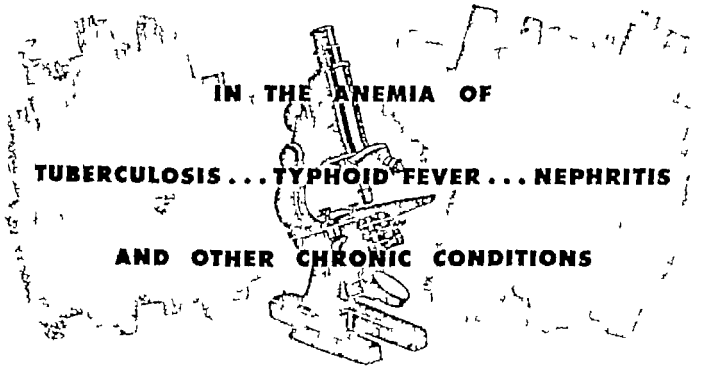
It was British humour that saved the situation in the dark days of the early blitzes, and evidently it was sustained until victory was finally assured

On Victory Day, when crowds filled the London streets and military forces with bands playing proudly paraded, a paternal Bobbie noticed a woman whose proper place, he opined, was the maternity hospital

"Mother," he said kindly, "You oughtn't to be in this crowd

"I'm afraid the excitement will be too much for you, let me get you out of the crowd I'll find a seat for you somewhere"

But the woman protested



"I've looked forward to seeing this day with my baby," she pleaded.

"But, mother," said the constable, "After all, the little chap can't see the parade"

"No," she replied, "But I would like to give the little blighter a chance to hear the music"

Of such stuff are heroes made —*Tonics and Sedation, J A M A, March 9, 1946*

Number 4 of a Series

HEPATINIC

Two factors function in chronic infections to produce the usually concomitant hypochromic anemia—

(a) increased destruction or increased utilization of red cells due to the infection

(b) impaired intake or utilization of diet

Consequently one phase of medical management of chronic infections includes eradication of the coexisting anemia. Hepatinic presents iron in preferred form, together with crude (unfractionated) liver concentrate, enhanced by the addition of the B complex The crude (unfractionated) liver concentrate is subjected in manufacture to a special process of enzymatic digestion , assuring maximum assimilation

Taste Appeal!

Taste is important in hemopoietic tonics Hepatinic—pleasantly palatable—is readily accepted even by finicky taste-conscious patients Samples will be sent to physicians on request

FORMULA:

Each fluidounce contains Ferrous Sulfate 12 gr., Crude Liver Concentrate (equivalent to 660 gr fresh liver) 60 gr fortified to represent Thiamine Hydrochloride 2 mg Riboflavin 4 mg Niacin amide 20 mg together with pyridoxine, pantothenic acid choline, folic acid vitamin B_{12}, vitamin B_{11} biotin inositol para amino-benzoic acid and other factors of the vitamin B complex.

Elixir Hepatinic is supplied in bottles of one pint and one gallon

McNeil Laboratories
INCORPORATED

Necrology

Oscar Baer, M D, of Niagara Falls, died on December 30 at the age of 67 As the consulting physician for the first prenatal clinic in Niagara Falls, Dr Baer played an important role in gaining for it state-wide recognition as a model in its field He also served as first chief of obstetrics on the staff of Memorial Hospital He was author of *Diet Charts*, a standard reference book, and other works

Dr Baer was elected, at various times, chief of the staff at Memorial Hospital, president of the Niagara Falls Academy of Medicine, and president of the Niagara County Medical Society He was a graduate of the New York Homeopathic Medical College, class of 1911

Arthur B Berresford, M D, of Ithaca, died on April 16 at the age of 42 Dr Berresford received his degree from Boston University School of Medicine in 1935 From 1942 to 1944, he was research fellow in the Department of Allergy, Roosevelt Hospital, New York City He was on the staffs of Memorial Hospital and the Cornell Infirmary The author of several scientific articles on allergy and a book on bronchial asthma, he was, also, coauthor of the book *Know Your Hay Fever* He was a member of the American Academy of Allergy, American Medical Association, and New York State and Tompkins County medical societies

Louis Bernstein, M D, of Brooklyn, died on April 24, 1945 He was 67 years old A graduate of the New York College of Medicine, class of 1904, he was a member of the American Medical Association and the Medical Society of the State of New York

Frank A. Brockmyre, M D, 68, of Canandaigua, died on February 7 He received his medical training at Hahnemann Medical College, Chicago, from which he was graduated in 1901 For several years Dr Brockmyre had been a member of the staff of Thompson Memorial Hospital, both as attending physician and surgeon He was a member of the Ontario County Medical Society, the New York State Medical Society, and the American Medical Association

James Bronson Conant, M D, of Amsterdam, died on January 5 He was 75 years old In 1896 he received his degree from the College of Physicians and Surgeons, Columbia University and a number of years later, pursued a postgraduate course at Vienna, Austria. Dr Conant was a member of the American College of Surgeons, American Medical Association, the Medical Society of the State of New York, and the *Medical Society of Montgomery County* He was an ex-president of the staff of the Amsterdam City Hospital and a member of the staff of St Mary's Hospital

William B Conner, M D, of Rochester, died on February 24. He was on the attending staffs of Highland, St Mary's and Genesee hospitals He was a member of the Rochester Academy of Medicine, Monroe County Medical Society, and Rochester Pathological Society

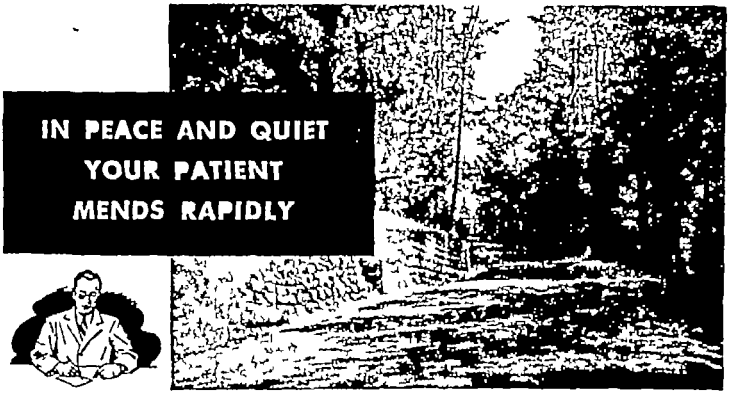
Dr Conner was a graduate of the University of Pennsylvania School of Medicine in the class of 1901 He was 69 years old

Gerald Edward Dailey, M D, of Gloversville, died March 3 at the age of 54 He was a graduate of Albany Medical School Dr Dailey was a member of the American Medical Association, the Medical Society of the State of New York, and the Fulton County Medical Society

Howard I. Davenport, M D, of Auburn, died on January 9 He was 67 Dr Davenport was a member and past-president of the Cayuga County Medical Society, a trustee of the Cayuga County Laboratory, a member and consultant on the staffs of both the Auburn City Hospital and the Mercy Hospital, and a member of the Medical Society of the State of New York He was graduated from Johns Hopkins Medical School in 1905

William H Davidson, M D, of Troy, died on March 9 at the age of 61 He received his degree from Albany Medical College and pursued two years of study of the eye in Paris and Vienna He was a member of the American Medical Association, and New York State and Rensselaer County medical societies

Earle V Gray, M D, of Helmuth, superintendent of Gowanda State Hospital at Helmuth for twenty-two years, died on April 21 at the age of 64 He had been on the Gowanda Hospital staff since 1909 He also had taught at the Cleveland Homeopathic Medical College, from which he was graduated in 1905



Hedley C W Graham, M D, of Rochester, died on January 12 at the age of 86 He was a graduate of Queens University, Kingston Dr Graham was physician for the Baltimore and Ohio Railroad and the Rochester Transit Corporation, surgeon for the Gleason Works and the Buffalo, Rochester and Pittsburgh Railway, and honorary surgeon for the Strong Memorial staff He was a member of the Monroe County Medical Society

Katharine S Munhall, M D, of Buffalo, died on April 15 at the age of 84 She was a graduate of the Women's Medical College, Pennsylvania, class of 1893, and one of Buffalo's earliest women physicians

Richard Mollenhauer, M D, of Mount Vernon, died on April 16 at the age of 92 He was a graduate of Bellevue Medical College, class of 1880

Leo Wolfson, M D, of Poughkeepsie, died on March 15 at the age of 45 Dr Wolfson studied medicine at the Syracuse University Medical College and was graduated in 1929 At the time of his death, he was supervising psychiatrist at the Hudson River State Hospital He received the Fellowship in child psychiatry in the Michael *Reese Hospital, Chicago, in 1938* Dr Wolfson had for a period of years conducted numerous clinics in child guidance in Poughkeepsie and in other cities in that vicinity In 1943, he became a Diplomate of the American Board of Neurology and Psychiatry The last three years, Dr Wolfson had been in charge of electric and insulin shock therapy at the hospital

He was a member of the Medical Society of the State of New York, Dutchess County Medical Society, the American Psychiatric Association, and the American Soviet Medical Society For the latter he had done considerable translation of Russian medical articles

Nature endowed the Saratoga Spa with naturally carbonated mineral waters of great therapeutic value, and she placed them in surroundings of surpassing beauty and serenity

Here, in peace and quiet, your patients achieve the mental and physical relaxation that gives full scope to the restorative powers of the Spa's famed waters

In superb facilities erected by the State of New York, they receive the benefit of your continuing medical direction in regimens which you yourself recommend for the treatment of cardiac, vascular or rheumatic disorders of a chronic nature

Well trained physicians are available in Saratoga Springs for consultation with your patient on the details of the program

Practitioners who found the Spa a valued adjuvant in less busy times are today doubly conscious of its service in lightening their postwar burden

PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

Many physicians have recently come to the Spa for the same kind of treatments that helped their patients here. After a restorative "cure" at the Spa, you, too, would return to your practice refreshed, revitalized, ready for the busy days that still lie ahead

THE SARATOGA SPA

For professional publications of the Spa, and physician's sample carton of the bottled waters with their analyses, please write W. S. McClellan, M. D., Medical Director Saratoga Spa, 155 Saratoga Springs, N. Y.

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

Hospital News

Governor Dewey Wants VA to Buy Halloran

GOVERNOR Dewey has proposed that the United States Veterans Administration purchase the $12,000,000 Halloran General Hospital on Staten Island at a price sufficient to enable the State to build, in the metropolitan area, a hospital for mentally defective infants and children.

The Governor, in a letter to Gen. Omar N Bradley, director of the Veterans Administration, rejected the latter's request that the State lease the hospital to the Veterans Administration for two years after the current Army lease expires late this year

Mr Dewey stressed the State's urgent need for hospitals to care for defective children, but he said he also recognized the need for hospitals to care for war veterans

Purchase by the government of the Halloran Hospital, coupled with an adequate purchase price and top priorities for building a new State hospital, would take care of Federal and State needs

The only existing Veterans Administration hospital in New York City is Kingsbridge in the Bronx, which provides 1,900 beds The latter hospital had a waiting list of 3,600 during one week in April

Hospital Discharges 1,000th Former Alcohol Addict

THE 1,000th patient was dismissed in April from Knickerbocker Hospital's year-old wing for the treatment of chronic alcoholics The rehabilitation project is now a definite part of the hospitalization routine at Knickerbocker, the first general hospital to admit liquor addicts as such

"We are satisfied that alcoholism should be treated as a disease and that good medical treatment, together with the help of Alcoholics Anonymous (a private group which helps in readjusting chronic inebriates) is the first step toward recovery and the resumption of normal life in the community," said A. Robert Munro, of the board of trustees

At Knickerbocker, a semiprivate hospital at 70 Convent Avenue, eighteen beds in private and semiprivate wards have been set aside under the supervision of Dr William Silkworth

Patients, directed there by Alcoholics Anonymous, usually spend five days, for which they pay $65 They receive a brain defogging medical treatment, which includes Vitamin B_1

During their stay patients are visited only by members of Alcoholics Anonymous and are dismissed in the company of some Alcoholic Anonymous member for continuing consultation and advice

Newsy Notes

The growing importance of, and need for women in the medical profession was underscored by leaders in medicine, business, and government at a dinner on April 23 at the Hotel Roosevelt inaugurating the New York Infirmary's campaign for $5,000,000

The infirmary, until recently the New York Infirmary for Women and Children, was founded ninety-three years ago by Elizabeth Blackwell, and is still staffed entirely by women doctors It is seeking the funds so that it may move from its present crowded quarters at 321 East Fifteenth Street to a building expected to be built on York Avenue between Sixty-Second and Sixty-Third Streets

• • •

Parsons Hospital in Queens has announced plans for a $200,000 addition adjoining the present structure at 35-06 Parsons Boulevard, Flushing

The new building will have 60 beds—all for maternity cases

Announcement of the project follows by three weeks the news that the Van Wyck Sanitarium would erect a $200,000 building at 144-01 Liberty Avenue, South Jamaica

A third project to provide urgently-needed Queens Hospital facilities is the $2,000,000 expansion program of Jamaica Hospital, for which a fund drive is under way This project would give the borough 600 additional beds *

Directors of the Brockport Central Hospital in Rochester have announced the purchase of the Shafer property and building on Main Street. This location and building has housed the hospital for more than fifteen years

The Central Hospital is a nonprofit organization, supported by public subscription in the area served It was organized about 10 years ago

The Lakeside Memorial Hospital, Rochester, fund campaign, which has received subscriptions in excess of $140,000 will be used to erect a new structure Pending construction, the hospital board authorized the purchase of the present site to insure operation of the hospital until the new building is constructed *

• • •

Robert Olcott, a member of the board of governors of Albany Hospital, has given $12,125 in personal securities to the hospital's $3,000,000 building fund

Mr Olcott, who also is chairman of the board of the Mechanics & Farmers Bank, asked that the contribution be used to memorialize a visitors' room in the name of his late uncle, Dudley Olcott *

HYDROSULPHOSOL

Provides all 9 desired requisites as a superior therapy in thermal, acid and caustic burns.

Provides for mechanical exclusion of air at site of burn • Insures prompt relief of pain • Aids in abating burn shock • Bacteriostatic influence • Non-toxic effect • STIMULATES TISSUE REPAIR • Rapidly reduces inflammation and edema • Results in absence or marked reduction of scar tissue • Tends to shorten convalescent period.

AVAILABLE FORMS

AQUEOUS SOLUTION:
Bottles of 8 4 and 1 fluid ounce

OINTMENT:
Jars of 1 lb and 1 oz.

ORDER TODAY *through your surgical or hospital supplier*

HYDROSULPHOSOL is a true solution of sulfur bearing compounds resulting solely from the reduction of flowers of sulfur by a catalytic process. In aqueous solution it is capable of rapidly releasing its high concentration of sulfhydryl ion (SH radical) in such form as can be effectively utilized by the body in the synthesis of sulfur-containing amino acids functionally active in cell stimulation and directly related to tissue respiration and repair

Unlike the sulfa group and many other sulfur compounds, Hydrosulphosol is non toxic when administered orally or topically applied in heavy concentrations, and will not result in damage to liver and kidney function

X-ray laboratory will be erected in Tompkinsville, Staten Island

The building will contain 19 rooms, including a dental office and waiting room

The center is to be used chiefly for diagnostic work *

. . .

North Shore physicians of the last century were prominent among the founders of the Nassau Hospital at Mineola which marks its fiftieth anniversary during the week of May 19 The celebration will be combined with the observance of National Hospital Day

Among the physicians who signed the articles of incorporation were Dr James S Cooley, of Glen Cove, Dr Joseph H Bogart, of Roslyn, and Dr John Mann, of Jericho

The program will be inaugurated by Vesper Service at the Cathedral of the Incarnation on Sunday, May 19 On Wednesday, May 22, and Thursday, May 23, exhibits of the work of the various departments of the Hospital will be open to the public in the auditorium on the hospital grounds

Nassau Hospital will observe "Open House" on Wednesday, May 22, from six to eight and on Thursday, May 23, from three to five

A booklet on the history and work of the hospital is being prepared and will be ready for distribution during Anniversary Week *

. . .

About 400 colleagues and friends of Dr E John Dolan, Bronx surgeon, attended a testimonial dinner in the Biltmore Hotel recently to honor him for his long service to the medical profession

The event was sponsored by the Association of Private Hospitals, of which he has been president for the past seven years, and by the attending staff of Westchester Square Hospital

Dr Dolan, besides being surgical director of this hospital, is visiting surgeon at Fordham Hospital, St Joseph's Hospital for Chest Diseases and St Elizabeth's Hospital, and consulting surgeon to Goshen Emergency Hospital and Good Samaritan Hospital, Suffern *

Improvements

Formal presentation of a new fracture table was made by representatives of Little Falls American Legion post to Little Falls Hospital in March *

. . .

Delivery to the Cohoes Hospital of the ambulance secured in the project sponsored by the Cohoes Rotary Club and financed by a drive was made in April

In addition to providing the ambulance, suitable arrangements were made for its housing and maintenance *

At the Helm

Dr James E Fish, former colonel in the U S Army Reserve who recently returned to the practice of surgery at Melrose and Boston, Massachusetts, has been appointed director of Ellis Hospital in Schenectady to succeed Miss Mary G McPherson who is retiring after more than twenty-one years as administrator of that institution.

Dr Fish received his medical degree from the Harvard Medical school in 1927 He served for a time as a student assistant in the pathology laboratory of Professor Erdheim at Vienna and then in 1928 received a surgical appointment at Massachusetts General Hospital, Boston, Massachusetts

A fellow of the American College of Surgeons, he has been on the medical staff of Harvard University and director of a clinic there He was called to active service with the army in 1941 *

. . .

Dr John A Lichty, who served as second assistant director of Strong Memorial Hospital, Rochester, under Dr Albert W Snoke before entering service in the U S Navy in August, 1943, has been appointed assistant director of Strong Memorial to succeed Dr Snoke

Dr Basil C MacLean, director of Strong Memorial, made the announcement

The newly appointed assistant director received his medical degree from the University of Rochester in 1932 He served a year's internship at the New York Hospital and a year at the New Haven Hospital, New Haven, Connecticut.

Coming to Strong in 1928 as a student, he later served on the resident staff, then as instructor in pediatrics and assistant pediatrician of the medical school and the hospital

Dr Albert W Snoke has taken up his duties as director of Grace-New Haven Community Hospital, New Haven, Connecticut *

. . .

The General Hospital of Syracuse which will observe its fiftieth anniversary at the end of the year, enters 1946 with a completely modern plant and in good financial position, stated William G Morton, retiring president of the board of trustees, at the annual meeting in March

Ernest L Owen, retiring treasurer of the board and publisher of *The Post-Standard*, was elected president of the board Other new officers are Philip R Chase and Mrs Henry W Brown, vice-presidents, Mrs J D Taylor, Jr, secretary, Asher S Markson, treasurer, Carl P Wright, assistant treasurer, and Mr. Chase, treasurer of expansion fund

Re-elected for three years were trustees, John F Marsellus, Stuart F Raleigh, Mrs Brown, Mrs William B Gere, Mr Morton, Mr Markson, Mr Chase and Charles S Estabrook

Last year marked the end of the construction program which was begun four years ago A new nurses' home, providing facilities for 68 nurses, was dedicated early in the year A modern kitchen and cafeteria were opened in June *

For congestive heart failure

NEXT IN IMPORTANCE TO DIGITALIS

In many cases of congestive heart failure mercurial diuretics are next in importance to digitalis in maintaining the patient's comfort and prolonging life

Following an injection of Salyrgan-Theophylline in patients with marked edema the urinary output frequently amounts to three or four liters in twenty-four hours.

Through such diuresis the heart is relieved of the added burden of propelling the blood through the compressed blood vessels. The blood volume is decreased, and in all probability the efficiency of the heart is increased by elimination of myocardial edema.

•

Salyrgan-Theophylline is available in ampuls of 1 cc. and 2 cc. for intramuscular or intravenous administration. For oral use (as an adjunct to decrease the frequency of injections and when parenteral therapy is impracticable) tablets in bottles of 25, 100 and 500.

SALYRGAN-THEOPHYLLINE

Dr Benjamin Palmer Whitaker, professor of social studies and former acting president of Union College, Schenectady, was named a member of the board of managers of Ellis Hospital in March *

• • •

Appointment of Dr Benjamin Freedman, resident physician at Pawling Sanitarium since 1935, as superintendent of that institution was announced recently by the board of managers there

At the same time the board announced that Dr Harry T Wygant who had been acting superintendent of the sanitarium since 1943 has resigned *

• • •

Dr C W Woodall is chairman of the new Ellis Hospital medical board, appointed recently by the hospital Board of Managers The Board members represent the four divisions of the hospital

Dr Woodall represents the surgical division and Dr A. H Congdon, the medical division, Dr W C Ostrom, specialties, and Dr Joseph Cornell, a re-appointee, gynecology and obstetrics They succeed Dr G M Clowe, Dr Albert Grussner, and Dr A. R Warner

Dr Grussner was named president of the staff and Dr Charles Rourke, secretary, at a recent staff meeting

Dr Clarence Ackerknecht has been appointed to the attending staff in obstetrics, and Dr Edward O'Keefe, to the attending staff in ear, nose and throat work *

• • •

Nineteen part-time senior consultants to the staff of the Bronx Veterans Hospital have been appointed by Maj Gen. Paul R Hawley, acting chief medical director of the Veterans Administration, it has been announced at Washington. The consultants were recommended by five medical schools and the manager of the hospital

The Bronx hospital will be the third to establish a system of part-time consultants and full-time resident physicians drawn from the communities in which the institutions are located

The consultants named are

Dr John E Scarff, neurological surgery, Columbia, Dr Maurice J Hickey, oral and facial surgery, Columbia, Dr J Herbert Conway, plastic surgery, Cornell, Dr Philip D Wilson, orthopedic surgery, Columbia, Dr Fred W Stewart, pathology, Cornell, Dr Archie Dean, neurology, Cornell, Dr R Towney Patton, ophthalmology, Columbia, Dr David H Jones, otolaryngology, Columbia, Dr Thomas Rennie, psychiatry, Cornell, Dr Harold Wolff, neurology, Cornell

Also Dr J Gardner, Hopkins, dermatology, Columbia, Dr Russell L Cecil, internal medicine, Cornell, Dr Karl Harpruder, physical medicine, Columbia, Dr Robert F Loeb, internal medicine, Columbia, Dr Arthur C DeGraef, internal medicine, New York University, Dr Charles Gottlieb, radiology, New York University, Dr J Burns Amberson, chest disease, Columbia, Dr Ralph E Herendeen, radiotherapy, Cornell, Dr Frederick E. Bancroft, surgery, Columbia and New York Medical College *

• • •

E Reid Caddy, director of St John's Hospital, announced in March the appointment of Dr Joseph Battaglia as director of the department of pediatrics, succeeding Dr Paul L Parrish

At the same time Mr Caddy said Dr Charles W Mueller will succeed Dr Cameron Duncan as director of the department of obstetrics and gynecology *

• • •

Dr Herbert M Bergamini has been appointed medical director of the Saranac Lake General Hospital

Dr Bergamini has been identified with the Saranac Lake group since his retirement as head of the Army's medical work at the Lake Placid club during the World War He has built hospitals and formed hospital organizations for the Army and before his military days was a noted specialist in New York City *

• • •

Dr James E Fish, of Boston, a former colonel in the United States Army, was appointed director of Ellis Hospital, Schenectady, in March

Dr Fish entered Army service in 1941, and was discharged after serving with the Medical Corps in Hawaii, in December, 1945 He previously was on the medical staff at Harvard university, where he received his A.B and his M D degrees in 1927 He studied also in Vienna, and in 1928 was a surgeon on the staff of Massachusetts General Hospital, Boston *

MANUSCRIPTS INVITED FOR NORTON MEDICAL AWARD

The book publishing firm of W W Norton & Company announce that they are again inviting manuscripts for submission to be considered for the Norton Medical Award of $3,500 offered to encourage the writing of books on medicine and the medical profession for the layman The first such award was made to *The Doctor's Job*, Dr Carl Binger's book, published last Spring, which gave the doctor's point of view on his work.

Announcement will be made shortly of the winning book for 1946 Closing date for submission of manuscript this year is November 1, 1946

AMINO ACIDS BENEFICIAL IN TREATMENT OF STOMACH ULCERS

A treatment for stomach ulcers that provided relief from pain in one to two days and disappearance of the ulcers on x ray films in two to three weeks in more than a score of cases was reported October 19, 1945 from the experimental surgery laboratory of the New York University College of Medicine.

The treatment, while not a "cure," was conservatively described in the report as "efficacious in promptly bringing acute peptic ulcers to a state of quiescence" It involves frequent feedings with "amigen" a protein hydrolyzate (predigested protein) now widely used in treating cases of severe malnutrition, extensive burns, and surgical convalescence.

It was during studies of the use of high amino-acid feedings in convalescence after stomach operations that the value of the treatment in ulcer cases was first suspected. Four patients in poor physical condition who were waiting for operations for stomach ulcers were given what the researchers call the "hyperalimentation' or 'high-feeding" treatment, primarily to prepare them for the operation All four experienced relief in twenty-four hours and all gained an average of a pound a day for the first eight to 10 days.

"One patient was so improved that he left the hospital refusing operation," the report says. The other three patients underwent operations. In one case the ulcer was completely healed over and only slight scars remained of what had been a serious stomach-ulcer condition In the other 2 cases the ulcers were still present but both were healing rapidly and marked improvement was evident.

Encouraged by this success, the researchers have since tried the treatment in 20 other cases over the past year, and in all cases the results have been similarly successful.

Proteins—which, with fats and carbohydrates, form the basis of nutrition—are composed of twenty-three amino acids eight of which are now known to be essential for life. The process of digestion, among other things, breaks down the proteins into these essentials so that they can be used by the body as "building blocks" in the continuous process of growth and repair Hydrolyzates of amino acids are simply proteins (milk proteins or packing house products) which have been digested in a manufacturer's vats by acids, alkalis, or enzymic action and thus relieve a patient's digestive canal of the necessity of digestion.

The preliminary work in discovering the role of the aminos in diet has been done on animals at several American universities, while much of what is known of their use in the treatment of human illness has been done at New York University, notably by a brilliant Chinese-born researcher, Dr Co Tui

"The follow-up results now available show that 22 of the 30 patients were discharged over three months ago' the report says.

These results suggest that this treatment does not insure against a recurrence of symptoms when the patient returns to old habits associated with persistence of ulcers, such as irregular feedings the eating of rough food, or indulgence in tobacco or alcohol.

Woman's Auxiliary

To the Medical Society of the State of New York

Highlights of the Convention

THE tenth annual meeting of the Woman's Auxiliary to the Medical Society was held at the Hotel Pennsylvania, New York City, Monday and Tuesday, April 29 and 30, 1946, with Mrs Edwin A Griffin, president, presiding

Mrs F Leslie Sullivan led in prayer and the Collect Mrs Charles R Seymour led in the salute to the Flag

Mrs George P Bergman extended a welcome to all present Mrs John J Buettner responded

Celebrating our tenth anniversary, the past presidents were our honored guests and introduced Mrs John L Bauer, Mrs Francis R Irving, Mrs Daniel J Swan, Mrs Luther H Kice, Mrs F Emerson Noll, Mrs F Leslie Sullivan, and Mrs Carlton E Wertz Mrs George B Adams and Mrs G Scott Towne were absent

The memorial service was conducted by Mrs Albert Bell, assisted by Mrs Thomas Cann as soloist

Reports of all elected and appointed officers were given and placed on file

Dr Edward R. Cunniffe, President of the State Medical Society, welcomed the Auxiliary and expressed thanks for the work performed by the members

Mrs Thomas E Bullard prepared and read a history of the first ten years of the Auxiliary

Delegates to Atlantic City for 1947 are as follows Mrs F Leslie Sullivan, Mrs Emerson Noll, Mrs Carlton Wertz, Mrs Luther H Kice, Mrs Alfred Madden, Mrs. Charles Seymour, Mrs Edwin Griffin, Mrs William Lavelle, Mrs John J Rainey, Mrs Daniel J Swan, Mrs Carlton Potter, Mrs John J Buettner, Mrs Louis A Van Kleek, Mrs B J Golly, Mrs Harold Johnson, Mrs John Louis Neubert, Mrs Albert F R. Andresen, Mrs William John Jameson, and Mrs Walter Arthur Schmitz

The Tellers Committee consisted of Mrs B F Golly, Chairman, Mrs Dance, Mrs Godfrey, and Mrs Kelly Total number of ballots cast was 83

Mrs Alfred Madden was presented the gavel by Mrs Griffin and the other elected officers assumed their respective places on the rostrum

A preconvention and postconvention Executive Board Meeting was held and we start another year under the capable leadership of Mrs Madden

The newly elected officers for 1946–1947 are as follows president, Mrs Alfred L Madden, Albany, president-elect, Mrs Harry F Pohlmann, Middletown, first vice-president, Mrs John J Buettner, Syracuse, second vice-president, Mrs Walter G Hayward, Jamestown, recording secretary, Mrs. John J. Rainey, Troy, treasurer, Mrs Fred G Jones, Utica, and corresponding secretary, Mrs Arthur F Holding, Albany The directors for one year are Mrs Luther H Kice, Garden City, and Mrs F Leslie Sullivan, Scotia, for two years, Mrs Carlton E Wertz, Buffalo, for three years, Mrs Edwin A Griffin, Brooklyn, and Mrs Charles R Seymour, Binghamton The chairmen of Standing Committees are Archives, Mrs Thomas M d'Angelo, Flushing, Convention, Mrs Kenneth G Jahraus, Buffalo, Finance, Mrs William Lavelle, Long Island, Historian, Mrs Thomas E Bullard, Schuylerville, Hygeia, Mrs Lee R. Sandborn, Angola, Legislation, Mrs Gerald C Cooney, Syracuse, National Bulletin, Mrs Kenneth P Foster, Gloversville, Organization, Mrs Herman W Galster, Scotia, Parliamentarian, Mrs Morris H Newton, Little Falls, Physicians' Home, Mrs. M M Monserrate, Binghamton, Press and Publicity, Mrs Bradford F Golly, Rome, Printing and Supplies, Mrs Leonard A Hulsebosch, Glens Falls, Program, Mrs Michael M Schultz, Hollis, Public Relations, Mrs James W Bucci, Albany, and War Participation, Mrs Joseph Elia, Niagara Falls

The advisory council consists of Dr Clement J Handron, Chairman, Troy, Dr Harry F Pohlmann, Middletown, Dr Nathan B Van Etten, New York City

The President's Message

WHEREAS, the object of the Woman's Auxiliary is to aid the American Medical Association in every way requested, and

WHEREAS, the most urgent need at the present time is for widespread dissemination of knowledge concerning the hazards of medical legislation,

"Therefore, be It Resolved that the House of Delegates of the American Medical Association request the Woman's Auxiliary to use evey avenue possible to bring such information to its members and through them to the public"

This resolution was introduced by Doctor Francis Borzell, Vice-Speaker, and adopted by the House of Delegates of the American Medical Association It indicates to each State Auxiliary one of its major lines of work The thing has been specified, and it remains only for us to accomplish the end desired

Public Relations and Legislation will work together on this.

With the war over we can, this year, move ahead in organization and membership We must bend our efforts toward regaining those members lost because of the war With the return of our doctors new members are found each month on the rosters of the country societies These mean potential members to the Auxiliary

With the removal of newsprint limitations, press and publicity will be able to branch out with the ultimate goal of our publication. Watch the JOURNAL closely It will be worth your while

The Bulletin chairmen feels that to be better informed each county officer and board member, as well as the State Board, should subscribe to our national magazine, *The Bulletin of the Woman's Auxiliary to the American Medical Association* It is our direct contact with the over-all plan of the Woman's Auxiliary

The Chairman on Archives will see that statistics and data are available on request to the chairmen of

[Continued from page 1162]

all committees The State Executive Board will direct what shall be filed and how

The Parliamentarian will oversee the use of that *framework of all good organizations*—Parliamentary Law

The Committee on War Participation is to continue with postwar plans direct from the national organization

The *Hygeia* Committee chairman is already busy with ideas to sell the magazine not only to doctors and dentists but with especial emphasis on libraries and schools

The Finance committee will budget our spending so that we will be an example to the nation by living within our means

The Chairman of Printing and Supplies will continue to obtain efficient correspondence material suitable to our organization

The committee on Physicians' Home will not forget that charity begins at home, and that this is one place where we are helping ourselves

The records of all our progress and good deeds will be kept by the Historian

One of the most vital committees is that on Program Besides instructing ourselves on the Volunteer Health plans, and the legislative problems that concern us, we will have some fun. We have done with little pleasure for five years now, so how about a few social affairs—alone, with our husbands, a dance, a dinner with a short skit, a hamburg roast, covered dish supper, or what are you interested in? There is nothing better than a "get-together," as our Constitution puts it, to promote harmony among physicians' families Surely this is one way to help present a united front If we can smooth out any differences so that each will get along with the other in our own little corner of the world, then who shall say we have not done our bit toward peace?

Lastly, remember the Convention The Chairman and her committees will see to it that 1947 and Buffalo will bring a bang-up time

"The Future belongs to those who prepare for it" That is our purpose Each officer and chairman working to help all the counties, and each county in turn playing its invaluable role in the success of State and National organization It is all your Auxiliary and will be no better than your support of its purposes Medicine and doctors have been in existence ever since the beginning of history With that in mind, we know that our work has just started It is up to us to recognize our place in the future, to take our place fearlessly, and to hold it steadfastly We do not build on sand We are not working for this year alone, nor for next year, but with the knowledge that any help we give organized medicine is a contribution to the health of the Nation, and so to the advancement of civilization

For results, worthy of this aim, we appeal for the active cooperation not of just a few, but of every doctor's wife in New York State!

Mary G Madden, *President*
(Mrs Alfred L Madden)

THE PROBLEM OF TUBERCULOSIS

Tuberculosis deaths in the upstate area are expected to be well under the 1942 and '43 figures, when the first increases in the past twenty years occurred Although the death rate has been set back to about what it was five years ago, great success in finding unknown cases of tuberculosis and getting them under care and treatment for cure and prevention has been achieved through taking x-rays of the chests of many thousands of industrial workers and other workers Sanatorium services, however, are still handicapped by shortages in medical and nursing personnel

The continuing problem of tuberculosis was emphasized in a statement by Judge Cantline and Mr Nelbach, who pointed out that more than 500 new cases and 200 deaths are being reported each month in the State outside of New York City Also, about 500 residents of New York State were discharged from the Army and Navy each year because of tuberculosis

A significant event in 1944 was the setting up of a tuberculosis control division in the U S Public Health Service with provision of financial assistance to the states for their control programs, in recognition of tuberculosis as a major public health problem on the national level

The virtual elimination of diphtheria as a destroyer of young children has been hailed For the first nine months of 1944 only one death has occurred upstate among six million people and 3 in New York City among eight million, as compared to 5 and 14 deaths, respectively, for the same period a year ago Prior to the continuous immunization campaign against diphtheria which was started in 1926, there were almost 600 deaths caused each year by diphtheria in the upstate area alone

The statement warned that a 20 per cent increase in early cases of syphilis has been occurring in these wartime years as compared to the prewar period, and urged unremitting law enforcement measures to reduce commercialized prostitution as a leading source of infection to servicemen and civilians

"Christmas Seal sale funds help to bring the aid and resourcefulness of an army of citizens to these campaigns," the statement concluded—*Release from State Charities Aid Association*

Welcome Relief

in POISON IVY DERMATITIS

The tormenting itch of Rhus dermatitis has few equals in routine medical practice Many patients receive early welcome relief after injections of POISON IVY EXTRACT Arlington

POISON IVY EXTRACT Arlington is an absolute alcohol extract of Rhus leaves of established potency The use of absolute alcohol results in an extract of greater dependability Use as supplied for diagnostic patch test and for treatment of poison ivy dermatitis.

Clinical evidence indicates that a single excitant is responsible for dermatitis due to poison ivy poison oak, and poison sumac. Thus, this extract is equally applicable to dermatitis caused by contact with any of these plants.

DOSAGE: As soon as possible after appearance of symptoms, three subcutaneous injections of 0.1 cc. each are given at daily intervals.

POISON IVY EXTRACT

When Vitamins Are Not Enough

In malnutrition, convalescence, anorexia and old age, more than vitamins are often indicated. Besides vitamins there are maltose, dextrose and dextrins and other food elements present in Maltine with Vitamin Concentrates

Some of the food elements in Maltine with Vitamin Concentrates— approximate content per 30 cc. (2 tablespoonfuls)

VITAMIN A	10,000 U.S.P. units
VITAMIN D	1,000 U.S.P. units
THIAMINE HYDROCHLORIDE	3 mg.
RIBOFLAVIN	4 mg.
NICOTINAMIDE	40 mg.
+ MALTOSE	8.6 gm.
+ DEXTROSE	4.2 gm.
+ DEXTRINS	10.2 gm.
+ PHOSPHORUS	278 mg.
+ CALCIUM	303 mg.
+ CHOLINE*	36 mg.
+ INOSITOL*	44 mg.
+ FOLIC ACID*	22 mcg.

*These constituents are members of the natural B Complex. Their need in human nutrition has not been established

Two tablespoonfuls supply at least twice the minimum daily requirements of the above vitamins and supplementation of other easily digested food elements. The Maltine Company, New York 22.

MALTINE WITH VITAMIN CONCENTRATES

MORE THAN A CAPSULE COULD HOLD

In the severe depressions of the menopause marked by apathy and psychomotor retardation

Many women in the climacteric period develop a true reactive depression, characterized by apathy, psychomotor retardation and despondency

• This depressive syndrome is frequently progressive, and, unless promptly and effectively treated, may seriously impair the patient's normal capacity for useful living

• In such cases, Benzedrine Sulfate helps to reawaken mental alertness and optimism, and to restore the savor and zest of life—especially when administered in conjunction with such fundamental measures as electric shock and estrogenic therapy

• Obviously, Benzedrine Sulfate should not be used for the casual case of low spirits or normal physiologic depression, as distinguished from true prolonged mental depression

Smith, Kline & French Laboratories, Philadelphia, Pa

BENZEDRINE SULFATE

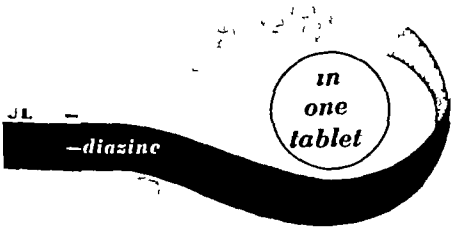
FOOTWEAR

In Postural Cases

Impressing the layman with the importance of proper clothing in promoting good posture cannot be over-emphasized Doctors know that proper shoes have a definite effect on posture in both adults and children, but the mere suggestion of an "orthopedic" shoe is enough to make the patient cringe



"PEDIFORMES", however, because they have a natural appearance, will not make your patient feel "let down" by your prescription for a helpful shoe Nor will you feel "let down" with the service, courtesy and experience of our shoe-fitters

To lessen renal complications during administration of sulfonamides *Combisul* - TD

Combisul TD is a combination of sulfaTHIAZOLE and sulfaDIAZINE in equal parts in one tablet Administration of these two sulfonamides together reduces the likelihood of renal involvement even though the total quantity of sulfa drugs is the same as when either is used alone [1] [2] Danger of calculus formation with oliguria and anuria is largely eliminated by *Combisul TD* for even crystalluria is uncommon. The chemotherapeutic activity of *Combisul TD* is equivalent to that obtained when either constituent is used in full dosage

Combisul TD available in 0.5 Gm. tablets each containing 0.25 Gm. sulfathiazole and 0.25 Gm sulfadiazine. Indications and dosage are the same as for either drug administered alone.
For the treatment of meningitis, *Combisul DM* consisting of 0.25 Gm. sulfadiazine and 0.25 Gm. sulfamerazine is available.
Combisul TD available in 0.5 Gm. tablets. Bottles of 100 and 1000.

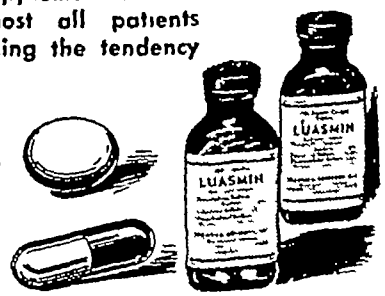
The nocturnal symptoms of many allergic disorders are often successfully controlled with

LUASMIN

CAPSULES and ENTERIC COATED TABLETS



(for prompt action) (for delayed action)

A LUASMIN capsule, administered as needed, and supplemented with an enteric coated tablet makes it possible for almost all patients to enjoy the benefits of a full night's sleep thus minimizing the tendency of recurrence of symptoms on the following day.

Each capsule or enteric coated tablet contains:

Theophylline Sodium Acetate	3 grains
Ephedrine Sulfate	½ grain
Phenobarbital Sodium	½ grain

Half formula capsules and tablets are also available for children, or for adults when symptoms are mild

Reduced incidence of secondary post-tonsillectomy hemorrhage

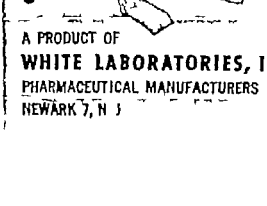
"Preliminary study of the effects of routine post-operative use of sulfathiazole gum indicated a reduction in the incidence of secondary hemorrhage "†

White's

SULFATHIAZOLE GUM

provides HIGH salivary concentration with LOW (negligible) systemic absorption

INDICATIONS: Local treatment of sulfonamide-susceptible infections of oropharyngeal areas acute tonsillitis and pharyngitis—septic sore throat—infectious gingivitis and stomatitis—Vincent's infection. Also indicated in the prevention of local infection secondary to oral and pharyngeal surgery



DOSAGE: One tablet chewed for one-half to one hour at intervals of one to four hours depending upon the severity of the condition. If preferred, several tablets—rather than a single tablet—may be chewed *successively* during each dosage period without significantly increasing the amount of sulfathiazole systemically absorbed

Available in packages of 24 tablets, sanitaped, in slip-sleeve prescription boxes.

IMPORTANT: Please note that your patient requires your prescription to obtain this product from the pharmacist.

†*McGovern F H., Prevention of Secondary Post Tonsillectomy Hemorrhage with Sulfathiazole Gum Arch. Otolaryn., 40.196-197 (Sept.) 1944*

"when the gum was chewed for one-half to one hour the average salivary concentration of sulfathiazole was 70 mg per hundred cubic centimeters The blood sulfathiazole of children chewing 1 tablet for one-half hour for twelve daily doses showed a maximal concentration of 0 5 mg per hundred cubic centimeters "†

7½ grain tablets and powder Dose 1 to 3 tablets, repeated

BILHUBER-KNOLL CORP. ORANGE, NEW JERSEY.

Right on the Job...
and Performing Efficiently

Neo-Synephrine minimizes the distressing nasal symptoms of common colds permits patients to work more comfortably, sleep more restfully—even during the acute stages of coryza.

Neo-Synephrine

HYDROCHLORIDE

L-ARYL-4 HYDROXY-β METHYLAMINO 1 HYDROXY ETHYLBENZENE HYDROCHLORIDE

For Nasal Decongestion

THERAPEUTIC APPRAISAL: Quick set ing, long lasting nasal decongestion without appreciable compensatory re-congestion; virtually free from cardiac and central nervous system stimulation; consistently effective upon repeated use; no appreciable interference with ciliary activity; isotonic to avoid irritation.

INDICATED for symptomatic relief in common cold, sinusitis, and nasal manifestations of allergy

ADMINISTRATION may be by dropper spray or tampon, using the ¼% in saline or in Ringer's solution in most cases—the 1% in saline when a stronger solution is indicated. The ½% jelly in tubes is convenient for patients to carry

SUPPLIED as ¼% and 1% in isotonic salt solution, and as ½% in isotonic solution of three chlorides (Ringer's), bottles of 1 fl. oz.; ½% jelly in ½ oz. collapsible tubes with applicator

Trial Supply Upon Request

In the Nutrition Problems of
CHRONIC CHOLECYSTITIS

Because of the low fat intake which is frequently necessary, many foods and beverages are denied the patient with chronic gallbladder disease If dietary curtailment becomes too drastic, however, nutritional deficiencies are apt to develop, adding further complications and physical discomfort

The delicious food drink prepared by mixing Ovaltine with skim milk provides many of the nutrients considered essential in hepatobiliary disease, without appreciably increasing the fat intake Its biologically adequate protein, readily utilized carbohydrate, B complex and other vitamins, as well as essential minerals aid in satisfying the need for these nutrients This food supplement makes a nutritionally excellent as well as delicious component of the extra feedings which are frequently required in the management of chronic cholecystitis

THE WANDER COMPANY, 360 N MICHIGAN AVE., CHICAGO 1, ILL.

Ovaltine

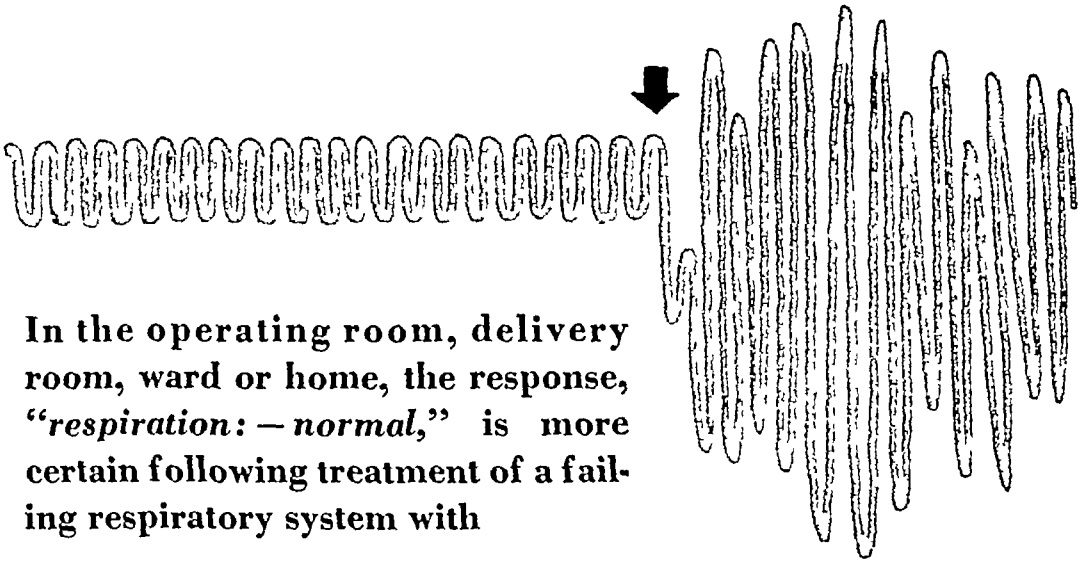
"Well-fed persons had little reaction to the same dose of x-rays which made the vitamin B deficient persons sick..."

Dunn, W.D., Spies, T.D., Vilter, C.W.
Am. J. Med. Sc., 201: 1 (Jan.) 1941

Reporting on the development of Roentgen sickness in persons on a diet poor in the vitamin B complex, the above authors feel that the optimum time for vitamin therapy is before and not after the syndrome appears, and that such therapy is essentially preventive in nature

A single capsule of White's Multi-Beta Capsules



provides basic adult daily requirements of all clinically proved B complex factors, plus all "unknowns" as provided by 155 mg of a special mixture of 1 20 liver concentrate and high potency brewers' yeast extract

The price of White s Multi Beta Capsules has been established with deliberate intent to pioneer a lower standard of cost-to-patient. Thus your patient obtains *complete* B complex reinforcement at a maximum economy

Supplied in bottles of 30, 100 and 500 Ethically promoted—not advertised to the laity

ERTRON IS *Distinctive*

Ertron is distinctive—therapeutically and chemically—from any other drug used today in the treatment of chronic arthritis

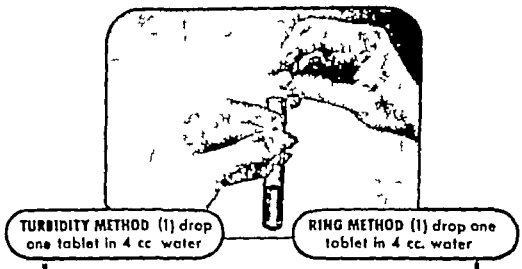
Ten years of *intensive clinical research* in universities, hospitals and private practice has established the efficacy of Ertron in the management of arthritis

Five years of *laboratory research* has produced definite evidence that Ertron is chemically different.

Simply stated Ertron is electrically activated vaporized ergosterol prepared by the Whittier Process Each capsule contains 5 mg. of activation-products having a potency of not less than 50,000 U.S P Units of Vitamin D

Ertron contains a number of hitherto unrecognized factors which are members of the steroid group The isolation and identification of these substances in pure chemical form further establish the chemical as well as the therapeutic uniqueness of Ertron

Physician control of the arthritic patient is essential for optimum effect. To Ertronize employ Ertron in adequate daily dosage over a sufficiently long period to produce beneficial results If signs of overdosage appear, discontinue medication for about ten days—then continue with three capsules per day gradually building up to the patient's optimum level



SUPPLIED IN BOTTLES OF 50 100 AND 500 CAPSULES

PARENTERAL FOR SUPPLEMENTARY INTRAMUSCULAR INJECTION

Ertron is the registered trade-mark of Nutrition Research Laboratories

Greater Response in IRON-DEFICIENCY ANEMIAS

White's MOL-IRON TABLETS

White s Mol Iron is a specially processed co-precipitated complex of molybdenum oxide 3 mg. (1/20 gr) and ferrous sulfate 195 mg. (3 gr) Available clinical evidence indicates that it is not only tolerated much more satisfactorily than ferrous sulfate, but also that its use provides the striking advantages charted below

GREATER RAPIDITY OF CLINICAL RESPONSE

Completely effective therapeutic response (return to normal blood values) was obtained in an average of 13.7 days of Mol Iron therapy—whereas ferrous sulfate therapy *failed* to produce normal hemoglobin values even after an average of 20.3 days.

GREATER AVERAGE DAILY HEMOGLOBIN INCREASE

Note that the group treated with Mol Iron averaged a daily hemoglobin increase markedly greater than the increase achieved with ferrous sulfate

MUCH LOWER AVERAGE INTAKE OF IRON

The group treated with ferrous sulfate ingested 100% more bivalent Iron than the Mol-Iron treated group—yet in the Mol-Iron group a return to normal blood values was achieved whereas optimal response in the ferrous sulfate treated group was not accomplished in the period of study

Charts summarize results of controlled study of comparative therapeutic response in post hemorrhagic and nutritional hypochromic anemias. Series includes 49 cases treated with Mol Iron, 21 with exsiccated ferrous sulfate results are typical of those observed in treatment of iron-deficiency anemias with White s Mol Iron.

DOSAGE 1 or 2 tablets 3 times daily after meals.

Bottles of 100 and 1000 tablets.

Ethically promoted—not advertised to the laity

ANOTHER CONVENIENT FORM OF

Non-Alkaline Antacid Medication

Creamalin, the original aluminum hydroxide gel, is now available in capsules, in addition to liquid and tablets

Creamalin capsules may be swallowed whole or their contents stirred into milk

Creamalin promptly reduces stomach acidity Moreover, the antacid effect is sustained With Creamalin there is no compensatory reaction by the gastric mucosa and no oversecretion of hydrochloric acid Furthermore, there is no risk of producing alkalosis Through the formation of a protective coating and a mild astringent effect, nonabsorbable Creamalin soothes the irritated gastric mucosa Thus it rapidly relieves gastric pain and heartburn, and helps in the healing of peptic ulcers

YOU CAN'T OVERRATE THE VALUE OF CONTROL

You probably know first-hand that it takes constant vigilance and scientific care to be sure of getting best results from your garden.

So, too, in the laboratory—in developing dependable pharmaceuticals. That's why quality control holds such a dominant position among the operations in modern U.D. research and production plants. From raw material inspection to final checking, every step of manufacture is guarded by one of the most detailed and successful control systems in the industry. Moreover, each finished U.D. formula is separately analyzed by the Formula Control Committee composed of doctors, chemists and pharmacists.

You may always be certain that your orders are filled with ingredients unexcelled in purity and potency when you indicate U.D. pharmaceuticals. Convenient Rexall Drug Stores provide these products—and offer skill and complete drug service to match their quality.

6 basic advantages in wound healing—

CHLOROPHYLL THERAPY

1 Accelerates healing
2 Stimulates normal cell growth
3 Reduces scar formation
4 *Controls infection*
5 Is nontoxic—bland and soothing
6 Deodorizes malodorous lesions

CHLORESIUM, the water soluble chlorophyll derivative preparation, stands out in the field of wound healing in a completely unique position. A natural biogenic agent, it is absolutely nontoxic, bland and soothing—and of marked biological activity. It promptly accelerates normal cell regeneration, thus measurably hastening the healing process. And by inhibiting anaerobic bacterial growth, it efficiently deodorizes foul smelling chronic suppurative conditions.

Tested in laboratory and clinic during the past five years—and in general practice since October 1945—Chloresium has been found by many authoritative investigators to be far more effective than any other agent previously used in the treatment of wounds, burns, ulcers and similar lesions, especially those of the chronic, indolent and resistant type.

If you have not used Chloresium, send the coupon below. The results it can achieve for you will be by far the best evidence of what Chloresium can do.

Chloresium

CHLORESIUM SOLUTION (PLAIN) 2-oz. and 8-oz. bottles
CHLORESIUM OINTMENT 1-oz. tubes and 4-oz. Jars
CHLORESIUM NASAL SOLUTION ½-oz. dropper bottles and 2-oz. and 8-oz. bottles

Both CHLORESIUM SOLUTION (PLAIN) and CHLORESIUM OINTMENT contain the purified, therapeutically active *water-soluble* derivatives of Chlorophyll "a" ($C_{55}H_{72}O_5N_4Mg$). They are maintained to rigid chemical and physical standards and are pharmaceutically adjusted to low surface tension to insure penetrability.

CHLORESIUM NASAL SOLUTION contains these same *water-soluble* chlorophyll derivatives in an isotonic saline solution suitably buffered for nasal instillation. Indicated for symptomatic relief and for acceleration of healing of acute and chronic inflammatory conditions of the upper respiratory tract.

SLOWER ABSORPTION *and Convenience* IN PENICILLIN THERAPY

Repostory injections of penicillin prepared with Emulgen consist of droplets of penicillin bearing water isolated by the pure sesame oil and special cholesterin base of this new emulsifying vehicle Such water in-oil emulsions of penicillin and Emulgen are quickly prepared and easily injected heat is not required

Most mixtures of penicillin with gum or ordinary oils produce an oil in water emulsion When these are injected into muscular tissue the medicament bearing aqueous phase rapidly passes into circulation leaving behind it a useless bed of oil globules Emulgen, on the other hand sheaths medicament bearing aqueous droplets in envelopes of oil This water in-oil emulsion allows the medication to pass into circulation only as the oil is absorbed

Emulgen prolongs the absorption of penicillin, avoiding the frequent injections which subject physician and patient alike to inconvenience and discomfort. Emulgen is supplied in 10cc rubber capped vials. Lakeside Laboratories, Milwaukee 1 Wisconsin.

LAKESIDE

EATON LABORATORIES Inc.
NORWICH, NEW YORK

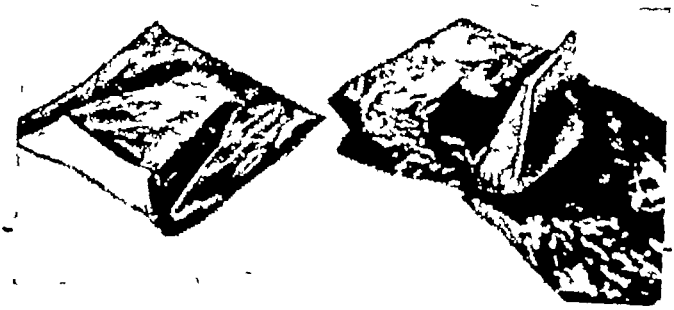
announces an innovation in

CONCEPTION CONTROL

Many failures in conception control are due to *one cause* failure of the patient to use the prescribed method *faithfully* This conclusion is abundantly supported by the literature The great need in conception control is to find a method more acceptable to patients, yet effective

Now Eaton Laboratories announces such a method a suppository which (a) is quick, easy, pleasant to use, (b) quickly forms a barrier film capable of occluding the cervical os, (c) kills sperm in less than one minute

Lorophyn Suppositories



A Lorophyn Suppository can be unwrapped and inserted in the vagina in a few seconds. There it melts in a matter of minutes to form an emulsion with cervical fluid Naturally, this ease and speed of use make the method highly acceptable to patients

The Barrier Film

Fig 1 shows the melted suppository adhering to the cervix, in the form of a film which occludes the uterine os This film serves the same purpose as the diaphragm in the diaphragm-jelly method of conception control. Fig 2 demonstrates the tenacity of this film, note that after intercourse the film still occludes the os

These photographs were made possible by the brilliant technic of Samuel L Siegler, M D, Brooklyn, N Y

Below is shown Lorophyn Suppository in hermetically sealed, leak-proof, aluminum foil wrapper also the unwrapped suppository

...DING PROPERTIES

As the Lorophyn Suppository melts in the vagina, it diffuses over the region where protection is needed. This has been demonstrated by X ray photographs. Reproductions of these films are available on request.

SPERMICIDAL ACTION

Lorophyn Suppositories contain 05 per cent phenylmercuric acetate, one of two compounds which have been referred to as the most effective spermicides known (1) In vitro tests indicate that the melted suppository, when thoroughly mixed in a tuberculin syringe with human semen and saline in dilution of 1 10 kills sperm in less than one minute.

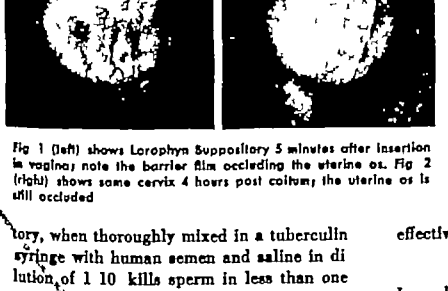


Fig 1 (left) shows Lorophyn Suppository 5 minutes after insertion in vagina; note the barrier film occluding the uterine os. Fig 2 (right) shows same cervix 4 hours post coitum; the uterine os is still occluded

PHYSICAL PROPERTIES

The base of Lorophyn Suppositories is a novel combination of synthetic wax and glyceride. The suppository is odorless, does not grease the fingers nor stain, and is pleasant to handle. It melts at body temperature, and during hot weather may liquefy No leakage occurs from the hermetically sealed metal foil wrapper, and the suppository may be resolidified by immersion in tap water

CLINICAL EFFECTIVENESS

More than four years of laboratory research and clinical investigation have been devoted to the development of Lorophyn Suppositories. In clinical evaluations covering hundreds of cases, Lorophyn Suppositories have given results which compare favorably with those obtained with the jelly and the diaphragm jelly methods as reported in the literature (2) (3) Clinical studies of Lorophyn Suppositories are being continued and enlarged.

CONCLUSIONS

From the above, it may be concluded that a method of conception control is now available which, because of its simplicity and convenience, should receive an extraordinarily high degree of *patient-acceptance. This new* suppository places a spermicidal barrier where protection is needed and is capable of killing sperm in less than a minute. Clinical evaluation to date indicates that this is a highly effective method of conception control.

PACKAGE INFORMATION

Lorophyn Suppositories, each weighing 8 Gm., are wrapped separately and hermetically sealed in aluminum foil. They are packed one dozen to the box. Directions for insertion are included.

FURTHER DATA

Additional data will gladly be supplied to physicians who address The Medical Director, Eaton Laboratories, Inc., Norwich, N Y

Medical Genetics and Public Health

The practitioner of medicine has given but little thought to hereditary factors as the cause of disease except in a very general fashion. He has been made aware that certain illnesses run in families, that deformities and certain physical abnormalities may appear in successive generations, but neither he nor the public has given much thought to their possible avoidance or prevention. Of course we know more about the principles of heredity today than we did formerly and that some of the stumbling blocks to human health are basically genetic Public health measures have attacked and conquered most of the infectious and nutritional diseases, but now the genetic anomalies and diatheses have become of equal relative importance And just as the bacteriologist pointed the way to the control of infectious diseases, and the biochemist to the control of nutritional disorders, so the medical geneticist now holds out hope for the understanding, and thus, the eventual control of the hereditary dyscrasias

Dr Laurance H Snyder, of Ohio State University, recently introduced this fascinating subject at the Hermann M Biggs Memorial Lecture at the New York Academy of Medicine Medical genetics, he said, is emerging as a new science Careful research has resulted in gathering information which should be of signal value to the profession, to the public health authorities, and to the public A knowledge of human heredity has become so important that courses of instruction are being incorporated into the curriculum of a number of medical schools

The precision of our knowledge has now reached the point where definite practical applications are available and in use These include, first, prevention, that is, the institution of preventive measures against certain diseases and abnormalities, on the basis of specific genetic backgrounds, second, diagnosis of conditions difficult to identify by other means on the basis of genetic data, third, genetic prognosis, that is, the furnishing of genetic advice in prospective marriages and for the benefit of prospective families, fourth, the determination of nonpaternity and other medicolegal and medical problems, on the basis of the various blood agglutinogens

The practical application of this knowledge is not a simple matter There are many pitfalls Discrimination in evaluating factors that present themselves to the examining physician is all-important. For similarity or variability within families may

be due to nongenetic as well as to genetic influences Environment can play a leading role, but the underlying genetic factors cannot be changed, for these depend on original genes resident in every person and these are apparently little influenced by environment

All of this accumulating knowledge has an important relation to public health questions The transmission of a variety of susceptibilities to disease, or mental or bodily defects, may in time determine the suitability of marriage between individuals thus affected

Blood groupings have already been called into question, we need further research to determine how far we may go in what, essentially, is an eugenic adjustment

It would pay physicians to familiarize themselves with these ideas; there are several excellent textbooks to be consulted The new science of medical genetics, in the words of Dr Snyder, will take its place beside bacteriology, epidemiology, and other specific fields as another bulwark in the ever-expanding structure of the program of public health

The Biology of Arteriosclerosis

Arteriosclerosis is conventionally viewed as a lesion peculiar to the senescent years, but in the strict sense, Moschcowitz in a recent article adduces evidence that arteriosclerosis represents the exaggerated expression of normal, morphologic progressive changes that begin at birth and perhaps even before The regrettable tendency of many observers who view any lesion that causes thickening of a vessel as arteriosclerosis is to be deplored Arteriosclerosis must be sharply defined from luetic arteritis, periarteritis nodosa, the lesions accompanying rheumatic fever, lupus erythematosus, and the medial calcification described by Monckeberg Of greater importance, *arterio*sclerosis must be differentiated from *athero*sclerosis, terms that, unfortunately, are employed interchangeably only too often, and the failure to distinguish between these two lesions has caused much misunderstanding, especially in the study of experimental lesions. Atheroma may be a facultative but not necessarily a part of the lesions of arteriosclerosis, the proof being that in arterioles, where true arteriosclerosis is admittedly common, lipoid deposits are absent except in very advanced lesions The hyperplasia of the intima and elastica are the essential lesions of arteriosclerosis and bear the earmarks of a compensatory process which, Moschcowitz believes with Aschoff, represent an adaptation to the increasing intravascular pressure that proceeds from birth to adulthood

The observation of thickening of the intima and the hyperplasia of the elastica in arteriosclerosis is enlightened by a study of the finer morphology of the vascular structure from the embryo to maturity In postuterine life the vascular system, in contradistinction to most other organs in the body, continues in the process of differentiation even up to the thirtieth year, and it is in the interpretation of these changes that difficulty arises as to when these are physiologic or morbid The thickening of the intima and the splitting of the elastica that proceed uninterruptedly from birth to maturity are microscopic findings and affect the gross appearance of the vessel only slightly The characteristic gross appearance of arteries is largely the result of the secondary gross degenerative changes, notably the deposition of lipoid deposits in the form of atheroma Many students of arteriosclerosis regard the incidence of degenerative changes as the distinctive evidence of arteriosclerosis, but they have failed to consider, first, that arteriosclerosis, characterized by profound thickening of the intima and splitting of the elastica, may occur without any degenerative changes whatever, and second, that under normal circumstances, lipoid deposits of microscopic dimensions are always present in the earliest childhood, and in infants may even manifest themselves as gross deposits These deposits are regarded probably as the result of the high fat diet, and are comparable to the lesions produced experimentally by Anitchkow in herbivores by high cholesterol feeding

It is apparent that the dividing line between physiologic aging and the lesions con-

ventionally grouped under the term "arteriosclerosis" is indefinite and that one merges into the other In other words, arteriosclerosis is a process which begins at birth (and perhaps before) and is an inevitable destiny of mankind The process may be influenced by other factors besides the normal intravascular pressure, for instance, by feeding, perivascular fixations and stresses, congenital or acquired abnormalities of the vascular tree, and perhaps other unknown factors, but it cannot be escaped This obviously does not imply that clinical and anatomic arteriosclerosis are equivalent Arteriosclerosis causes disease only when the circulation of a vital organ is seriously compromised by narrowing, thrombosis, or when the weakened wall ruptures

The Pediatrician Studies the Child

On another page of this issue appears an important announcement by Dr Alexander T Martin, Chairman of the Subcommittee on Child Health of the Medical Society of the State of New York. He describes the study of child health facilities being launched by the pediatricians of the State as a part of a nation-wide survey by the American Academy of Pediatrics Postwar planning for child health has been a popular activity in recent years, and has engaged the interest of many nonmedical groups and individuals It is encouraging as well as significant now to have the pediatricians come forward to study the situation There is the prospect of having practicing physicians undertake to gather the necessary facts from which well-founded plans can be evolved and to determine the extent and quality of services now available In short, the pediatricians propose to make the diagnosis before prescribing the treatment

Although the members of the American Academy of Pediatrics in this State are committed to carry out the task, the success of this tremendous undertaking is the responsibility of every physician To obtain a complete picture of the existing child health facilities, in addition to the information obtained from hospitals, health departments, and other agencies serving children, physicians and dentists in private practice will be asked to complete a short one-page questionnaire concerning their pediatric practice No picture of child health services in the state or nation would be complete without this information from all physicians because pediatricians care for only about 10 per cent of the country's children. These questionnaires will be distributed soon and should receive early consideration

This study is important and unique It is an opportunity for physicians not only to investigate their own affairs, but also to collect factual data as a logical basis for good child health programs in this State in the future. Unless physicians undertake this task, others less qualified will It is hoped that every physician will read Dr Martin's statement and be ready to respond to the challenge and opportunity to assist in this study The success of the venture in this State depends entirely upon the cooperation of all New York State doctors

thors conclude that physostigmine
salicylate has relieved muscle spasm and associated conditions such as fibrositis and bursitis It is less expensive than neostigmine methylsulfate and has fewer local pain reactions, eases active and passive motion, has a rapid effect which may persist for several days, tends to relieve pain and prevent deformities, and is no more toxic than neostigmine in comparable doses Oral administration of neostigmine bromide in treating muscle spasm, rheumatoid arthritis, and allied conditions is not warranted

Anonymity Occasionally, we receive communications from readers in which resentment, dissatisfaction, or implied criticism is expressed about our editorial opinions and statements Some criticize us for having no opinions at all Whether the authors of these letters lack the courage of their convictions, are too bashful, too hesitant, or are just modest must ever remain a mystery to us for they surround themselves with the dark cloak of anonymity

For such as these, we can have no sympathy The destiny of unsigned communications is the waste paper basket The editors have no desire to be arbitrary in their expressions, they make no claim to infallibility, they welcome comments and justifiable criticism, but they do want to know the source so that they may be in a position to make adequate reply Differences of opinion are to be expected, usually there are two sides to every question and argument, sometimes three Our readers are privileged and encouraged to assert their ideas, we provide a correspondence column for this purpose when communications are signed and the waste paper basket when they are not When you write, tell us who you are *Verb sap!*

Infantile Paralysis The *National Foundation News* for April, 1946,[1] states that

A total of 444 new infantile paralysis cases have been reported in the United States for 1946 up to March 9 For the 1945 period up to March 10 cases totaled 373

California, with 83 new cases, leads the list for 1946, with Florida next, 46 cases, and New York with 32, and Washington with 33 cases In 1945, New York was in first place with 91 and California with 32 in the same period

[1] Of the National Foundation for Infantile Paralysis, Vol 5 No 4

LOUIS HOPEWELL BAUER, M.D

The President Elect

Dr Louis Hopewell Bauer was born in Boston, Massachusetts, the son of Charles Theodore and Ada Marian (Shute) Bauer He was educated at Boston Latin School, attended Harvard College, where he received the degree of A B in 1909, and the degree of M D *cum laude* in 1912 He interned at Mercy Hospital, Springfield, Massachusetts, until 1913 when he entered the Medical Corps of the U S Army as first lieutenant He re-

mained in the Army until 1926 with the grades of captain, major, and lieutenant colonel He was an honor graduate of the U S Army Medical School in 1914, honor graduate of the School of Aviation Medicine in 1920, and the first commandant of the School of Aviation Medicine, in which assignment he remained until 1925 He was graduated from the Army War College in 1926

Dr Bauer was colonel in the Medical Reserve Corps from 1934 to 1939 and has the honor of being the first medical director of the Aeronautics Branch Department of Commerce (now the Civil Aeronautics Administration) from 1926 to 1930 He was the author of the first textbook on aviation medicine and of chapters on the same subject in Oxford, Tice, and Cyclopedia Systems of Medicine He was the first recipient in 1940 of the John Jeffries Award from the Institute of Aeronautical Sciences

In 1930 Dr Bauer entered private practice at Hempstead, Long Island, where he confined himself to the specialty of cardiology He is a Diplomate of the American Board of Internal Medicine, a Fellow of the American College of Physicians, a Fellow in aviation medicine of the Aero Medical Association of the United States (its first president from 1929 to 1931), a Fellow of the American Medical Association, and member of the Board of Trustees and member of the Council on Medical Service and Public Relations

He was also a member of the House of Delegates of the American Medical Association, 1938–1939 and 1941–1944, and is a member of the Medical Society of the State of New York (Vice-Speaker, 1938–1940, Speaker, 1940–1946), a member of Nassau County Medical Society (president, 1938–1939), past-president of Second District Branch, 1939–1941, delegate to the American Council on Rheumatic Fever, a member of the American Heart Association, American Cancer Society (professional Board of Directors), the Institute of Aeronautical Sciences, and the Associated Physicians of Long Island, and editor-in-chief of the *Journal of Aviation Medicine*

Dr Bauer has been identified with the State Society in an active capacity for many years, he is thoroughly acquainted with its problems, and is superbly qualified to assume the duties of the high office for which he was universally acclaimed at the recent meeting of the House of Delegates The JOURNAL extends to him its cordial good wishes and felicitations

A METHOD OF APPROACH IN A VETERANS' PSYCHIATRIC CLINIC

SIMON ROTHENBERG, M D , Brooklyn, New York

(From the Brooklyn Jewish Hospital Rehabilitation Clinic)

THE complex phenomenon known as morale can be defined briefly as an attitude of idealized discipline created for the purpose of sustaining the objectives of warfare The failure to maintain morale, despite conscious efforts to the contrary, is apt to result in neurotic casualties. In the light of this perception it is, perhaps, surprising that the emotional storms of actual war and the tensions of the "war of nerves" have not ravaged the mental stability of mankind more than they did This optimistic observation points to the efficacy of morale as a predominating cohesive force supporting mental stability Zilboorg[1] has defined morale as "a general sense of security in the face of hardship and danger" Those not reached by this force are screened from the effects of it by inherent counter forces peculiar to certain individuals who are classified as the neurotically beset They constitute a heterogeneous group of people who are resistant and maladjusted to the moral social patterns of reality Through Selective Service and the war, they have become conspicuous in number and a particular problem to both the armed forces and themselves

Modern psychiatry, carrying the torch of "saneness" as a symbol of its aims, has already assumed its full measure of responsibility in applying to the job of rehabilitating these veterans its knowledge and experience. If the statistical data concerning the number of men disqualified from service because of mental instability is at all correct, the task confronting us is surely one of great magnitude. Added to these known millions, there are countless veterans who conceal their neurotic difficulties and will, in time, also require psychiatric help

In order to facilitate such an enormous program, the first aim should be directed toward finding routine technics with which it will be possible to rehabilitate large numbers of veterans seeking psychiatric help in a clinic The second aim should be to lessen the strain on the clinical staff engaged in doing this intensive work. This may be partially attained by organization of group work in which trained psychiatric social workers, psychologists, and psychiatrists will cooperate in obtaining the necessary data for the proper perception of the psychiatric problems involved in each case. The third aim, in this process, should deal with the simple classification of all problems of veterans into types of psychogenic disturbances and psychotic ailments.

The fourth and final aim should outline a rapid course of effective treatment commensurate with an established, provisional diagnosis and the facilities at hand for its attainment

The purpose of this presentation is to describe a method of approach used in the Rehabilitation Clinic at the Brooklyn Jewish Hospital, embodying the principles and a systematized technic intended to facilitate a relatively rapid insight into the dynamics of neurotic difficulties of veterans Such a procedure has, in the opinion of the writer, an advantage over other types of approach in that it attempts as quickly as possible to shift the focus of attention from obvious causes of neurotic breakdowns to earlier and deeper factors in the personality make-up This method, despite its schematic pattern, is largely psychoanalytically pointed and aims to establish a provisional diagnosis at the very outset of treatment. Therapy, too, is most efficacious when it is directed as early as possible toward penetrating the defensive mechanisms of a neurosis and when it can successfully seek out and attack the mental fox-holes wherein repressed emotional factors find convenient shelter When this plan is properly and consummately followed through, half the battle against the unseen enemy is won This procedure is not new, Freud called it *Eine Kleine Analyse* (A Brief Analysis) Most neurotics find it feasible to blame their difficulties upon the manifest happenings of situations while in service They establish cause and effect relationship for their failures and breakdowns, overlooking those elements in their character which predisposed them to their neurosis The therapist is too often tempted to follow suit in regarding the superficial complaints of patients as materially important He is apt to follow the patient's lead into the same dead-end street of reasoning There are, of course, many reality situations which first provoke the defensive mechanisms, but they can always be fitted into the personality pattern which determines the ultimate breakdown

Already a good many original observations on the total picture of war neurosis, as well as on particular methods of their treatment have appeared in the literature Among the outstanding authorities on the subject may be mentioned the following Gillespie,[2] Hargrave and Crichton Miller,[4] of England, Menninger,[6] Grinker,[7] Kubie[8] in this country The accumu-

gained from the vast experience with this psychologic morbidity of the war will no doubt form a major contribution to the science of human personality

Our procedure calls for one or two interviews with a veteran whose case history and all available data in connection with his referral to the Clinic obtained by a psychiatric social worker The psychiatrist then presents the case before a conference of the entire clinical staff for discussion in order to establish a provisional diagnosis and to prescribe his treatment I should like to cite a few cases to further illustrate this method

Case Reports

Case 1—L C, age 34, born in Poland of Jewish parents, was first seen by our psychiatric social worker who obtained from him his personal history and the nature of his difficulties during and since his service in the armed forces He is one of three children An older brother preceded him to this country years before His education consisted of attending an elementary school in Poland and of some instruction in Hebrew Thereafter, at an early age, he went into his father's business His life in Europe was uneventful He was married six years ago and has one child He came to this country on a visit five years ago, intending to return to his family soon Then the war broke out in Europe and he was unable to return He then stated that he liked this country very much for the things it meant to him, in freedom and opportunity, and felt, therefore, he should fight for it As a result, he enlisted in the Army During the entire period of his stay in this country he heard nothing of his family and consequently does not know whether his wife and child are still alive Before enlistment, the veteran was for a time employed by a brother in a grocery store and later worked for the Post Office His interests consisted of reading, going to lectures, and enjoying light amusements Occasionally, he went out with women and admits having continued with normal sex life during the entire period of his stay in this country

His present disturbance started with an episode of acute pain in his chest while crawling on his belly during amphibious training, with practice fire going on over his head The pain was so severe that he was taken to a hospital where he was said "to have talked out of his mind," and behaved so badly that he finally had to be placed in a psychiatric ward He remained there three months when he was discharged as a neurotic Since that time he has felt very irritable, unable to sleep or work or listen to loud noises, without reacting with palpitation or dizziness His head does not feel clear and he imagines himself to be a changed person. These symptoms might well be described as anxiety-hysteria His recollection of the acute episode of pain and maniacal behavior is vague and beclouded but he insists that, on the day following this acute onset of his ailment, he had felt perfectly rational and asked why he had been restrained in his bed or kept in a mental hospital He persisted, however, in complaining of his chest injury even though he had been told that nothing was wrong with it It was apparent that he had had no insight into the nature of his peculiar behavior during the onset of his illness

In his first interview the patient was asked to disregard his present disturbances and to try to recollect any experiences in his past which may have been similar to the episode of pain in his chest At first nothing occurred to him but on further questioning, with regard to remembrances of experiences during World War I, he faintly remembered the scene of an experience in Poland when, one morning, he had come out of hiding from the fields where they had frequently spent days and nights in order to avoid the shell-fire of the enemy, he came across the body of a soldier lying on the ground, who had evidently been bayoneted through the chest, causing a flow of blood to cover his clothes This screened memory was a significant finding which was appropriately correlated with his own similar experience as a soldier in the present war, and was an immediate focal point upon which it was possible to fasten his attention on his unconscious participation in the objectives of his hysterical attack The explanation of his behavior and the likely meaning of it he readily understood to be an insinuation that he had feared being in the war and by means of this supposed injury he would eliminate himself from further service This accusation caused him to deny any such possible motive or purpose, and he resisted the thought implied that he might be cowardly He felt that such a desire was something totally foreign to his nature and, therefore, vehemently opposed the supposition of a fictitious attempt at sickness

At another interview it was revealed that his older brother was in World War I at the time he saw the soldier bayoneted He remembered the anxiety of his parents in connection with his brother's service in the Army When asked how he and his brother had gotten along with each other while in this country, he said that during the time he worked for his brother, they did not get along well and that he regarded him as a "tough guy" Elucidation on this hostility toward his brother brought out the realization that he was envious of his success and aggressiveness in civil life as well as in his former experience in World War I At this time, inquiry with regard to his feeling in relation to the deprivation of his family by the Hitler scourge brought forth the reply that he felt no different than other men he knew, who likewise have not heard from their families and have regarded the possibility of the death of their loved ones in the light of a great misfortune, which they were obliged to accept as a reality Further questioning as to how he would feel were he to hear that his family was alive resulted in the answer that he would surely be glad about it, but it was evident that he showed no great emotion one way or the other despite a former statement that he had been a happily married man and a loving father

Subsequent to these revelations, he reacted with

even greater excitability and temper tensions at the slightest provocation His interests at present are nil and he complains of poor memory He often asks himself what is wrong with him and why he behaves so badly but finds no answer He feels that he should have no shame for having been discharged from the Army because he does not have to account to anyone He is sure if he had his former health and self-control, he would again make a living and is not worried about any disability money from the Government He thinks he has lost his former desire to associate with affable types of women and he regards this as a sign of his changed personality

His dreams deal repetitively with being killed chased, or shot and most of the time by his own father In actual life, his father was a very mild and kind man, who rarely threatened him Another dream deals with being shot at by someone and that he was shouting "Murder!" and "What do you want from me?" In association with this dream he says that when he reads of something sad or someone dying, he begins to cry He was never like this before. Lately he has feared being near an open window or near a bridge imagining some imminent danger to himself.

The therapy consisted of interpreting the revelations of his brief analysis and of gradually and patiently relating it to the nature of his fears and behavior He had to learn that his conscience had dictated to him to fight for the country that virtually protected him from certain death in Europe. It was further pointed out to him that his other emotional conflict had its basis in the ambivalent feeling between wanting and not wanting to hear that his family might be alive. Hence the fear of noises, his restlessness, his confusion of mind, all of which are symbolic of guilty feelings for his repressed wishes in connection with his family situation The anxiety he suffered was a danger signal of the punishment he feels he deserves but which he actually imposed upon himself through his neurosis. It was amazing to see how this veteran responded to this method of therapy, which gradually improved him within a period extending over eight to ten interviews. The enucleation of the forgotten traumatic experience was of itself not so much the reason for the effectiveness of his therapy as it was the surprise element in discovering that the symptoms in his recent illness reflected the memory of his childhood past.

Case 2—H. W., age 34 came to us seeking psychiatric help for his predominating symptom of lack of security in himself in any of his undertakings.

He had served in the Coast Guard as a seaman for fourteen months He found it a great hardship to endure the regimentation and regulation of military life. While on a ship for four months, he felt himself crowded and shut-in. Although his superiors had commended him for doing a good job he found that he was not deriving any satisfaction from his work and lacked the confidence in himself to ask for a higher rating. He was slightly depressed and was unable to make friends and felt as though he were apart from the rest of the men He began to suffer digestive disturbances. He was sent to a psychiatrist for consultation and then hospitalized for a few days before being discharged as a psychoneurotic The patient volunteered the thought that his problem in military service was tied up with similar difficulties prior to his induction This had to do with a long-existing feeling that his inability to advance himself in any undertaking was due to some defect in his personality His present complaint since his return to civil life, is really a duplication of his experience in military life in that he again finds himself in a rut, unable to continue in his present occupation or in anything else After a few interviews this veteran's case was presented before our conference for discussion It was found that except for some occasional symptoms of claustrophobia, which had bothered him for many years there were no outstanding neurotic symptoms This shut-in feeling of which he complained while in service was, however similar to his former claustrophobic symptoms This became more noticeable whenever he had to face difficult situations or when any aggression was manifested toward him. Despite the awareness of these traits, he enlisted in the armed forces, thinking that he would attain greater facility for achieving things were he to learn to accept authoritative command. He is a married man and for a time his wife stayed near him while in service He was unable to tell of any unusual episodes or incidents while in the Coast Guard, which might have caused him to feel the general apathy and restlessness that finally led to his discharge Likewise in civil life prior to induction, no catastrophic events had occurred which might be considered pertinent to the present breakdown. At school he had been a fair student and had shown special interest in dramatics. Although he never did anything to further this aim, he always hoped something would happen to bring it about. Sexually, he regarded himself as entirely normal. Although he admitted his marriage was not founded on love, he would do nothing to disrupt it nor would he cement it by raising a family At one time he felt he was in love with a glamorous girl connected with the stage but he lacked sufficient confidence in himself to make good his desire to possess her His home life was largely distressing because his parents never got along well together and he witnessed many violent disagreements and scenes. His father died while he was in service and he felt he had not been affected enough by it and, therefore, reproached himself for being unable to grieve He spoke of his father as a very simple unaggressive man, and of his mother as overwhelmingly aggressive

From this data it is not easy to attribute specific precursory causes to his neurotic breakdown. Nevertheless it is obvious that the behavior of this individual is passive in type and shows a characteristically weak ego His claustrophobic symptom can be interpreted as a fear of being shut-in by any authoritative aggression from which he like all such patients, wished to escape. It probably had its origin during the early years of his childhood as the aggressive love object of his mother His desire to be an actor shows an exhibitionistic tendency possibly arising from some childhood fixation, in his relationship to his parents or on account of some rivalry with his older brother

It is fortunate for this veteran that he has the capacity for intelligent thinking and ready psychologic perception It was, therefore, possible to begin his therapy early in the interviews with interpretation of the material he presented The influence his parents had had on his personality and, especially, upon the subsequent effect of his repressed hostility toward his aggressive mother was the starting point of a broader understanding and deeper interest in the dynamics of his personality In subsequent interviews, he learned that it was as difficult for him to become aggressively masculine as it was to succumb to her domination, for this would have meant his complete identification with his mother, an eventuality he had feared and unconsciously resisted through his neurosis Hence, the development of his ambivalent nature leading to his paradoxic behavior and final breakdown The process of rehabilitation was of necessity very slow, since the aim here was to develop a different ego and not to merely return him to his former self At the end of ten interviews, the veteran admitted having gained ground and felt capable of making further progress in the future

Case 3—H V, age 33, claimed he never was aware of being neurotic and insisted that the first manifestation of symptoms occurred during his basic training It was then that he suddenly found himself in trouble with his sergeant because of his ineptitude in handling a gun This inadequacy was the beginning of his anxiety and produced in him a loss of confidence in his ability to be the equal of the other men in his company and he became very self-conscious of all his movements, mirroring himself before the eyes of everyone about him He became the object of ridicule of other men when they saw him shake and tremble during firing practice, as he apparently thumbed his way through it Later on, after he was transferred to another camp where he entered a school for water-purification, he again became so upset that it was necessary to hospitalize him for treatment After the first episode of anxiety this veteran showed a marked hypertension but after a few weeks of rest and quiet his condition subsided and he was then sent to school for study At first he seemed to be interested in chemistry and had done well until one day when, suddenly, he felt his memory had lapsed, and he was unable to recall what he had diligently studied on the previous night He was once more hospitalized and finally discharged as a psychoneurotic The veteran's reason for his breakdown was that he had been worrying over the pranks the men have played on him and the "kidding" he had had to endure to which he reacted with hostility and nervousness He had no explanation for his inability to handle guns or for his failure in the second undertaking at his new post To proceed with effective therapy it was necessary to give this patient an overall picture of himself instead of dealing merely with the superficial manifest facts of his breakdown during service Previous experience has taught us it is not sufficient to purge the existing conscious hostility or grudges engendered toward those accused of being antagonistic or hostile There are always antecedent situations which require working through in order to resolve the present difficulties This man's parents had been separated and he had been a witness to many bitter arguments between them early in his life He recollected his early hatred of his father and his grief and sympathy for his mother Shortly before his acute upset, he visited his mother who had suffered a stroke Another contributing factor to his breakdown was the conflict over his inability to associate with women or obtain sexual gratification Especially significant is the symbolic meaning of his difficulties with the handling of guns and chemicals, which probably represent his hate and love conflicts Identification with his mother in her hatred of the father was, no doubt, the initial turning point in his subnormal masculine development, which subsequently prevented him from becoming the real aggressive "he-man" in the Army, capable of handling guns

From this insufficient material, it is hardly possible to reconstruct the entire personality make-up and to account for this veteran's predisposition to a neurotic casualty It is, however, discernible from even this oversimplified analysis that his idea that he had never suffered from neurosis before his entering the Army was incorrect This brief outline of the problem involved served as a basis for further insight into his needs, in the pursuit of civil aims He was pervasively directed from the conscious causes of his disturbances to the need of reorganizing his personality toward attaining clearer orientation of his aims

Case 4—L H, age 23, came to the clinic because of a fear that he was losing his mind This thought had originated in him at a time when his father had insinuated to him there was insanity on his mother's side of the family He became fearful and was obsessed with the thought that he had inherited this trait of insanity, shortly after he was discharged from the Marine Corps, where he had served five years He had made a good adjustment to the service until the time of his joining a mystical society, the Rosicrucian Organization, which led him into fields of introspection and served to bring him to a state of confusion and emotional instability

He had joined the group while in the South and became deeply interested in its teaching as an aid to his ambitions But, before his transfer to the West Coast, he was given a furlough home for the purpose of attending the wedding of his brother, whose marriage was a cause of much concern to the family The prospective sister-in-law was a very unprepossessing girl and the veteran's father said at the time that his son must be crazy to marry her, and sought the veteran's help in preventing it Thus insinuation upset the veteran very much owing to its implication of insanity in the family to which his father had previously referred On returning to the coast, he found he was not included in his outfit which was being shipped across This proved to be the second real blow he had encountered during his time of service His first setback took place when he had been washed out as a pilot Prior to these happenings, he had been deeply engrossed in the various teachings of the Rosicrucian Order and, when he achieved the desired rank of sergeant, he

attributed his success to the understanding of the various cycles, or so-called cosmic influences, which supposedly played a direct role on one's life accomplishments. However his disappointment on being left behind when his outfit was sent across caused him to visit the headquarters of the organization in California in order to learn why he had failed and what the future might hold for him. He then subjected himself to hypnosis as a means of obtaining more "cosmic influence toward his progress." This was done through the organization's doctor who "experimented on him" along various lines suggested to him. By this time, he was evidently in a state of growing confusion which was recognized by his superiors as abnormal. He was referred for psychiatric consultation which resulted in a period of hospitalization and final discharge from service. His condition at the time he came to the clinic, showed him to be in a state of mental bewilderment, suspicious of his own sanity and fearful of the loss of faith in the principles supporting the dogmas of Rosicrucian. He had read of "schizophrenic psychosis" and felt he might be developing this disease.

Of interest in this case is the fact that although he was observing himself and thinking of the possibility of being mentally affected he nevertheless continued with his belief in the truth of the mystical philosophy which claimed to prognosticate the future according to "cosmic influences." He never regarded his thoughts about the cult as delusional. He persisted in his desire to pursue his studies in this cult in order to fulfill his mission as a true member of the order. Further interrogation revealed his deep affection and attachment for his father whom he outwardly avoided and feared. It was not easy for him to admit his love for his father since he held him responsible for the unhappiness of his home life with his mother.

It is quite apparent that this veteran is a schizoid individual with paranoid ideas threatening to develop into a schizophrenic psychosis. It was, however, possible to distract him from his obvious delusions and preoccupation with his dogmas, by showing him that his desire to be hypnotized and to be under the influence of the leaders of the organization were substitutes for unconscious submission to his father who is represented in his delusions as the cosmic consciousness by which he is seeking to be controlled. During the several interviews he had with us, he seemed to respond rather quickly despite his delusions. The correlation of his symptoms with that of his life situations resulted in decided improvement in his mental attitude.

Many cases with psychosomatic ailments, causing discharge from service revealed neurotic mechanisms superimposed upon actual organic conditions. Two such cases with severe heart ailments which developed during service, came to us with behavior disturbances that indicated their refusal to accept the truth about their organic ailments. They acted as though there was nothing wrong with them. One danced and exercised excessively the other became overambitious in the pursuit of his work, undertaking travel in subways and climbing stairs, despite knowing it was detrimental to his health. He disregarded all caution to take care of himself. Inquiry revealed interesting regressive phases in each individual which might very well explain their paradoxical behavior.

Discussion

In the first patient there was a history of rheumatism in childhood which had confined him to bed for a long time. He had been advised by his physician not to take any exercise, but someone else had told him to move his limbs and disregard his medical advice. This he did with the result that he made a good recovery. He now evidently reactivated a forgotten unconscious experience to cure himself once again by means of contrary behavior.

In the second patient, it was found that as a child he had been witnessing the suffering of his mother from some ailment, and he remembered being imbued with the desire to become a doctor and upon growing up curing her of her ailment. This patient's irrational overactivity may be said to be a fantastic attempt at fulfilling his mother's hope for him in becoming his own doctor in order to cure himself. His identification with his father in his role toward his mother was a subject of further interest in his treatment. It is apparent that both patients attempted to escape from the painful realizations of their organic ailments.

Other cases suffering from ties, traumatic neurosis, simple reactive depressions, and individuals with psychopathic personalities have all afforded us many surprising insights. Few veterans had any consummate understanding of the deeper relations of symptoms to personality make-up and the conflict of emotions. I am fully aware of the danger involved in using any method, especially the psychoanalytic one, with which one wishes to gain an inordinately rapid insight into the dynamics of a case. This might result, particularly in the hands of the untrained, in what Freud called a "wild analysis." However, I have been pleasantly surprised to find that some of my coworkers in the clinic have gradually caught on to this technic with a facility that has yielded fairly good results. It is exceedingly important to obtain a comprehensive history taken by a well-trained psychiatric social worker. Corroborating proof of the correctness of our diagnostic estimations must be constantly checked by the nature of the transference responses, as revealed in dreams and subsequent conduct. In addition to the foregoing technic, our cases have at the same time been studied by a staff of competent psychologists who have used all available psychometric tests in order to find correlation with our clinical findings. This has sometimes helped us arrive at a [illegible]

hypothesis, when the clinical material was of a doubtful nature

If a rapid and useful rehabilitation is to be effected, the veteran must first of all be viewed as one who has suffered a mental casualty exactly as if it were a physical one He must be made to understand that he has the sympathy and understanding of the therapist in his desire to find himself reinstated as a normal individual When this is attained he is then ready to discuss the problems of his economic or social situations His failure to get into the Army or his difficulties while in service have of necessity deflated his self-esteem His residence in a mental hospital, guard house, or being under psychiatric treatment have all tended to cause extensive damage to his ego Such memories must be dealt with tenderly and realistically, to the satisfaction of the veteran, before he can be regarded as properly restored Reactivated recollections of horrible experiences in war, deaths of buddies, guilty feelings with respect to critical failures should all be related to past experiences in both childhood and adult life All these objectives can hardly be expected to be attained within the brief span of a few clinic treatments At the same time, significant interpretations, properly transmitted, can do wonders toward furthering scientific objective interest in bringing about ultimate, if not immediate, recovery

Summary

A method of approach in a Veterans' Psychiatric Clinic is described in which the emphasis is directed toward gaining rapid insight into the problems and to proceed with effective therapy The method is psychoanalytically pointed, and a number of case histories are cited The first step is to survey the patient's total personality through the case history which is obtained by a trained psychiatric social worker Next, the veteran is interviewed by a psychiatrist who fathoms the basic disturbance and outlines the problems involved The third step requires the psychiatrist to present the case before the entire staff to establish a provisional diagnosis Finally, treatment is instituted in an effort to shift the patient's focus from the obvious defense mechanism to the deeper personality disturbances, thus advancing him along the road toward rehabilitation

INTERNAL MEDICINE COURSES FOR THE MONTH OF JUNE

The Joint Committee on Post-Graduate Education of the Medical Society of the County of Kings and the Long Island College of Medicine, announces a post-graduate course in Internal Medicine and Allied Specialties, to be given at The Jewish Sanitarium and Hospital for Chronic Diseases, Rutland Road and East 49th Street, Brooklyn, New York, on Mondays, Wednesdays, and Fridays, from 2 to 5 00 P M , and Sundays at 10 00 A M to NOON, during June, 1946 The director will be Dr Charles Solomon

The following is the schedule for the month June 3, cardiology, June 5, gastroenterology, June 7, pharmacology and therapeutics, June 9, neurologic conference, June 10, cardiology, June 12, gastroenterology, June 14, endocrinology, June 16, neurologic conference, June 17, pharmacology and therapeutics, June 19, hematology, June 21, hypertension and nephritis, June 23, neurologic conference, June 24, diabetes mellitus and diseases of metabolism, June 26, allergy, June 28, infectious diseases, and June 30, neurologic conference

Dates for Clinicopathologic Conferences and Clinicocardiologic Conferences will be announced Each afternoon session of three hours will consist of thirty-minute lectures, demonstrations, presentation of cases, and round-table conferences

Registration fee is $35 Veteran physicians may apply under the G I Bill of Rights

To make application or to obtain further information, call Sterling 3-6900, or address The Registrar, Joint Committee on Post-Graduate Education, Medical Society of the County of Kings, 1313 Bedford Avenue, Brooklyn 16, New York

THORACOLUMBAR SYMPATHECTOMY IN THE TREATMENT OF ADVANCED ESSENTIAL HYPERTENSION

J WILLIAM HINTON, M D , and JERE W LORD, JR , M D , New York City

(From the Sympathectomy Clinic of the New York Post-Graduate Hospital)

ACCORDING to the United States Bureau of Census, the total number of deaths for the year 1943 was 1,459,544 Of these 645,109, or 44 per cent, were due to cerebral hemorrhage, cerebral thrombosis, hemiplegia, chronic nephritis, and heart disease (excluding rheumatic heart disease) It is estimated that at least 40 per cent of these patients had an associated hypertension

Before hypertension can be classified as essential, the underlying cause must be determined Therefore, excluding hypertension associated with chronic nephritis, chronic pyelonephritis, intracranial tumor, coarctation of the aorta, and adrenal and pituitary tumors, we find that most cases of hypertension fall into the essential group

Deaths from malignant tumors totaled 169,000 in 1943 Based on Page and Corcoran's estimate[1] that 90 to 95 per cent of all patients suffering from hypertension fall into the essential group, it is evident that essential hypertension far exceeds malignant tumors as a cause of death.

Smith, Goldring, and Chasis[2] reviewed 76 cases of unilateral kidney disease In 51 per cent of these cases the authors themselves report negative results from nephrectomy in respect to blood pressure reduction As for the 49 per cent in which apparently positive result was obtained, these authors hold that 30 cases were incorrectly appraised, either because the blood pressure did not fall within the normal range, or the postoperative follow up was inadequate, or the blood pressure was shown to return to hypertensive levels within six months following operation In the final appraisal, therefore, unilateral nephrectomy was successful in reducing the blood pressure in only 7 of these 76 cases Accepting these 7 cases at their face value, the authors feel that in only 1 case in 10, in which the thesis has been tested by nephrectomy, is there evidence that the hypertensive process has its origin in unilateral kidney disease Weiss and Chasis[3] report a case in which unilateral nephrectomy for unilateral kidney disease had no effect on the hypertension

Keith, Wagener, and Barker[4] have given us a grading of essential malignant hypertension based on eyeground findings

Group 1 —Retinal changes consist of mild narrowing or mild sclerosis of the arterioles This state is compatible with good health for many years The blood pressure is not excessively high and falls during rest

Group 2 —The changes in the retinal vessels are more marked than in Group 1, but retinitis is not present The disease is more progressive, the blood pressure is higher and more sustained, but the general health is good and cardiac and renal functions are satisfactory

Group 3 —Angiospastic retinitis is present, together with definite sclerotic changes in the arterioles, but there is no edema of the disk. Hypertension is high and sustained Although cardiac and renal functions may be adequate, alterations sometimes occur, as indicated by dyspnea on exertion, changes in the electrocardiogram, and nocturia. Nervousness, headache, vertigo, visual disturbances, proteinuria, and hematuria may be noted.

Group 4.—The most significant retinal alteration is edema of the disks. There is also marked spastic and organic narrowing of the arterioles with diffuse retinitis. Characteristic symptoms are nervousness, asthenia, loss of weight, headache, visual disturbances, dyspnea on exertion, and nocturia. Proteinuria, cylindruria, and red blood cells are usually noted on urinalysis Prognosis is serious

A grading scheme such as this has the distinct advantage of providing a basis for prognosis For example, three years after the first examination, 20 per cent of Group 1, 36 per cent of Group 2, 75 per cent of Group 3, and 94 per cent of Group 4 were dead

Morris and Oldt[5] studied 100 hypertensive patients and 100 individuals with normal tension They found that 97 per cent of the former and 12 per cent of the latter had arteriolar sclerosis of the kidney Castleman and Smithwick[6] in a report of 100 kidney biopsies, following thoracolumbar sympathectomy, found that 28 per cent showed little or no vascular disease and an additional 25 per cent showed only mild changes Using Keith, Wagener, and Barker's criteria based on eyeground changes[4], 32 per cent of these cases would fall in Group 1, 28 per cent in Group 2, 26 per cent in Group 3, and 14 per cent in Group 4

Cohen,[7] in reporting on the ophthalmologic

Read before the Brooklyn Surgical Society February 7 1944.

findings in 90 cases of essential hypertension admitted to Post-Graduate Hospital, has classified them according to the changes found in the fundus into normal, mild, moderate, and severe hypertension In the normal group he lists 23 patients, one of whom refused a thoracolumbar sympathectomy Among the 22 cases coming to operation, only 3 biopsies revealed normal kidneys, the others showed arteriolar sclerosis The mild group includes 43 patients, one of whom refused operation All 42 cases in which a thoracolumbar sympathectomy was performed showed arteriolar sclerosis on kidney biopsy The moderate group included 20 cases One patient refused operation and 1 case was too far advanced for a thoracolumbar sympathectomy In the 18 cases coming to operation, arteriolar sclerosis was found on kidney biopsy The fourth group comprised 4 severe cases Two of these patients were refused operation and in the other 2 cases arteriolar sclerosis was revealed on kidney biopsy Of the 84 cases operated upon, 81, or 96 per cent, showed arteriolar sclerosis on kidney biopsy Cohen's grouping of patients with hypertension on the basis of ophthalmologic findings does not agree with that of Keith, Wagener, and Barker, and the 90 patients reported comprised only one-half of the total number operated upon during that period In a previous report by us[8] on 87 cases followed from two months to three years, we found that 76 per cent were in Group 3 or Group 4, 24 per cent in Group 2, and none in Group 1

Indications for Operation

Since conservative methods of treating advanced arterial hypertension have proved disappointing, careful studies are being made to find out whether surgery holds any hope of relief for this large group of patients

The greatest difficulty the internist and the surgeon encounter is the selection of suitable cases for operation in order to have a reasonable chance of obtaining a successful result Unfortunately, there is no test or series of tests that will give such assurance The sodium amytal test gives us a lead as to the lability of the blood pressure

Patients in whom the pressure drops the most under sodium amytal, seem to offer the highest percentage of good results On the other hand, in a definite group of patients in whom the pressure did not fall under sodium amytal, amazingly good results have followed operation, while in some cases in which the blood pressure dropped the lowest under sodium amytal, the operation failed to produce satisfactory results Grimson *et al* [9] believe that any surgical prognosis based principally on rest, sodium amytal, or anesthesia tests may be misleading, and that a reduction in blood pressure by any of these methods should constitute only one of many factors to be considered in evaluation of the hypertensive patient Our experience[10] with the sodium amytal test confirms Grimson's observations

In evaluating indications for surgery, we have at our disposal the electrocardiographic findings, the six foot heart x-ray, kidney function tests (including urea clearance and concentration tests), intravenous urography, blood chemistry findings including nonprotein nitrogen, urea nitrogen, and creatinine We have, also, the response to sodium amytal, basal metabolism studies and routine urinalysis When all these tests are evaluated, we can usually arrive at an opinion as to whether a patient is a safe surgical risk, but the final outcome following operation is difficult to prognosticate Page and Corcoran[1] are of the opinion that the selection of patients for sympathectomy is still in the empiric stage, and surgeons who have had the most experience and the greatest success with this procedure use a combination of factors together with a large measure of intuition

The great question is Is the case severe enough to warrant operation or is it too far advanced to hope for a successful result from operation? Obviously we do not wish to operate on a patient who may live for ten to twenty years without showing constitutional manifestations of hypertension Neither do we wish to operate on a patient in whom hypertension is so far advanced that there will be no reversibility of the process

Confusion exists as to what pressure the doctor is referring to in discussing hypertension Is it the routine office pressure, or is it the resting pressure in the office, or is it the pressure several days after admission to the hospital? Obviously there is great variability in all these pressures The average patient who requests surgery does so because he wishes to continue an active business and social life, and therefore the pressure that most nearly represents his routine daily existence is the most important We[11] employ the exercise test as a means of evaluating the blood pressure which most nearly represents the average daily pressure of an active person This test was adopted because of the experimental observation of Blakemore and King[12] that the blood pressure of normal dogs exercised on a treadmill did not change significantly However, if the animals were sympathectomized and then exercised, there was a definite fall in blood pressure, the fall being roughly proportional to the magnitude of the sympathectomy If the pressure is taken in the office, first in both arms, then in the lower arm after resting for five minutes, after sitting for one minute, after standing for one minute, and then after exercising by stepping on and off a footstool twenty times, first with one foot and then with the other, pumping the arms simultaneously with

TABLE 1.—NUMBER OF CASES IN WHICH THE POSTOPERATIVE DIASTOLIC BLOOD PRESSURE IS BELOW 100

Total Number of Cases*	Follow-Up Period	Number of Cases with Blood Pressure Below 100
152	6 months	46 (30%)
99	12 months	18 (18%)
31	18 months	4 (13%)
15	24 months	1 (6.7%)
8	36 months	— (0%)

* In the column of total cases in all Tables, 152 had satisfactory follow-up for six months. Of the 152 patients, 99 had an adequate follow-up for twelve months; of the 99 patients, 31 had an adequate follow-up for eighteen months; of the 31 patients, 15 had an adequate follow-up for twenty-four months; and of the 15 patients, 8 had an adequate follow-up for thirty-six months.

each step, a very marked increase in the systolic and diastolic pressures will be noted following such exercise. In a preoperative study of 30 patients we found that following exercise the systolic pressure rose 23 mm. of mercury and the diastolic 16 mm. of mercury above the resting pressure. Postoperatively, the same group of patients had a systolic pressure of 64 mm. of mercury and a diastolic pressure of 32 mm. of mercury lower than the preoperative pressures. After exercise the postoperative pressure did not rise higher than the resting pressure. These cases varied in a follow-up of from two to six months.

Lowering of the blood pressure is not the only benefit to be expected from a thoracolumbar sympathectomy. It is known that definite improvement is noted in the electrocardiographic findings, diminution of the heart enlargement and improvement in the eyegrounds. Some improvement in kidney function and blood chemistry has also been observed. Symptomatically, the patient will have marked relief from headaches, irritability and fatigability even when the blood pressure has not been markedly lowered by this operative procedure.

It is frequently suggested that any major operation will have the same effect as a thoracolumbar sympathectomy in lowering blood pressure. This statement has been disapproved by Rajos, Smithwick, and White.[12] They selected 100 hypertensive patients having major operations including hysterectomies, mastectomies, gastroenterostomies, and thyroidectomies, and compared them with 100 hypertensive patients having a bilateral lumbodorsal sympathectomy as performed by Smithwick. In a follow-up of ten months none of the 100 patients having major operations showed a significant reduction in blood pressure, while in a follow up of twenty months, 62 per cent of the 100 patients having lumbodorsal sympathectomy showed a pronounced reduction in systolic pressure, and, 56 per cent showed a pronounced reduction in diastolic pressure. These authors define a pronounced reduction as 25 per cent or more of the preoperative blood pressure.

TABLE 2.—NUMBER OF CASES IN SMITHWICK GROUPS 1 AND 2*

Total Number of Cases	Follow Up Period	Number of Cases
152	6 months	81 (53%)
99	12 months	33 (48%)
31	18 months	12 (39%)
15	24 months	5 (33%)
8	36 months	5 (63%)

* Smithwick found 11 at in 150 cases followed one to five years 61.5 per cent had a postoperative diastolic pressure at least 20 mm. lower than the preoperative diastolic pressure.

Evaluation of Results

In advanced cases of hypertension it would seem fair to evaluate the end results of surgery according to the grouping of Keith, Wagener, and Barker[4] for medically treated cases. If their results can be improved significantly by thoracolumbar sympathectomy, then there would seem to be little argument as to its merit. We know that the advanced stage of arterial hypertension offers a hopeless outlook, since these cases fall in Group 4 of Keith, Wagener, and Barker's classification, and 94 per cent of their patients in this group were dead within three years following examination. If patients in this group can be operated upon with a reasonable low mortality rate and their life expectancy can be doubled or even trebled, then the operation would seem to be justified.

In a previous report[8] we studied 87 patients with advanced hypertension. Of these, 23 were in Keith, Wagener, and Barker's[4] Group 4. Three of these patients died in the hospital, a mortality rate of 13 per cent. There was a significant improvement in 61 per cent of our cases. According to Keith, Wagener, and Barker this group's life expectancy was only 10.5 months after the first examination. Therefore, our results in the late cases are most encouraging.

The end results of operations on the sympathetic nervous system for hypertension will depend to a great extent on the degree of removal of the sympathetic chain, ganglia, and the splanchnic nerve. We followed the technic of Smithwick from February, 1942 until July, 1945. Smithwick[14] is of the opinion that the sympathetic chain and ganglia should be removed from the eighth or ninth dorsal through the second lumbar ganglion including the greater, lesser, and least splanchnic nerves.

During the past seven months we have performed more extensive operations, first the seventh, then the sixth thoracic ganglion through the second lumbar on both sides, including the greater, lesser, and least splanchnic nerves *in toto*. This was extended to include the fifth, fourth,

TABLE 3 —NUMBER OF CASES MARKEDLY AND MODERATELY IMPROVED*

Total Number of Cases	Follow-Up Period	Number of Cases
152	6 months	123 (81%)
69	12 months	62 (90%)
31	18 months	28 (90%)
15	24 months	11 (73%)
8	36 months	8 (100%)

* This evaluation is based on postoperative blood pressure, electrocardiographic readings, heart x-ray, blood chemistry and urinalysis, and symptomatic improvement

TABLE 4 —CASES SUBJECTIVELY IMPROVED

Total Number of Cases	Follow-Up Period	Number of Cases Subjectively Improved
152	6 months	116 (76%)
69	12 months	58 (84%)
31	18 months	24 (77%)
15	24 months	11 (73%)
8	36 months	8 (100%)

TABLE 5 —CASES RESULTING IN DEATH

Total Number of Cases	Follow-Up Period	Deaths
152	6 months	13 (8 5%)
69	12 months	3 (4 4%)
31	18 months	1 (3%)
15	24 months	1 (6 7%)
8	36 months	0 (0%)

Total number of operations 152
Total number of deaths 18
Mortality rate to date 12 per cent

and third thoracic ganglia These cases are not ready for evaluation but one fact is obvious, the mortality rate is definitely increased

This presentation includes the cases in which the classical Smithwick procedure was followed During the period from February, 1942 to July, 1945, 180 patients have been operated upon, but in only 152 cases is the follow-up adequate for proper evaluation The end results are shown in Tables, 1, 2, 3, 4, and 5

If surgery offers improvement in advanced cases of hypertension, why should it not be employed in early cases? There are two reasons for not doing so, first, patients may live for ten to twenty years with a definite hypertension without manifesting any constitutional symptoms, and second, regeneration of the sympathetic system is a reality as stated by Smithwick [14]

Conclusions

1 There is no test or series of tests by which the end results of surgical intervention in hypertensive patients can be prognosticated

2 In considering end results of surgery for essential hypertension, we should make a distinction between early cases (Groups 1 and 2), and advanced cases (Groups 3 and 4)

3 The blood pressure is only one means of measuring the beneficial results from thoracolumbar sympathectomy The diminution in heart enlargement, reversible electrocardiographic findings, improved kidney function, improved blood chemistry, together with disappearance of subjective symptoms must also be taken into consideration

4 The sympathetic nervous system has a marked tendency to regenerate Therefore, it must be remembered that early operation may not necessarily prove beneficial in a long follow-up

SPECIAL TRAIN FOR THE AMERICAN MEDICAL ASSOCIATION CONVENTION

Under the auspices of the Oklahoma State Medical Association, a special train service is being organized for the trip to San Francisco open to all physicians and their families, who might wish to join the tour at advantageous points, while en route to the American Medical Association Convention An all-Pullman train will be routed via the Santa Fe from Chicago, through Kansas City with a full day at the Grand Canyon, arriving in San Francisco on June 30

After the convention, the return journey will be through Portland, Seattle, Victoria, B C, Mt Ranier, and Yellowstone Park For further particulars, apply to Harry E Kornbaum, Rainbow Travel Service, First National Bank Building, Oklahoma City, Oklahoma

THE DIFFERENTIAL DIAGNOSIS BETWEEN RECURRENT POSTOPERATIVE CHOLELITHIASIS AND RECURRENT OR CHRONIC PARENCHYMATOUS HEPATITIS

ABRAHAM O WILENSKY, M D , New York City

THE presently completed military emergency has produced another diagnostic problem which promises to increase in frequency It is to be expected that among the military personnel, there were and still are the usual number of individuals with a history of a previous cholelithiasis with and without chronic cholecystitis for which operation—cholecystectomy with or without choledochostomy—will have been performed at some time previous to the individual's entry into military service. Among these there will undoubtedly be the usual number of instances of recurrences of symptoms amounting in civil practice to approximately 10 per cent

The records show that in the armed forces there were a very large number of cases of acute hepatitis—both of the virus and of the homologous serum varieties It has also been determined that about one-half of the cases of acute hepatitis do not undergo complete resolution and symptomatic and anatomic healing In the latter, the records show that there have been and very probably will continue to be, a continuation of symptoms either as a progressive and continuous phenomenon, or as a series of episodes of recurrences and/or exacerbations

It has happened that there are individuals in whom both of these series of events had taken place and that, subsequently, somewhere along the line episodes had occurred which might and did simulate, in their manifestations, the symptomatology of either one of these preceding groups of cases Then, the question of diagnosis arises The necessity for the clinical differentiation of such late episodes is as apparent as it is difficult and will continue to be so

The symptomatology and other clinical manifestations, including bouts of jaundice, are remarkably similar in both of these groups. Radiographic evidence is not possible, or is inconclusive, and does not establish a diagnosis The laboratory work-out shows similar variations in either group there may be no abnormal laboratory evidence or, the latter may show diminutions or aberrations of function which are not quantitatively large, and, therefore, not sufficiently marked or defined for significant bedside clinical use Repetitions of study at regular intervals do not produce more facts and, because of these uncontrollable deficiencies in clinical observation and laboratory reports, one is confused and perplexed

Exploratory operation will undoubtedly be necessary in some of the cases at least, in order to exclude the presence of recurrent cholelithiasis As a consequence there may be unnecessary fatalities because of the presence of parenchymal hepatic disease which will not tolerate the insult of an exploration

The following is a case in point

Case Report

The patient is a physician now in the fourth decade of life In 1916 he was operated upon for an inguinal hernia. In 1929 an appendectomy was done Otherwise he has always been in good health except that one could distinguish a tendency toward an easy disturbance of his emotional make-up

Since 1913 episodes of biliary colic occurred of a fairly characteristic pattern and with increasing frequency, so that finally, four or five attacks occurred in the two months preceding the operation, which the latter attack compelled in May 1940 At the operation, a moderate amount of pericholecystitis was present and the gallbladder was adherent to the pylorus, the colon, and the duodenum, the liver and pancreas were normal to sight and to touch the gallbladder was packed full of stones of mixed cholesterol and pigment composition, and the terminal ducts were empty to palpation and admitted a large probe through the papilla into the duodenum The patient made an uneventful recovery was discharged from the hospital within a fortnight and thereafter remained well—as he said "very well'

In February 1941 he entered military service and was stationed in England In August, 1941, he developed a very profuse diarrhea which apparently, had previously been more or less endemic at the post, and which assumed somewhat epidemic proportions just at this time. The diarrhea subsided after six weeks. Nevertheless, at intervals of several weeks thereafter, there would be episodes of abdominal pain, cramps, and tenesmus, and the evacuation of large bulky stools These episodes disappeared after July, 1945

Since November 1941, eighteen months after the cholecystectomy, nine months after having entered military service and three months after the initial episode of diarrhea, the patient has had episodes of right upper quadrant symptoms which, while simulating to some extent the preoperative symptoms, might very well be due to some form of hepatitis There were bouts of mild jaundice, but, as these times, the stools were dark brown in color These episodes increased in severity Later the symptoms are described as pressure and gnawing epigastric pain associated with nausea and vomiting,

appearing one to two hours after eating, lasting a number of days, and being succeeded by a period of remission of symptoms

In October, 1942 he was hospitalized at the Walter Reed Hospital, in June 1945 he was at the Crile General Hospital, and later he was at the Baker General Hospital At each place he was studied extensively with the following results

During the first of these studies (Walter Reed) there was occult blood in the stools, the icteric index was 12, the cephalin flocculation test was 2 to 3 plus There was said to be some crystals in the biliary drainage The glucose tolerance curve and the basal metabolic rate were normal

During the second hospitalization (Crile) the icteric index was 18, there was bile in the urine, Van den Bergh's test was 0 9, and there was an abnormal urobilinogenuria The cephalin flocculation test was normal There were no crystals in the biliary drainage

At the Baker General Hospital, the gastrointestinal radiographic series was essentially normal What little changes were present about the pylorus are undoubtedly due to postoperative distortion. There was no free hydrochloric acid in the stomach contents and the total acidity was 12 The icteric index was 35 and the van den Bergh test was 1 8 The icteric index subsequently receded to 18

I am indebted to Dr H L Bockus, of Philadelphia, for the following notes of his laboratory work-out

Biliary drainage fluid was yellow to amber color without any concentrated fraction being found The microscopy was normal The stool showed no indigestion of fat, muscle, or starch, and contained no ova or parasites, the test for occult blood was plus 3 Sigmoidoscopy showed a normal lower bowel

The blood count was as follows

erythrocytes	4,890,000
hemoglobin	13 5 Gm
leukocytes	5500
neutrophiles	71 per cent
lymphocytes	24 per cent
monocytes	3 per cent
eosinophiles	1 per cent
basophiles	1 per cent

The blood Wassermann test was negative

Fasting blood sugar	89 mg per cent
Sedimentation rate	*1 mm*
Serum lipase test	0 5 cc normal

The liver function tests showed the following

blood serum cholesterol	380 mg per cent
cholesterol esters	194 mg per cent
serum bilirubin (Van den Bergh)	1 2 mg
prothrombin concentration	14 seconds or 95 per cent
bromsulfalein test	5 per cent retention (dose 2 *mg*)
galactose test (oral)	0 53 Gm excreted (normal)
serum phosphatase	3 2 Bodansky units
cephalin flocculation	negative
thymol turbidity	negative
colloidal gold	negative

Comment

This is a typical instance of what one may expect in the crossing of a history of postoperative symptoms after a previous cholecystectomy for cholelithiasis and a presently occurring episode of a possible hepatitis in a single individual

It is apparent that the only disturbance of hepatic function is indicated by a slight hyperbilirubinemia Otherwise, there are no competent laboratory studies of any kind which might tip the scales to either diagnosis The subjective symptoms are indefinite and indicate a possible psychosomatic basis for some of them There seems to be unanimity of opinion concerning the presence of some hepatic disturbance But, there is doubt as to whether this may not be due to a postoperative recurrence of the previous cholelithiasis The fact that there was complete disappearance of the previous symptoms after operation, the fact that there was a sharp onset of diarrhea, the fact that the present symptomatology followed the latter and seemed to continue thereafter—all of these make me feel that the present symptomatology is due to some form of chronic parenchymatous hepatitis Nevertheless, while the indication at present is to pursue a strictly conservative attitude, the possibility is there that, at some future time, a secondary exploration may be necessary to exclude the presence of any recurrent cholelithiasis

---

THE ROBERT TRUBEK FELLOWSHIP IN RHEUMATIC DISORDERS

A one-year, nonresident appointment is open to graduate physicians with at least two years of previous training in internal medicine or its equivalent The appointment is renewable for an additional year by mutual agreement

The Fellowship will combine supervised research and special clinical training in the rheumatic disorders under the direction of Dr Otto Steinbrocker Stipend $2,500 a year

(Candidates contemplating a two year tenure are preferred)

Applicants should send their educational qualifications, accompanied by two letters of recommendation from senior physicians under whom work was done, to the Robert Trubek Fellowship Committee, Fourth Medical Division, Bellevue Hospital, 26th Street and First Avenue, New York, 16

PROGRESS IN PHYSICAL MEDICINE DURING THE PAST TWENTY FIVE YEARS

RICHARD KOVACS, M D , New York City

THE story of the progress of physical medicine as part of the practice of medicine during the past twenty-five years is impressive. In the United States, up to the time of World War I the few men practicing as "electrotherapists" were looked upon by many of their medical brethren with suspicion mingled with pity Hydrotherapy, manipulation, and massage were mostly exploited by poorly educated technicians or adherents of cults. Generally speaking, there were no physical therapy departments in hospitals and medical schools, where the different physical methods could be correlated with each other and be a part of a general therapeutic regime, and where clinical and laboratory research could be carried on This situation first changed for the better during and after World War I by the installation by the Army and Navy of broadly conceived physical therapy departments, in order to benefit the injured and disabled In these departments all time-honored and many of the new methods of physical therapy were practiced under the watchful eyes of capable medical men. After the War, there became available a body of competent technicians and a number of physicians who continued the work in civilian practice. Groups of medical men and technicians organized for mutual cooperation and study, the medical profession at large showed much interest in physical therapy and its departments in civilian and reconstruction hospitals were gradually installed

The New York Electrotherapeutic Society was organized on March 9, 1921 as an affiliated group of the American Electrotherapeutic Association which was founded in 1891 and centered chiefly in the East. Out in the Midwest, the American College of Physiotherapy was organized after starting in 1922 as a Physiotherapeutic Convention It became in 1928 the American Congress of Physical Therapy In 1932 the two large national organizations amalgamated The organ of the Congress, the *Archives of Physical Therapy*, thus became the official publication of organized physical therapy in the United States, and is now the leading physical therapy periodical in the world An Academy of Physiotherapy, founded by former medical officers in the first World War, centered chiefly around Boston. The New York Electrotherapeutic Society changed its name to that of "The New York Society of Physical Therapy" in 1933, affiliating with the Congress, and the only other active regional organizations in Pennsylvania and on the Pacific Coast did likewise The New York County Medical Society was the first county society to appoint a special committee on physical therapy in 1927, the Medical Society of the State of New York created a special committee two years later, this State Committee had as its special object to foster postgraduate instruction in all counties of the State The American Medical Association created in 1927 a Council on Physical Therapy, this Council soon became a potent factor in disseminating nation wide proper information on physical therapy in advocating basic training in it and in curbing unwarranted claims and commercialization.

As a result of all these factors, in the years up to World War II, there was constant progress in education, research, in clinical application, and in the development of new methods in physical medicine

Development of New Methods

Perhaps the most spectacular progress in physical therapy methods during the past twenty five years occurred in the field of high frequency electricity Although high-frequency heating of the human body was discovered by d'Arsonval way back in 1892 and introduced, chiefly by Nagelschmidt, under the name of diathermy in 1910, in the United States the first efficient multiple spark-gap apparatus was not produced until 1920, in the intervening period the principles of electrosurgical destruction were also developed by de Keating Heart, and Doyen in France, and Cook and William L. Clark in the United States After World War I the medical profession here was flooded first with spark-gap apparatus and in another decade with "short-wave" tube apparatus, so much so that after a while no self-respecting physician's office seemed to be able to exist without one of these machines. When at the outbreak of World War II, steps were taken to take a census of diathermy apparatus, first for purpose of national safety, and later, for the diminution of radio-interference, it was found that some 2,200 hospitals and over 50,000 physicians—one out of four of every physician in the U.S.A —possessed such an apparatus. It is evident that in the hands of the majority these machines amounted to little more than that of a glorified heating pad

It is the present consensus that the clinical

Read at the Twenty Fifth Anniversary Meeting of the New York Society of Physical Medicine, March 16, 1946.

effects of both long-wave and short-wave diathermy when properly applied are deep tissue heating, and their chief value lies in treatment of chronic inflammatory and traumatic conditions of organs of the chest, abdomen, pelvis, and of bones and joints After much deliberation, the Federal Communications Commission last year assigned three definite wave lengths (22, 11, and 7 32 meters) for the use of diathermy apparatus so that a minimum of radio interference is caused to other services

Artificial fever treatment by diathermy, and by other methods of general body heating came to the fore some fifteen years ago Much of the pathfinding studies of its physical and physiologic effects were made in New York State by Bierman, Carpenter, Warren, and Whitney The first International Conference on Fever Therapy was held in New York City in 1937 Today the newer developments of chemotherapy have to a great extent superseded fever treatment of gonorrheal infections, but fever therapy has remained a standard form of therapeutics in a number of well-defined conditions

Other methods of electrotherapy have undergone a variegated course in the past two decades Static electricity had a temporary upsurge after World War I and then went into a steady decline, chiefly because of bulky apparatus, radio-interference, and other measures compensating for the undoubtedly useful effects of static electricity Galvanism was at a low ebb at the beginning of this cycle, but since then has commanded a constant increase in interest, chiefly by utilization of ion-transfer Much painstaking experimental and clinical work was done with ion-transfer of vasodilating drugs, mecholyl, and histamine, their application now plays an important role in the treatment of traumatic and rheumatic conditions and of vascular spasm

Low-frequency apparatus has undergone a gradual cycle of evolution from the original, simple galvanic faradic outfit to bulky and complicated motor generators and now, to more simple and efficient electronic generators The often-doubted clinical value of electrical muscle stimulation in flaccid paralysis has been definitely reaffirmed by extensive experimental work of recent years At the same time considerable progress has been made in other methods of electrodiagnosis, including electromyography

The method of inducing convulsions by means of an alternating current applied to the brain came about as an evolution from the more hazardous drug administration for shock therapy in mental disorders, it repeats the similar transition from drug therapy to physical therapy for physically induced fever Electric shock therapy has proved especially applicable to the early stages of depressive mental conditions

The employment of artificial ultraviolet irradiation has assumed much importance since Huldschinsky in 1919 reported its curative effect on rickets The controlled studies of Hess of New York, first published in 1924, that oils and fats could be made antirachitic by ultraviolet rays mark also the beginning of modern vitamin therapy Air sterilization of operating rooms and for preventing cross infection in wards by generators emitting the predominently bactericidal band of 2,537 Angstroms promises further interesting developments On the other hand, the earlier enthusiasm toward the employment of ultraviolet transmitting window glass has gradually faded out

Hypothermy, or the therapeutic use of cold, has been greatly stimulated by clinical research in recent years The original claims for some specific action in inoperable malignancies have been abandoned, but on the other hand, the scope of employment in military and industrial surgery and in peripheral vascular disease are expanding For amputation of gangrenous extremities, the technic developed by Allen and Croteman has proved to be efficient

Hydrogymnastics or the carrying out of exercises and manipulation in therapeutic pools and tanks, together with the earlier employment of the whirlpool bath, or hydromassage, has brought hydrotherapy into more extensive use Originally introduced for the redevelopment of muscles weakened by infantile paralysis and unable to work against gravity outside of the water, pool or tank exercise has been found useful in treatment of the sequelae of many traumatic conditions, of hemiplegia, and chronic arthritis

Spa-therapy in the United States has undergone gradual decline for many years Members of the American Congress of Physical Therapy made a survey of the spa situation a few years ago and subsequently, the American Medical Association appointed a Committee on Health Resorts, in order to study and to promote spa-therapy This subject has now been brought into the foreground of interest by the fact that the Army, Navy, and Veterans Administration took over a number of resorts for active utilization in rehabilitation It is to be hoped that under the impetus of these developments an era of a more general and more intelligent use of our health resorts will arise, instead of their misuse by the idle rich as society playgrounds or by commercial exploitation for much valueless treatment

The institution of a nation-wide program for rehabilitation of those disabled by war and war-connected industrial activity has brought about

widespread attention to the importance of exercise and physical fitness Instead of much of the cumbersome passive therapy apparatus of former years, the present tendency is to use early active exercise without any apparatus and later, either active exercise apparatus of simple construction or various devices of the curative workshop principle, aiming to restore function as well as the individual's habit of work. All this leads to an increasing tendency to combine physical therapy with occupational therapy under competent medical direction

Physical Therapy Technicians

Technical help is indispensable for institutional work and in busy physicians' offices to carry on physical therapy The training and qualifications of technicians during the developmental period of physical medicine in the United States was in a somewhat chaotic condition, varying from those with a background of nursing or physical education, or those with a college background trained in a few high-class physical therapy schools, to graduates of massage schools or other commercial establishments. The American Medical Association in 1934 established a program of standardization of schools for physical therapy technicians by cooperation of the Council on Medical Education and Hospitals and the Council on Physical Therapy In conjunction with the standardization of schools, the American Congress of Physical Therapy established the American Registry of Physical Therapy Technicians Only those with acceptable training are allowed to take examinations for membership in the Registry According to 1945 figures, there was a total of 3 967 physical therapy technicians in hospital service and there were over 3,000 members in the Registry In spite of the nation wide high standard thus established, local and state politics still cause considerable confusion New York City furnishes the most glaring example, with no less than four sets of standards. (1) the national, (2) a state law empowering "registered" physiotherapists to keep offices of their own, practicing nominally under a physician s supervision, the majority of this group of over 400 was licensed under a waiver clause, without passing any examination, (3) massage technicians licensed by New York City, (4) technicians employed in city hospitals under Civil Service requirements. The recent adoption by the Army of the term "physical therapist" to denote technicians is another source of nation-wide confusion in differentiating between physicians and technicians

Instruction and Research

Undergraduate and postgraduate instruction in physical medicine, and clinical and laboratory research showed a steady increase in the past two decades However, an accelerated progress became dramatically inaugurated two years ago by the establishment of the Baruch Committee on Physical Medicine and by large grants for research in physical therapy made by the National Foundation for Infantile Paralysis and the National Council of Research The original recommendations of the Baruch Committee, the establishment of teaching and research centers, establishment of fellowships and residencies, and promotion of teaching and research in physical medicine in all approved medical schools are being fully carried out and reports on the results of this work of large scope are beginning to come in. Among the most promising and most fascinating results of this activity is the establishment of a center for special training in physics and engineering and of a laboratory of applied biophysics at the Massachusetts Institute of Technology The inauguration of so much research and the entry of many newly trained, enthusiastic minds into the field of physical medicine should bring forth many desirable new developments in experimental results and clinical application, in addition to the less heralded and less subsidized patient research work being steadily carried out by individuals and some institutions

Recent Developments

A number of significant developments in the status of physical therapy have taken place in the last few years or are about to be consummated One of the most important ones was the adoption of the term Physical Medicine by the American Medical Association in 1944 to replace the term of physical therapy Under this definition physical medicine includes the employment of the physical and other effective properties of light, heat, cold, water, electricity, massage, manipulation, exercise, and mechanical devices for physical and occupational therapy in the diagnosis and treatment of disease The new term is much more comprehensive and adds dignity to this department of medicine In accordance with this change, the names of all organizations and publications pertaining to physical medicine have been changed Physicians specializing in physical medicine have long felt the need for a more distinctive and simple term to describe them as practitioners of physical medicine. A special committee appointed by the Society of Physical Medicine has studied this question and found the term "physiatrist" etymologically the more correct for this purpose The Council of Physical Medicine recently voted to adopt this term and has recommended its promulgation by the *Journal of the American Medical Association* An even more important

development is the very recent consideration of the Advisory Board of Medical Specialties that a board on physical medicine be established as a conjoint board of a major specialty and thus, physical medicine be officially recognized as a specialty On the more practical side of newer developments the rejuvenated veterans' services have also recognized physical medicine for the first time and attendants and consultants on physical medicine are being now appointed nation-wide All present rehabilitation and reconditioning regimens are planned and executed with physical medicine as the cornerstone of the work This fact will, in turn, unquestionably have profound effects on the future scope and methods of physical medicine in civilian hospitals

In summing up, it can be safely asserted, that after twenty-five years of constant progress, and in spite of many handicaps, physical medicine has at least come to a turning point where its value as part of a modern medical regimen is fully recognized and where the prospects for its further development both as a science and as an art are most encouraging

"THE RESPONSIBILITY OF THE HONOR"

Among literature which crossed our desk recently was a transcript of the baccalaureate sermon delivered on June 14, 1945, by the Most Reverend Michael J Ready, D D , Bishop of Columbus, at the commencement of the Schools of Medicine and Dentistry, St Louis University

Referring to the responsibility which accompanies the honor of being a member of the medical profession, Bishop Ready said

"You are citizens of a favored country This joy and dignity we all share with you But, if I may borrow an expression from the writers of advertisements, I must call you 'super citizens' Or you may paraphrase St Paul as each of you looks about him at his fellows in other walks of life, he may say, 'They are Americans, I am more!' Yes, your position in your country is one of inevitable prominence If we are all equally citizens, you are among the first of equals Soldiers in the line of advance are all equal, but some move first, some lead the way and set the pace Upon their bravery and endurance depends, in great measure, the spirit and energy of those who follow You take upon you now, with your professional character, a new civic and social responsibility Henceforth your conduct, your opinions, your attitudes, will leave not only a stamp, but will exercise an active molding force upon the American Body politic You stand, regardless of your wishes in the matter, in the vanguard of national life and progress America justly expects of you the type of citizenship that is literally exemplary

"Your country would suffer a slackening of the bonds that hold her civic life at seemly level were you to prove careless or recreant in your slightest civic obligations Physicians are not expected to be politicians Neither are they to play the dilettante, the parlor radical, the loose tongued critic of men and matters For 'what the doctor says' is taken as seriously among Americans as 'what the doctor ordered.' His work, because of his professional and social position, is held weighty and worth quoting in any department of thought or action

"However, it is high time for the medical profession to speak more clearly to the American public on the variety of proposals and plans affecting doctor-patient relationships which citizens now regard as a heritage of freedom. A well organized propaganda actually has convinced many citizens that the medical profession stands in the way of better health services and facilities in our nation

"Physicians generally have been in the front ranks of those best serving the community Their very considerable personal sacrifices in serving the economically depressed citizens are not forgotten by thoughtful leaders in social welfare The Profession's recommendations for constantly better standards of medical education, of hospital administration, and of more extensive public health programs are chiefly responsible for the magnificent progress in national health noted throughout our country

"Government controlled and administered medical services have nowhere equalled the record achieved by this nation's traditional system of private medicine Medical men should not permit a species of totalitarian propaganda to push them into a position of alleged opposition to better and to more widely attainable medical services for the people The physicians and surgeons want what all decent citizens want They want the public to have the best service and the best hospitals at the fairest cost to all

"State control and an ever increasing taxation have never demonstrated in welfare and institutional management any special efficiency in better serving the public dependent on Government aid

"Our citizens should exercise eternal vigilance in appraising plans and programs which hinder the individual from his right to select his own physician and which order a physician to engage his talents and skills according to bureaucratic control It is well to remember in these days of sacrifice and death and struggle for liberty that so-called government benevolence can hide in edicts and decrees an even greater multitude of sins than charity can possibly cover

"The watchword of a possible American totalitarianism will not be 'Heil der Fuehrer' nor 'Proletariat Unite' but some version of 'The State, like mamma, knows best—take it and like it!'

"Because of the physician's high civic responsibility, he will be conscious of a deep moral responsibility For surely there can be no doubt or question about the root relation between morality and citizenship The physician whose views on moral issues are loose, materialistic, agnostic, carelessly tossed off, fails as truly in civic as in moral duty"——*Ohio State Medical Journal, April, 1946*

BENZHYDRYL ETHER HYDROCHLORIDE (BENADRYL) IN THE SYMPTOMATIC TREATMENT OF ALLERGY

EMANUEL SCHWARTZ, M D , and LOUIS LEVIN, M D , Brooklyn, New York

(From the Division of Allergy of the Department of Medicine, The Long Island College Hospital)

ACCORDING to the theory advanced by Sir Thomas Lewis,[1] and the work of Lewis and Grant,[2,3] and Lewis and Harmer,[4] it is assumed that the physiologic response in allergy, or anaphylaxis, is due to the union of antigen and antibody in the shock tissues, with the resulting liberation of a histamine-like substance Recent investigation with antihistaminic drugs has suggested that in the wheal producing allergies, i e., urticarias, the predominating physiologic response is mainly due to liberation of histamine, while in others, i e., hay fever and some cases of asthma, it is due to a combination of antigen-antibody union and histamine liberation It has also been suggested that the unfavorable response to antihistaminic drugs occurs in those allergies characterized by a predominating antigen-antibody reaction with little or no histamine liberation, i e , asthmatics, who receive no benefit from the administration of antihistaminic therapy

Review of the Literature

Recent reports in the medical literature have presented more evidence favoring the hypothesis that most of the symptoms of anaphylactic shock are due to the liberation of histamine by the tissues during the antigen-antibody reaction

Hill and Martin[5] published an extensive review in 1932 in which they mention numerous substances that have been used with no success for alleviating anaphylactic shock in experimental animals Since 1932, many other antihistaminic substances have been sought to combat anaphylactic shock Among these was histaminase which was shown to destroy histamine in vitro Claims were made that the parenteral injections of histaminase counteracted histamine in anaphylactic shock. Subsequent investigations did not support this view Clinical application of histaminase in the allergic group of diseases was of no value, as shown by many reports

Sheldon, Fell, Johnston, and Howes[6] demonstrated that histamine functions as a hapten when combined with *desperiated normal horse* serum globulin In our experience, histamine azoprotein is of no benefit in bronchial asthma. However, *several patients with allergic rhinitis* and physical allergy responded favorably

French investigators, especially Staub and Bovet,[7] have experimented on animals with a number of highly potent antihistaminic chemical compounds Two compounds, 2-isopropyl-5-methylphen oxyethylamine (929 F) and *N-Phenyl-ethyl-N diethyl ethylenediamine* (1571 F) were shown to alleviate anaphylactic shock, histamine induced bronchoconstriction and prevented histamine *from contracting intestinal* muscles These findings have been confirmed

The drug antergan, similar in action to 929 F and 1571 F, *has recently been reported to be* effective in some cases of asthma, hay fever, serum sickness urticaria, and migraine A series of similar compounds have been studied by Mayer, Huttner, and Scholx,[8] and preliminary reports on their last product, pyribenzamine, indicate that it possesses a high antihistaminic activity A new synthetic chemical, β-dimethylamino ethyl benzhydryl ether hydrochloride, was demonstrated by Loew and his associates[9,10] to be an efficient histamine antagonist of low toxicity The benzhydryl ethers induced no toxic symptoms and were capable of protecting all, or a majority of the guinea pigs from death on exposure to atomized histamine The benzhydryl ethers were then administered intraperitoneally in doses of 3 0 mg /Kgm thirty minutes before injecting histamine diphosphate (1 67 mg /Kgm) into the jugular vein. The mortality rate was 50 per cent in groups of 20 animals, whereas all of the 20 control animals which received saline placebos died within ten minutes after intravenous administration of histamine This benzhydryl alkamine ether was called "Benadryl"

Curtis and Owens[11] gave Benadryl to a group of 18 patients who had acute and chronic urticaria and noted prompt relief of symptoms in 11, definite improvement in 3, and no benefit in 4 O'Leary and Farber[12] treated 15 patients who had acute urticaria Prompt relief was experienced by 9 This consisted of a decrease or disappearance of pruritis in from twenty to sixty minutes after the initial dose, with the disappearance of lesions in from two to six hours There was improvement in 5 others and one did not receive any benefit. Benadryl was given to a series of 30 patients who had chronic urticaria The average duration of the urticaria in this group was four years, the shortest duration was four months, the longest, thirty years Of these 35 patients, 24 complained of angioneurotic edema, the common sites being the lips, nose, ears, hands, throat and eyelids The lesions of 25 of these patients disappeared completely

save for the occasional presence of a few nonpruritic hives There was definite improvement in 7, and 3 were not benefited

Koelsche, Prickman, and Carryer[13] reported the use of Benadryl in hay fever and asthma Of those patients with hay fever only 39 of 52 cases, or 75 per cent, were benefited In the group with asthma and hay fever in association, 14 of 19 cases, or 74 per cent, were benefited, and in the group with bronchial asthma only 4 of 12 cases, or 33 per cent, were benefited Feinberg and Friedlaender[14] obtained relief in their first 8 cases of cold urticaria, and these cases were kept under control with the drug Two severe cases of urticaria factitia, of several years standing, were dramatically relieved from the whealing and itching after the first dose The drug was stopped and started on numerous occasions, and always with the same results Relief was obtained with the drug, and on discontinuing it, the symptoms recurred in from six to twenty-four hours They prescribed doses of from 50 to 100 mg three times daily, but later the patients were able to adjust their dosage and intervals to their own requirements Benadryl was also given in 50 mg doses to a series of allergic patients with dermographism, five hours, three hours, and one hour before skin testing In all of the patients, the Benadryl produced either complete or partial inhibition of the dermographic whealing without interfering with the positive atopic skin reactions No results were obtained in the treatment of 17 cases of asthma They obtained relief in 2 cases of chronic rhinitis, 12 were not helped Two patients with chronic urticaria were almost completely relieved, and 2 others were not helped They obtained relief in one case of serum sickness, and relief in itching in several cases of atopic dermatitis

In a group of 100 patients reported by McElin and Horton,[15] there were no abnormal changes in the erythrocyte, leukocyte and differential blood counts, hemoglobin, or urine No abnormalities of the platelet counts, bleeding time, clotting time, or blood urea nitrogen were noted in a small group maintained on quite high dosages for a considerable period

Side reactions occurred frequently after the administration of Benadryl Drowsiness was reported in 50 per cent to 75 per cent of all reports In some cases, this symptom was so severe that the patients stopped the use of the drug In others, this effect would diminish or gradually disappear even while continuing the drug Other side effects were dizziness, dry mouth, a feeling of nervousness, urinary frequency, nausea, vomiting, tinnitus and numbness, or tingling in the hands and legs

Personal Observations

The present report deals with the use of Benadryl* in a series of 50 cases of allergy This group comprised the following bronchial asthma, 20 cases, vasomotor rhinitis, 10 cases, acute urticaria, 8 cases, chronic urticaria, 5 cases, and a miscellaneous group of 7 cases which included one generalized pruritis following transfusion, 1 case of allergic pharyngitis of three months' duration, 2 cases of contact dermatitis, 2 cases of allergic conjunctivitis, and a pharmacist who developed asthmatic attacks on exposure to taka diastase Various forms of therapy, such as the elimination of substances giving positive skin reactions after having been intradermally tested to the common allergens, dust desensitization, catarrhal vaccine therapy, and the use of many drugs that are commonly employed for symptomatic relief, had been given to these patients Patients with bronchial asthma, vasomotor rhinitis, and chronic urticaria had not responded to any other form of therapy previous to the administration of Benadryl Unless the patient claimed at least 50 per cent relief of symptoms following a reasonable trial of the Benadryl, we called the result "no benefit" The dosage employed was 50 mg given orally three times daily

TABLE 1.—Results of Treatment of Patients with Benadryl

Allergic Condition	Number of Cases	Relief	No Relief	Percentage Relieved
Asthma	20	8	12	40
Vasomotor Rhinitis	10	6	4	60
Chronic Urticaria	5	4	1	80
Acute Urticaria	8	8	0	100
Miscellaneous	7	3	4	43
Total	50	29	21	58

Space does not permit the discussion of each individual case in detail, but it is of interest to make some general comments on the cases as groups In the asthma group, although the results were not too brilliant, the administration of Benadryl gave symptomatic relief in 8 out of 20 patients These asthmatic patients were selected because they were most resistant to all other forms of therapy Many of them have had daily asthmatic attacks for several months and most of them had had attacks for years Although many of them still continued to have attacks, these attacks were diminished in severity, and in some cases, completely relieved The eight asthmatic patients who were benefited by Benadryl reported relief after one or two days of medication Dosage had to be adjusted in many according to their own individual requirements

* Benadryl was supplied by Parke, Davis and Company, Detroit, Michigan

In those cases that were relieved, symptoms would usually return when the patient was placed on a placebo In some cases, however, the patient kept reporting relief on the placebo A few of them, however, when kept on the placebo for over two weeks, began to report recurrence of symptoms, with relief again when returned to the drug It was possible to determine the results in the vasomotor rhinitis group after the first or second dose of Benadryl. These patients reported either marked relief within one hour or no benefit at all Once relief was obtained, it was necessary, in most of the cases, to continue the drug every four hours because its action was only palliative. The chronic urticaria group gave excellent results while on the drug In most of these cases the symptoms could be turned on and off at will by giving or withholding the drug The acute urticaria group gave the best results The urticarial wheals began to disappear in from twenty minutes to one hour

The miscellaneous group can best be explained by considering each one individually In marked angioneurotic edema of both lips, the first dose was 50 mg of Benadryl with considerable subsidence of swelling in one hour, a second dose of 50 mg was given four hours later, and one hour following this dose the edema disappeared completely In generalized pruritis following a transfusion an initial dose of 50 mg with subsequent doses of 50 mg was given every four hours There was complete relief in thirty-five minutes after the first dose In allergic pharyngitis of three months' duration, following the 1945 hay fever season, the dose given was 50 mg every four hours There was relief after the first dose and this relief was maintained on subsequent doses. There were 2 cases of contact dermatitis. The first case was given Benadryl in 50 mg. doses every four hours for one week There was no relief of the itching and no decrease in the severity of the skin lesions The second case developed marked drowsiness after the first dose of 50 mg and the drug had to be discontinued There was no relief of symptoms One case had allergic conjunctivitis, with the attacks lasting from twenty-four to thirty-six hours The attacks were not relieved in one hour with a 50 mg dose of Benadryl. Subsequent attacks were not relieved in the same way In a case of sensitivity to taka diastase, producing asthmatic attacks in a pharmacist, Benadryl given in 50-mg dosage one hour before deliberate exposure was of no benefit The asthmatic attack that resulted on exposure to taka diastase after taking Benadryl was more marked than previous attacks.

Of 50 patients treated with Benadryl 30 or 60 per cent, complained of side reactions In four cases, the reactions were so severe that the drug had to be discontinued Two patients stopped the use of Benadryl because of marked drowsiness One patient complained of mental incoordination, and another felt as if he "were walking on air" Drowsiness occurred in 20 of the 50 patients However, this effect gradually diminished or entirely disappeared even though the use of Benadryl was continued on the same dosage schedule

Other side effects occurred as follows dryness of the mouth in 11 cases, headache in 5, numbness or tingling of hands in 8, dizziness in 3 nervousness in 2, tinnitus in 2, and vomiting in one These symptoms varied from one to as many as four in some patients These side reactions, also, either diminished in severity or disappeared even though Benadryl was continued

Summary and Conclusions

1 A group of 50 patients with various forms of allergy were treated with Benadryl

2 Symptomatic relief occurred in 8 of 20 cases (40 per cent) of asthma, in 6 of 10 cases (60 per cent) of vasomotor rhinitis, in 4 of 5 cases (80 per cent) of chronic urticaria, in 8 of 8 cases (100 per cent) of acute urticaria, and in 3 of 7 cases (43 per cent) of miscellaneous allergies

3 The majority of the patients who obtained relief from Benadryl reported benefit within one hour after administration Symptomatic relief was palliative

4 Side reactions occurred in 30 patients, or 60 per cent of the entire group In 20 patients the side reactions disappeared gradually even while continuing the drug on the initial dosage schedule of 50 mg every four hours. Four patients stopped the use of Benadryl because of severe side reactions

5 It is concluded that Benadryl was an effective drug in the symptomatic relief in 20 of the 50 (58 per cent) allergic patients

AN UNUSUAL TOXIC REACTION TO A MERCURIAL DIURETIC

MILTON SCHLACHMAN, M D , Corona, New York

IT IS the purpose of this paper to describe an unusual toxic reaction to a mercurial diuretic (mercupurin), to point out that many of the fatalities previously reported may have been avoidable if the admonition of the nonfatal untoward symptoms had been heeded, and to explain the pathologic physiology which accounted for the unusual sequence of events in this case

The toxic reactions following a mercurial diuretic may be classified into four main groups

1 *Those reactions produced through severe dehydration and diuresis* [1,2] The symptomatology is due to depletion of sodium and water These are manifested in weakness, apathy, somnolence, delirium, coma, and muscle pains Tetany, with or without low serum calcium, may occur Digitalis intoxication due to the mobilization of digitalis from the extracellular, interstitial fluid is not unusual

2 *The direct action of the drug on the heartmuscle or indirectly through the vagus* [3,4] Deaths in these cases are due to intraventricular block, ventricular fibrillation, and respiratory failure Jackson concluded that the mercurial acts on the heart by stimulation of the vagus If the vagi are cut, the mercurials cause death through paralysis of the respiratory centers Barker[5] has shown experimentally that the mercury acts directly on the ventricular muscle to produce a fibrillation and not indirectly through the vagus The auricles may contract long after ventricular standstill

The symptoms here are manifested in unconsciousness, shallow respirations, pallor, slow pulse, substernal pain, acute pulmonary edema, severe asthmatic attacks, cardiac arrythmias, and finally cardiac standstill [6,7]

3 *The toxicity due to the mercurial ion per se* Melvile and Stehele, as quoted by N H Keith,[8] feel that during the latent period, the mercurial diuretic liberates mercury from its organic form and that it is the ionizable inorganic mercury which may give rise to toxic symptoms of mercury poisoning These symptoms consist of stomatitis, salivation, colitis, renal tubular damage, dermatitis, and anuria A state of shock may occur long before diuresis begins

4 *The fatal and nonfatal toxic reactions due to an anaphylactic-like response* [7,9–13] These reactions have been attributed to speed-shock because incoagulability of the blood has been noted at necropsy in the fatal cases H Evans and K M H. Perry[14] state that the drug functions as a hapten conjugated with a colloidal protein carrier

The fatal reactions in the anaphylactic group simulate those attributed to sudden cardiac death so closely that one wonders if the mechanism is not the same in both groups, viz , sudden cardiac death The symptoms are dyspnea, substernal pain, cyanosis, acute pulmonary edema, asthmatic attacks, and collapse [6,8] The nonfatal toxicity takes the form of flushed skin, erythema morbilliformis, pruritis, urticaria, chills, fever, and exfoliative dermatitis [11,12]

The overwhelming majority of deaths due to mercurials have been preceded by some untoward, nonfatal reactions which, if heeded or properly evaluated, should have served as a warning that future injections might lead to a fatality Only one report of a fatality with the first injection appears in the literature [13]

J Wolf and A D Bongiorna were the first to report a fatality on this continent [12] Their patient was a four-year-old boy, with nephrosis, who experienced nonfatal toxic effects with the first five injections These consisted of chills, fever, and morbilliform rash The sixth injection ended in death

Pace and Stern report three deaths in 7 cases of unfavorable reactions (mental confusion, apathy, and restlessness), which were due to excessive dehydration Death was caused by vasomotor collapse [3]

William H Higgins' case[15] manifested chills, dyspnea, pulmonary edema, and emotional upset with each of the four doses of 2 cc of mercurial The fifth dose of 1 cc produced a near fatality, the patient not recovering from the toxic symptoms for twenty-four hours

The case of T Fox *et al* [9] showed toxic symptoms in the form of flushed skin, paræsthesias, pruritis, temperature, etc , within ten minutes after an injection of 0 5 cc of mercupurin.

M C Tyson[10] reports a death in a three-year-old boy with nephrosis, after the second injection. No untoward reactions are mentioned with the first injection, although no diuresis was obtained In a 27-year-old man with nephrosis, the fourth injection of esidrone produced such alarming reactions, in the form of convulsions, cyanosis, cardiac standstill with alternating periods of coma and mania, that no further injections were attempted It seems certain from the above description that a fatality would have resulted with persistence in giving mercurial in this case

H Evans and K M H Perry[14] report six deaths from intravenous mercurials None of these deaths occurred with the first injection No mention is made of untoward reactions with the injections previous to the fatal one

M Barker *et al* [5] report a 59-year-old white man with arteriosclerotic heart disease and tabes who received twelve to fifteen injections of salyrgan with no unfavorable reactions On January 15, 1935, after a dose of 2 cc of mercupurin, the patient developed cyanosis, unconsciousness, auricular fibrillation, and cardiac asystole He regained consciousness in ten minutes and was well in half an hour On April 12, he received 2 cc of salyrgan and died within a few minutes from ventricular fibrillation Here we have a premonitory warning four months before the fatal accident They also report three other fatalities in patients who received a number of

injections, but no mention of nonfatal, untoward reactions is made.

George Brown *et al*[8] report a 68-year-old man with coronary thrombosis who had a severe seizure consisting of unconsciousness, shallow respiration and bradycardia, following 1 cc. of intravenous mercupurin. The dose was repeated intravenously five days later, with a recurrent seizure. Ten intramuscular injections were given subsequently with no reactions. On resumption of the intravenous route, a fatality occurred They also report a 52 year-old woman who had eighteen untoward reactions (dyspnea, orthopnea), before the fatal outcome, a 48-year-old woman, with luetic heart disease, who showed no ill effects before the fatal injection, and a 60-year-old woman, with coronary thrombosis who showed "ill effects" with each of a number of injections (coldness, pallor, sweating), before death occured.

In the calamities reported by J Wexler and L. B Ellis[7] each had unpleasant, untoward reactions before the fatal dose. One was a 27-year-old woman with congenital heart disease, who experienced apprehension, dyspnea, and tachycardia after each injection. The other patient was a 27-year-old woman with nephrosis, who had thirteen previous injections accompanied by "an unpleasant sensation which she could not describe"

One can readily see from this brief review of fatal reactions that the vast majority of fatal cases showed premonitory signs and symptoms of toxicity to mercurials. If these had been properly evaluated and no further injections given, death may have been obviated. Probably several deaths were avoided because the authors [6,9 10] were so alarmed by the near-fatal reactions that mercurials were discontinued.

I do not mean to condemn the use of such a valuable drug as the mercurial diuretic, but cannot overemphasize that if an unfavorable response occurs, no matter how mild, a substitute diuretic should be used. If one persists in the use of the mercurial, then the intramuscular rather than the intravenous route should be used, for no fatality has been reported from the intramuscular use

The following case is reported not because the symptomatology is unusual but because the sequence of events are of great interest and no similar explanation has heretofore been offered.

Case Report

Mrs I M., was a 72-year-old white woman with arteriosclerotic heart disease, coronary thrombosis, enlarged heart auricular fibrillation, diabetes mellitus, and glaucoma.

Past History.—The patient began to experience attacks of angina pectoris about eleven years ago at which time a slight hypertension was discovered. Two years later she had an acute coronary thrombosis for which she was hospitalized for seven weeks. From that point on she was in a constant state of auricular fibrillation with a moderate degree of heart failure. Four years ago, she received her first injection of a mercurial diuretic with no untoward symptoms. She had received a number of injections since that time at irregular intervals depending on her state of compensation, without toxic symptoms and good diuresis.

On May 6, 1945, at 10 00 A.M., the patient received 2 cc of mercupurin, intravenously, with no effective diuretic action The next morning she complained of soreness over her entire body Several hours later, she became irrational, disoriented restless, spoke incoherently and held her head with both hands, indicating that severe head pain was present.

When seen on May 7, 1945 at 4 00 P.M., she was still irrational, restless verbigeration was present and she indicated that her head was very painful. Physical examination at this time revealed nothing different from her usual physical status. She was still fibrillating with a ventricular rate of 120/min., there was no alteration in blood pressure, nor was there nuchal rigidity or reflex changes The patient was put to bed and because of the extreme restlessness was given a sedative. On May 8, 1945, at 2·00 A.M. she insisted on getting out of bed and going to the bathroom The nurse reported that at this time she had an extremely profuse diuresis, the first since the mercurial injection. From this point on she made a very rapid recovery of her normal sensorium When seen at 9:00 A.M on May 8, 1945, she was entirely rational, oriented, and was able to express herself with clarity When questioned about the preceding twenty-four hours, all she could remember was that the pain in her head was so severe that she thought "the top of her head would blow off The patient has remained well since that time except for her cardiac status. No mercurial injections have been given since this toxic reaction.

Comment

O W Swengert and Reginald Fitz[16] have found that some patients exhibit an increase in the blood volume after the injection of mercurials. This finding is not constant, for some show a decrease or no change. George Hermann[17] noted that before diuresis starts there is a tendency for the blood volume to increase. George M Dechard,[18] using Evans' Blue Dye T1824 has shown that with 2 cc of salyrgan a short transient drop in blood volume occurred, followed by a definite rise if diuresis did not take place With the onset of diuresis a further drop in plasma volume occurred.

The studies of Italo F Volini and Robert Levitt[19] showed that the mercurial diuretics caused a decrease in cerebrospinal fluid pressure which was directly related to the urinary output. This decrease in the cerebrospinal fluid pressure was even greater than that produced by direct spinal drainage.

One can now postulate from the foregoing findings the sequence of events, as they occurred in this patient. There seems no doubt that the retained mercurial diuretic, which had no effective diuretic action for forty two hours after the injection, caused an increase in the plasma volume[17 18] with a consequent rise in the venous and cerebrospinal fluid pressure.[19] These factors caused an increase in the intracranial pressure with its consequent symptoms of severe head pain, incoherency disorientation and verbigeration.

This assumption is borne out by the fact that the moment the patient had a profuse diuresis with a reversal of the above events, viz. a sharp decrease in the plasma volume[17–18] she made a rapid recovery

and within a few minutes was completely rational and coherent

The toxic manifestations in this case will not fit into the four main groups of poisonous reactions from a mercurial diuretic (1) Diuresis and dehydration may be eliminated by the fact that the former caused recovery and not symptoms (2) There is no evidence of local action of the drug on the heart muscle as no change in the normal cardiac status of this patient was noted Moreover, this type of toxicity occurs within a few minutes after injection (3) There is nothing in the symptomatology (salivation, stomatitis, dermatitis, and colitis) to indicate a low grade poisoning by the ionized mercury (4) Anaphylaxis and drug sensitivity may be discarded by the time element factor, as this type of reaction also occurs within a few minutes after the injection

Therefore, one may conclude that this unusual picture was due to the gradual increase in the plasma volume[18,19] with its subsequent increase in venous and cerebrospinal fluid pressures

Summary and Conclusions

1 An unusual toxic reaction to a mercurial diuretic is presented which does not fall into the four main groups of toxicity

2 The pathologic physiology which accounted for the symptoms is explained on the basis of an increase in blood volume and cerebrospinal fluid pressure when an effective diuretic action does not occur or is delayed

3 An admonition is repeated When a toxic response to a mercurial diuretic occurs, no matter how mild, the drug should not be given again or should be given by the intramuscular route only, for a fatality may result with future injections

CONNECTICUT PHYSICIANS SPEAK

"Doctor—Inform your patients!

"*We Connecticut physicians* oppose the Wagner-Murray-Dingell Bill because

(1) it would cost an exhorbitant amount, and comparatively, would be financed by those in the *lower* income brackets, and

(2) it would deprive the people of their free choice of physician, and destroy *Free enterprise in American Medicine*

"*What would be the cost of the Wagner-Murray-Dingell Bill to the wage earner?*"

Wages Month	Tax per Month	Employers' Tax per Month	Cost per Year
$100	$ 4	$ 4	$ 96
200	8	8	192
300 and above	12	12	288

Self-employed—5 per cent of income

"The greater proportion of the money assigned for medical care would not go to physicians to encourage better medical service, but toward administrative expenses Under the British Compulsory Sickness Insurance scheme, 12 5 per cent of the funds go to physicians, and over 80 per cent toward administration In the British (voluntary) Insurance 'Clubs,' 80 per cent goes to the physicians, and only 20 per cent to overhead

"'*Why would free choice of physician be limited?*'"

"To use this compulsory insurance, people could select a doctor only from among those physicians who consent to serve under the government plan, and 90 per cent of the physicians do not want to do so Such a system would result in overpayment for inferior services It would result in the destruction of *free enterprise in American medicine!*

"*We Connecticut physicians believe that voluntary prepayment medical and hospital plans bring protection from the catastrophe of illness at less cost than that provided by the government, and with retention of freedom for both patient and physician*"—*Connecticut State Medical Journal*

INJURY TO THE URETER DURING APPENDECTOMY

EDWARD O FINESTONE, M D, F A C S, New York City

(From the Surgical Service of the Sydenham Hospital)

INJURIES to the ureters have been frequently reported. Most of these injuries have occurred during gynecologic operations. However, in the past fifty years only two instances of injury to the ureter during appendectomy could be found in the literature.

The first case was reported by Powers[1] in 1899 His patient was an 18-year-old boy who was operated upon through a McBurney incision for a gangrenous adherent appendicitis. When the appendix "was hooked up by the finger," a gush of straw-colored fluid oxuded from the depths of the wound The origin of the urinary leak could not be determined, but was first presumed to arise from the bladder Accordingly, a suprapubic incision was immediately made, but the bladder and perivesical tissues were found to be intact. A urinary fistula developed and healed spontaneously in a few weeks

The second case reported in 1935 by Marino and Veppo[2] was a 20-year-old man who was operated upon for appendicitis through a McBurney incision. There were numerous adhesions and copious peritoneal fluid A typical appendectomy was performed and the cul-de-sac of Douglas was drained by a rubber tube. A fetid discharge developed and the wound was treated according to the Dakin technic with another tube in the wound. The condition improved, the fever subsided, but about three weeks postoperatively a urinary fistula was noted. At first it was thought to communicate with the bladder, so that an indwelling Pezzer catheter was used. Pyuria and a frank cystitis developed Lipiodol injected into the fistula was demonstrated to ascend the right ureter up to the fourth lumbar vertebra. An intravenous pyelogram confirmed the fact that the fistula communicated with the ureter The patient made an uneventful recovery Marino and Veppo concluded that the ureteral injury resulted from the operative trauma, rather than the pressure of the drainage tube.

Rusche and Bacon,[3] who have thoroughly reviewed all injuries to the ureter, classify the causes as

1 Surgical
2 Intraureteral instrumentation
3. External violence
4 Foreign bodies

Surgical injuries are classified as

A. Female genitalia (gynecologic surgeon)
   1 Hysterectomy, salpingo-oophorectomy, Cæsarean section
   2. Forceps for breech delivery, abortion, colporrhaphy, prolonged use of pessary
B Abdominal viscera (general surgeon)
   1. Sigmoid and rectum, especially for carcinoma and diverticulitis
   2. Vermiform appendix
   3. Inguinal hernia (ureter in sac)
C Genitourinary system (urologic surgeon)
   1 Kidney and ureter
   2 Bladder especially for diverticula and carcinoma

Kelly and Hurdon[4] enumerate ten different positions which the vermiform appendix may assume (Fig 1) Among these ten positions are three in which it may be in close proximity to the right ureter

1 behind the cæcum
2 behind the ileocæcal junction
3 behind the ileum

When the appendix is so inflamed that the process extends to the surrounding structures, it is conceivable that the ureter may form part of the wall of the abscess or periappendicial inflammation Urinary symptoms and changes in the urine (pyuria or hematuria) are not infrequent findings. Brickner,[5] Hunner,[6] Seelig,[7] Kretchmer,[8] and Brown, Engelbach, and Carman[9] report cases of the appendix involving the right ureter in such a fashion as to produce signs and symptoms simulating purely ureteral disease

In removing a retrocecal appendix, it is common to deliver it manually, unless it is removed in retrograde fashion. During this latter technic the mesenteriole is divided after the appendix has been divided at its base. Thereupon, the tip is gradually approached and may be delivered from the depth of the retroperitoneal pocket without manually tearing it from its attachments. It is this latter method of "hooking up the appendix" that probably accounts for the injury encountered in the following case.

Case Report

C F a 24-year-old negro, was admitted to the Sydenham Hospital on October 19, 1945, with a two-day history of diffuse abdominal cramps followed by nausea, vomiting, and constipation. For the latter, the patient took a cathartic, whereupon the pain was aggravated with localization in the right lower quadrant. No pain was referred to the flank or right lumbar region, nor were there any urinary symptoms. Temperature was 102.6 F, pulse, 110 and respirations, 22. White blood cells were 13 400, neutrophil bands, 18 per cent, neutrophil segments 60 per cent, lymphocytes, 18 per cent, monocytes, 4 per cent hemoglobin, 87 per cent, red blood cells, 4,400,000 The urine was clear and contained no sugar, albumin casts white blood cells or red blood cells, but there were a great number of epithelial cells and some acetone A diagnosis of acute appendicitis was made and operation was performed about three hours after admission.

Spinal anesthesia was administered and a Kammerer incision made. However, the anesthesia was ineffective and general anesthesia in the form of nitrous oxide, ether, and oxygen was then begun, just before the peritoneum was opened Forty-five minutes were consumed up to this point.

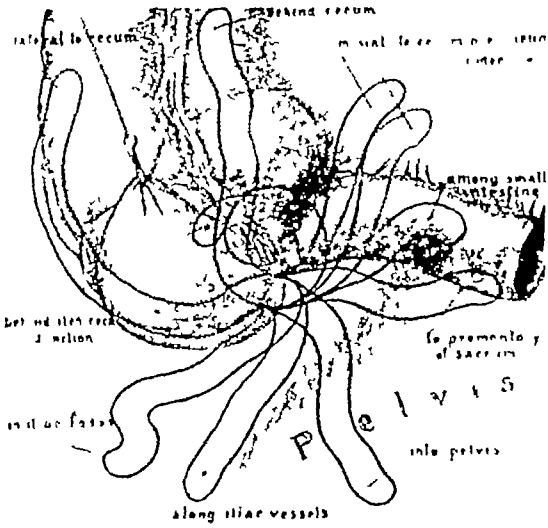

FIG 1 Various positions which the appendix may assume (after Kelly and Hurdon) Three of these positions may involve contact with the right ureter

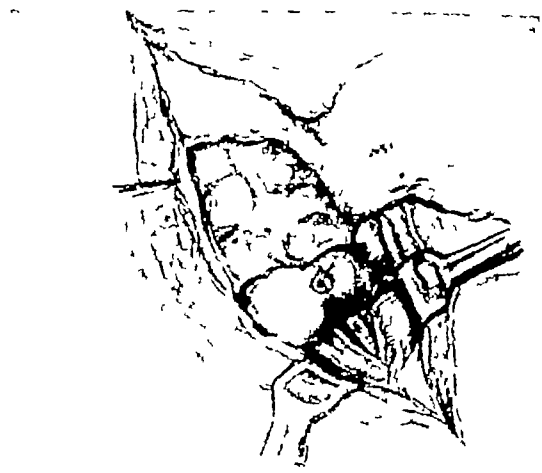

FIG 2 Appearance of wound in the ureter during appendectomy The cecum has been drawn proximally and the stump of the appendix ligated The right ureter with its traumatic wound is seen in the retroperitoneal space

On opening the peritoneum, no free fluid was encountered and the cecum was found immediately beneath the wound The terminal ileum was packed medially and the cecum withdrawn from the wound Thereby, the base of the appendix was seen to be the site of an acute inflammatory process The remainder of the appendix could not be seen, because it lay retrocecally along the medial aspect of the cecum and partly behind the terminal ileum To expose it properly, the lateral and inferior peritoneal reflections from the cecum were incised The cecum was now more easily delivered and turned over proximally The appendix was gently "hooked out" from the abscess pocket formed by the terminal ileum and cecum anteriorly and the posterior parietes posteriorly The mesentery was clamped and divided The base of the appendix was ligated and divided with a carbolized knife On tying the mesentery, hemostasis was complete and the field at all times was unusually dry There had been only a small amount of seropurulent fluid in the pocket, the walls of which were now inspected On drying the depth of the pocket with a sponge, a repeated small ooze of straw-colored fluid was clearly seen to exude from an aperture 2 mms in diameter (Fig 2) The right ureter was now definitely identified by its location and by palpation Its anterior wall formed part of the abscess cavity The ureter was thickened and edematous, being twice its normal size The enlargement was due to marked periureteritis

Several methods of dealing with the wound in the ureter occurred to the writer (1) It was considered advisable to drain the wound extraperitoneally, as is done following ureterolithotomy, especially in view of the small size and the lack of damage to the lumen by constriction or interruption of continuity (2) Cystoscopy with immediate ureteral catheterization, controlled by direct inspection of the wound was also entertained (3) The wound was too small to consider the insertion of an indwelling ureteral catheter through the wound

The writer was motivated by the inordinate length of anesthesia which had been prolonged and difficult during the induction, following the failure of spinal anesthesia. Either cystoscopy or intraureteral manipulation would have easily added another hour to the length of the operation The patient weighed 235 pounds, so that he was not a good surgical or anesthetic risk The weight and build of the patient was also taken into consideration in deciding whether to drain the pocket extraperitoneally

Two atraumatic sutures were taken in the direction of the ureter and leakage ceased A large Penrose drain was placed into the abscess cavity into which 5 Gm of sulfamilamide were deposited When the cecum and terminal ileum fell back into position, they made a very effectual pocket from which the drain issued Nevertheless, the possibility of intraperitoneal urinary extravasation was entertained, because the drain emerged through the peritoneal cavity before it passed through the wound which was sutured in layers Continuous chromic for the peritoneum and interrupted chromic catgut for the anterior rectus sheath were used

After consultation, it was decided to watch the patient very carefully postoperatively, rather than submit him to cystoscopy It was felt that were ureteral catherization attempted without visual control of the wound in the ureter, the latter might be aggravated by false passage or other trauma Accordingly, the patient was placed on Wangenstein suction A continuous intravenous infusion of saline and glucose was given for two days Twenty thousand units of penicillin were injected intramuscularly every three hours for five days and 4 Gm of sulfadiazine were given daily for ten days The patient was able to void spontaneously postoperatively and there were no urinary signs, symptoms, nor abnormalities in the urine The abdomen was never distended There was no nausea, vomiting, tenderness, or rigidity The flank was carefully inspected and no swelling, induration, tenderness, or discoloration developed

The patient made an uneventful recovery On the fourth postoperative day he was afebrile White blood count was 11,700, neutrophil bands, 18 per

cent, neutrophil segments, 60 per cent, lymphocytes, 18 per cent, monocytes, 4 per cent, the urine was clear and contained no albumin or formed elements. The Kahn, Kline, and Mazzini tests were 3 plus.

An intravenous pyelogram made on October 26 1945 showed no evidence of radio-opaque calculus Both kidneys appeared to be normal in size, shape and position, with the right kidney slightly larger than the left Excretion was somewhat poor and the kidneys were partially obscured by intestinal shadows, but no definite abnormalities were noted Certainly there was no hydronephrosis or hydroureter The bladder showed no abnormality

The patient was out of bed on the seventh postoperative day when the drain was removed. At no time was there any urinary leakage through the wound which quickly healed without any evidence of infection or retention. The patient was discharged on the twelfth postoperative day

The pathology was reported as follows "The specimen is an appendix measuring 8.5 by 1 cm It is kinked and held in that position by adhesions. The serosa is hemorrhagic and discolored The lumen contains hemorrhagic material Histology Acute gangrenous appendicitis and periappendicitis."

Comment

Retrocecal gangrenous appendicitis (with abscess) is not uncommon. Therefore, the wall of the abscess should at times be formed by the right ureter When the appendix is delivered from the depth of such a pocket, it is easy to understand how the wall of the ureter may be torn in shelling out the appendix. It is difficult to understand why this accident has not been reported more frequently

The accident has not occurred more often perhaps (1) because the appendix is removed before the erosion has time to take place, (2) because a pyogenic membrane has formed, and (3) because the ureter, having its own intrinsic blood supply, remains viable and walls off the infection rather than assume it or become necrotic

With considerable swelling, induration, edema, and fibrinous inflammation about the ureter, it would be difficult under ordinary circumstances to recognize a small hole in the ureter, especially in the presence of imperfect hemostasis or continued exudation from the walls of the abscess. In the author's case the relaxation was good, the hemostasis perfect, and the purulent exudate in the pocket minimal Therefore, it was easy to visualize the defect in the ureter and to repair it promptly In neither of the 2 cases reported in the literature[1,2] was the defect visualized or repaired, so that a urinary fistula developed in both. In the writer's case, although the repaired ureter was drained transperitoneally, neither urinary extravasation nor fistula developed

322 Central Park, West

PRESCRIPTION WRITING

The best medical treatment is that fitted to the individual patient. Drug therapy highly significant in most medical treatment is secured by the prescription. As Sollmann aptly says a prescription is 'an order for medicine sent by a physician to a pharmacist ' Some of the practical requirements for writing an effective and correct prescription are often neglected.

The instructions for the pharmacist and patient must be legible and intelligible, this is why English is now preferred to Latin. The prescriber should use correct, descriptive names for the ingredients and not just their trade names, such description insures fewer misunderstandings. If an ingredient is official or otherwise open to manufacture by several firms, a firm name should be placed adjacent to the ingredient if the physician wishes to show his confidence in any one manufacturer, otherwise any brand may be used to fill the prescription. The use of English abbreviations and numbers as designations for drugs should be avoided Complex mixtures should not be ordered if simple ones will suffice. Unrelated substances such as purgatives and hypnotics are not properly included in a single prescription. They are best prescribed separately and timed in their administration to be most effective The physician should be mindful of the frequency with which prescriptions are refilled without his knowledge. Thus he may limit the number of doses to the actual needs of the patient and state specifically on the prescription whether it can be refilled and, if so, how often. The importance of such directions, for example when barbiturie acid compounds are prescribed, is obvious Of course the pharmacist bears the responsibility of filling the prescription when he is in doubt concerning the ingredients or directions, it is his moral responsibility to call the prescribing physician to do otherwise invites disastrous results —*J.A.M.A.*, January 26 1946

SUBCONJUNCTIVAL LUXATION OF THE LENS DUE TO INDIRECT TRAUMA WITH GOOD VISUAL RECOVERY

F F Talbot, M D , W Yerby Jones, M D , Walter F King, M D , Buffalo, New York

(From the Department of Ophthalmology of the University of Buffalo Medical School and Edward J Meyer Memorial Hospital)

TRAUMATIC subconjunctival luxation of the lens with recovery of good vision following such an accident is uncommon We report here a case which recovered good vision

The diagnosis is usually made by the history of severe contusion There is hypotonia, coloboma of the iris and iridodonesis The coloboma and iridodonesis are usually obscured by hyphemia until the acute stage has passed There is conjunctival "tumefaction," at the site of the luxated lens There may be chemosis, and loss of vision Often photophobia is marked

Prognosis for recovery of vision is usually poor

Case Report

The patient, M C , (#281817), a robust, white man, aged 49 years, was admitted to the hospital December 23, 1944

A few hours prior to admission he had struck his left eye on the corner of a cabinet He experienced sharp pain and sudden loss of vision

In 1924 following a penetrating injury of the right eye, an enucleation was done

After the removal of the right eye, he had for the first time repeated attacks of iritis in the left eye Search for a focus of infection was in vain so the implant in the right eye was removed This did not alleviate the recurrent iritis in the left eye The patient then stopped wearing his prosthesis and experienced no recurrence of the iritis in the left eye

The vision in the left eye prior to the accident was 20/20 without the aid of a correction

The rest of the past history had no bearing on the case

On admission a right anophthalmos was noted The left eye conjunctiva was markedly injected and chemotic Tearing was profuse Vision was limited to light perception There was hemorrhage in the anterior chamber The pupil was irregular, there being a coloboma at twelve o'clock. Underneath the conjunctiva just back of the limbus at twelve o'clock, a small elevation was seen On transillumination a shadow was seen at this site, which was round and about the size of a lens

There was no tear or wound noted in the entire conjunctival surface, nor was there any corneal or conjunctival staining The tension was 4 mm of mercury, Schiotz There was slight swelling and ecchymosis of the lids Funduscopic examination was not possible, because of the hyphemia

An x-ray of the skull showed a very slight separation of the sutures at the junction of the frontal bone with the zygomatic bone, along the lateral margin of the left orbit The separation involved the zygomatic frontal suture

The hemorrhage in the anterior chamber absorbed considerably during the first few days, so that six days after admission the patient stated that he could see moving objects The conjunctiva remained markedly injected and chemotic

Eleven days after admission, the lens shadow and conjunctival elevation at twelve o'clock were gone There was some organized hemorrhage on the posterior capsule The pupil was key-holed The vision with a plus 10 00 sphere was 15/200 There was no lens material evident on examination

Atropine sulfate, 1 per cent, and hyoscine hydrobromide, $^1/_{10}$ per cent, were used topically Hot moist applications were also applied He received a course of Typhoid H antigen intravenously Blood Wassermann test was negative Chest x-ray showed some enlarged nodes at the root of both lungs but no parenchymal infiltration Urinalysis revealed no abnormalities

Six months after the accident the vision was 20/30 plus 2 with a plus 10 00 sphere with a plus 1 00 cyax 160 By adding a plus 2 50 sphere to the above correction, the patient read Jaeger, Number 1 at 13 inches The eye was no longer injected or chemotic There was no complaint of photophobia

The fundus was easily visible with a plus 10 lens in the ophthalmoscope and presented no abnormalities Tension was 13 mm of mercury, Schiotz There was no sign of irritation or inflammation in the eye The coloboma of the iris was still present and had the appearance of an aphakic eye, following a cataract extraction There was still no evidence of lens or lens substance on examination of the anterior chamber or vitreous

The patient has no complaints and is very active in his present occupation At the time of this writing the vision has improved to 20/20 minus 1 with his correction

Discussion

The literature in English on traumatic subconjunctival subluxation of the lens with good visual recovery is almost nonexistent

Brooks wrote in the *British Medical Journal* of scleral rupture and luxation of the lens [1]

Brav wrote in the *American Journal of Ophthalmology* of a case of scleral rupture without luxation of the lens [2]

Sema wrote on luxation of the lens into Tenon's space in the *Revista de La Asociacion Medica Argentina* [3]

Teruggi wrote on "luxacion subconjunctival del cristalimo" [4]

Cardenas reported two cases of ocular trauma in the *Archivos de Oftalmologia* de Buenos Aires [5]

B and A Castresana have written an extensive and detailed article on scleral rupture with subconjunctival luxation of the lens in *Revista Cubana de Oto-Neuro-Oftalmiatria* [6] Anyone interested would do well to read it

Scleral ruptures may be divided into two groups

1 Spontaneous
  Ectopias or congenital luxations
2 Traumatic
  (*a*) Those with direct trauma

FIG 1 Appearance six months after accident

(b) Those with indirect trauma
(1) With rupture of the conjunctiva
(2) Without rupture of the conjunctiva

These cases caused by direct trauma are usually the result of a blow with a sharp object, as in the case of the gore of a bull or sharp instrument

Those caused by indirect trauma are the result of a blow by some blunt object. In these cases the blow strikes the globe at one point and the globe is ruptured at some other point

Our case falls in the class of indirect trauma. The point of contact was at the lower pole of the globe The point of rupture was at the upper pole

Spontaneous ruptures will be excluded from this discussion

Castresana[4] has discussed sites of scleral ruptures Michel found the site was below in 3 per cent Wachtler found the site was usually 1 to 3 mm from the limbus. Sachs found the site above in 42 per cent.

Theories

There are several theories concerning scleral rupture.

1 *Rupture Contrecoup*—This theory supposes that a force strikes the globe at a given point and is transmitted to the opposite side of the globe, where there is initiated a rebound or force in the opposite direction This would not be true in the case of indirect scleral ruptures The contrecoup theory is not acceptable because the eye is not hard. This theory is only acceptable when projectiles which pass near the eye cause rupture on the opposite side or in the area of rebound or recoil

2. *Rupture of Schlemm's Canal*—This theory supposes that the sclera ruptures at the thinner parts of the sclera e.g., Schlemm's canal and underneath the tendons of the recti muscles This obviously does not explain ruptures at the equator and behind the equator

3. *Theory of the direction of fibers*—This theory supposes that the eye reacts to a blow in the same manner as a tennis ball reacts to a blow of the racket As the globe is struck, it is indented at the site of contact and the globe stretches at the two poles in the opposite meridian Also the globe may be forced upward and inward to contact the orbital rim This increases the compression and produces more pressure at the opposite bulges The rupture would occur in the line of the direction of the fibers of the sclera at these points.

There are several other theories, which we shall not discuss but suffice to say, there seems to be several factors concerned with the site and mechanisms of scleral rupture.

Complications

There are a wide variety of complications which may ensue The type size, and site of the scleral scar are important

If the conjunctival sac is infected, one may get panophthalmitis. This may be true of even microscopic ruptures.

Sympathetic ophthalmitis may occur early or late Iritis uveitis, or glaucoma may complicate the picture.

The prognosis is always serious. It is dependent upon the complications.

Treatment

The injured eye should be gently cleansed with a saturated solution of boric acid and then a mydriatic instilled The lacrimal sac should be irrigated

The patient should be kept quietly in bed a sedative given if necessary

The surgical treatment depends upon whether or not the conjunctiva is ruptured If the conjunctiva is not ruptured, no surgery, except where there is herniation of the contents of the globe causing gaping of the wound In this latter case the conjunctiva must be opened and the wound repaired

If the conjunctiva is ruptured, immediate surgery is indicated All prolapsed tissue should be excised the sclera carefully sutured and covered with a conjunctival flap

Comment

This case serves to show that there is a wide variety of sequelae which may follow subconjunctival luxation of the lens, due to indirect trauma. Very rarely one may secure good vision following this type of injury

SCHOOL PHYSICIANS WILL MEET

The New York State Association of School Physicians will hold its Annual Meeting and Conference at Saratoga Springs, June 24.

ACUTE PANCREATITIS

J L Cantor, M D , Riverhead, New York

(From the Eastern Long Island Hospital, Greenport, Long Island)

ONE of the most uncommon of abdominal catastrophies and one which has the highest mortality rate of abdominal emergencies is acute pancreatitis It is rarely a primary condition, and it should be kept in mind by all surgeons confronted with questionable right upper abdominal pathology The sequence of pathology in acute pancreatitis is an acute edematous type, going into the hemorrhagic and finally to the necrotic type All of this may transpire within several hours

Case Report

The patient, a 69-year-old white woman, a known chronic diabetic, was first seen by myself at home on January 15, 1946 She was complaining of severe agonizing pain in upper abdomen, vomiting, collapse, with pallor and rapid, thready pulse Two days prior to this, she complained of intermittent epigastric pain, and occasionally vomited clear fluid There was no diarrhea, constipation, nor chills, and urinary symptoms were absent There was no history of a previous gallbladder disease Examination revealed extreme tenderness in the right upper abdomen, a right rectus spasm, and rigidity A suggestive mass in the gallbladder area was palpated, although this could have been an enlarged liver edge Temperature was 97 F , pulse 120 and blood pressure 142/86 She was sent immediately to Eastern Long Island Hospital in Greenport, Long Island The laboratory findings were as follows white blood cells, 19,000 with 86 per cent polymorphonuclears, urinalysis, 4 plus sugar, 2 plus acetone, blood sugar, 300 mgm per cent Blood amylase was not performed due to the lack of ingredients for this test Intravenous Ringers' solution was given as well as insulin to combat shock and possible diabetic coma Shock therapy was instituted and 1/2 grain of morphine in divided doses, without effect on pain nor on shock A preoperative diagnosis of empyema of the gallbladder or possible rupture of the gallbladder was made and a laparotomy was performed under ether anesthesia, through an upper right rectus incision As the peritoneum was opened, a small amount of oily sanguinous fluid escaped A mass of dense adhesions was encountered along the undersurface of the liver to the foramen of Winslow, the gallbladder was not visualized nor palpated, nor was there any evidence of peritonitis nor stones The appearance was one of an old chronic inflammation of the gallbladder which had probably atrophied to a shell The posterior surface of the first portion of the duodenum appeared to have been the site of an old healed ulcer, the stomach was normal, the liver appeared to be engorged and large, the right kidney felt normal The gastrohepatic ligament was opened and the pancreas presented itself as a tremendously distended hemorrhagic organ, seemingly as if to burst through its capsule The lobules were so distinct it appeared as if one were peering through a powerful microscope The capsule was incised after packing off the surrounding structures, with the release of moderate amount of dark, grey hemorrhagic fluid, probably about two ounces in all A biopsy was taken, two cigarette drains were inserted in this area and brought out through the lower angle of the wound The abdomen was closed routinely, and the patient left the operating room in fairly good condition An intimate exploration of the biliary system was not attempted due to the absence of any acute condition in this area and to the poor condition of the patient at the time of operation Pathologic report from the biopsy of the pancreas was "acute hemorrhagic pancreatitis." The patient did very well following the operation, by the next morning all symptoms of shock and pain had vanished, she was cheerful and alert The diabetic condition was controlled by insulin and diet

On the eighth postoperative day a gradual increasing jaundice developed with fever, chills, no abdominal tenderness, no mass, icterus 100 mgm per cent, acholic stools, and bilinuria A tentative diagnosis of cholangitis was made and expectant treatment was instituted, consisting of amigen, glucose, blood plasma intravenously, heat to the abdomen, intravenous Solu-B, thiamin in large doses, and calcium gluconate daily There was practically no drainage from cigarette drains, bowels moved daily—these being acholic—and the patient ate fairly well As the condition did not improve in five days, consultation with Dr C G Heyd, of the New York Post-Graduate Hospital, was held He advised that the patient be sent in to New York for study as to the cause of the complicating obstructive jaundice She stood the trip well, going by ambulance, for a distance of ninety miles, and partook of liquids all the way She improved considerably, the icterus index dropping from 150 mgm. per cent to 102, her temperature stayed slightly above 100 F , and she was taking fluids and food well Exploratory operation was advised by Dr Heyd in order to determine a cause for the obstructive jaundice and to eliminate it if possible On February 2, 1946, at the Post-Graduate Hospital, Dr Heyd performed a choledochotomy and posterior gastroenterostomy At the time of operation the gallbladder was found to be atrophic, the common bile duct was exposed with considerable difficulty, this was opened and a tube was inserted into the duodenum with ease This was sutured in place A mass of inflammatory reaction was found around the site of an old perforated duodenal ulcer, this apparently was pressing on the common bile duct, causing the jaundice On separating the adhesions around the duodenum, the perforation presented itself This was closed with purse-strings of linen, and a posterior gastroenterostomy was performed Whole blood was given to the patient during and following the operation The prognosis was serious At the time of operation, several pieces of shotty omentum were excised, and pathologic diagnosis on these was "fatty necrosis " Apparently the sequence of events was as follows — a long continued gallbladder infection, with obliteration of the gallbladder and cystic duct, followed by an inflammatory reaction around the ampulla of Vater and Wirsung's duct, causing an acute hemorrhagic pancreatitis, followed by an extrahepatic obstructive jaundice, complicated by an old perforated duodenal ulcer The part that the latter played in this picture is not entirely clear, as at no

time was there pain postoperatively (following the first operation) It is possible that as a result of the inflammatory reaction around the hepatic nerve plexus, pain could not be produced Three weeks following the second operation, the patient expired due to an overwhelming pyemia or multiple liver abscesses.

Summary

This is an unusual case of an elderly woman, a chronic diabetic of 69 years with no previous history of gastrointestinal symptoms developing an acute abdominal emergency, at which time an acute hemorrhagic pancreatitis was found, the pancreas incised and drained, developed an extrahepatic obstructive jaundice on the eighth postoperative day, was operated on again, at which time a common bile duct drainage and saturation of duodenal ulcer with posterior gastroenterostomy were performed with apparent exitus due to overwhelming pyemia.

PRESENT STATUS OF PENICILLIN THERAPY FOR SYPHILIS

Any statement on the present status of the treatment of syphilis with penicillin should begin with this note of caution penicillin therapy for syphilis is still being studied and is not yet a standardized procedure. Since the original announcement of the effect of penicillin on patients with early syphilis was made in 1943 by Dr Mahoney of the United States Public Health Service Venereal Disease Research Laboratory, much careful work and study has been done. A nation-wide organized study is now in progress to determine the optimum method of use of the drug. The results thus far available are preliminary Penicillin has demonstrated a profound immediate effect in early syphilis in terms of (a) disappearance of surface organisms from open lesions, (b) healing of lesions (c) a trend toward serologic reversal.

These immediate effects cannot be utilized to determine the optimum time-dose relationship which in man depends on the incidence of relapse As a matter of fact, according to the best available methods, the incidence of relapse in early syphilis in patients treated with penicillin is approximately equal to that observed in patients treated with any of the recommended massive dose arsenotherapy regimes.

Furthermore, syphilis is a treacherous and insidious chronic infection which may lie dormant for years, before again manifesting itself by damage to vital organs. Before final conclusions can be made a minimum period of at least five years of careful observation of treated patients is needed.

The optimum time-dose relationship of penicillin in early syphilis is not yet established. The latest schedule adopted by Dr Mahoney uses a total of 3 400 000 Oxford units divided into 85 intramuscular injections of 40 000 Oxford units each given every two hours, day and night. The present schedule in the New York City Rapid Treatment Center consists of a total dosage of 1,200,000 Oxford units of penicillin given in 60 injections, each consisting of 20,000 units every three hours, together with eight daily intravenous injections of 0 04 gram mapharsen. Still other schedules employ penicillin, arsenical drugs and several intramuscular bismuth injections. Herxheimer reactions after the penicillin treatment of early syphilis are frequent but not serious, other reactions due to penicillin itself are usually of a mild nature

The durability of the good effects thus far observed the possibility of complications from induced allergic response, and disturbance of the immunity balance of the individual in latent and late syphilis remain to be explored by larger experience and longer periods of observation

In any consideration of penicillin therapy, the caution expressed by Moore should be kept in mind 'As matters stand at present, penicillin is a new and powerful addition to syphilo-therapy How best to use it, alone or in combination with other forms of treatment, is as yet undetermined, but is under organized, nation-wide governmentally sponsored study from which definitive results may be expected rapidly to emerge."—*Quarterly Bulletin Department of Health, City of New York January-December, 1945*

CORRECTION NOTICE

CONFERENCES ON THERAPY

DEPARTMENT OF PHARMACOLOGY AND MEDICINE, CORNELL UNIVERSITY MEDICAL COLLEGE AND THE NEW YORK HOSPITAL

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors The next report will appear in the July 1 issue and will concern "The Use of Placebos in Therapy"

Treatment of Meningitis

DR C H WHEELER The subject of the conference this afternoon is the treatment of meningitis The discussion will be opened by Dr Wolf

DR GEORGE A WOLF, JR I will confine my remarks to meningococcus meningitis and pneumococcus meningitis In general, the prevention of complications as well as the reduction of the mortality rate in meningitis depends on early, adequate and sustained treatment

Meningococcus meningitis is tricky It may be preceded by recurrent attacks of meningococcemia with a little fever, malaise, a few petechiae, and transient joint pain In twenty-four hours or a few days the patient is better A few weeks later there may be a recurrence Then suddenly there is an explosive onset of meningitis The meningitis could have been prevented if the meningococcemia had been recognized and treated adequately Sometimes, meningococcus meningitis is insidious in onset and develops slowly so that the diagnosis is in doubt for some period Finally, it may be entirely explosive in nature and develop completely within a period of a few hours, the patient having been asymptomatic before Pneumococcus meningitis is nearly always insidious in onset Approximately 50 per cent of the cases of pneumococcus meningitis have recognizable foci of infection such as mastoiditis, sinusitis, or otitis media When one detects sensorial disturbances in a patient, or when signs of minimal meningeal irritation are present, one should not hesitate to use the lumbar puncture needle, if the early diagnosis of meningitis is to be made

A few words about the symptomatic treatment of patients with meningitis Probably the most prominent complaints are pain in the head and restlessness The restlessness may be controlled with the usual sedatives, while codeine may be used for the pain Morphine should not be used, because, in the presence of increased intracranial pressure, respiration may be seriously depressed

The pulse, respiratory rate, and blood pressure should be taken at hourly intervals while the patient is seriously ill There are two reasons for this If the pulse rate increases, the blood pressure rises, and the rate of respiration falls, intracranial pressure may be increasing When these signs are present one should take steps to reduce the intracranial pressure This is accomplished by lumbar puncture with cautious drainage After the initial lumbar pressure is determined, with the needle and the manometer still in place, the fluid is allowed to run out of the top of the manometer by tipping it toward the horizontal, until the pressure is reduced to approximately half the initial pressure This should be repeated as often as necessary Other methods may be used to lower intracranial pressure, such as 50 cc of 50 per cent glucose given intravenously, or the Murphy drip, 100 or 200 cc of 50 per cent magnesium sulfate by slow rectal instillation

The other reason for taking of the blood pressure, pulse rate, and respiratory rate, repeatedly, is that shock may develop in the course of meningococcal infections The Waterhouse-Friderichsen syndrome may also occur Saline, fluids, and oxygen, as well as desoxycorticosterone and epinephrine may be indicated

Drs Ferguson and Barr have reported glycosuria and acetonuria in meningitis The usual diabetic regimen has been employed in the management of these patients Occasionally in meningococcic meningitis there is severe joint involvement In such circumstances, local measures for the relief of pain and splinting of the joints to prevent pain and deformities must be employed Finally, muscle palsies are common in meningitis For these, splinting, massage, and physiotherapy must be used to prevent contraction deformities

In regard to specific therapy, I would like first to consider whether sulfadiazine or penicillin should be used in the treatment of meningococcus meningitis Dr Holmes, formerly of this hospital, told me that while on shipboard, he saw a man who complained of fever and malaise Dr Holmes was unable to make a diagnosis immediately but because the patient appeared seriously ill, he gave penicillin, 20,000 units every two hours

Twelve hours later the patient developed a diffuse petechial rash Lumbar puncture was done twelve hours after penicillin was started, the spinal fluid was then clear The penicillin was continued Nevertheless, approximately six hours after the negative spinal tap the patient developed frank meningococcus meningitis This suggests that penicillin is not very effective in meningococcemia and in preventing meningitis We have also had a patient develop meningococcus meningitis while receiving penicillin Ramelkampf and Keefer, and McDermott and his group here, have shown that penicillin is not transported in significant amounts across the cerebrospinal barrier Even when inflammation of the meninges is present, penicillin given intramuscularly is not found in significant amounts in the cerebrospinal fluid Therefore, if penicillin is used to treat meningococcus meningitis, it would have to be given intrathecally, as has been found necessary in pneumococcus meningitis

There is the observation of Finland and his group in Boston made in a small series of cases, that penicillin in adequate doses used both intrathecally and intramuscularly, in meningococcus meningitis did not produce as rapid a therapeutic response as did sulfadiazine There is also the problem of transverse myelitis and persistent root pain after the indiscriminate use of intraspinal therapy The evidence would indicate, therefore, that in cases of meningococcus meningitis penicillin is not to be used if sulfadiazine is available.

As soon as the diagnosis is made, 5 Gm. of sodium sulfadiazine are given in one liter of sixth molar sodium lactate by intravenous infusion If the patient is comatose or vomiting, 2.5 Gm in 500 cc of the lactate may be repeated every eight hours. If the patient is alert, 2 Gm. of sulfadiazine and approximately 4 Gm. of sodium bicarbonate are given by mouth every four hours The attempt is made to maintain blood levels of sulfadiazine between 10 and 15 mgm per cent

Approximately four or five days after the temperature has returned to normal one may consider terminating the treatment If the temperature is normal, but the disease is still there, as seen by the fact that there are organisms in the spinal fluid sediment, or the spinal fluid sugar has not returned to normal, therapy is continued until the sugar reaches a normal level and the organisms have disappeared from the spinal fluid

There are data on the results of the treatment of meningitis which I think are very dramatic. Before the days of serum the death rate from meningococcus meningitis ranged between 50 and 90 per cent, and the average duration of the disease was approximately five weeks With serum the death rate fell to levels of 15 to 40 per cent and the duration of the disease to eleven days With the use of sulfonamides, the death rate has been reported as from 2 to 10 per cent and the duration of the disease has been reduced to from four to five days In a small series of penicillin treated cases, the death rate has been low but the duration of the disease has been slightly longer than in patients treated with sulfonamides

In pneumococcus meningitis or if the etiology is in doubt, both penicillin and sulfadiazine are used at the same time Our procedure for the use of penicillin in pneumococcus meningitis is as follows With the diagnostic lumbar puncture needle in place, approximately 15 cc of cerebrospinal fluid is removed Then 10,000 to 20,000 units of penicillin, dissolved in 10 cc of sterile saline, are allowed to drip by gravity into the spinal canal One can use a syringe without the plunger as a funnel Fluid should not be forced into the spinal canal It is important also to remove more spinal fluid than is put in At the same time 20,000 to 25,000 units of penicillin in a small amount of sterile saline are given intramuscularly every two hours In addition, sulfadiazine in the doses described for the treatment of meningococcus meningitis should be given The penicillin and sulfadiazine are given simultaneously throughout the course of the illness

Recurrences are not uncommon when the treatment has been discontinued too soon The intrathecal penicillin should be continued as long as organisms and increased sugar are present in the spinal fluid Intramuscular penicillin and oral sulfadiazine should be administered for some time after these are normal The duration of this phase of the treatment requires clinical judgment, although I think a period of a week may be taken as a minimum

Prior to the sulfonamides virtually all patients with pneumococcus meningitis died With sulfonamides alone, mortality rates in different series of reasonable size have varied between 50 and 90 per cent. The experience with penicillin in pneumococcus meningitis is still not large, but I think the results leave much to be desired Dr H.Cairns and his collaborators in England treated 16 patients, of whom 4 died Drs E Applebaum and J Nelson in this city treated 61 patients, of whom 41 died Harford and his group had 9 patients and 1 died There were 9 deaths in the 16 patients of Sweet and his group In a group of children, treated by Waring and Smith, only 1 of 12 died In most of these sulfadiazine was used with penicillin

The final point which comes up in the therapy of pneumococcus meningitis is the management of foci of infection It is still an unsettled question, although probably the weight of evidence is on the side of those who try to eradicate them. Foci of infection such as acute, purulent sinusitis or mastoiditis should be attacked, and drainage es-

tablished as soon as possible after penicillin and sulfadiazine therapy has been instituted

It is clear then, that although the treatment of meningococcus meningitis is highly successful, the results in pneumococcus meningitis are far from satisfactory

DR WHEELER Dr McDermott, may we have some comment from you?

DR WALSH MCDERMOTT There are several points which I should like to emphasize, the first being the extreme deceptiveness of meningococcus infections in general Meningococcemia is a febrile state, but during most of the day, the patient may have a normal temperature As a result, during the periods of the day when one is most apt to see the patient, he may appear perfectly well and relatively little attention may be paid to the fact that the temperature mounts in the evening After a period of days or weeks in that lulling type of illness, within a matter of hours very serious meningitis may develop

The second point is, as Dr Wolf stated, that the best agent for meningococcus meningitis is still sulfadiazine, and that sulfadiazine should be used in all other bacterial meningitides as well

The third point relates to the choice of chemotherapeutic agent for prophylaxis in the patient who seems to have a serious bacterial infection and in whom one is awaiting further developments or the results of diagnostic tests When the physician sees a patient for the first time with fever, and leukocytosis of, say 18,000, he naturally wishes to institute some form of effective chemtherapy to protect the patient as well as to cover himself, although it may be any one of a large number of possible types of infection The tendency in these days would be to give penicillin in some form, conservatively perhaps, by the oral route Actually, with the possibility of meningitis in mind, the proper drug would still be sulfadiazine because of its greater penetration of the central nervous system Should it prove to be a case of pneumococcemia or meningococcemia, the sulfadiazine would much more likely prevent the development of meningitis The experience of Dr Holmes which was cited has been observed more than once and is not a novel phenomenon However, we are not advising indiscriminate chemotherapy

The fourth point relates to pneumococcic meningitis As you know, it is associated with a very plastic exudate over the surface of the brain and the cord, and block of the subarachnoid space is quite common Furthermore, the disease is not limited to the surface of the brain, it is a true meningo-encephalitis Sulfadiazine is given because of its greater penetration Penicillin is injected intrathecally, but should there be any evidence of block, one should introduce the drug higher up Professor Cairns, in an extensive study, found that the cisternal route offers no advantage over the lumbar route In the presence of block, therefore, ventricular puncture, placing the penicillin directly into the ventricle, is the only alternative This may seem like an heroic procedure, but then Dr Wolf has pointed out the unfavorable results of most observers in the case of pneumococcic meningitis, here, we have lost 6 out of 8 patients whom we treated with penicillin Under such conditions, heroic measures are indicated Fortunately, not all cases of pneumococcus meningitis are equally serious Some are mild, as mild as the mildest meningitis infections, but the majority of them are of the serious type

For tuberculous meningitis, streptomycin has been tried here Ten patients were treated There were no recoveries

Hitherto, the choice agents for hemophilus influenzae meningitis were the sulfonamides together with Dr Alexander's serum We have had no experience with that form of therapy, but Dr Levine in the pediatric department undoubtedly has had It is noteworthy that these organisms are among the few against which streptomycin in vitro is bactericidal Dr Alexander has now used streptomycin in 8 patients with hemophilus influenzae with recovery in seven One might, therefore, consider streptomycin for hemophilus influenzae meningitis In all other forms, one should administer sulfonamides, and add penicillin only in those infections which are known to require penicillin

DR WHEELER Dr McDermott, while you are still up, would you tell us about the treatment of choice for streptococcus beta-hemolyticus infections?

DR MCDERMOTT We have treated our cases of beta-hemolytic streptococcic meningitis solely with penicillin and obtained excellent results However, I feel that at the present time it would still be advisable to treat it precisely the same as pneumococcus meningitis, that is, intrathecal and intramuscular penicillin, with the addition of a sulfonamide, for greater penetration of the tissue of the central nervous system

DR WHEELER Dr Levine, I wonder if you would tell us whether your experience in pediatrics differs significantly from what you heard here about adults Would you also say something about the influenzal meningitis cases, which we, dealing with adult patients, so rarely see?

DR SAMUEL Z LEVINE With respect to meningococcus meningitis, I think our experience duplicates yours in adults Sulfonamide therapy when instituted early in the disease, in the first twenty-four or forty-eight hours after onset, has been almost invariably effective As a matter of

fact, at Hopkins and at Buffalo, they are treating meningococcus meningitis with sulfonamide for only forty-eight hours They practically never have a death Furthermore, at Buffalo it was felt that sulfonamide was so effective that treatments with a single dose have been tried The results with this are promising

I should like at this point to raise a question as to the advisability of that combination of intravenous and oral sulfonamide, a method so commonly used for securing the immediate and prolonged effects Sometimes this procedure may lead to excessive concentrations of sulfonamide in the urine

Incidentally, we have a patient on the ward now who received a sulfonamide for a meningococcemia and meningococcus meningitis The temperature dropped within forty-eight hours but later began to rise and remained up for three days We stopped the sulfonamide and the temperature promptly declined Prolonged sulfonamide therapy will sometimes keep the fever up in meningococcic meningitis

With regard to the hemophilus influenzae meningitis, we have not used streptomycin In our experience sulfadiazine and the anti-H influenzae rabbit antibody, or Dr Alexander's serum, proved effective in 8 of 10 cases This therapy is especially effective in those treated early I think that the residual manifestations are sometimes greater in the influenzal than in the meningococcic and streptococcic meningitis, because of the plastic nature of the exudate It is interesting that before the antibody was available, we used Fothergill's complement method, and our first 3 cases recovered This was much better than his results, but the next 3 or 4 cases in which it was tried all terminated fatally

Streptomycin seems to be as effective as the combination of sulfonamide and the rabbit antibody It will probably be a much simpler and far less expensive procedure One milligram of antibody now costs a dollar, and one has to use a minimum of 50 mgm., and usually 100 mgm So, treatment costs at least $100 It is worth it because it is very effective I presume streptomycin will be very much cheaper

DR. WHEELER Dr Cattell, do you have any comment?

DR. MCKEEN CATTELL I am interested in the evidence of the relation between the diffusibility of the compounds and their effectiveness I think many of us have wondered why it is necessary for the drug to be present in the spinal fluid Apparently, however, your clinical experience is that the diffusion of the drug into the spinal fluid is helpful in combating the infection of the meninges

DR MCDERMOTT It is not in the spinal fluid that we wish to get the drug, but rather into the tissue of the central nervous system Apparently penicillin does not get into the tissue of the central nervous system in appreciable concentrations

DR CATTELL I wonder why that should be because, certainly, it must be true that all tissues have some circulation If it is present in the blood, one would think it must come in pretty close contact with the cells

DR WALTER MODELL Dr McDermott, sulfathiazole does not get in the spinal fluid as readily as sulfadiazine and for that reason is not advised in meningitis, yet Applebaum stated at a conference here once that the results obtained with sulfathiazole were probably just as good as with sulfadiazine

DR. WHEELER That might mean that a relatively low concentration in the spinal fluid was effective

DR. MCDERMOTT That is the point The usual argument is that the amount of sulfathiazole which gets in the spinal fluid is in low concentration But the concentrations obtained in the spinal fluid are in the neighborhood of 2 mgm per cent, and that is unbound sulfonamide, there being no plasma protein around Whether it is bound or unbound, that is a pretty good level, especially since the meningococcus is so sensitive to sulfathiazole On the other hand, the concentrations of penicillin found in the spinal fluid are generally much less than 0 04 unit per cc and that appears to be the ceiling

I would like to emphasize that a minimal level of penicillin may occasionally be obtained, which is curative for some penicillin-sensitive infections It certainly is effective in syphilitic meningitis In many meningococcus infections it might be effective, but in others it would not

DR. MODELL Is the 0 04 unit the concentration of penicillin usually obtained in the spinal fluid of the patient with meningitis?

DR. MCDERMOTT The concentrations are not different in patients with meningitis or neurosyphilis, from those in normal people The highest is 0 04 to 0 06 unit per cc regardless of how high the plasma concentration may be

DR CATTELL Is it not related at all to the plasma concentration?

DR MCDERMOTT Yes, if one has a plasma concentration such as is provided by a single intramuscular dose of 500,000 units of penicillin, one finds concentrations such as I've mentioned in the spinal fluid, but under the more usual conditions, say, when 25,000 units are given every two hours, almost none gets into the spinal fluid

DR MODELL After the intrathecal doses, how high does the concentration of penicillin go?

DR MCDERMOTT It may go up to ten units per cc

DR HARRY GOLD Have we had any experi-

ence in treating meningitis with doses of penicillin in the order of a million or two million units a day? I am wondering whether we may not encounter here pretty much the same sort of situation as prevailed in the case of bacterial endocarditis

At first, there were fifty-three failures in 55 cases Then came the perfectly massive doses and reversed the picture There may, of course, be no justification in risking cases to try them out I was just wondering whether many of the failures in meningitis are not based on inadequate amounts of penicillin

DR McDERMOTT First, I would like to make a statement about the early cases of bacterial endocarditis treated with penicillin, because they haunt us whenever we say that a drug is not good for some condition or other Actually, those 53 of 55 cases treated with penicillin showed an effect, but we did not realize it at the time The temperatures fell The effect was simply not good enough

DR GOLD Do you mean you just could not believe it was happening?

DR McDERMOTT We did not ascribe to the effect its proper significance In answer to your question, Dr Gold, we gave one patient in the neighborhood of 500,000 units four times a day

DR PAUL BUNN More than that, we gave 25,000 every two hours, in addition to 400,000 or 500,00 units four times a day for four days

DR McDERMOTT It was about a half million units four times a day in addition to the regular course of penicillin treatments

DR GOLD Was it any good?

DR McDERMOTT No, it wasn't but, then, the patient was a pretty sick one

DR WHEELER I would like to ask a question Since there seems to be a suspicion that the introduction of 10,000 or 20,000 units of penicillin in 10 or 15 cc of water may be irritating to the central nervous system, why are such concentrated solutions used? Could we not put in a much weaker solution which would still be far in excess of what is necessary for the antibacterial effect?

DR WOLF I think the question of irritation is possibly more related to the impurities than the number of units of penicillin

DR WHEELER In any case, the more concentrated the solution used, the more intense would be its irritant effects How many units would you have to put into the spinal fluid to get an effective therapeutic level?

DR McDERMOTT The limiting factor in all local therapy is the same First you determine the concentration of the penicillin which is nonirritating, and then you decide how much fluid you can put into the spinal canal You must put in less fluid than you withdraw I suppose you could withdraw 50 cc and replace it with 40 cc of half the concentration advised by Dr Wolf

DR WHEELER I do not mean that Why not put just two or three units instead of 10,000 or 20,000?

DR. McDERMOTT The reason is that the drug concentration will fall too quickly to subtherapeutic levels Such dosage requires tapping too frequently in order to maintain a minimal therapeutic level of penicillin in the spinal fluid

DR GOLD Isn't it a fact that the drug stays fairly long in the intrathecal spaces, that it not only has difficulty getting into them from the blood, but also has difficulty getting out, pretty much as in the case of the pleural space?

DR McDERMOTT It has as much difficulty getting out as getting in

DR. MODELL Does it not leave faster in the patient with meningitis than it does in the normal patient?

DR McDERMOTT Yes

VISITOR How do you give Alexander's serum?

DR LEVINE That is given intravenously accompanied or immediately preceded by an infusion to hydrate the patient It is not given intrathecally except in dire emergencies How often have we used it intrathecally, Dr Fraser?

DR ALAN W FRASER Not in the last two years.

VISITOR Is the diagnosis of hemphilus influenzae meningitis difficult?

DR LEVINE It can be, and when in doubt of the organism, it is sometimes desirable, if you have anti-influenzal antibody available, to attempt the quellung test If the organisms will quell in the presence of the antibody serum, it indicates that it probably represents hemophilus influenzae, even though not recognizable You know how pleomorphous influenzae is when found in the spinal fluid, and so the quellen test is sometimes of value If the smear is negative, and we cannot find any organisms, we usually assume that it is a pyogenic meningitis and give penicillin and sulfadiazine, and not Dr Alexander's serum

INTERN Would you accompany each diagnostic tap with penicillin intrathecally until you have had time to examine the smear of the spinal fluid?

DR McDERMOTT Until the diagnosis is established?

INTERN Since you have the needle already in the spinal canal, would you routinely put in penicillin?

DR McDERMOTT I would not because the reactions to intrathecal penicillin are not inconsiderable I would myself rather be tapped twice and be treated with sulfadiazine while waiting for the specific diagnosis

DR WHEELER Dr Wolf, can you explain why it is considered to be dangerous to remove spinal

fluid in a patient who has increased intracranial pressure due to brain tumor, but not in one with meningitis?

DR. WOLF The usual explanation is that if you have a space-occupying lesion in the brain, removal of spinal fluid below it may cause a shift of the tumor, producing impaction of the brain stem in the foramen magnum That presumes that the space-occupying lesion is above the level of the foramen magnum, and that pressure above the lesion is greater than below it because of block

Relief of pressure from below, therefore, may increase this difference enough to cause movement of the brain In meningitis the pressure in the whole system is equally elevated and removal of fluid therefore does not cause a drastic shift in the position of the brain

DR. WHEELER Dr Gold, I would like to ask you what you consider to be the most effective way to dehydrate the central nervous system?

DR. GOLD I am not sure of the answer to that The mercurial diuretics are not often used to dehydrate the central nervous system, although they are the most efficient dehydrating agents in patients with heart failure

DR. WHEELER That is what I was wondering It is my impression they are not very effective

DR GOLD It may very well be that the measures generally used are effective not entirely because of the dehydration, but because of a rapid lowering of the intraspinal pressure I am not aware that one can lower the spinal pressure very satisfactorily with the mercurial diuretics, yet high concentrations of such sugars as dextrose sucrose, and sorbitol, often do produce an abrupt lowering of the cerebrospinal fluid pressure The relief of headache and restoration of consciousness may be due to this rather than to sustained drying up of the brain tissues

DR. WHEELER Dr Wolf, is there good evidence that 50 per cent sucrose or glucose cause substantial dehydration of the central nervous system?

DR WOLF In patients with brain tumor Dr Ray has reported that, after the use of 50 per cent glucose or the Murphy drip, patients will frequently come out of coma in two or three hours

DR. GOLD There is some literature on the effect of hypertonic sugars on the cerebrospinal fluid pressure in animals and man The effects are variable, sometimes an initial rise followed by a fall which may last a few hours The fall is usually of short duration. Sucrose and dextrose have been used in doses of 100 cc of 50 per cent solution intravenously, and sorbitol 50 cc of 50 per cent solution intravenously Sorbitol exerts nearly twice the osmotic pressure of sucrose and should be preferable, but there is no agreement that it is more effective, and it sometimes causes chills

DR. WOLF On what sort of subjects were these experiments done, those with brain tumor, or what?

DR. GOLD The studies embrace a variety of intracranial lesions, including tumors and encephalopathies of hypertension

DR WHEELER It is my impression that it is the rare case of meningitis which requires that sort of treatment nowadays Would you agree with that?

DR WOLF In the 30-odd cases we had here, which I reviewed, there were no instances in which we used that procedure

DR CATTELL I want to ask Dr Gold how effective the mercurials are in the absence of edema

DR GOLD One can get, in what appears to be a normal person, the loss of four or five pounds of body weight by a large dose Students in the laboratory obtain it in normal dogs Of course the total effect is much less than in the edematous patient

DR MCDERMOTT I would like, in connection with what Dr Gold has just said, to point out that there is a difference between the problem of increased intracranial pressure associated with infection and that associated with a tumor It makes no difference in the patient with a brain tumor if one removes plasma fluids On the other hand, in one with an infection a possible predisposition toward shock might be aggravated by a dehydrating agent like a mercurial diuretic I would like to ask Dr Gold if he would not believe that while in a case of a brain tumor, it be permissable to use both sorbitol and the mercurial in an infection one should use only the sorbitol type of agent.

DR GOLD It sounds reasonable

DR WHEELER I would like to ask Dr McDermott if we have any treatment for mycotic meningitis, like torula meningitis? Is penicillin effective in any of them?

DR. MCDERMOTT No Some of those seem to be affected slightly by the sulfonamides Other than that there are no fungo-static agents available

DR BUNN Streptothrycin

DR MCDERMOTT Intrathecally?

DR BUNN I don't know whether it has been used intrathecally but it is effective in vitro Its effect is greater than that of streptomycin, but I don't know if any has been used in humans It has in animals

DR WOLF There may be a difference between adult medicine and pediatric practice Dr Levine mentioned a single effective dose of sulfadiazine. We had several instances in which pa-

tients were treated with sulfadiazine for meningococcus meningitis They presumably were recovering when they turned for the worse It was the opinion of some that we were poisoning them with sulfadiazine which was, therefore, stopped After that they got much worse They had convulsions and the spinal fluid showed changes We reinstituted sulfonamide therapy and the patients went on to recovery It may be that in adult patients a single dose will not work.

DR LEVINE I am not recommending it

DR THOMAS P ALMY I would like to ask about the precipitin reaction in the spinal fluid in the diagnosis of meningococcus meningitis How valid is it?

DR MCDERMOTT That reaction for meningococcus meningitis is quite useful, if done properly The percentage of false positives is very low The test requires only a few minutes The end point is clear-cut The only objection to the use of the test is that unless one is seeing a number of patients with meningococcic meningitis and has the laboratory set up for the test, it is a good deal of trouble For a hospital it is an excellent procedure We use it

STUDENT I would like to ask if the indole test of the spinal fluid has been used Some of the textbooks mention that in influenzal meningitis, the spinal fluid contains indole which can be used as a diagnostic aid

DR LEVINE We have tried the test in every case of meningitis and I think it was most often negative in influenzal meningitis

DR FRASER It has no connection with the disease

DR LEVINE It was suggested that indole was found in some and not in other forms of pyogenic meningitis We have never been able to confirm that.

Summary

DR MODELL We may now bring together the essential points in the therapy of meningitis which were discussed this afternoon Specific agents seem to have transformed the outlook in certain forms of meningitis In meningococcic meningitis, mortality has been reduced from the range of 50 to 90 per cent, and the duration of the disease from five weeks, to a death rate of from 2 to 10 per cent, and duration of the disease to four or five days The results are not as satisfactory in pneumococcic meningitis Here the mortality is still quite high, although it has been greatly reduced from the position of a nearly uniformly fatal disease Most patients with hemophilus influenzae may count upon a cure, and the outlook for beta-hemolytic streptococcic meningitis is also highly satisfactory Tuberculosis and mycotic meningitis seem still to be in a bad way

Since it is so important to treat meningococcus meningitis early, emphasis was placed on a few of the peculiarities of the disease which may delay a diagnosis, namely, the fact that it is a systemic infection with a meningeal complication and that in the early days of meningococcemia, it may resemble an inconsequential infection Among others, it was pointed out that the precipitin test on the spinal fluid is a valuable aid in diagnosis Vigorous treatment at that time may prevent the meningitis An obvious source of infection, as in the mastoid, the sinus, or the ear, often attracts attention to the disease in the case of pneumococcus meningitis

In a person in whom the problem of meningitis is suspected, no matter what type, sulfadiazine, and not penicillin, is the prophylactic agent of choice

In meningococcus meningitis, sulfadiazine is the preferable specific therapy at the present time, 5 Gm of the sodium salt in a liter of sixth molar lactate intravenously, followed by half that dose every 8 hours if the oral route cannot be used, otherwise, followed by 2 Gm of the sulfadiazine with 4 Gm of sodum bicarbonate orally every four hours, in an attempt to maintain a blood level of 10 to 15 mgm per cent The therapy is discontinued when the spinal fluid is sterile and the spinal fluid sugar has returned to normal. This is usually so in four or five days after the temperature is normal

Prolonged sulfonamide therapy sometimes produces fever, which declines only when the drug is discontinued

Treatment is essentially the same in children In these, meningococcic meningitis is so sensitive to sulfonamide that dosage for only forty-eight hours or even a single dose has been used with almost 100 per cent recoveries

While penicillin is effective against meningococcus meningitis, and there are some reports of high incidence of cures, it is not the treatment of choice, because the incidence of failure is still usually high, and the need for frequent intrathecal injections is a source of risk There are patients who have developed meningococcus meningitis during active treatment with penicillin The reason seems to be the low power of penicillin to penetrate the tissues of the central nervous system

In pneumococcic and beta-hemolytic streptococcic meningitis, the foregoing plan of sulfadiazine therapy is followed, simultaneously with intraspinal injections of 10,000 to 20,000 units of penicillin, and 25,000 units intramuscularly every two hours In pneumococcus meningitis, because of the plastic nature of the exudate and the frequent subarachnoid block, the penicillin may need to be given by ventricular puncture

The intrathecal penicillin is not without its disadvantages and dangers, so that it is advised to withhold it until need for it is established by the diagnosis, even if it requires repetition of the spinal tap, and not to introduce it routinely with the diagnostic tap It is necessary to remove more fluid than is injected, remove 15 cc and inject by gravity 10 cc.

In hemophilus influenzae meningitis, sulfonamide together with 50 to 100 mgm of anti-H influenzae rabbit antibody (Dr Alexander's serum) intravenously give a high incidence of cures in children Streptomycin seems to offer equally satisfactory results The positive quellung test helps to establish the diagnosis, although the indole test of the spinal fluid which has been suggested as an aid in diagnosis seems to be of no value

In syphilitic meningitis, penicillin is highly effective In mycotic meningitis, streptothricin is suggested on the basis of in vitro and animal experiments Streptomycin offers some promise in tuberculous meningitis, although the few clinical experiences thus far are unsatisfactory

Several measures were suggested in the form of symptomatic treatment Sedatives and codeine are used for pain Morphine is risky Signs of increased intracranial pressure are treated by spinal tappings, dehydrating agents, such as intravenous 50 per cent sugar, or rectal instillation of 100 to 200 cc of 50 per cent magnesium sulfate The mechanisms of action and relative values of glucose, sucrose, sorbitol, and the mercurial diuretics for this purpose were discussed These dehydrating measures are rarely necessary in meningitis Signs of shock are combated by intravenous infusions, oxygen, and desoxycorticosterone The glycosuria and acetonuria are managed by the usual diabetic regimen The joint and muscle pains are treated by splinting, massage, and physiotherapy

SURVEY HEALTH OF 4,018 U S. MEN FREED FROM JAP PRISONS

A health survey of 4,018 repatriated American prisoners of war from the Far East revealed that 60 to 70 per cent harbored intestinal parasites or worms—sometimes from two to six different kinds at a time.

The Surgeon General established a board of specialists to conduct the survey The report is presented in the April 13 issue of *The Journal of the American Medical Association* by Brigadier General Hugh J Morgan, United States Army, Colonel Irving S. Wright and Lieut. Colonel Arie van Ravenswaay of the Medical Corps, Army of the United States

The survey, which was made in debarkation hospitals on the East and West Coasts, began on September 1, 1945 and was terminated October 22 1945 The period of captivity among the patients ranged from three and one-half years to a few days. According to the authors the "conditions under which most of the men had lived were those of starvation, filth and lack of suitable clothing, with periods of definite torture Thousands died as a result of these hardships."

The *Journal* article says in part

"Many of the troops captured in the Philippines had been on starvation diets and had suffered from dysentery and malaria for many weeks before capture. Some had lost 30 to 50 pounds before capture.

"While the total weight of many of these patients at the time of the survey was equal to their former normal weight, examination with particular attention to their shoulder girdles and extremities indicated that their nutritional state as evidenced by muscular development was far below normal The newly gained weight in these persons was largely confined to their protuberant abdomens, or so-called 'rice bellies.'

"Careful histories revealed that 2,519 men believed that they had had malaria sometime during their imprisonment. Since most of these men had received little or no antimalarial therapy during their imprisonment, this adds considerable evidence to the belief that malaria will 'burn itself out' without treatment over a period of from a few months to several years.

A detailed study was carried out on 75 anemic patients These men had been on a grossly inadequate diet consisting mainly of rice for an average of 40 months. The average loss of weight was 37 pounds Nutritional deficiency was observed in 50 to 70 per cent. A history suggesting wet beriberi (a form with anemia and dropsy, but without paralysis, caused by a deficiency of vitamin B_1) was obtained in 77 per cent, and a history of dry beriberi (a form in which paralysis are the dominant feature) was obtained in about 50 per cent.

Anemia was observed in 52 per cent of the first 1 500 released prisoners surveyed.

"The factors concerned in the production of these anemias were complex. They included severe nutritional deficiencies, intestinal parasitic infestations and other causes, including dysentery, malaria, blood loss and infections.

'Beriberi heart (marked by a deterioration of the heart muscle) was encountered but in a high percentage of victims resulted in death in the prison camps

Five hundred and five men reported having had pneumonia. One hundred and one out of 3,742 checked showed evidence of active pulmonary tuberculosis on x-ray examination This is a high percentage of infection and indicates that exposure of these prisoners to tuberculosis must have occurred frequently

"Outbreaks of diphtheria, both skin and faucial (involving the passage from mouth to pharynx), were common, and in certain camps deaths occurred from diphtheria. A scar not dissimilar from the scar of skin ulcers due to diphtheria was found to have been produced by the so-called fire treatment' of Japanese doctors which was used not only on American prisoners but on their own troops This consisted in applying a small pellet of sulfur to the skin and igniting it. An ulcer was produced which inevitably became infected This form of treatment was applied in diverse parts of the body, depending on the disease being treated."

Special Article

THE AMERICAN ACADEMY OF PEDIATRICS NEW YORK STATE STUDY OF CHILD HEALTH SERVICES WHAT IT IS

ALEXANDER T MARTIN, M D , Chairman of Subcommittee on Child Health, Medical Society of the State of New York

THE Study of Child Health Services in New York State is part of the National Study undertaken by the American Academy of Pediatrics to plan for better and more evenly distributed health services for children The National Study embraces four major fields (1) pediatric education, (2) distribution, qualifications and activities of professional personnel, (3) hospital facilities, including outpatient clinics and laboratories, (4) health services rendered by official and voluntary agencies The New York State Study is concerned with the second, third, and fourth areas of the National Study The specific objectives of the Study in this State are

1 To determine with the assistance and cooperation of the medical and dental professions and official and voluntary health agencies the availability of child health services in New York State,

2 To make this information available to enable state and local groups to evaluate the quality of these services and to use this knowledge as a basis for local planning

Reasons for Conducting the Study

1 The American Academy of Pediatrics has agreed that "a program should be developed in order to make available to every mother and child in the United States all essential, preventive, diagnostic, and curative medical services of high quality, which, used in cooperation with other services for children will make this country an ideal place for children to grow into responsible citizens "

2 The Academy believes that pediatricians should take the initiative in planning this program for children It is essential that those who know what constitutes good care and who are engaged in rendering the care be the ones to develop and conduct the program

3 Before a program can be evolved, the services now available must be determined

4 Data needed as a basis for planning are incomplete, scattered, and in some fields almost totally lacking.

5 Since the State Legislature has adopted the Governor's comprehensive public health program which includes the development of child health services, the Study in New York State has added significance and timeliness The Interdepartmental Health Council formed by executive action of the Governor will require for its planning purposes information such as this Study proposes to obtain

Method of the Study

A series of eighteen schedules, prepared by the pediatric staff of the National office of the Study with the technical assistance of statisticians of the United States Public Health Service, will be used These questionnaires are the same as will be employed in all other states The Director of the Study, Dr George M Wheatley, assistant vice-president of the Metropolitan Life Insurance Company, is a member of the Academy of Pediatrics His services are being provided by the Metropolitan on a part-time basis The Study Committee for the Academy of Pediatrics is composed of Drs Paul W Beaven, of Rochester, William J Orr, of Buffalo, and Frederick H Wilke, of New York City The Subcommittee on Child Health, through its regional chairmen, is aiding by serving as regional representatives of the Study

The State has been divided into a Metropolitan New York area, including Long Island and north to include Dutchess, Ulster, and Sullivan Counties, and an upstate area which includes the major cities of Albany, Syracuse, Rochester, and Buffalo, and all the other counties The office for the Metropolitan New York area is at 411 East 69th Street, New York City For Metropolitan New York and adjacent counties, the executive secretary is Dr Theodore E Allen, a pediatrician and war veteran

Cost

A pilot study made in North Carolina cost approximately $5,000 The cost for the Study in New York State with five times the population of North Carolina, about one sixth of all the

physicians and dentists in the United States, one fifth of all the pediatricians in the country, and a better than average number of official and voluntary health agencies and institutions, is estimated at $30,000

The New York State Study is estimated as a six months' project Three months is planned for organizational work and three months for field work to collect the data from hospitals, physicians, dentists, and official and voluntary agencies providing health services for children

Cooperating Agencies

The Study has had assurance of coöperation from The New York Academy of Medicine, the Medical Society of the State of New York, the State Health Department, the New York City Health Department, State Charities Aid Association, New York City Welfare Council, the local chapters of the National Foundation for Infantile Paralysis in the State, New York Association for the Aid of Crippled Children, the Catholic Charities, and many other state and local child health and welfare organizations with a logical interest in the Study

An Advisory Committee representing official and voluntary organizations is being invited to serve Agreement has been reached with the State Joint Hospital Board of the Postwar Public Works Planning Commission to include the Academy Study schedules with the survey of hospitals in the upstate area The same arrangement has been made with the United Hospital Council of Greater New York now conducting a hospital survey in New York City This splendid assistance by the hospital survey authorities represents a substantial saving of time and effort for the Academy Study

The other institutions, health agencies, pediatricians, general practitioners, and dentists will be reached by mail and personal contact by key physicians or other representatives in each of the sixty-two counties of the State. Questionnaires will be mailed out to physicians and dentists in the State beginning about June 1 The success of the Study depends upon the willingness of every physician to fill out his one-page questionnaire and return it promptly Even though the physician sees no children in his practice, he should return the questionnaire with this information

---

PROGRAM FOR TRAINING OF SPECIALISTS ANNOUNCED BY THE BUREAU OF MEDICINE AND SURGERY UNITED STATES NAVY

Establishment of a long term program for training of specialists, involving the designation of 9 large naval hospitals as special centers of instruction, is announced by Vice Admiral Ross T McIntire, U.S.N Chief of the Bureau of Medicine and Surgery

Intended to fulfill more adequately the medical and surgical needs of an expanded peace time Navy, the program will make available to medical officers a complete term of specialization training comparable to the best obtainable in civil life. All of the recognized specialties will be taught, including anesthesiology, dermatology and syphilology, internal medicine, neurosurgery, obstetrics and gynecology, ophthalmology orthopedic surgery otolaryngology, pathology, pediatrics plastic surgery, psychiatry and neurology, radiology surgery and urology

The nine postgraduate teaching centers will be set up at the following naval hospitals Chelsea, Massachusetts, St. Albans New York Philadelphia, Pennsylvania, Bethesda, Maryland, Great Lakes Illinois, San Diego, Long Beach, and Oakland, California, and Seattle, Washington

The board of honorary consultants to the Navy Medical Department composed of ranking civilian members of the profession, has actively cooperated in formulation of plans and will assist in their development.

Instructors will include not only the regular staffs of the 9 special training centers but also members of the Naval Reserve Medical Corps who are outstanding in their various fields of medicine and surgery Duties of the latter, as volunteers will include consultations in problem cases and organization of the curricula. Headquarters of the program will be in the Bureau of Medicine and Surgery and a central advisory committee will be created

Present plans, which are flexible call for a definite period of training for the young doctor who enters the Navy upon his graduation from medical school. This period would cover 1 year's internship, 1 or more years of residency training, 2 years of sea or foreign shore duty, and, finally a definite period of intensive work in this country in that field of medicine which the officer has chosen and which has been approved by the central advisory group

Chief advantage of the program, from the individual doctor's point of view, is that it gives him an opportunity to become a specialist without the financial, assignment, and other complications which attend the same effort in civil life. The training will not be given to those medical officers who do not wish to specialize or who demonstrate that they are better fitted for general practice

Internships and residency training will continue to be given at all naval hospitals which are properly accredited with the more advanced teaching being offered at the 9 specialization centers. Augmenting the latter will be the postgraduate facilities of a number of civilian teaching institutions, to be announced.—*Bulletin of the American College of Surgeons, February, 1946*

Department of Workmen's Compensation

CONDUCTED BY DAVID J KALISKI, DIRECTOR

Mary Donlon Fund

THE Mary Donlon Fund for the New York State School of Industrial and Labor Relations was presented to Dr Edmund E Day as President of Cornell University, of which the school is a part, on Wednesday, April 17, 1946, at the University Club, New York City The Fund consists of surplus funds from the testimonial dinner tendered to Miss Donlon on December 12, 1945, at the Hotel Commodore, which was attended by over a thousand persons representing industry, labor, the medical profession, insurance carriers, and the public generally Mr Henry D Sayer, general manager of the Compensation Insurance Rating Board, and Messrs Thomas J Curtis, Martin Hilfinger, and Dr David J Kaliski formed the presentation committee

Miss Mary Donlon, a distinguished Cornellian and trustee of the University, is Chairman of the Workmen's Compensation Board of the Department of Labor

ARMY NEUROPATHOLOGIST'S REPORT ON EXAMINATION OF DR. ROBERT LEY'S BRAIN

The brain of Dr Robert Ley, Nazi leader, which was shipped by air to the United States in November of last year for gross examination and microscopic study by Army pathologists shows "a long-standing degenerative process of the frontal lobes"

Degeneration in the brain of Dr Ley, who hanged himself to avoid trial as a war criminal, was sufficient to account for the unusual behavior of the former German labor leader

Reports on the results of the neuropathological study of the brain, which was made at the Army Institute of Pathology under the direction of Colonel J E Ash, stated that photographs of the brain show considerable thickening of the brain covering over the frontal lobes of both sides The underlying convolutions as well as some of the blood vessels are hidden from view by this thickening However, the rest of the brain has a normal appearance, in that it is delicate and transparent

Slight atrophy is indicated by the prominent condition of the grooves between the convolutions of the frontal lobes, and examination of the frontal lobes under the microscope disclosed a long-standing degenerative process, which in medical parlance is referred to as a "chronic encephalopathy"

This disease process cannot be ascribed to the airplane accident Dr Ley suffered in 1917, because the damage is so symmetrical, according to Army pathologists They also added that there is no evidence of pre-existing meningitis

Dr Ley's type of degeneration, the report pointed out, is sometimes seen in those addicted to alcohol, but proof that alcohol is in itself a causative factor is completely lacking The degeneration is of sufficient duration and degree to have impaired Dr Ley's mental and emotional faculties and could well account for his alleged aberrations in conducts and feelings, since normally the frontal lobes are requisite for complex types of thinking and for a proper development of the "social sense" and since they exercise a restraint on emotional impulses, the report explained

IMPROVEMENT IN MEDICAL CARE

"Those who are agitating for an elaborate Federally controlled national health program, such as that proposed by President Truman in his message to Congress, lay great stress on the shortcomings of the existing system They thereby create the impression that individual states and communities have 'failed' to solve the nation's health problem, and that therefore it is time for the Federal Government to take over the job

"In making that assumption they ignore an impressive movement looking toward improved health care that is now showing intense activity throughout the country It is a movement not inspired from above but initiated by the communities It is not revolutionary, but a continuation of a health program that has been going on for years It is what used to be called typically American, in that it is an effort on the part of the people to help themselves instead of waiting for somebody else to help them."

—Editorial, *Baltimore Sun*, January 8, 1946—*Journal of the Michigan State Medical Society, March 1946*

Medical News

Passano Foundation Makes Award to Dr Goodpasture

DR. ERNEST W GOODPASTURE, Professor of Pathology and Dean of the School of Medicine of Vanderbilt University, Nashville, Tennessee is the 1946 recipient of the Passano Foundation Award Presentation of the $5,000 cash award was made at an appropriate ceremony in historic Osler Hall of the Medical and Chirurgical Faculty of Maryland in Baltimore, on the night of May 15

The Foundation, which was established in 1944 by the Williams and Wilkins Company, Medical Publishers, of Baltimore, proposes to aid in any way possible the advancement of medical research

Dr Goodpasture received the award for his original development of the method for propagation of viruses in pure culture by inoculation of chick embryos and for his outstanding contributions to advancement of knowledge of the cell-parasite relationship in bacterial and virus infection

Residencies in Physical Medicine Available

OPPORTUNITIES for appointment as resident in physical medicine are available at the following hospitals affiliated with the Faculty of Medicine of Columbia University Presbyterian Hospital, New York Post-Graduate Hospital Mount Sinai Hospital, Goldwater Memorial Hospital, and Montefiore Hospital.

These residencies have been developed as part of the program of the graduate training in physical medicine sponsored by the University The purpose of this program is to provide a sound background for a career in the field of physical medicine based on clinical experience under supervision and an appreciation of the related fundamental sciences

The residencies consist of four months of basic instruction at the medical school followed by twelve months of clinical work at the hospitals Appointments are made annually and are subject to renewal for periods up to three years. Applications should be made directly to the hospitals.

A limited number of those who have completed the first or second years of the residency or have a sound background in a related basic medical science may apply for fellowships in physical medicine at the University

Applications for fellowships should be submitted to the Dean of the Faculty of Medicine, Columbia University 630 West 168th Street New York City

Symposium on Industrial Medicine to Be Held in June

THE Department of Medicine of New York Post-Graduate Medical School, Columbia University announces a Symposium on Industrial Medicine to be held June 10 through June 14 The Symposium will be directed by Dr Harry J Johnson and Dr Frank R. Ferlaino

All applications and inquiries should be addressed to the Director of the School 309 East 20th Street, New York 3 New York The fee is $45

Two features will be added to the program this year There will be an evening showing of the sound moving picture made by General Motors entitled 'The Doctor in Industry" This will be followed by a round table discussion on the value of an industrial health maintenance program

Also on Saturday following the course, a visit will be made to one of the nearby General Motors plants

Fellowships in Health Department Available

FIVE fellowships have been established by the New York State Department of Health for the training of physicians in the public health laboratory field The appointments are for a period of one year and are open to physicians with postgraduate laboratory training who wish additional experience in pathology bacteriology or biochemistry to qualify for positions in the public health laboratories in New York. Candidates must be United States citizens who have graduated from a medical school approved by the American Medical Association and who are licensed or eligible to take the examination for license to practice medicine in New York State. Inquiries should be directed to the Division of Laboratories and Research, State Department of Health, Albany 1 New York.

County Society News

Albany County

Dr C Stuart Welch of Albany recently released from the Army in which he served as a lieutenant colonel, has been appointed a professor of surgery at the Tufts Medical College

Dr Welch was graduated from Tufts in 1932 and served as a fellow in surgery at the Minnesota Mayo Foundation until he came to Albany in 1937 *

Dr Alvan I Barach, associate professor of clinical medicine, College of Physicians and Surgeons, Columbia University, was the speaker at a meeting of the Albany County Medical Society, April 24, in Albany

Dr Barach presented all the information now available on the use of aerosol penicillin. A business session preceded his talk.*

Dr Edward R. Schlesinger, of Syracuse, has been named Acting Director of Maternal and Child Health Division of the State Health Department Dr Schlesinger succeeds Dr Helen H Owen, Altamont, who retired Monday after twenty-three years' service *

. . .

Maj Harold Bellin, of Albany, returned from the Army Medical Corps in April and has resumed his practice in general surgery

Entering service in September, 1942, he was assigned as post surgeon and commanding officer to the Station Hospital at Clinton Prisoner of War Camp, Clinton, Miss Later transferred to Camp Rucker, Ala , he served as chief of orthopedic surgery and medical examining board chief *

.

Dr Harold G Wolff, associate professor of medicine and psychiatry at Cornell University, addressed an open meeting in March at the Albany College of Pharmacy, opening a campaign by Albany Area physicians to increase public understanding of a new medical field He spoke under the sponsorship of the Albany Society for the Advancement of Psychosomatic Medicine *

. .

The medical societies of Albany and ten nearby counties, preparing for operation of a pre-payment medical plan by fall, discussed at their April meeting a proposed schedule of fees to be charged patients

Dr Lyle A Sutton, of Albany, said that the fee schedule now is in the "formative" stage but that it may be adopted by the eleven societies in June *

Allegheny County

Dr Edward W Briggs, Jr , surgeon with nearly five years' service in the U S Army and nine years of practice in surgery with the New York State Department of Mental Hygiene, opened offices April 1 in Wellsville

Dr Briggs was graduated from the University of Pennsylvania Medical School in 1932

In addition to his service in Guadalcanal he also was assigned to Naval hospitals in Philadelphia and on the West Coast

While with the state department he had charge of surgery at the Harlem Valley State Hospital in Dutchess County

Broome County

Six Binghamton doctors attended an annual meeting of the Central Section of the American Urological Association of Western New York and Ontario at Buffalo recently

They included Dr Ernest Hock, Dr D O Chamberlain, Dr Alfred L Wolfe, Dr Joseph Sabak, Dr James DeJutte, and Dr Edward Forgrave The latter four are interns at Binghamton City Hospital who completed their national board examination prior to the conference

Officers were elected and discussions of "Hyaluronidase and Its Relation to Sterility" and "Streptomycin in Urinary Infections" were held

. .

Three doctors from this County were honored at a banquet of the alumni association of Albany Medical College, March 19, in Albany

Dr Edward Gillespie, Dr Edward Parrish, of Oneonta, and Dr Philip S Young, of Sidney, were presented with fifty-year certificates marking the golden jubilee of their graduation from Union University

A native of Schenectady, Dr Gillespie was graduated from Albany Medical College in 1896 and began service on the staff of the Binghamton State Hospital in that year

. . .

Dr Richard Trozzo, of Binghamton, has been discharged from the Army Medical Corps and has resumed his practice in Binghamton The physician entered the Army in November, 1942 and served fourteen months on the staff of the 104th U S General Hospital in England Since his return from overseas, Dr Trozzo has been on the staff of Rhoads General Hospital, Utica.*

. . .

Members of the Broome County Medical Society have unanimously endorsed a central blood bank for Broome County

A resolution describing the present system and facilities for dispensing blood and plasma in the county as "woefully inadequate" to the needs of the community, was passed on March 12 in the City Hospital

The Medical Society also heard an address by Dr Lester S Knapp, attending physician at the Buffalo General and Millard Fillmore Hospitals, Buffalo *

Bronx County

Two lectures were presented at the April meeting of the Society Dr Manfred Sakel spoke on the rationale of shock therapy and chemical shock therapy, and Dr Joshua Leiner discussed electric shock therapy

Cayuga County

The Cayuga County Medical Society has issued for display by its members a card addressed "to the patient whose doctor served in the armed forces" The card reads "As your doctor returns to civilian practice, please feel free to again seek out his service. We encourage you to do this in appreciation of what he has sacrificed for all of us He merits our fullest support during his period of reconversion to civilian life We are pleased to have served you in his absence and appreciate your tolerance of our limited service"*

Chautauqua County

Dr William W Plummer, professor of orthopedic surgery at the University of Buffalo, School of Medicine, addressed a dinner meeting of thirty members of the Jamestown Medical Society in the Hotel Jamestown on March 30, explaining the treatment of war injuries of the extremities from combat zones through reconstruction hospitals Dr Frederick R. Weedon, director of Municipal Laboratory and president of the Society, presided A technical floor discussion followed the speaker *

Chemung County

After forty-two months in the Army, Dr Henry B Marshall returned to Elmira and resumed the practice of urology in March

---

* Asterisk indicates that item is from a local newspaper

Dr Marshall began active duty as a first lieutenant in the Army Medical Corps in September 1942 and was assigned to Lawson General Hospital In October, he was transferred to Moore General Hospital at Swannanoa, N C, where he served as assistant chief of urology

Later, he was assigned chief urologist with the 80th Evacuation Hospital.

He won the rank of major in August 1945 He wears the American Theater ribbon, the Asiatic-Pacific Theater ribbon the Victory Medal and the Meritorious Service Unit Plaque

Prior to entering service Dr Marshall was associated with the late Dr Elliot T Bush in Elmira.*

Dr Leo J Palmer will return as superintendent of the Reformatory in Elmira on April 1 after an absence of one year and nine months

Frank Smith superintendent, will retire from the state service after thirty-six years and five months and return to his boyhood home Kerhonkson Ulster County *

Chenango County

The members of the Executive Committee for the Chenango County Field Army of the American Cancer Society are

Dr William D Mayhew, of Oxford president of the Chenango County Medical Society, Dr Martin H. Jacobi, of Norwich, Dr B L. Dodge of Bainbridge, Mrs. Eva M Fuller, of Sherburne, Deputy Commander, and Mrs. Pauline Park

Dr Mayhew, Dr Jacobi, and Dr Dodge have also volunteered to serve on the Speakers' Bureau They will speak at meetings held throughout the county, discussing the medical aspects of cancer prevention.*

Clinton County

Dr Thomas Avery Rogers, Plattsburgh, was honored at the banquet of the alumni association of Albany Medical College in Albany, March 19 when he was presented a fifty-year certificate marking the golden jubilee of his graduation from Union University

Dr Rogers shared honors with nineteen classmates and with Dr Carter Davidson who was welcomed as the new chancellor of Union University an institution which unites Union College in Schenectady Albany Medical College, Albany Law School Albany College of Pharmacy Dudley Observatory and the Union University School of Nursing in Albany *

The Army Service Forces Training Center, Camp Plauche, New Orleans, Louisiana, announces that Maj Harry L. Freedman, (MC), of Dannemora, has, by the direction of the President of the United States, been awarded the Legion of Merit decoration by the War Department. Major Freedman was decorated for exceptionally meritorious conduct in the performance of outstanding services for his country

Columbia County

Dr Algird White, of Stottville, veteran of World War II established an office in May for the practice of medicine in Philmont.*

Dr Joseph P Gold, of Hudson, recently honorably discharged from the Army, has resumed medical practice

Dr Gold, who served in the Army as a captain, was in the service approximately two years. He was a member of staffs in various Army hospitals in the South and Southwest.*

Dr Edward F Urba, of Kinderhook was appointed to the County Board of Health in March Dr Urba's term will conclude on December 31 1946 he being appointed to fill the term due to the resignation of Dr Leon J Shank, of Kinderhook. Dr Shank had resigned shortly before his death recently *

Delaware County

Dr Curtis P Bight has opened an office for the practice of medicine in Kingston.

Dr Bight practiced previously at Fleischmanns until 1943 when he joined the Army Medical Corps. He went overseas to France with the 116th Evacuation Hospital and later saw action with the 57th Field Hospital in Germany *

Dr Harold Guzzo recently arrived in Margaretville and began the practice of medicine in the former offices of Dr Maurer *

Dutchess County

Dr J E. Vigeant was honored at a testimonial dinner in observance of his fifty years in medicine at the Nelson House, Poughkeepsie, in April. The Dutchess County Medical Society sponsored the dinner and Dr Henry Nobel MacCracken president of Vassar College, spoke. Dr Vigeant has been practicing medicine since 1903 *

Dr Charles Lamont, of Poughkeepsie, who has been on terminal leave from the United States Naval Reserve since February 15, has been appointed by the Board of Health to be parochial school physician.

Dr Lamont was the first Dutchess County physician to enlist in the Navy during the war He served with the Amphubious Corps after volunteering for service in November 1942, and participated in the Sicily invasion and the battles of Salerno and Anzio

Dr Lamont practiced in Poughkeepsie three years prior to his commencement of naval activities. He was graduated from Georgetown Medical School.*

Dr Frederick S. Zipser of Flushing, L.I., is now conducting a general practice in Red Hook.*

Dr Michael J Badeen has reopened his offices in Millerton.

Dr Badeen who served as a captain in the Army Medical Corps, entered the service on August 29 1942. In England he was chief of General Surgery at the 307th Station Hospital until December,

1943 He was also with the 3rd Army 8th Convalescent in North Wales

Dr Badeen was in charge of Surgical Unit L S T 311 during the invasion of Normandy and was with the late General Patton's 3rd Army in the drive through Normandy and France He was also with Gen Simpson's 9th Army and with the 7th Army of Occupation

His decorations include four battle stars, an arrowhead, and certificates of merit Dr Badeen earned on his medical practice in Millerton for approximately two and a half years before the war *

. . .

The May meeting of the Dutchess County Medical Society was held at the Pavilion, Hudson River State Hospital, Wednesday evening, May 8, 1946 at 8 30 P M

A gastrointestinal symposium was conducted by Dr John Bruckner, of New York City

Erie County

An Army medical officer for three and a half years, Maj John C Kinzly, North Tonawanda, was discharged late in May, when he resumed his medical practice

Doctor Kinzly was chief of surgery at Syracuse Army Air Base before going to the Air Base depot in England He served in France and later as base surgeon at the Air Force Replacement Depot at Furstenfeldbruck, Bavaria, near Munich He was overseas twenty-eight months *

. . .

Add to Dr Francis E Fronczak's titles Health Commissioner Emeritus of the City of Buffalo Upon the recommendation of Mayor Bernard J Dowd, the HCE degree was conferred in March by the Common Council on the commissioner, who retired from his city job to accept a post with UNRRA in Poland April 1 *

Col Charles D Shields, of Buffalo, subject to his release by the Army, will succeed Dr Fronczak

. . .

Dr Stockton Kimball, assistant dean of the University of Buffalo, School of Medicine, for nineteen months, was appointed acting dean by Chancellor Samuel P Capen He fills the vacancy left by the death of Dr Edward W Koch, dean for sixteen years

Dr Kimball received his medical degree from the University of Buffalo He was appointed instructor in medicine and pharmacology in the Medical School, later promoted to associate and named assistant dean in July, 1944 *

Franklin County

Dr Alfred A Hartmann, of Malone, who left his medical and surgical practice in April, 1941, to serve as a medical officer with the U S Army, has resumed his practice *

Fulton County

A number of doctors who have seen service overseas in various branches of the armed forces spoke at the March meeting of the Fulton County Medical Society held in Hotel Johnstown

Dr John R Ford spoke on his observation in the China Theater of War and Dr R D Kunkel told of the general setup of the Army Medical Corps

Dr Malcolm McMartin, of Johnstown, reviewed his experiences in a battalion aid station in Italy, while Dr M E Bruckner told of his experiences as a flight surgeon Dr H C Hageman told of various tropical medicines *

. . .

Capt Joseph Thompson, of Gloversville, has enrolled at Cornell University Medical Center, New York City, for a six months' course in internal medicine under Dr David Barr

Capt Thompson received his discharge April 1 and will resume his practice of medicine at 75 First Avenue about November 1

Capt Thompson was in service three and a half years and overseas two years He was connected with the First General Hospital of the Bellevue unit and served in the European theater *

Genesee County

Dr George S Young, of Batavia, who served in the Navy for two years, has received his discharge, and has returned home He plans to resume his practice in the near future

Dr Young was in the South Pacific for nineteen months and was in the Philippine area and Japan

. . .

Dr Osborn P Willson, of Batavia, is now engaged in the practice of medicine in Le Roy

During World War II, Dr Willson served twenty-six months overseas in both the Atlantic and Pacific theaters of operations He went on terminal leave on December 19, 1945, and since then has been taking refresher work at the Rochester General Hospital *

Greene County

Dr Frances E Persons, of Lexington, president of the Medical Society of the County of Greene, welcomed back to active practice three of Greene County's outstanding physicians, who volunteered their services to the United States armed forces

The three doctors are Dr William Petry, of Catskill, Dr Curtis Lacy, of Freehold, and Dr Frank Greenwald, of Prattsville

Jefferson County

Dr Henry Babcock, of Watertown, received his honorable discharge as a lieutenant-commander in the USNR in March.

Dr Babcock has been stationed for the past year at the Philadelphia Naval Hospital in the Neuro-Psychiatric Division, Philadelphia, Pennsylvania On May 1, he entered Butler Hospital in Providence, Rhode Island, as resident physician *

. . .

The March meeting of the Medical Society of Jefferson County was held at the Black River Valley Club The speaker was Dr Walter W Street, professor of clinical medicine at the Syracure University College of Medicine, who discussed "Clinical Diagnosis and Treatment of Cardiac Arrhythmias" *

. . .

Dr W Webber Young, of Watertown, formerly commander in the Medical Corps of the U S Naval Reserves, has returned home and has resumed his medical practice after more than forty-six months of active service in World War II

Kings County

The Medical Society of the County of Kings and Academy of Medicine of Brooklyn held their stated meeting Tuesday evening, April 16 1946, in MacNaughton Auditorium. The Scientific Program consisted of two lectures "The Abuse of Narcosis During Parturition" by Robert A. Hingson M D, Surgeon, U.S Public Health Service University of Tennessee, Memphis, Tennessee, and "Cesarean Section" by Edward A. Schumann, M D, G A C S Chief Obstetrician and Gynecologist, Philadelphia General Hospital, Philadelphia, Pennsylvania.

As a part of the educational program of the Brooklyn Cancer Committee, a gift of $200 will be made to the Medical Society of the County of Kings for use in adding more literature on cancer to its library, it was announced recently by the Information and Education Committee of the Brooklyn Cancer Committee.*

"Prevent World War III by keeping alive in people's memory the events of World War II" Dr Irving J Sands attending neurologist of the Neurological Institute, urged at the Kings County Medical Society meeting in March. He addressed a group of physicians in the first of the Spring series of Friday afternoon lectures on the subject "The Rehabilitation of the Neuro-Psychiatric Veterans."*

Lewis County

Dr Chris G Ronson, of Watertown, has returned to this city after recently being discharged from the Army as a captain, and will start a general practice of medicine and surgery with his offices in the Electric Building.

A dinner meeting was held April 11 at the Strife House Hotel, in Lowville by the Lewis County Nurses Association and the Lewis County Medical Society

Dr J G Frod Hiss, heart specialist of Syracuse, was the main speaker His subject was "Rheumatic Fever and the Cardiac Child" Dr Bruce M Phelps, president of the Lewis County Medical Society, introduced Dr Hiss.*

April marked the golden jubilee of Dr Frank M Ringrose as doctor for Constableville and its surrounding countryside.

It was just fifty years ago in the heart of the horse and buggy days, that Dr Ringrose came to Constableville to open his practice

A central New Yorker all his life Dr Ringrose was born in the town of Whitestown, January 19 1867 He received his education in the district school in Point Rock and in the Lee Center Union school. He was graduated in 1890 from Ives Seminary in Antwerp New York

He received the doctor of medicine degree from Syracuse University on June 14, 1894, and interned in Lying In Hospital New York. He returned to the scene of his early childhood, Point Rock, to begin his professional career, but in 1896 he came to Constableville.*

Madison County

Dr Richard Cuthbert, Canastota, Town of Lenox health officer, who recently returned from nearly four years of service in the Army Medical Corps, in March resumed the chairmanship of the Madison County Public Health Committee *

Dr Everett T Centerwall, former captain, home on terminal leave, has opened offices in the residence of his father, Charles Centerwall, Greene.

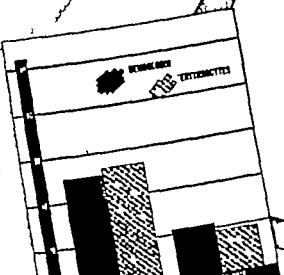
ANEMIA, IN INFANTS, IS SO IMPORTANT A FACTOR IN PREDISPOSING TO INFECTION THAT NO ANEMIA EVEN OF SLIGHT DEGREE IS INSIGNIFICANT



A LARGE number of babies, divided impartially into two groups—one being given iron medication and the other used as controls—were studied by Mackay* who concluded that most infants experienced a mild hypochromic anemia, due to iron deficiency, beginning at about the fourth month, which was *preventable* by iron medication. The anemia, even though slight, lowered markedly the resistance of the child to infectious diseases. In those given iron, the incidence of infection was lower and its duration considerably shorter. Growth was retarded by iron deficiency. Babies receiving iron averaged one pound heavier than those in the control group. Mackay concluded that anemia, even of slight degree, is too important in predisposing to infection ever to be considered insignificant.

It has been shown that iron-containing foods, when *homogenized*, make considerably more iron available for absorption than similar foods which have been only strained. The texture of homogenized baby foods is so fine that they may be fed—mixed in the formula" —through a nipple opening of normal size. Thus, supplemental feeding may be started as early as the fifth week of life, before the prenatal stores of iron have been exhausted, and before the so-called "physiological anemia" of infancy has set in.

Libby's Baby Foods are the only *homogenized* and *strained* baby foods available.

Erythrocyte and hemoglobin curves of first year of life plotted from statistics of Holt and McIntosh Holt's Diseases of Infancy and Childhood New York, N.Y., D. Appleton-Century Co., 1940 11th ed., p. 61.

Comparative effects of spinach feeding on hemoglobin and erythrocytes of anemic animals: left spinach strained and homogenized; right strained but not homogenized.

Hospital News

Forty-Eighth Annual Hospital Convention to Be Held in September

PHILADELPHIA is to be host to the forty-eighth Annual Convention and Postwar Conference of the American Hospital Association during the week starting Monday, September 30 With the Philadelphia Commercial Museum, Exhibition and Convention Hall containing excellent facilities booked for meetings and exhibits, the Bellevue-Stratford and Benjamin Franklin hotels will be used for hotel activities

Facilitating the assignment of hotel rooms, a Housing Bureau will be conducted in the Association's Chicago headquarters to handle all requests for living quarters

In order that transportation facilities may be secured prior to hotel notification of the date of arrival of the conferees and exhibitors, applicants will be issued a form authorizing the selected hotel to assign rooms directly rather than through a bureau there Since relatively few single rooms will be available it is urged that those attending plan to utilize twin or double bedrooms

Dealer's Day at the convention will be Thursday, October 3, in accordance with the following resolution adopted by the Association's Board of Trustees at its June, 1946 meeting

"That nonexhibiting dealers and manufacturers might, on invitation of the Association, attend the exhibit at the annual convention on the last day from 12 NOON to 8 00 P M , for the purpose of familiarizing themselves with the nature of the exhibit material and not for the purpose of solicitation. The Association agrees to assume the additional cost of maintaining the exhibit open past the usual previous closing time "

Army to Give Up Rhoads Hospital in July

THE U S Army will give up Rhoads General Hospital about July 1, it was announced in April by Col A. J Canning, the commanding officer

At the same time, Colonel Canning revealed that the Veterans Administration now definitely is interested in Rhoads as a veterans' facility

The forecast of July 1 as a possible date for surrender of the Hospital by the Army is predicted, Colonel Canning said, on an order received from the Surgeon General, blocking Rhoads as of April 3 from receiving any further patients except local emergencies

That means, it was explained, no convoys or groups of patients will come here from other hospitals

A "normal clearing period" of 90 days generally follows a block, during which present patients are to be sent elsewhere or discharged.

Rhoads Hospital received its first patients August 5, 1943 and since then has registered more than 25,250 patients

The cost of the institution as it now stands was estimated at six million dollars Comprising 105 buildings, it occupies 175 acres and is heated by nine miles of pipe Its peak capacity was reported as 2,700 patients The current operating staff includes 1,004 civilians and 720 Army personnel, including WACs, enlisted men, physicians, and nurses

Rhoads has specialized in orthopedic cases and achieved a splendid reputation for surgical work in that field, while recording an exceptionally low rate of mortality

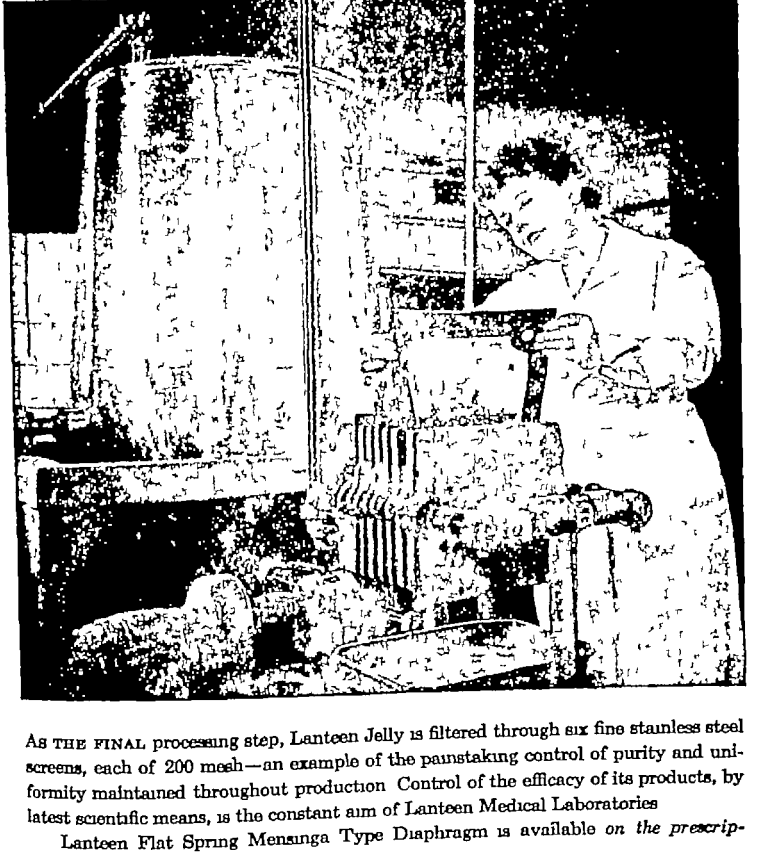
Hospital Care Costs Shown Rising in New York City

THE cost of hospital care in New York City has increased, a survey of the institutions has disclosed

Patients in most of the ninety-three voluntary nonprofit as well as in the fifty-one private hospitals have been paying $1 a day or more for food or accommodation services

It was said that the increases, in some instances as high as 10 per cent, began the first of the year and were owing to mounting costs of food and general maintenance

It was pointed out that patients under insurance plans are not affected directly, as the insurer takes up any of the increases in rates



At the Department of Hospitals it was explained that cost of hospital care as in operation of business generally has been on the increase for the last two years The hospital rates, it was said, were kept to prewar levels and advanced only when there was no alternative It was pointed out that patients unable to pay are receiving free services as usual. The twenty-two municipal hospitals are among those where services are free and nominal charges are made only when patients can afford to pay

Newsy Notes

In its postwar mental hygiene educational plan the Willard State Hospital of Willard, New York, under the directorship of Dr Kenneth Keill, has initiated an educational program to afford communities in the surrounding counties an opportunity of increasing lay knowledge of psychiatry and of understanding the role played in the community by the mental hospital. In connection with this, invitations were sent to the medical societies of the counties of Allegany, Cayuga, Onondaga, Ontario, Schuyler, Seneca, Steuben, Tompkins, Wayne, and Yates to attend the biweekly staff meetings, and tours, lectures, and clinical demonstrations have been available to the following colleges or universities Keuka, William Smith, Hobart, Cornell, Wells and Alfred, during the month of May

Also in May, as part of the postgraduate course to health officers of the County of Ontario a psychiatric program was made possible in conjunction with the latter training course

Benedict Memorial Hospital building fund drive ended "over the top" by more than seven thousand dollars The final total was $132,052 25 and the goal was $125,000 *

• •

Through a $15,000 subscription to Albany Hospital's $3,000,000 building fund from William Barnet and Son, Inc , the children of William and Rose B Barnet will establish a memorial to their parents in the enlarged hospital The memorial is to be the large admitting office adjoining the general lobby on the first floor of the main building *

• •

Two additional subscriptions totaling $4,500 have been received for the $3,000,000 building fund for Albany Hospital, Alfred Renshaw, chairman of corporation subscriptions, has announced

Joint contributions of $3,000 were made by the Albany Hardware and Iron Company and members of the family of William C Dearstyne, president of the company, for a room in the North Building, memorializing William I Baker, former president of the hardware concern

Green's, Albany stationers, has subscribed $1,500 for a bed in a four-bed room in memory of Mrs Pearl Cohen Green, wife of George H Green *

• • •

A subscription of $4,200 to the building fund of the Tarrytown Hospital by the Lions Club, which will supply one room in the Robins' Nest, the children's department of the new hospital, was announced in April by Sylvester J Balassi, chairman of the memorial gifts committee of the fund

Mr Balassi also announced an additional contribution of $500 to the Dr Todd Memorial Fund bringing the total of that memorial to $3,270 thus far The Dr Todd Memorial Fund is being held open for further subscriptions, in memory of Dr John Clarendon Todd *

• •

Residents of four more communities directly served by Jamaica Hospital have contributed $32,970 toward the $2,000,000 sought for a 300-bed addition to the hospital

The combined contributions of the ten-community house-to-house canvass is $99,022 The house-to-house quota is $240,000 The balance of the $2,000,000 building fund is being collected on a county-wide basis by commerce and industry and a special gifts committee *

• •

A new Catholic hospital, costing several million dollars, will be constructed by the Archdiocese of New York from 63d to 64th Streets The Archdiocese has contracted for the hospital site, and will take title in June, 1947 *

The Keller Hospital in Westhampton Beach, Long Island, was officially opened on March 15, after having been closed since it was vacated last fall by the U S Coast Guard

The hospital is directed by Dr Donald R Keller who has recently been discharged from the Navy Associated with him is Dr S J Post, of Center Moriches There is a staff of 15 consulting specialists, five nurses, four associate nurses, and two practical nurses *

• •

When the end of 1946 rolls around, St Joseph's Hospital for Chest Diseases, of the Bronx, will have completed its sixty-fourth year of caring for the tuberculous of New York City St Joseph's is the oldest Catholic Hospital in its district Established in 1882 by the Sisters of the Poor of St Francis, the hospital was originally located at 109th Street In 1888 the Sisters, realizing the advantages of a better location, selected its present site at 143d Street and Brook Avenue St Joseph's is one of the specialized hospitals affiliated with New York Catholic Charities whose annual fund appeal was carried on in April *

• •

Designed to combat alcoholism, a clinic was opened at Meyer Memorial Hospital, Buffalo, in April This announcement was made by Dr Donald C O'Connor, hospital superintendent, after a conference with doctors, clergymen, social welfare workers, and representatives of Alcoholics Anonymous The meeting, attended by 30 persons, was held at the hospital at the request of Dr O'Connor

Dr Alfred L Ulrich, chief of the hospital's neuropsychiatric department, will be in charge of the clinic and will be assisted by an internist, yet to be named *

•

City Hospital in Binghamton has been approved for residencies in pathology and orthopedics

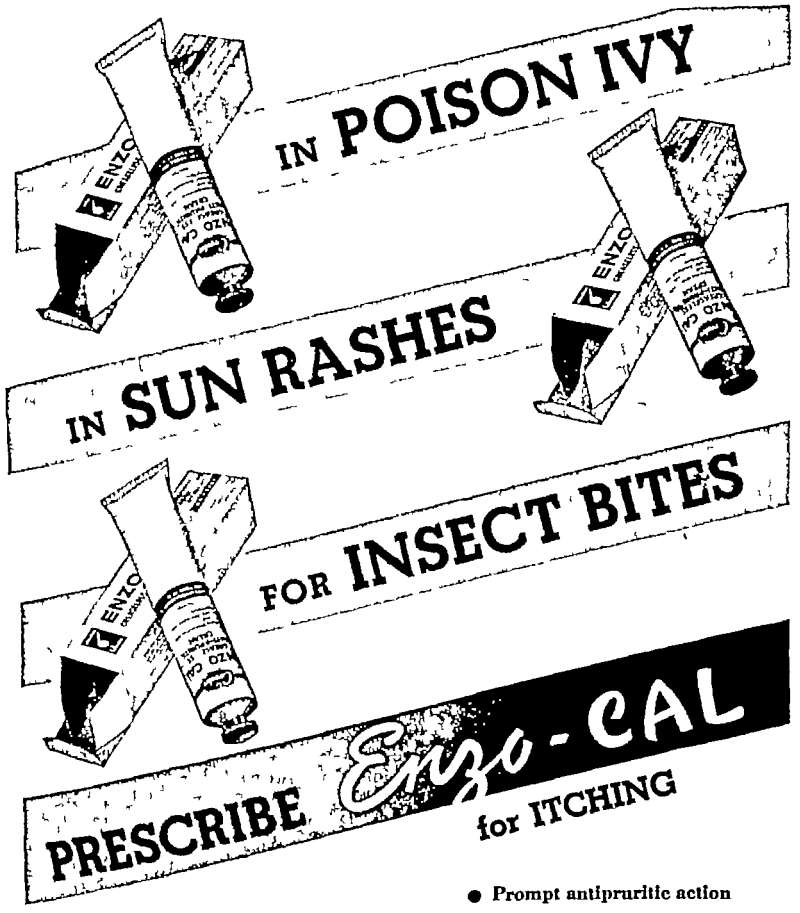
Under the approval by the American Medical Association and the American Boards of Pathology and Orthopedics, the hospital will accept doctors for "resident training" in these two divisions of medicine

This was announced by acting Manager Marion E Sawtelle, who said that "many returned veterans of World War II are now looking for this type of training"

Under the approval, City Hospital may now provide "quarters and facilities including full maintenance," for one man in each of these fields at a time, he added *

•

Testimonials in the form of bronze scrolls were presented to Drs Louis F Litch and John M Scannell, consulting surgeons of Mary Immaculate Hospital, at a dinner given recently in Brooklyn in their honor at the Commercial Hotel



About 130 attended the affair, sponsored by the doctors on the hospital staff to mark the retirement of the men as active attending surgeons, after a quarter of a century of service, to take consulting status *

•

"Mt Kisco will have one of the most modern hospitals in the county," Ralph Walker, of Chappaqua, executive vice-president of the Northern Westchester Hospital and Chairman of the Building Committee, said in commenting on the one-half

million dollar addition to the present hospital for which ground was broken in April

The new addition will be three stories high to the South of the building and will be red brick with white trim to conform with the present structure

It will contain a new kitchen, new dining rooms for the staff, new entrance, administration quarters for the superintendent and chief of nurses, convalescing porches, brand new surgery with two modern operating rooms, and central sterilizing rooms for entire hospital Forty-six beds, mostly private and semi-private will be added

A central storeroom will be developed in the basement of the present building and the present entrance in front of the hospital will be converted into a clinical pavilion, emergency operating rooms, examination rooms, x-ray department, and laboratory

The maternity section in the hospital will be revised and improved with a complete change and improvement of the nursery Improved parking grounds will complete the program *

• •

St. Elizabeth Hospital in Utica will be expanded to meet existing and future needs for increased hospital service

While details are tentative and subject to further action, it has been announced that in all probability the hospital will erect an additional building or buildings to cope with overcrowded conditions and to provide adequate service The plans call for the addition of about 100 beds *

• • •

Miss Cora Dean, of Gouverneur, has left the A Barton Hepburn Hospital of Ogdensburg a legacy of $5,000 for maintenance of a room in her memory *

• •

The Medical Board of Flushing Hospital has stretched out a helping hand to young North Queens' physicians by setting an age limit of 63 for attending physicians, surgeons, and specialists

The outpatient department recently has been considerably enlarged through the establishment of cardiology, metabolic and gastroenterology clinics

A complete reorganization of the medical department is under way and all other departments are filling positions according to a new table of organization

The new ruling means that the older doctors will automatically step down when they reach their sixty-third birthdays and that younger men, particularly doctors recently returned from military service, will replace them Shortly after the ruling goes into effect, two department directors will retire and their places will be filled by considerably younger men *

• •

Organization of a Hospital Council for Malone took place in March

Representatives of the following hospitals are members of the council The Alice Hyde, Malone, Potsdam Hospital, Massena Memorial, Stephen B Vanduzee, Gouverneur, Mercy Hospital, Tupper Lake, and the Gabriels Hospital. The Physicians' Hospital and the Champlain Valley of Plattsburgh, as well as the Moses Ludington Hospital of Ticonderoga, and the A Barton Hepburn of Ogdensburg, are also affiliated with the organization, but representatives of the institutions were unable to attend the organization meeting

Purpose of the Council, Miss Isabel M Reardon, superintendent of the Alice Hyde, said, is to secure the advantages of combined experiences, and standardize rates and policies, of the participating hospitals, as well and to exchange credit and collection informations of patients who enter the various hospitals from this area *

• • •

Howard S Cullman, president of the Beekman-Downtown Hospital, New York City, disclosed in April in his annual report that the drive for a new building under the chairmanship of William C Langley had raised $2,881,550 Despite the success of the campaign in surpassing the original goal by $131,550, Mr Cullman said it would be continued to raise $350,000 more for higher building costs The new building is planned as a 175-bed hospital *

•

Lenox Hill Hospital, New York City, is making its first general appeal for funds to meet increased operating costs

The annual report of the hospital's board of trustees disclosed an operating deficit in 1945 of $284,692, which William H Zinsser, president of the hospital, described as the highest since the hospital was incorporated in 1851

The report also showed that 13,489 patients, more than in any previous year, were cared for at the hospital last year A tribute was also paid to the volunteer workers and nurses' aides who helped maintain the full services of the hospital during the war years

Their work is commemorated by a bronze plaque in the hospital. Lenox Hill Hospital is a member of the Greater New York Fund and since 1880 a member of the United Hospital Fund *

At the Helm

Headed by Dr Thomas D'Angelo, of Flushing, president, officers of the Medical Board of Flushing Hospital were re-elected in April.

Dr J Coombes has been promoted from attending surgeon to consultant in surgery, and Dr E Allen Good from attending otorhinolaryngologist to consulting otorhinolaryngologist Dr William Benenson, Dr Benjamin Goldsmith, and Dr Edward Veprosky are new members of the board

The following Queens physicians have been reappointed as members of the consultant staff

Dr Herbert D Ayers, Sr, Flushing, dental surgery, Dr Abraham Braunstein, Long Island City, tuberculosis, Dr Frederick Courten, Richmond Hill, orthopedic surgeon, Dr Frank H Deely, Jamaica, surgery

Dr John F Dick, Flushing, physician emeritus, Dr Gustav P Frahm, Flushing, dental surgery, Dr Leonard B Goldman, Elmhurst, radiation therapy, Dr George J Lawrence, Sr, Flushing, gynecology-obstetrics, Dr J C McCauley, Jr,

Flushing, orthopedic surgery, Dr Johnston MacLeod, Flushing, medicine, Dr Charles B Story, Flushing, surgeon emeritus, Dr Joseph S Thomas, Flushing, consultant in surgery, Dr Joseph N Wickham, Flushing, surgeon emeritus, and Dr Frederick B Wood, Elmhurst, physician emeritus

Other officers of the board are Dr Frederick Carpenter, vice-president, Dr James R. Reuling, Jr, secretary-treasurer

Dr D'Angelo is chairman of the executive committee, which includes Dr Reuling, Dr Carpenter, Dr Abraham Levy, Dr Benjamin Darrah, Dr Harold Vogel, and Dr William K Rogers *

. . .

Dr Gene S Rogatti, of Valatie, has been appointed physician at the County Home at Ghent Dr Rogatti opened his office in Valatie after being honorably discharged from the Army *

. . .

Dr Kenneth E Snyder, of Scotia, who received his medical degree from Albany Medical college on March 22, began his internship at Doctors' Hospital, Washington, on April 1 *

. . .

Dr John Powell, of New York City, a native of Elmira, has joined the staff of St Joseph's Hospital as an intern after three and a half years with the Army Medical Corps *

. . .

Miss Miriam Hodges, R.N, has been engaged as the new superintendent of Canastota Memorial Hospital. She will succeed Mrs Elmer Lavery who has served as superintendent of the institution for the past ten years, and who has resigned the position to take effect June 1

Miss Hodges is a graduate of Middlebury College with a degree of B S in 1937 She also was graduated from a five-year nursing course in the School of Nursing at the University of Minnesota in December, 1943 She is a graduate nurse, a registered nurse, and also a certified public health nurse For about a year she served as a member of the U S Army Nurse Corps, seeing service in overseas hospital institutions in the Pacific area *

John R Normile, former assistant Broome County district attorney, in April was appointed to the Board of Managers of Binghamton City Hospital.*

. . .

Robert L Eckelberger, administrator of Wilson Memorial Hospital in Johnson City, is the new president of the Board of Managers of the Broome County Tuberculosis Hospital *

. . .

Dr Steward E Goldblatt, of Schenectady, has been appointed to the resident staff of the Perth Amboy, New Jersey, General Hospital *

. . .

Maj William D Millner has been named director of supplies in Rhoads General Hospital He replaces Maj W H Flanders who is leaving the hospital for overseas assignment *

. . .

Dr Cecil L Schultz, superintendent of the Columbia County Sanatorium at Philmont, has resigned his position to become officer, senior grade, of a large Veterans Administration hospital near Asheville, North Carolina He began his duties there June 1

Dr Schultz came to the county sanatorium August 1, 1934, succeeding Dr Samuel Post He served as president of the Columbia County Medical Society for two and a half years, and is a member of the American Society of Chest Physicians and of the American Trudeau Society He also is a member of the board of directors of the Columbia County Tuberculosis Eradication Association

Formerly, Dr Schultz was assistant superintendent at the J N Adams Memorial Hospital, at Perrysburg, maintained by the City of Buffalo A graduate of the University of Buffalo, College of Medicine, he served an internship in the Buffalo General Hospital and an additional year as resident physician on tuberculosis in the Buffalo City Hospital.

. . .

Dr Francis Carr was elected president of the medical board of St Agnes Hospital, White Plains, succeeding Dr Daniel MacDonald, at the annual meeting of the hospital's medical board and board of governors in March.

Dr Harry Klapper was elected vice-president, and Dr Henry J Vier, secretary *

MEMORIAL TO FLORENCE NIGHTINGALE

On May 13 a significant meeting was held in the Town Hall auditorium in New York City, when Gertrude Lawrence dedicated a memorial chair in the name of Florence Nightingale, as a tribute to all members of the nursing profession

This meeting was sponsored by the Board of Trustees of Town Hall in cooperation with the Town Hall Historical Committee of which Mrs James H Van Alen is chairman.

Following Miss Lawrence's reading of Longfellow's poem, "The Lamp," she was assisted in the unveiling of the Florence Nightingale chair by Miss Annie Warburton Goodrich, dean emeritus and founder of the Yale School of Nursing

Other speakers on the program were Mrs August Belmont, Board member, New York Chapter, American Red Cross, Mrs James H Van Alen, Dr Charles Edward A. Winslow, professor emeritus of the Yale School of Public Health, and Col Yale Kneeland, Jr, (MC), USA, consultant in medicine to the United Kingdom Base The topic discussed was "Our Nurses in War and Peace" Mrs George V Denny, Jr, president of Town Hall, Inc, presided Others who participated in the ceremonies were representative members from the nursing schools of Bellevue, Presbyterian, Lenox Hill, Beth Israel, Fordham hospitals, also from New York Hospital and the College of Mount St. Vincent

REVIEWED

Cancer of the Colon and Rectum Its Diagnosis and Treatment. By Fred W Rankin, M D, and A Stephens Graham, M D Second printing Octavo of 358 pages, illustrated Springfield, Ill, Charles C Thomas, 1939 Cloth, $5 50

In this outstanding volume are incorporated the experiences of the authors as well as the work of other surgeons, here and abroad, interested in cancer of the rectum and colon

The book is divided into three parts of five chapters each, covering the subject in an orderly, authoritative, and detailed manner Emphasis is placed on pathology, diagnosis, choice of operation, preoperative and postoperative care, and operative procedures

The reviewer is thoroughly in accord with the authors' statement in regard to the treatment of patients with carcinoma of the rectum, to wit " radical surgery is well worth while and that radical surgery may not be applied save by the use of colostomy "

By this time it is well known that Rankin "reluctantly abandoned" the routine use of intraperitoneal vaccine After giving some interesting figures, the authors state "This series of cases has convinced us that the decline of the mortality rate under cooperative management which included intraperitoneal vaccination was due more largely to the other rehabilitory and decompressive steps than to vaccine "

There are 133 excellent illustrations and 54 illuminating tables dealing with operability, operative mortality, and end results that reflect the progress made in the management of carcinoma of the large bowel

There are references at the conclusion of each chapter and a complete author index as well as an excellent index by subjects

The work is complete and should prove of inestimable value to those interested in the subject

A W Marino

Medical Diseases of War By Lt Col Sir Arthur Hurst, late R A M C, with the cooperation of seven authors Fourth edition. Octavo of 511 pages, illustrated Baltimore, Williams & Wilkins Co, 1944 Cloth, $6 00

Since 1916 this volume has grown from 151 pages to 510 Need much more be said to indicate its present breadth and completeness! Seven clinicians of prominence are associated with the distinguished author, and the result is a book of great value

One notes only one conspicuous omission filariasis The special syndromes are all included hysteria in its many phases, functional disorders of hearing and vision, exhaustive states, anxiety neuroses, effort syndrome, the varied types of hepatitis, trench fever, war nephritis, the malarias, typhoids, and dysenteries

The volume is splendidly written and can be highly recommended

Frank Bethel Cross

Textbook of Neuropathology By Arthur Weil, M D Second edition Octavo of 356 pages, illustrated New York, Grune & Stratton, 1945 Cloth, $5 50

This book reviews the present stage of our knowledge in neuropathology It contains a collection of facts which should enable one to obtain a better understanding of the reaction of the nervous system in disease It describes the pathology of the nervous tissues in such diseases as anemic softening of the brain, arteriosclerosis, infections, intoxications, concussion, skull fracture, and brain wounds The close relationship of the nervous system to its environment is emphasized by the influence of nutrition, internal secretion, and chemical changes There are also chapters describing the degenerative diseases of the brain, brain tumors, and congenital malformations of the brain The text is profusely illustrated The appendix describes the manner of removing the brain and spinal cord, the sectioning of it, and staining methods On the whole the book is very instructive and should be in the possession of every practitioner of medicine

Edward H Nidish

Infections of the Peritoneum By Bernhard Steinberg, M D Octavo of 455 pages, illustrated New York, Paul B Hoeber, Inc, 1944 Cloth, $8 00

The first one hundred and eighty pages of this excellent book are devoted, properly and thoroughly, to the academic discussion of developmental mechanism, applied physiology, pathology, and some other related subjects Then follow the chapters on the types of infection, with one devoted to illustrative histories The concluding three chapters consider treatment, with case histories illustrating therapeutic management

In the foreword, Dr Frederick A Coller, of Ann Arbor, tells of the experimental studies made by Dr Steinberg for many years and the value of the practical application of these studies Whether the coming years will find some new measures in the therapeusis of this dreaded and dreadful condition, the scientific studies of Dr Steinberg have added much to our present understanding of peritonitis, in our efforts to prevent its occurrence and to treat it in its varying phases

Joseph Raphael

Hope Deferred By Jeanette Seletz Octavo of 536 pages New York, Macmillan Co, 1943 Cloth, $2 75

The pilgrimage of Jone Brent through medical college, internship, romance, and beginning professional life is interesting reading There is a degree of scientific accuracy not often seen in books so highly colored with almost sentimental adoration of the profession The writer has the gift of inspiring identification with the characters in her reader

The age-old war of the idealist with the reality of his environment is well drawn The writer yields to the usual temptation of painting some characters white and some black and letting them fight it out through the book. Some day a book depicting the real war of each man with himself will be written, but this writer lacks that insight as yet, and so the book falls short of being great

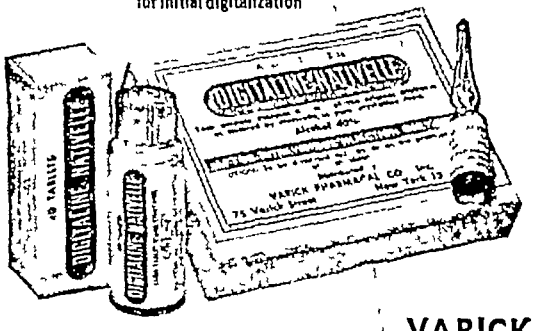
In Daily Maintenance, too...

ALL THESE ADVANTAGES

MAINTENANCE of sustained, unvarying, digitalization of the failing myocardium can be accomplished only through the use of cardiotonic drugs of uniform potency and dependable therapeutic action Differences in potency make for varying clinical results which, in the case of cardiac disease, may prove extremely distressing to both patient and physician



With Digitaline Nativelle—pure crystalline digitoxin—such uncertainty is circumvented Representing the chief cardiotonic glycoside of Digitalis purpurea, Digitaline Nativelle is so constant in potency and pharmacologic action that dosage can be and is measured by weight One tablet of 0 1 mg represents the therapeutic equivalent of 1 5 gr of standardized whole digitalis leaf, a ratio which reflects its high state of purity [1]

Dependable maintenance digitalization is effected by 0 1 mg daily, only rarely must this quantity be raised to 0 2 mg daily Thus no different instructions need be given the patient Because it is absorbed in toto, probably from the stomach, Digitaline Nativelle virtually never produces nausea or vomiting from local irritation [2]

If desired, rapid, *complete*, digitalization may be produced in 6 to 10 hours by the *oral* administration of 1 2 mg of Digitaline Nativelle,[3] given either at one time or in 2 doses of 0 6 mg each at a 3- to 6-hour interval

WHEN THE INTRAVENOUS ROUTE IS DESIRED

Digitaline Nativelle is available in ampuls of 0.2 mg (1 cc.) and 0 4 mg (2 cc.), in packages of 6 ampuls Intravenous dosage identical with oral dosage for initial digitalization

BAPTISM UNDER FIRE

Out of the experiences of amphibious warfare and beach landings has come hyoscine (scopolamine) for seasickness. Tested under rigorously controlled conditions[1] [2] by American and British Armed Forces, hyoscine, the major component of VASANO has proved its value in decreasing significantly distress due to motion of sea and air travel.

containing hyoscine and hyoscyamine as camphorates counters travel sickness by inhibiting vagus irritation and disturbances of the higher centers in susceptible individuals.

VASANO is available in tablet and suppository form and is best taken one to two hours before starting a trip. The usual dose consists of two tablets initially, followed if necessary by a third and fourth tablet four hours apart. When the use of tablets is not indicated, VASANO Suppositories may be employed, one suppository substituting for two tablets. No more than four tablets should be taken in twenty four hours.

Packaging: VASANO Tablets containing 0.1 mg hyoscine (scopolamine) camphorate and 0.4 mg. hyoscyamine camphorate, in boxes of twelve; VASANO Suppositories containing 0.2 mg. hyoscine (scopolamine) camphorate and 0.8 mg. hyoscyamine camphorate, in boxes of ten

For National Rehabilitation

Ice Cream is so Delicious

it's hard to believe

it can be so Nutritious!

But look what it provides

On top of its welcome deliciousness beyond its tempting, refreshing taste that everyone loves see what bounteous nourishment every helping of ice cream brings

Vitamins Ice Cream is a good source of Vitamin A and Riboflavin (Vitamin G) and contains other vitamins found in milk

Minerals Calcium necessary for strong bones and teeth, is supplied abundantly by Ice Cream

Proteins. Ice Cream provides high quality proteins those found in milk to promote health and well being

No other single food provides Ice Cream's particular combination of nutritive elements *No wonder* Ice Cream is playing a leading role in national rehabilitation and in lifting everyone's morale.

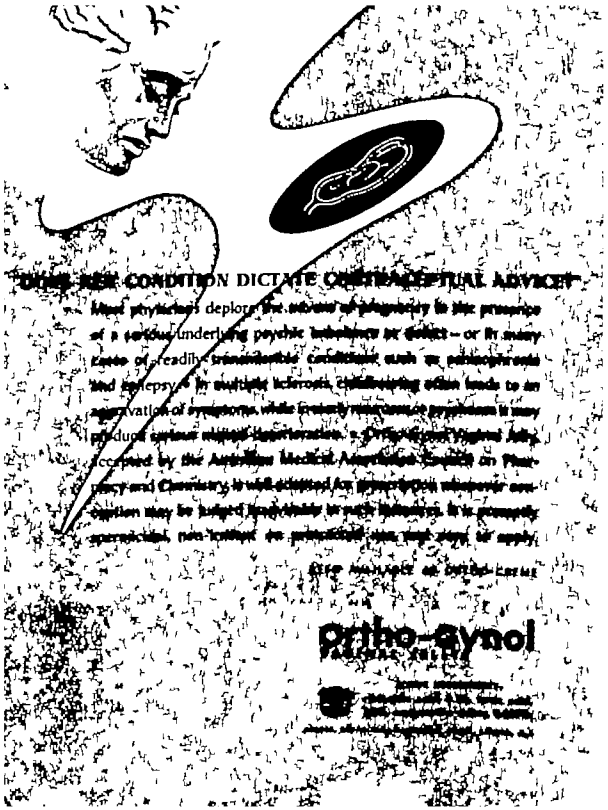
THESODATE Brewer

The ORIGINAL ENTERIC-COATED TABLET OF THEOBROMINE SODIUM ACETATE



to control frequency and severity of attacks in **CARDIOVASCULAR AND RENAL DISEASES** *and to prevent* **EDEMA**

Clinical experience and studies have proven the value of Theobromine Sodium Acetate in certain Cardiovascular and Renal Diseases In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs

It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin The enteric coating (especially developed for Thesodate) permits larger doses without the drug's contact with the Gastric Mucosa

Supplied—in 7½ grains with and without Phenobarbital ½ grain, in 5 grains with Potassium Iodide 2 grains and Phenobarbital ½ grain, and in 3¾ grains with and without Phenobarbital ¼ grain. Capsules, not enteric coated, are available in the same potencies for supplemen ary medication.

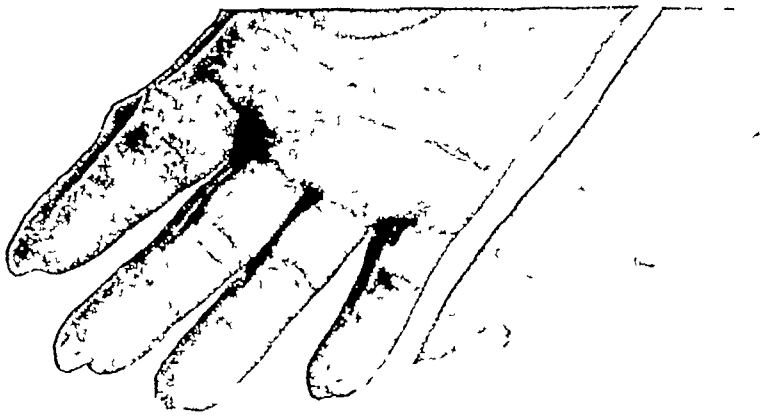
The "SMOOTHAGE" regimen in the treatment of constipation

A rounded teaspoonful of Metamucil stirred into a glass of water milk or fruit juice three times a day provides the soft mucilaginous bulk which is desirable for natural elimination Metamucil contains no roughage no oils no chemical irritants.



Metamucil is the highly purified non irritating extract of the seed of the psyllium Plantago ovata (50%) combined with anhydrous dextrose (50%). It mixes readily with liquids is palatable easy to take

Supplied in 1 lb., 8-oz. and 4-oz. containers

Metamucil is the registered trademark of G.D Searle & Co.

SEARLE

RESEARCH IN THE SERVICE OF MEDICINE

Tissue Stimulation To Promote Healing

IN slow-healing wounds, chronic ulcers, burns, suppurating wounds, or open amputation stumps, cod-liver oil has been shown to possess the property of stimulating the growth of granulations and of epithelium [1,2,3] Bacteriologic studies have shown that when infection is present, cod-liver oil lowers the vitality of pus-forming organisms [1]

Morruguent Ointment, containing cod-liver-oil concentrate, presents a 25 per cent greater content of the unsaponifiable fraction than is contained in cod-liver oil U S P, and none of the objectionable fish-oil odor The response to Morruguent is quickly apparent. Wound odor, if present, disappears Necrotic material is liquefied, granulation tissue fills the lesion, and epithelization is observed early after treatment is begun Healing takes place with a minimum of surface disfiguration

Morumide Ointment, 10 per cent sulfanilamide in a suitable base incorporating cod-liver-oil concentrate, adds the bactericidal and bacteriostatic efficacy of sulfanilamide to the cod-liver-oil effect.

presents a convenient and effective means of rapidly correcting hypochromic anemia and its associated multiple nutritional deficiencies, whether caused by inadequate food intake, increased requirement or by blood loss

EACH CAPSULE CONTAINS:

Ferrous Sulfate U S.P	4½ Grains
Vitamin A (Fish Liver Oil)	5,000 U S P Units
Vitamin D (Tuna Liver Oil)	500 U S P Units
Vitamin B_1 (Thiamine Hydrochloride)	2 mg
Vitamin B_2 (Riboflavin)	2 mg
Vitamin B_6 (Pyridoxine Hydrochloride)	0 1 mg
Calcium Pantothenate	0 333 mg
Niacinamide	10 mg

Together with a Liver Concentrate (Vitamin fraction) derived from 6.5 Gm fresh liver and dried yeast U S.P Not intended for use in the treatment of pernicious anemia

For the speedy correction of the anemia syndrome and its associated multiple nutritional deficiencies, iron alone is usually inadequate. *All* the lacking essential nutrients must be supplied by both diet and appropriate medication.

Supplied in boxes of 50 and 100 capsules

VITAMIN A

in Tomato Juice . . .

A growing appreciation of the importance of vitamin A in the diet leads to a consideration of the excellent source of this vitamin (as well as C) in tomato juice The vitamin A content of tomato juice is several times that of orange juice

In addition, it has been proved by Dr Harry Steenbock that the vitamin A content of the tomato is found principally in the meaty solids of the fruit Dr Walter Eddy states that the vitamin A content is in the pulpy part, hence the thicker juices are much richer in this essential factor "

Kemp s Sun Rayed tomato juice is a "thick" juice made from vine ripened, *whole,* U S Government grade, carefully cored tomatoes. All the vitamin packed solids are converted into juice by Kemp s patented process No 1746657 which insures high retention of vitamins A, B_1 and C, homogenizes the color ful solids and prevents the juice from being thin or watery

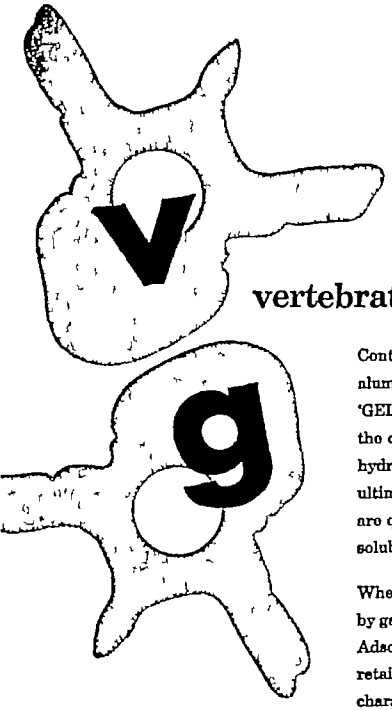
Similar to human milk

★The name is never abbreviated; and the product is not like any other infant food — notwithstanding a confusing similarity of names.



The fat of Similac has a physical and chemical composition that permits a fat retention comparable to that of breast milk fat (Holt, Tidwell & Kirk, Acta Pediatrica, Vol XVI, 1933) . In Similac the proteins are rendered soluble to a point approximating the soluble proteins in human milk Similac, like breast milk, has a consistently ZERO curd tension . The salt balance of Similac is strikingly like that of human milk (C W Martin, M D, New York State Journal of Medicine, Sept. 1, 1932) *No other substitute resembles breast milk in all of these respects*

ACCEPTED AMERICAN MEDICAL ASSN

A powdered, modified milk product especially prepared for infant feeding, made from tuberculin tested cow's milk (casein modified) from which part of the butter fat is removed and to which has been added lactose, olive oil, cocoanut oil, corn oil and fish liver oil concentrate.

WHERE NATURE WORKS HAND IN HAND WITH MEDICAL SKILL

Restorative treatments in the relaxing environment of the Saratoga Spa have become more widely known in medical circles as, year by year, increasing numbers of physicians have found them beneficial to patients

The therapeutic powers of the Spa's naturally carbonated mineral waters are being utilized more extensively than ever, for postwar strain is bringing us an unusually large number of patients suffering from cardiac, rheumatic or vascular disorders of a chronic nature.

Here your patient, relaxed in mind and body, is in skilled hands which are guided by your directions in a regimen of treatment that you recommend Well trained physicians are available in Saratoga Springs for consultation with your patient on the details of the program

Thus the Spa lightens your heavy burden, with full assurance that your patient will receive the best of care to prepare him for your continued medical direction

THE SARATOGA SPA

"PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

Many physicians have recently come to the Spa for the same kind of treatments that helped their patients here After a restorative "cure" at the Spa, you, too, would return to your practice refreshed—revitalized—ready for the busy days that still lie ahead

VOLUME 46 JUNE 15 1946 NUMBER 12

Editorial

The Social Aspects of Medicine

Under this title, the *Journal of Pediatrics*,[1] a periodical by and for pediatrists becomes the first medical journal in the country to feature regularly a section on this topic

The editors are to be heartily congratulated on this positive and forward-looking section. As the *Journal* says in part

> The very nature of their specialty has made them pioneers in the practice of preventive medicine It is true that early pediatrists conceived their role of service in this field to be primarily the prevention of disease This negative concept has recently enlarged to encompass the promotion and preservation of child health Acceptance of this expanded sphere of service calls for as keen a knowledge of social conditions as of medical science itself The medical forum inaugurated by the *Journal of Pediatrics* is a harbinger of the growing recognition by pediatrists of their expanding obligations as purveyors of medical care

In seven recommendations, the *Journal* covers a great deal of ground which should be carefully studied as a desirable pattern for discussions on social planning by any medical society

1 Let us not waste time saying that physicians are superior ethically to other occupational groups. Physicians by and large probably do not differ much from the general run of human beings It is much safer for us to assume that anyway

2 Let us not waste time, either, in saying how enlightened pediatricians are The pediatricians have been most forward in the practice of preventive medicine, but that development was a corollary to our work and need not go to our heads

3 Also, let us not waste time in protesting to achievements in medicine of the last [illegible] years as if they implied that the public must have no voice in determining medical [illegible] The achievements in medicine merely parallel those in chemistry, physics, and [illegible] they are just part of a general advance of science The essential point is that the [illegible] in medicine have far outstripped their practical applications and have created [illegible] possibilities.

The first three recommendations [illegible] avoid some of the worst pitfalls [illegible] most lamentable, futile, [illegible] sodic episodes of medical [illegible] aptly designated [illegible] verbo-floral tributes [illegible] nevertheless, dead-[illegible] are, if anything, just [illegible] commendation of [illegible] the exemplars in [illegible]

This was no pose This young man had personally never paid a medical fee in his life, believe it or not Until he left school, his medical bills had been paid by his family At school such minor accidents and cuts as he had had were dressed by the school nurse

At seventeen he had left school, and the war being on, had been absorbed into one of the war industries Either his family, the school physician or nurse, or workmen's compensation had supplied his medical service at no cost to him He had never considered, never had occasion to think about who paid his bills How many of him are there?

Survey

In a recent article[1] the results of a national inquiry conducted by *Medical Economics* among demobilized doctors are set forth

> Replies to a questionnaire sent to all physician-veterans reveal that many are "disgusted" by the attitude of their home-front colleagues, that some decry the lack of residencies, postgraduate courses, and hospital privileges, that some feel they have been let down by their medical societies, and that others gripe about the G I Bill of Rights, unfair licensure laws, the shortage of office space, housing, and cars, and the inroads of chiropractic and osteopathy A minority of the replies contain bouquets for the home front, most of them heave brickbats
>
> Statistically, the results (based on the first 2,000 replies received) seem to confirm the prediction made months ago by the editors of this publication that a majority of veterans would have to depend largely upon their own resources and initiative in re-establishing their practices

A study of the topics covered by the replies as set forth above seems to indicate that the well-known human nature has not changed a great deal, that the doctor is as good a griper as anybody, bar none, and that in the opinion of the demobilized doctors there is a good deal to complain about

This is hopeful Perhaps they will be serious enough about their gripes to question the government about the inadequacies of the G I Bill of Rights, the shortage of housing and cars, to question the leaders who, for one or another reason, are encouraging the work stoppages creating the housing shortages and lack of office space If licensure laws are unfair, why not change them?

Medicine is organized to a certain extent Membership in county, state, and national societies is open for all who qualify Everyone has a congressman and senator to whom he can write A national election is in the offing

The best way to improve conditions is first to become sufficiently irritated, then to exercise the resources and initiative which the editors of *Medical Economics* predicted would have to be used, and change the conditions for the better Make the gripes work for the profession and each individual in it

---

[1] "This is What Gripes Me," Medical Economics, March, 1946, p 111

Vomiting of Pregnancy

Among the annoying and often times distressing accompaniments of pregnancy is "heartburn" There have been conflicting ideas and theories about its causation The acidity of the gastric contents was once thought to play a major role, but various studies have shown that gastric acidity decreases as pregnancy advances and is at its lowest point during the third trimester when heartburn is apt to be most prevalent and severe Obviously then, the commonly employed bicarbonate of soda is irrational The change in the position of the stomach as the uterus rises, the increasing atony of its musculature, with relaxation of the cardiac sphincter, permitting access of the gastric

contents into the lower esophagus especially in the recumbent position, and finally the diminished motility which causes a delay in the normal emptying time, probably all contribute to the production of the symptom

These changes in the physiologic activity of the stomach during pregnancy substantiate the neuromuscular theory and suggest a possibly effective remedy, namely, prostigmine H M Wiley reports the results (*American Journal of Obstetrics and Gynecology*, February, 1946) obtained in series of 20 cases, using 15 mg tablets of prostigmine bromide The patients were directed to take the remedy as soon as the heartburn was noted and they experienced quick relief in all but a few cases Inasmuch as the simple effective dose is so small, there is little likelihood of any side reactions and the dose may be repeated daily as needed The procedure is worthy of further trial

Current Editorial Comment

War and Disease The health of the American people in 1945, still *without benefit of meddlesome, bureaucratic, Federal dictation, and control be it noted* seems to persist in being excellent It does not appear that this fact will appease the curiosity of proponents of state medicine to find out at the people's expense by legislative experiment how bureaucratic interference can change all that Well, anyway, here is the picture under free enterprise,[1] at least for medicine

War and disease are traditional allies Yet, the health of the American people, as reflected by the death rate, has been maintained at a very high level in 1945, as it has been throughout the war period Last year, among the many millions of industrial policyholders of the Metropolitan Life Insurance Company, the death rate, exclusive of losses from enemy action was 7 4 per 1,000, or 2.2 per cent below the comparable figure for 1944, and only a shade above the all-time low of 7.3 registered in 1942 If adjustment could be made for changes in the age distribution of this insured population it is very probable that the death rate in 1945 would establish a new minimum.

The expectation of life at birth among the industrial policyholders in 1945, excluding deaths from enemy action, was 65 02 years, or 0 62 years above the figure for 1944

In the years 1879 to 1889 the expectant citizen-taxpayer at birth could look forward to thirty-four years in which to enjoy life, liberty, and the pursuit of happiness under a flourishing young free enterprise system strongly sustained by the Bill of Rights, a good five-cent nickel, gold coin in exchange for greenbacks,[2] the Civil Service Reform Act,[3] reduction in postage for letters weighing not less than half an ounce from 3 to 2 cents,[4] and in 1885 letters weighing a full ounce for the same two cents, the Alien Contract Labor Act,[5] "boycotting" of labor by employers, the formation of the A F of L,[6] and the strengthening by Congress of the Department of Agriculture,[7] the year of strikes[8] beginning with the horse-car drivers and conductors in New York, demanding an eight-hour day and increased wages, the Standard Oil Company,[9] and the Western Union Telegraph Company;[10] the Interstate Commerce Act;[11] the admission of four new states to the Union, Montana, Washington, North Dakota, and South Dakota [12]

From 1879 to 1945, life expectancy increased by thirty-one years,[1] to a figure of 65 This was accomplished in spite of three wars (1898–1917–1941), twelve New Deal years all of the sixty-six year period totally without Federally controlled medicine except in the armed forces and the United States Public Health Service, and in spite of Mr Truman's deductions in his 1945 pleas for a National Health Bill from draft rejection figures, and in spite of the mounting toll of death from the great American killer—the automobile

Thus, at the beginning of 1946, the newborn citizen taxpayer has at his disposal sixty-five years of three hundred and sixty five days each in which to enjoy life the best way he can, pay his just debts or just pay his debts whichever is simpler, watch the U N O or the Congress of the United States whichever is funnier, read

Make It Simple Lively words of wisdom come from the pen of Dr Paul B Brooks in *Health News*[1] His subject is timely and very much to the point This JOURNAL has, from time to time, advocated better public relations for the medical profession Surely a good start could be made if what the doctors have to say were intelligible to those who are courteous enough to listen to them "Doctor Jones" says

Using fancy words where simple ones'll do—I was just reading, here, some extracts from an article—this fellow's criticizing social workers for what he calls "robing the simplest thoughts in cabalistic phrases" ("Cabalistic"—I take it what he means there is something mysterious—not easily understood) And claims they tend to dress up their ideas in language so involved and technical that it takes an expert to interpret it into anything an ordinary person could understand Those aren't his words but that's the general idea

Well, from what I've read of things social workers have written, I can't say't I ever noticed that particularly About the worst offenders, I'd say, are the doctors—with engineers a close second They use a technical language—a good many of 'em do—that's largely made up of "ten-dollar" words and then they wonder why their ideas don't seem to register with ordinary folks

These word tests,' like the magazines have been running—I got quite a letdown when I started trying 'em You know, they give you a list of more or less unusual words and you're supposed to check the meaning you think is right and then look over the page to see what your rating is Well, sir, I've been looking up words in the dictionary ever since I was a kid and I started out expecting to get a rating of "Excellent," to say the least About the best I've ever been able to do was "Fair" Not wanting to admit that I was dumb, I concluded that simple words had answered my purpose so well I hadn't had occasion to use the fancy ones

Of course improving our vocabulary—it ought to be encouraged And using words they have to look up in the dictionary—I s'pose it makes a good impression sometimes But what we've got to say—if it's important for ordinary folks to understand it, it's sort of necessary to speak a language that they don't have to have an interpreter translate it for 'em I figure the less words we use the more people they're liable to reach Yes, words are like some clothes it's remarkable how few you can get along with and still get by

And while we're on the subject, perhaps this applies as well to the written word as to the spoken We have on what remains of our battered editorial conscience an uncomfortable feeling that even writing primarily, as we are supposed to do, for doctors we have transgressed (sinned) with the result that not as many readers as we could wish have comprehended (understood) what it was all about

• • •

Straws in the Winds of 1946. The public reads newspapers and magazines, not medical journals Doctors are supposed to read both, and to practice medicine

Suppose that the practice of medicine by day and reading medical journals all night should confine the doctors' digest of the newspapers to a brief session (interrupted by the doorbell and the telephone) *in camera* with the shaving brush and the dull razor blade, what would the public have read of importance to the doctor that the doctor should have read? We shall attempt to excerpt some of the important things of the new year's news

Mark Sullivan says[2] that a main issue for 1946 is the fate of free enterprise in the United States

The issue exists There is an American economic system—call it free enterprise, or private ownership with competition, or capitalism, or what have you This system is under attack, in America and throughout the world In other countries the attack has been so successful that America is today the only large country maintaining the system On this issue Congress is for maintaining the system, uncompromisingly

This is the view of an experienced newswriter who is close to congressional sources It has significance for organized medicine, since it aligns the Congress squarely behind the fight against socialized medicine, and emphasizes the importance of constant communication between physicians and their elected representatives If your congressman and senator are fighting for what you believe to be right, tell them so

TULAREMIA IN NEW YORK STATE

I J Tartakow, M D ,* Hempstead, New York

THE man who picks up his gun, whistles to his dog, and starts out for a day's hunt for wild rabbits, is, no doubt, fully aware of the dangers which may result from the careless handling of firearms He may not, however, suspect that danger also lurks in the bodies of the apparently harmless little animals he is carrying home in his bag The housewife and the cook who dress or handle wild rabbits, and the trapper whose hands come in contact with the raw flesh and blood of the rodents whose pelts he is removing for the market, may be exposing themselves to a risk unknown to them

The disease which man may acquire in his search for fun, food, and fur is known as tularemia. It causes prolonged morbidity and disability, and has a case fatality rate of about 5 per cent. Cases have been reported in all forty-eight states as well as in several foreign countries In 1938 there were 2,088 cases with 139 deaths reported in the United States During the past three years, from 1942 through 1944, a total of 2,449 cases of tularemia was reported The greatest number occurred in the Central States, with Illinois, Ohio, and Missouri leading all the rest. New York State had 81 cases with five deaths since 1927 Of that number, 45 occurred in New York City, 4 of which terminated fatally Approximately all of the cases in New York City were caused by the handling of wild rabbits supposedly brought in from areas outside of the city In December, 1936, an outbreak of tularemia occurred in New York City in which 13 persons, all of whom had been in contact with wild rabbits, were involved

Although tularemia is, relatively speaking, not a common infectious disease, the physician may be called upon, particularly during the hunting season, to see one or more such cases. Four cases have come to the attention of the author, and diagnosis in each instance was not made by the attending physician until one month, or more, after onset

In this paper, the author presents the four cases studied by him and discusses the other cases registered in New York State since 1927 The recent literature is reviewed in an attempt to familiarize the reader with developments in the epidemiology, laboratory diagnosis, and treatment of the disease Control measures through legislation are discussed, and personal precautions to avoid infection are described

* Epidemiologist, Division of Communicable Diseases, Nassau County Department of Health Mineola, New York.

Case Reports

Case 1 —A party of four hunters on November 4 1943, shot five cottontail rabbits near Quogue, which is located on the south shore of Suffolk County One rabbit according to one of the hunters, was shot while not on the run The game was divided among three members of the party two of whom skinned and cleaned several of the animals for their own consumption and distributed the remainder among their friends Both men remained in good health and none of the other persons who skinned, handled, or ate their rabbits became ill

The third huntsman divided nine rabbits, which were his share of the kill among his two brothers and two of his employees. All skinned and cleaned their own rabbits and none suffered any illness with the exception of one of the brothers, G H , a garage owner 48 years of age, residing in the Town of Hempstead, Nassau County This man skinned and cleaned two rabbits on the evening of November 4. His wife soaked them in salt water overnight and the following morning cut up and pot-roasted one in a pressure cooker at 320 F for twenty minutes. The cooked meat was eaten by G H , his wife, and 13-year-old son, and his father-in-law

A day or two prior to handling the rabbits, the garage owner had broken the skin of his right thumb and left index finger while doing some mechanical work On the morning of November 6, he suffered a severe headache, nausea, weakness, fever, and chills. The wounds on his fingers appeared infected His family physician diagnosed his illness as grippe and prescribed antipyretics. On November 7 the lymph glands in both axillae became swollen and tender There was moderate ulceration of the infected digital lesions with progressive enlargement of the axillary glands.

The red cell count on November 20 was 3,670 000 cells per cubic millimeter with a hemoglobin of 72 per cent. The white cell count was 12,700 with a normal-appearing smear and differential count. Specimens of blood serum on December 8 and December 27 were found to agglutinate Pasturella tularensis in dilution of 1 20 and 1 60, respectively, establishing the diagnosis.

The fever and weakness continued for about six weeks. Suppuration of the glands on the left side necessitated incision and drainage on December 23 and December 27 Two small subcutaneous nodules developed on the right hand and one on the left hand near the digital lesions. Drainage of the incised bubo continued for about two weeks after which the incision healed. Convalescence was slow The other members of the family escaped illness.

Case 2 —On November 6 G H (Case 1) gave the second rabbit already skinned and cleaned and soaked in salt water, to B D , a 46-year-old roofer from Queens New York City, whom he had engaged to make repairs on his home. On his arrival home

about the strikes or attend the ball game whichever is more exciting, put in an order for a new automobile and hope that he may get it before his life expectancy runs out or the atomic bomb gets him

Make It Simple Lively words of wisdom come from the pen of Dr Paul B Brooks in *Health News*[1] His subject is timely and very much to the point This JOURNAL has, from time to time, advocated better public relations for the medical profession Surely a good start could be made if what the doctors have to say were intelligible to those who are courteous enough to listen to them "Doctor Jones" says

Using fancy words where simple ones'll do—I was just reading, here, some extracts from an article—this fellow's criticizing social workers for what he calls "robing the simplest thoughts in cabalistic phrases" ("Cabalistic"—I take it what he means there is something mysterious—not easily understood) And claims they tend to dress up their ideas in language so involved and technical that it takes an expert to interpret it into anything an ordinary person could understand Those aren't his words but that's the general idea

Well, from what I've read of things social workers have written, I can't say't I ever noticed that particularly About the worst offenders, I'd say, are the doctors—with engineers a close second They use a technical language—a good many of 'em do—that's largely made up of "ten-dollar" words and then they wonder why their ideas don't seem to register with ordinary folks

These word tests, like the magazines have been running—I got quite a letdown when I started trying 'em You know, they give you a list of more or less unusual words and you're supposed to check the meaning you think is right and then look over the page to see what your rating is Well, sir, I've been looking up words in the dictionary ever since I was a kid and I started out expecting to get a rating of "Excellent," to say the least About the best I've ever been able to do was "Fair" Not wanting to admit that I was dumb, I concluded that simple words had answered my purpose so well I hadn't had occasion to use the fancy ones

Of course improving our vocabulary—it ought to be encouraged And using words they have to look up in the dictionary—I s'pose it makes a good impression sometimes But what we've got to say—if it's important for ordinary folks to understand it, it's sort of necessary to speak a language that they don't have to have an interpreter translate it for 'em I figure the less words we use the more people they're liable to reach Yes, words are like some clothes it's remarkable how few you can get along with and still get by

And while we're on the subject, perhaps this applies as well to the written word as to the spoken We have on what remains of our battered editorial conscience an uncomfortable feeling that even writing primarily, as we are supposed to do, for doctors we have transgressed (sinned) with the result that not as many readers as we could wish have comprehended (understood) what it was all about

• • •

Straws in the Winds of 1946 The public reads newspapers and magazines, not medical journals Doctors are supposed to read both, and to practice medicine

Suppose that the practice of medicine by day and reading medical journals all night should confine the doctors' digest of the newspapers to a brief session (interrupted by the doorbell and the telephone) *in camera* with the shaving brush and the dull razor blade, what would the public have read of importance to the doctor that the doctor should have read? We shall attempt to excerpt some of the important things of the new year's news

Mark Sullivan says[2] that a main issue for 1946 is the fate of free enterprise in the United States

> The issue exists There is an American economic system—call it free enterprise, or private ownership with competition, or capitalism, or what have you This system is under attack, in America and throughout the world In other countries the attack has been so successful that America is today the only large country maintaining the system On this issue Congress is for maintaining the system, uncompromisingly

This is the view of an experienced newswriter who is close to congressional sources It has significance for organized medicine, since it aligns the Congress squarely behind the fight against socialized medicine, and emphasizes the importance of constant communication between physicians and their elected representatives If your congressman and senator are fighting for what you believe to be right, tell them so

TULAREMIA IN NEW YORK STATE

I J Tartakow, M D ,* Hempstead, New York

THE man who picks up his gun, whistles to his dog, and starts out for a day's hunt for wild rabbits, is, no doubt, fully aware of the dangers which may result from the careless handling of firearms He may not, however, suspect that danger also lurks in the bodies of the apparently harmless little animals he is carrying home in his bag The housewife and the cook who dress or handle wild rabbits, and the trapper whose hands come in contact with the raw flesh and blood of the rodents whose pelts he is removing for the market, may be exposing themselves to a risk unknown to them

The disease which man may acquire in his search for fun, food, and fur is known as tularemia It causes prolonged morbidity and disability, and has a case fatality rate of about 5 per cent. Cases have been reported in all forty-eight states as well as in several foreign countries In 1938 there were 2,088 cases with 139 deaths reported in the United States During the past three years, from 1942 through 1944, a total of 2,449 cases of tularemia was reported The greatest number occurred in the Central States with Illinois, Ohio, and Missouri leading all the rest. New York State had 81 cases with five deaths since 1927 Of that number, 45 occurred in New York City, 4 of which terminated fatally Approximately all of the cases in New York City were caused by the handling of wild rabbits supposedly brought in from areas outside of the city In December, 1936, an outbreak of tularemia occurred in New York City in which 13 persons, all of whom had been in contact with wild rabbits, were involved

Although tularemia is, relatively speaking, not a common infectious disease, the physician may be called upon, particularly during the hunting season, to see one or more such cases. Four cases have come to the attention of the author, and diagnosis in each instance was not made by the attending physician until one month, or more, after onset.

In this paper, the author presents the four cases studied by him and discusses the other cases registered in New York State since 1927 The recent literature is reviewed in an attempt to familiarize the reader with developments in the epidemiology, laboratory diagnosis, and treatment of the disease Control measures through legislation are discussed, and personal precautions to avoid infection are described

* Epidemiologist, Division of Communicable Diseases, Nassau County Department of Health Mineola New York

Case Reports

Case 1 —A party of four hunters on November 4 1943 shot five cottontail rabbits near Quogue which is located on the south shore of Suffolk County One rabbit, according to one of the hunters was shot while not on the run. The game was divided among three members of the party two of whom skinned and cleaned several of the animals for their own consumption and distributed the remainder among their friends. Both men remained in good health and none of the other persons who skinned handled or ate their rabbits became ill

The third huntsman divided nine rabbits, which were his share of the kill, among his two brothers and two of his employees All skinned and cleaned their own rabbits and none suffered any illness with the exception of one of the brothers, G H a garage owner, 48 years of age, residing in the Town of Hempstead Nassau County This man skinned and cleaned two rabbits on the evening of November 4 His wife soaked them in salt water overnight and the following morning cut up and pot-roasted one in a pressure cooker at 320 F for twenty minutes. The cooked meat was eaten by G H , his wife, and 13-year-old son, and his father-in-law

A day or two prior to handling the rabbits, the garage owner had broken the skin of his right thumb and left index finger while doing some mechanical work On the morning of November 6, he suffered a severe headache, nausea, weakness, fever and chills The wounds on his fingers appeared infected. His family physician diagnosed his illness as grippe and prescribed antipyretics. On November 7 the lymph glands in both axillae became swollen and tender There was moderate ulceration of the infected digital lesions with progressive enlargement of the axillary glands.

The red cell count on November 20 was 3,070,000 cells per cubic millimeter with a hemoglobin of 72 per cent. The white cell count was 12,700 with a normal-appearing smear and differential count. Specimens of blood serum on December 8 and December 27 were found to agglutinate Pasturella tularensis in dilution of 1 20 and 1 60, respectively establishing the diagnosis.

The fever and weakness continued for about six weeks. Suppuration of the glands on the left side necessitated incision and drainage on December 23 and December 27 Two small subcutaneous nodules developed on the right hand and one on the left hand near the digital lesions. Drainage of the incised bubo continued for about two weeks after which the incision healed Convalescence was slow The other members of the family escaped illness.

Case 2 —On November 6 G H (Case 1) gave the second rabbit, already skinned and cleaned and soaked in salt water to B D , a 46-year-old roofer from Queens New York City, whom he had engaged to make repairs on his home. On his arrival home,

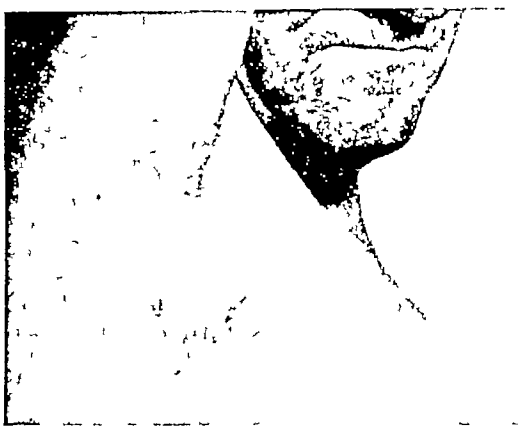

FIG 1 Case 2, B D, showing axillary bubo

B D unwrapped the rabbit, placed it on a dish, and put it in the refrigerator Later that evening he held the animal in his hands long enough to show it to his brother-in-law, and then replaced it in the refrigerator On the morning of November 8 he developed severe headache, sweats, chills, and fever A wound on his right thumb, which he had cut about a week before and which had become infected, appeared more inflamed A few days later, the glands in his right axilla became enlarged and painful A tender subcutaneous nodule appeared at the base of the right thumb He was too ill to eat any of the rabbit which was cooked on the afternoon of November 8

When he was seen on December 27, the right axillary bubo which was about the size of a hen's egg (Fig 1) was tender but nonfluctuant The lymphatic vessels along the inner aspect of his right arm felt hard and bead-like A specimen of blood examined at that time was found to give characteristic agglutination with Past. tularensis in a 1 1200 dilution of the serum Agglutination was also obtained with Brucella abortus in a 1 320d ilution of the serum

As the axillary bubo persisted, he was hospitalized six months later, at which time the bubo was aspirated and 40 cc of thin yellow pus was removed No Past tularensis was found on culturing this fluid Agglutination of his serum with Past tularensis in a 1 5120 dilution was obtained at that time Wassermann and Kahn tests were negative

The infected axillary gland failed to subside after several aspirations He was readmitted to the hospital after two months and an incision and drainage of the bubo was performed Staphylococcus aureus was found on culture The wound healed after several weeks

None of the other members of his household, which consisted of the patient's sister, her husband, and their two children, all of whom ate portions of the cooked meat, were affected

It may be assumed that both Cases 1 and 2 contracted their infection from the second rabbit which was the only animal handled by both patients This was probably the rabbit which one of the hunters remembers shooting while not on the run In Case 2 infection occurred apparently during the brief contact when the patient unwrapped and placed the rabbit in the refrigerator, and later when he showed it to his brother-in-law It is significant that neither the wife of Case 1 nor the sister of Case 2, both of whom handled the raw meat of the infected animal, became ill Neither had any abrasions or lacerations of the hands at the time Unbroken skin, however, is not necessarily a safeguard against infection, as demonstrated by Case 3

Case 3—M deG, a 60-year-old housewife, of Rockville Centre, Nassau County, and her husband, drove on November 17, 1944, to Marshall, Virginia, for a seven-day vacation On November 23 her husband went hunting and brought home five cottontail rabbits These were cleaned and skinned by a *handyman, and hung up in the ice house Three of* the rabbits were brought to Rockville Centre on November 25 Mrs M deG washed and cut them up on the following day, and placed the meat in diluted vinegar On November 29 she suddenly had chills and high fever, with malaise and headache She also vomited several times and had general body pain The following day she noticed a small tender inflamed area on the outer aspect of the little finger of the right hand and complained of pain over the right axillary nodes The digital lesion became pustular and ulcerated, and the axillary glands enlarged and tender

As she failed to improve under sulfadiazine treatment, she was hospitalized and penicillin was administered Specimens of blood gave no agglutination with Eberthella typhosum, Bacillus paratyphosum, Brucella abortus, and Bacillus proteus OX19 On January 11 and January 18 characteristic agglutination with Past tularensis in a 1 320 dilution of the serum was obtained

Improvement was gradual She remained at the hospital for five weeks, at which time both the primary lesion healed and the bubo subsided. Convalescence, however, was slow and weakness persisted for three to four additional weeks

The rabbit meat had been cooked by a friend of the family on December 2 It was eaten by the friend, her husband, and the patient's husband None of these persons, including the handyman in Virginia who skinned the rabbits, became ill.

In this case the causative organism seems to have penetrated apparently unbroken skin, as the patient denied having injured the digit on which the primary lesion developed, neither prior to nor at the time of handling the rabbit meat The author recently learned that a subsequent case (Tables 1 and 2, Case Z A) which occurred in Buffalo in December, 1944, following the handling of wild rabbit, gave a similar history of not being aware of any abrasions or lacerations previous to the appearance of the initial digital ulcer

Case 4.—T S, a 14½-year-old white boy, a high

[1] Not reported as tularemia was first made reportable in 1939. This was the first case recognized in Upstate New York.
[2] Died December 19 1932.
[3] Not reported at time discovered through blood agglutination in 1939.
[4] Daughter of F. M.
[5] Discovered upon investigation of other trappers after case of L. W.

school student of Baldwin, Nassau County, hunted wild rabbits on November 1, 3, and 4 in the southern portion of the village of Wantagh. On November 7 he hunted in some woods in northern Baldwin. While walking through the woods he scratched his right thumb on some briars. He later shot a cotton tail rabbit which he skinned and cleaned. Three days later, he noted that the scratch on his thumb appeared infected and he felt feverish. On November 13 the lymph gland in his right axilla became tender and swollen. Fever, sweats, and weakness persisted for about three weeks. As the axillary bubo increased in size it was incised and drained. A blood specimen submitted on December 7 was reported as giving characteristic agglutination with Past. tularensis in a 1:1200 dilution of the serum.

The significance of this case is its indication that tularemia apparently exists among wild cottontail rabbits within Nassau County.

Cases of Tularemia in New York State

Analysis of the 36 cases reported among residents in upstate New York, based upon data made available through the courtesy of the New York State Department of Health (Tables 1 and 2) reveals that 24, or 66.7 per cent, of the cases occurred among males, and 12, or 33.3 per cent, among females. All of these cases, with the exception of two 14-year-old boys, were adults ranging in age from 20 to 68 years. The onset in 20, or 55.8 per cent, of the 34 cases in which the date of onset is known, occurred during the months of November and December.

The first case in New York State was discovered in 1927 in the city of Buffalo. The patient was a chef who dressed a market rabbit. Prior to 1936, 11 cases were reported in upstate New York. The source of one of the cases is unknown. All but one of the other cases contracted their infection from rabbits, ten of which were purchased at market and originally imported from the Middle West. One case occurred in a laboratory worker who handled a rabbit from Kansas. The one exception occurred in 1930 and was supposedly contracted while dressing a deer that had been shot in the Adirondack Mountains in Essex County. One death resulted in 1932.

Three cases occurred in 1936. One patient became infected in Maryland and the other two cases occurred in a mother and daughter from Rochester, with the source suspected to be rabbits shot in Ontario County, New York.

Two cases were reported in 1938. The source

[1] Case discovered in 1939 through blood agglutination test.

of the infection in one patient, a Rochester resident, was found to be rabbits hunted in Wayne County The other contracted the infection from Illinois rabbits

In 1939, 7 cases were reported, one of which was infected in Missouri The other 6 patients contracted their infection from various wild life within New York State two who trapped and skinned muskrats in Oswego County, two who hunted and skinned wild rabbits, one from Jefferson County and one from Suffolk County, one was a hunter who shot and skinned a red fox in St Lawrence County, and one a farmer in Broome County who gave a history of having been bitten by a deer fly

A single case occurred in 1941 in a New York City hunter who skinned cottontail rabbits which he had killed in Suffolk County Three muskrat trappers from Wayne County became infected in 1942

In 1943 a farmer, also from Wayne County, acquired the disease following a bite from his cat which was an ardent rabbit hunter, and a housewife from Oneida County became ill following the handling of local wild rabbits Two additional cases occurred later that year in men who had handled Suffolk County wild cottontail rabbits (Cases 1 and 2)

During the first eleven months of 1945, of 4 cases reported, the onset in 2 was in 1944 An imported wild rabbit was responsible for 1 (Case 3) The source of infection in the third reported case, which occurred in a 14-year-old school boy from Suffolk County, was not available at the time of the writing of this paper The most recent case was in a 14 1/2-year-old boy from Nassau County (Case 4)

Of the 36 cases which are known to have occurred in upstate New York, 24, or 66 7 per cent, were caused by rabbits, ten of which were killed within the state Seven other persons contracted their infection from other wild life (muskrats, red fox, and deer) hunted and killed within the borders of New York State (Table 3)

The occurrence of 19 cases with the source of infection within New York State would suggest that this disease may be more common among wild life in this state than is ordinarily assumed These cases, the distribution of which is shown in map 1, indicate that tularemia exists in enzootic form among wild life in those counties, and, under favorable conditions, may become epizootic

Definition and Etiologic Agent

Tularemia is primarily an acute infectious disease of wild rodents which may result in an accidental infection of man It is also known as

TABLE 2.—SOURCES OF INFECTION OF 38 CASES OF TULAREMIA REPORTED IN UPSTATE NEW YORK 1927–1945*

* Through November 1945.

rabbit fever and deer fly fever The etiologic agent belongs to the group of micro-organisms which are named Pasteurella because they cause pasteurelloses or hemorrhagic septicemias of animals The outstanding member of this group is Pasteurella pestis, or the plague bacillus

Pasturella tularensis is pleomorphic or variable in form. Most often it is bacillary, but coccoid or bipolar forms are noted It is gram-negative, aerobic, nonmotile, and nonspore-bearing. It is readily destroyed by ordinary disinfectants and by temperatures above 56 C

Epidemiology

Burroughs and his coworkers[1] have reviewed the literature and have compiled a list of 48 vertebrates known to be naturally infected with tularemia Various forms of wild rabbits and wild hares (cottontail, jack rabbits, and snowshoe hares) are the direct cause of over 90 per cent of human cases in the United States [2] Analysis of 249 cases in Iowa by Jordan[3] and 120 cases in Kansas by Brown and his associates,[4] revealed similar results It is estimated that about one per cent of the wild rabbits and hares in this country are naturally infected [5] Rabbits raised under domestic conditions in rabbitries and hatches, although highly susceptible, have not been found naturally infected, due, probably, to their freedom from ticks. The snowshoe hare, which is more or less resistant to tularemia, is apt to survive infection. It may appear perfectly normal when shot and reveal no gross lesions upon autopsy, yet Past tularensis may be isolated from the internal organs.[6] The relatively small number of these rodents in New York State may account for the low prevalence of tularemia in this state

A number of other wild animals susceptible to the disease and capable of transmitting it to man are the ground and tree squirrel, woodchuck, opposum, raccoon, skunk, beaver, fox, shrew, chipmunk, guinea pig, deer, bull snake, and various types of rats and mice Among birds, infection has been reported in grouse, quail, sage hen, owl, and gull The domestic dog,[7,8] cat, sheep, and calf have also been found infected

The disease is transmitted to animals principally by the bite of infected blood-sucking arachnids or insects, such as the tick, deer fly, rat flea, squirrel flea, rabbit tick, louse, and flea The main and permanent reservoir of infection is the wood tick, Dermacentor andersoni,[9] and the dog tick, Dermacentor variabolis,[10] which are capable of transmitting the infection through its eggs on to successive generations The rabbit tick, Haemaphysalis leporis-palustris, which rarely bites man, but transmits infection from rabbit to rabbit, is also an important vector

In his excellent paper on Rocky Mountain spotted fever, Parker[11] states "In connection with spread, it is worth noting that fully as high a per cent of spotted fever infected rabbit ticks is met with among those taken from birds as among those collected from rabbits, and since birds of the species involved move about considerably, within at least limited areas, it may be readily comprehended that this tick and its bird hosts form an excellent means for intense local distribution of the virus and, possibly, in some instances for its transportation over long distances " It is conceivable that tularemia infected rabbit ticks may be transported in a similar manner from areas where tularemia is epizootic

Occasionally, animals contract the disease by eating the carcass of an infected animal

Tularemia may be transmitted to man directly by the bite of the infected tick or deer fly Byfield and his associates[12] recently reported 15 tick-borne cases which occurred within a thirty-day period among soldiers on maneuvers in Tennessee Hillman and Morgan[13] reported the occurrence of 27 cases during three weeks in July among men in a Civilian Conservation Camp in Utah, all of whom were bitten by deer flies

Persons whose occupations or recreational inclinations expose them to contact with animals and insects have a high infection rate. Hunters, market men, butchers, cooks, and housewives who skin and dress wild rabbits with bare hands, become ill as the result of contact with the blood, liver, spleen, or bone marrow of an infected animal In most instances, the point of entry of the organism is a wound of the hand inflicted shortly before by barbed wire, nail, thorn or burr, or at the time of contact by a knife or bone fragment The organism may, however, penetrate apparently unbroken skin, as in the author's Case 3 Trappers may become ill as the result of contact with, or bite by, an infected wild animal

Campers, woodsmen, and foresters are exposed to bites from infected ticks or deer flies Shearers and herders acquire the disease through contact with wood ticks and their feces located on the wool of sheep A case recently occurred in a New York City girl, an assistant nurse to a

veterinary surgeon, who was bitten by a tick from a sick dog which she was handling

Laboratory workers have developed tularemia while doing autopsies on infected guinea pigs and rabbits, or while handling infected ticks Nearly all of the early investigators of the disease, including Francis, Chapin, McCoy, Mayne, and Lake became infected

Improperly cooked infected wild rabbit meat may also cause illness [14] Infection of 43 persons resulting from drinking contaminated water was observed in Russia in 1935 Incidental to studies of epizootic tularemia in beavers, Public Health Service workers[15] have found that the water in three Montana streams was contaminated with Past tularensis

Susceptibility in man is general, although it is more prevalent in adults It may occur any time of the year The onset of the majority of cases occurs during November and December, as these months constitute the "open season" when the hunting of wild rabbits is permitted The cases caused by fly bites occur during the summer months—June to September, while those due to the bite of wood ticks usually occur from March to August [2]

Transmission of the disease from man to man has not been reported, but it appears possible in view of the recent isolation of Past tularensis from the sputum of persons having tularemia [16] Infection, however, is reported following injury while performing a postmortem examination in a human case [17]

Recovery from an attack of tularemia confers a permanent immunity which, according to Foshay,[18] "protects against subsequent massive exposure with an effectiveness seldom encountered in bacterial diseases" If a second infection does occur, as it sometimes does in laboratory workers, it is in the nature of an immune reaction such as is present in revaccination with vaccinia virus [19]

Symptoms and Physical Findings

The disease may assume several clinical forms Francis has grouped them into four types the ulceroglandular, the glandular, the oculoglandular, and the typhoid, to which may be added an additional form, the pulmonary type

1 Ulceroglandular Type—This is the most common form of tularemia In both Brown's[4] and Jordan's[3] series about 90 per cent of the cases were of this type Following an average incubation period of three and a half days after contact, the onset comes on suddenly with chills, fever, headache, sweats, vomiting, and body pains A local lesion appears in the form of a papule at the site of entry of the infectious organism If a preexisting abrasion of the fingers is present, necrosis sets in, followed by central sloughing An ulcer with indurated borders results If the organism is introduced through an insect bite, the lesion is usually on an exposed part and starts as a papule which later becomes pustular and ulcerated The lymph nodes draining the area become tender and indurated They frequently break down and may require incision (Cases 1, 2, and 4) Occasionally, subcutaneous nodules may appear along the lymphatic channels between the initial lesion and the regional lymph nodes (Case 2) A maculopapular eruption may occur on the arms, neck, and chest The acute constitutional symptoms last two or three weeks Convalescence, characterized by great weakness and debility, is slow, running from several months to a year

2 Glandular Type—In some instances the primary lesion may be absent The characteristic bubo, the constitutional symptoms, and the course remains the same This type often makes for confusion

3 Oculoglandular Type—The primary infection in this type may be said to be the conjunctival sac It is believed to be caused by the hands carrying the infection from the flesh of the infected animal to the eye It results in swelling of the eyelids and a severe acute inflammatory reaction of the conjunctiva accompanied by pain, itching, tearing, and redness Small yellow nodules and ulcerations may appear on the conjunctiva The preauricular, cervical, and submaxillary glands may become tender and swollen It is usually unilateral and the general symptoms are the same as in the ulceroglandular type The conjunctiva usually clears up after three to five weeks and rarely does permanent corneal scarring result

4 Typhoid Type—An atypical form of the disease is occasionally seen, in which the general symptoms are present, but neither the initial lesion nor the bubo occurs This form is characteristic of laboratory infections Green[20] suggests that the uniformity of the typhoid type of infection among laboratory workers "may owe its identity to a strain of Past tularensis modified by passage through the guinea pig to a uniform type" Experimentally, he passed grouse strain and rabbit strain which have different virulence through guinea pigs, and obtained strains of equal virulence

The typhoid type of tularemia is also believed to be the result of eating insufficiently cooked rabbit meat and is often confused with typhoid or undulant fevers

5 Pulmonary Type—In this type,[21 22] as in the typhoid type, no primary ulceration is present The patient complains of a pain in the chest and upper abdomen, and has signs of pulmonary involvement with pleural effusion The fever curve shows wide fluctuation, the pulse is

slow in relation to the amount of fever, and the white blood cell count may be normal or only slightly elevated Chill is seldom noted at the onset. Resolution, as well as convalescence, is slow Tularemic pneumonia should be considered in cases of atypical pneumonia This form has a high case fatality rate

Laboratory Tests

Clinical diagnosis is confirmed by means of the agglutination reaction and by isolation of the causative micro-organism through animal inoculation and cultures Agglutinins appear in the blood during the second week of illness, and may reach a titer of 1 to 1280 within the third week. These agglutinins may persist for many years after recovery Blood serum from a patient with tularemia may cross-agglutinate Brucella abortus (Case 2) and Brucella melitensis organisms, the causative agents of undulant and Malta fever

Guinea pig or rabbit inoculation with the exudate from the initial lesion or from the bubo, or with blood of the patient obtained during the septicemic stage, offers additional diagnostic aid

An easily prepared liquid medium for the cultivation of Past tularensis has recently been described.[23 24]

The intradermal test of Foshay,[25] which consists of the injection of 0 01 ml of tularemia antigen, if performed on the fourth day of illness, frequently gives a positive local reaction in forty-eight hours It is not considered, however, altogether reliable.

Past. tularensis has been isolated by Larson[16] from the sputum of three persons suffering with tularemia, who manifested no frank clinical signs of pulmonary involvement He recommends the inoculation of mice with the sputum suspensions from patients suspected of having tularemia, as a laboratory procedure Thus, a tentative diagnosis may be established at an early period by microscopic examination of smear preparations of the spleen of infected mice stained with Wayson's stain

Diagnosis

In the majority of cases tularemia is easily recognized. It is occasionally erroneously diagnosed as influenza (Case 1), undulant fever (Case 2), typhoid fever, pneumonia, septic infection, infectious mononucleosis, Hodgkin's disease, and tuberculosis

A careful history will often uncover information regarding the handling, skinning, cleaning, or eating of wild rabbit or other form of wild life, or a bite from a tick or other insect The usual clinical picture consists of the occurrence of a solitary ulcer at the site of entry of the infection, usually a finger, with a unilateral swelling of the regional lymph nodes, accompanied by symptoms of general sepsis The clinical diagnosis is further confirmed by the laboratory aids mentioned above

If the reader is cryptologically inclined, he will find that the word *Rabbit* may be utilized as a simple memory aid, as each letter should bring to mind one of the cardinal points in the diagnosis of tularemia, as follows R rabbit contact, A agglutination test, B bite of insect, B bubo, I initial lesion, T temperature elevation

Treatment

Treatment is largely supportive or symptomatic as in any acute febrile disease Hot, moist applications of a mild germicide to the local lesion and suppurating buboes is advisable in order to make the handling of the dressings less dangerous Tense fluctuating buboes, which fail to open spontaneously, may require incision and drainage (Cases 1, 2, and 4) Conjunctival inflammation should be cleansed and mild ophthalmic ointments instilled

Although Foshay[25] reported, early in 1940, favorable results with antiserum, an editorial on tularemia which appeared in the *American Journal of Public Health* that year stated "In spite of some claims to the contrary, there is no specific preventive or curative treatment of the disease"[27]

In an attempt to evaluate claims of beneficial use of various chemotherapeutic agents, such as sulfanilamide,[28 29] sulfathiazole,[30] acriflavine,[31] neoarsphenamine,[32] and metaphen,[33] a series of controlled tests was recently run by Bell and Kahn[34] with a group of agents in the treatment of experimental tularemia in guinea pigs In addition to the above products, the group included sulfadiazine, sulfamoxazine, mapharsen, antimony, arsenic with bismuth, iodine with bismuth, and hyperimmune equine antitularemic serum They reached the following conclusion "It is our opinion that the results of the therapeutic trials do not demonstrate any advantage in employing these drugs therapeutically"

Penicillin,[35,36] generally contraindicated in gram-negative bacillary infections, is ineffective in the treatment of tularemia. Streptomycin, another antibiotic, appears effective against a variety of gram negative bacteria. Preliminary experiments at the Mayo Clinic[37] on experimental tularemia have been very encouraging The case fatality rate in 30 control animals was 100 per cent within four days after infection, while all of the 30 infected mice that received 1 mg of streptomycin per day survived a ten-day period

Prevention and Control

As previously stated, tularemia is primarily a disease of rodents, especially wild rabbits and

hares, acquired through the bite of infected blood-sucking insects or ticks, and transmitted to man under certain conditions Man may also become directly infected through the bite of ticks or flies

Control of spread of the disease by the eradication of the insect vector seems a hopeless task With the advent of the new insecticide, DDT,[38] and with improvements in its use, it appears promising that epizootics among wild rodents may be prevented by the suppression of these insects

The prevalence of tularemia, like other communicable diseases, is dependent upon the abundance of its hosts A marked reduction in the wild rabbit population by declaring open season and the abolishment of protective game laws may prove unpopular among sportsmen, but it would help minimize the danger of this disease

The interstate shipment of wild rabbits and hares for the purpose of stocking the fields should be prohibited Officials of game clubs in Massachusetts, who imported rabbits from Missouri and Arkansas in 1941, found that 136 of them had died in transit or some time after arrival Post-mortem examinations revealed that the cause of death of 110 of the rabbits was tularemia [39]

The sale in markets of the meat of wild rabbits brought in from other states should be restricted Connecticut,[40] New Hampshire,[41] and Ohio[42] have enacted legislation regulating such practices

The New York State Trichinosis Commission in its report[43] in 1941 called attention to a strange situation which still exists in New York State with regard to the importation of rabbits into the state

The New York State Conservation Department, under authority granted by Section 174 of the Conservation Law, requires permits for the importation of rabbits and hares for game purposes, and the department does not grant permits to import these animals from states in which tularemia is prevalent No restrictions, however, exist on the importation of rabbits into the state for food purposes Should conditions warrant, there is no doubt that the New York State Department of Health would prohibit admission to the state of slaughtered rabbits for purposes of consumption

Following the outbreak of tularemia in New York City in December, 1936, all receivers of wild rabbits agreed to a procedure outlined by the New York City Department of Health, whereby rabbits which were skinned, eviscerated, and properly wrapped before arrival in New York City could be sold without any further inspection provided they were clean and sound and fit for human consumption Rabbits which arrived unskinned and not eviscerated had to be inspected by the department In this manner, infected animals which appeared poor and emaciated were eliminated, and handling by butchers, chefs, and housewives was reduced to a minimum

The most practical means of preventing tularemia is the avoidance of direct contact of the bare hands with infected wild animals It is recommended that the following advice be made available to hunters, cooks, housewives, and marketmen

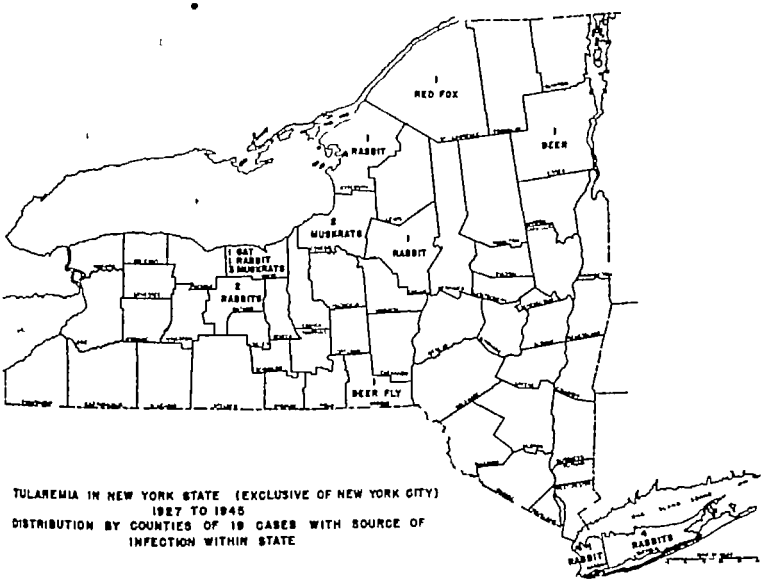
1 The hunter should not kill or handle a wild rabbit or hare which is too sick to run or which is caught by the dog According to Hendrickson [44] "The sick animal (tularemic rabbit) doesn't raise the head, doesn't carry the front feet well, rubs the nose and front feet into the earth, lies in tremors, staggers along a few rods, and again lies in tremors" This is not true of infected snowshoe hares [6]

2. Rubber gloves should be worn when skinning and dressing wild rabbit A person who has sores or cuts on his hands should not clean rabbits

3 Care should be taken not to puncture the gloves and injure the hands with a knife or bone fragments If the skin is injured, the wound should be immediately washed with soap and water, after which an antiseptic solution should be applied to the injury

4 The liver, spleen, and lungs of the rabbit should be examined when the carcass is being dressed The presence of small white spots may indicate that the animal has tularemia. Such an infected carcass should be burned or buried so as not to be eaten by a dog or cat

5 The liberal use of soap and water followed by disinfection of the hands is recommended in order to remove all rabbit blood from the hands Even when only the fur is handled, the hands should be thoroughly washed



6 The hands of the rabbit handler should be kept away from the eyes

7 Wild rabbit meat should be thoroughly cooked from surface to center in order to destroy the organism causing tularemia, as it will remain alive and virulent in the red juice of the bones of partly-cooked game Refrigeration does not kill the organisms, as rabbits kept constantly frozen at minus 15 C may remain infective for three and a half years

8 During the summer, hunters, trappers, campers, and woodsmen should wear tick-proof clothing, with trousers tucked into the shoes in order to avoid bites from infected ticks

9 Raw drinking water should be avoided in known infected areas

It is also recommended that only persons immune by a previous attack should be employed in laboratories working with known or presumably infected animals or insect hosts of the disease.

TULAREMIA IN NEW YORK STATE (EXCLUSIVE OF NEW YORK CITY)
1927 TO 1945
DISTRIBUTION BY COUNTIES OF 19 CASES WITH SOURCE OF INFECTION WITHIN STATE

There is no effective specific preventive treatment of the disease [17] Foshay and his coworkers[18] claim "a useful degree of protection was confirmed by annual vaccination" with a vaccine prepared by oxidation of virulent strains by nitrous acid, and that "individuals who were not completely protected experienced significant favorable modification in the course of disease" Larson[16] has produced an active immunity to infection with Past tularensis in white rats by the administration of vaccines prepared from yolk sacs of infected chicken embryos Its effect on humans is as yet not known

Summary

1 Four cases of the ulceroglandular type of tularemia, which were reported in Nassau County, are described

2. A total of 81 cases, 45 of which occurred in New York City, have been reported in New York State since 1927

3 Wild rabbit was the main source of infection, although several cases resulted from contact with other wild life, and from insect bites

4 The source of 19 cases out of the 36 cases which occurred in upstate New York was found to be within the state, indicating that tularemia is more common among wild life in New York State than is commonly supposed.

5 Recent literature on the epidemiology, symptomatology, laboratory diagnosis, and treatment is reviewed and discussed.

6 Control of tularemia through legislation is discussed and prophylactic measures to avoid infection are enumerated

ULCERS ABOUT THE ANORECTUM

STUART T ROSS, M D , Hempstead, New York

CONFUSION concerning the diagnosis and treatment of ulcers about the anorectum seems to be due partially to the lack of specific characteristics of some of the ulcers, and partially to a general ignorance of the various conditions which commonly produce such lesions *The present paper is concerned with presenting* (1) a workable clinical classification of those anorectal ulcers which are at all likely to be met, together with (2) their respective diagnostic criteria.

Classification

Infective
- Specific—Tuberculosis
  - Venereal
    - Syphilis
    - Gonorrhea
    - Chancroid
    - Lymphogranuloma venereum with stricture
  - Bacillary dysentery
  - Amebic dysentery
- Nonspecific—chronic ulcerative colitis
  - Agranulocytic angina (this might with reason be classified under the Toxic heading)

Physical
- Straight trauma
- Stercoral
- Factitial
- Varicose
- Hemorrhoidal

Constitutional
- Nephritic
- Diabetic
- Trophic

Toxic
- Mercury
- Arsenic

Malignant
- *External* (Perianal)
- 1 Ringworm
  - Herpes
  - Eczema
- 2 Tuberculosis
  - Chancroid
  - Syphilis
  - Granuloma inguinale
  - Epithelioma

Pathogenesis and Symptoms

Before proceeding to consider each of the above entities individually, it will be well to describe some of the factors they have in common. Many ulcers involve the mucosa only, the deeper ones, the mucosa and submucosa, only occasionally is the muscularis invaded In the latter case, of course, perforation is to be feared

Many ulcers are roughly ovoid in shape, and these often tend to have their long axes conform *to the direction of the blood vessels or the valves* of Houston The major blood supply of the rectum consists of branches of the superior hemorrhoidal artery, which is a continuation of the inferior mesenteric Thus artery bifurcates at the level of the third sacral vertebra, and its two main branches course from above, downward and anteriorly, one on each side, thus gradually embracing the rectum The final branches anastomose freely over the lower aspects of the rectum. Owing to this manner of distribution the upper rectum is supplied by branches which come off the main vessels nearly transversely Therefore, while ovoid ulcers in the lower rectum may have their long axes oriented in any direction, in the upper rectum, they will usually be transverse Also, when on or near the edge of one of the valves of Houston, the ulcer will conform to the slanting direction of the valve.

In general, the symptoms of rectal ulcer will be pain, discharge, and diarrhea As with all proctologic conditions, the subjective complaints are not diagnostic, but are merely invitations to a sigmoidoscopy The intensity of such symptoms as are present will vary (within reason) not with the size of the ulcer, but with its location A tiny ulcer in the anal canal will produce acute pain, whereas, a much larger ulcer in midrectum may be entirely painless, or give rise only to a dull sacral ache. Discharge, when present, will consist of mixtures in various proportions of blood, pus, and mucus The diarrhea may be of the before-breakfast variety, although *this is not invariable*

Complications are two hemorrhage and perforation. Either may be serious, but fortunately, neither is especially common If perforation takes place above the peritoneal reflection, peritonitis may, of course, ensue

External Ulcerations (Anal and Perianal)

The perianal region is subject to a number of skin ailments which differ in no wise from similar conditions elsewhere in the body Mention may be made of herpes zoster, eczema, epithelioma, and occasionally, a mycotic infection. In addition to these, four important conditions are entitled to discussion.

Tuberculosis—Tuberculosis about the anorectum is nearly always, though not invariably, secondary to pulmonary disease A perianal tuberculous ulceration is more likely to be primary than a similar lesion inside the anal canal One may speculate about the reason for this, but it is probably a matter of ingested bacilli from sputum, which would naturally have more contact with the anal lining

The appearance of the ulcerations is suggestive The base is dirty and bumpy and raised in the middle, sloping down on all sides to undermine the skin edges Discharge is scant, but foul, and contains many bacterial contaminants Bleeding is slight It is ordinarily difficult to obtain the organism from scrapings, but histologic section reveals tuberculous granulation tissue These ulcers are usually single, and may be extensive Particularly suggestive features are the ragged aspect, the undermined edges, and often a violaceous appearance of the tissues surrounding the ulcer

Syphilis—Several varieties of syphilis may occur

1 Congenital Fortunately, this condition is uncommon and becoming more so It should be thought of when perianal ulcers and fissures are present in the newborn In addition to the lesions themselves, a coppery tinge, not unlike lupus vulgaris, may be seen in the perianal region

2 *Chancre* When fully developed, this presents an aspect similar to that of chancre elsewhere in the body, however, it may lack induration in the early stages, and temporarily resemble a chancroid or fissure The most frequent site is in the posterior commissure, where its discharge may give rise to intense irritation

3 Secondary lesions While these are not strictly ulcers, it seems appropriate to mention them here A mucous patch manifests itself as a pearl-gray area—often multiple—often large Later, these patches may be replaced by typical condylomata lata

Chancroid—These are occasionally found in the perianal skin In men and boys, their presence is usually due to sodomy, but in females, may result simply from misplaced zeal The lesions are multiple, superficial or deep, small, irregular ulcers, surrounded by erythematous areolae They are soft (distinguish from chancre) and covered with a profuse purulent foul discharge, from which Ducrey's bacillus may be isolated In contradistinction to chancre, the involvement of the regional lymph nodes is of an acute nature, indeed, the nodes may suppurate Autoinoculation is a marked feature Ordinarily, the diagnosis of chancroids is easily determined, and should not occasion much difficulty.

Internal Ulcerations (Rectal and Sigmoidal)

Tuberculosis—Since in this paper we are concerned only with ulcerations, no consideration will be given to the miliary and hyperplastic forms of anorectal tuberculosis All types are found secondary to tuberculous disease elsewhere in over 90 per cent of cases

In the rectum, a tuberculous ulcer presents the same characteristics noted in the descriptions of external ulcerations Its axis follows the course of the blood vessels Associated symptoms consist of discharge, diarrhea, and pain in varying degrees, pain is usually not present unless the ulcer is located at or near the anorectal line (or, in the case of external lesions, within the grasp of the sphincters) In most cases, the ulceration is comparatively superficial, involving only mucosa and submucosa, and is irregular, with a dirty, nodular base, and undetermined edges There may be an inseparable slough

Treatment is medical, and consists mostly of attention to the main tuberculous focus, which will usually be found in the lungs Various local applications may be used with benefit Suitable preparations include aqueous solution of argyrol, 20 per cent, aqueous solution of silver nitrate, 5 per cent, and pure balsam of Peru To control the diarrhea, the subcarbonate of bismuth may be used, or camphorated tincture of opium in doses of one teaspoonful or less may be given for short periods only. Tenesmus is treated by instillations of 2 ounces of warm olive oil through a number 14 F soft rubber catheter Starch-water irrigations may also be soothing The cold-quartz light may be employed over the general body surface in rectal or sigmoidal ulcers, and directly on the ulcer when the latter is external When applied directly to an external ulcer, the light should be held at a distance of twenty inches, and an exposure of thirty seconds given for the first dose Additional exposures may be administered two to three times weekly, increasing the exposure time by thirty seconds each time until the skin reacts with a faint erythema Two minutes should be a maximum dosage

Penicillin and the sulfonamides are ineffectual, except for the control of secondary infection

If it is deemed necessary to perform surgery on such lesions, the Paquelin cautery or radio knife should be used

Syphilis—Above the anorectal line, syphilis makes itself known either in the form of ulcer, or a gumma The ulcer is a punched-out depression with sharply defined edges which give the appearance of being at right angles to the surface of the mucous membrane Upon digital examination, the edges are felt to be indurated

Gumma, before ulceration, presents itself as

an ovoid, painless, rather elastic, smooth mass, ranging from the size of a pea to the size of a lemon. Through the sigmoidoscope, the appearance is slightly cyanotic These lesions usually occur within five years of the initial chancre, and are, ordinarily, low down in the rectum, although the author has seen one healed gumma high on the posterior wall If diagnosed and properly treated before ulceration, the gumma will heal without scarring

The treatment is that of syphilis, plus whatever measures may be advisable for the relief of local irritative symptoms Such measures have been described in the section on rectal tuberculosis

Healed gummatous ulcerations have a characteristic appearance The edges of the ulcer are smoothly rounded and rolled under and appear to be separate from the base, so that the one slides over the other

Gonorrhea —The inflammation produced by the Neisserian diplococcus is as acute in the rectum as it is in the urethra The mucous membrane becomes hot, red, and covered with a purulent exudate. Ordinarily, gross ulcerations are not present, but in some cases, there may be a few superficial erosions The inflammatory process is limited to the lowermost two or three inches of the rectum, above the anorectal line The condition is to be suspected in any acutely inflamed rectum with abundant purulent discharge. Suspicion is then supported by the discovery of an associated urethritis or vaginal discharge, or the relaxed sphincter of pederasty, and is finally confirmed by finding the specific organism in pus obtained through an anoscope.

Treatment The diplococcus of Neisser is susceptible both to the sulfonamides and penicillin. Penicillin is the drug of choice, and may be given every four to six hours, in equal doses of such size that a total of 100,000 to 150,000 units is administered in twenty-four hours If neither of these drugs is available, suppositories containing 3 per cent protargol may be used, and are quite effective

Chancroid.—This condition is extremely rare above the anorectal line.

Lymphogranuloma Venereum with Stricture — The subject of lymphogranuloma is an extensive one, and cannot be considered in detail here. Briefly, however, it may be stated that inflammatory stricture of the rectum (as opposed to stenosis of the anus) in women, is most often caused by this disease The stricture may either be annular (less than one inch in length) or tubular (one inch or more in length) It consists of a massive fibrous infiltration of all the coats of the rectum, as well as the perirectal tissues This fibrous tissue eventually contracts, reducing the lumen to a size through which solid stool cannot pass Due to the persistent pressure of feces from above, as well as the general inflammation and interference with the blood supply, the mucous membrane becomes ulcerated, and emits a discharge of blood, pus, mucus, and debris Healing is slow and difficult.

No difficulty is encountered in recognizing rectal ulcers due to stricture, the picture is characteristic Treatment, on the other hand, is most difficult and in the majority of instances is best left in the hands of those experienced in handling these cases These ulcers will never be completely and satisfactorily healed until the stricture is markedly improved Treatment of inflammatory stricture is beyond the scope of this paper, it includes dilatation, proctotomy, and colostomy The condition may, however, be improved by cautious dilatation with a graduated series of Wales' bougies These soft rubber instruments are manufactured with a lumen, through which the upper limit of the stricture may be irrigated with suitable preparations, such as one ounce of 1.8000 potassium permanganate, or the same quantity of an aqueous solution of merourochrome, $\frac{1}{2}$ per cent

Exhibition of sulfadiazine, 1 Gm (15 grains) every four hours for three days, given with an equal amount of sodium bicarbonate and plenty of water, will often tend to reduce the secondary infection, and thus aid in the healing process *If* the condition is too advanced and too acute to admit of this procedure, and obstruction is present, it may be necessary to resort to colostomy

Bacillary Dysentery —This disease is caused by infection with B Dysenteriae of the Shiga, Flexner, and other various subvarieties It is an acute process, accompanied by fever, prostration, and marked by a severe diarrhea, with the passage of numerous liquid stools containing blood, mucus, and pus Diagnosis is made by finding the specific organism in the stool culture In difficult or obscure cases, it may be necessary to culture material taken directly from an ulcer through the proctoscope

The inflammation extends as a rule, only into the submucosa, where a hemorrhagic exudate forms early and is visible Later, these areas break down into ulcers, which tend to be transverse, are covered with necrotic sloughs, and which bleed when traumatized

Sulfaguanidine is a specific for this condition To an average-sized adult, it should be administered in a dose of 3 Gm once, followed in six hours by a dose of 2 Gm and then by 1 Gm. every three to four hours This regimen may be altered to fit the individual patient and the severity of the disease In cases of bacillary dysentery in which sulfaguanidine is exhibited sufficiently early, ulcerations will frequently not occur Dur

ing World War II, the author was privileged to observe a number of these cases in India, all received sulfaguanidine, and none developed extensive ulcerations

Amebic Dysentery—This important disease, which is becoming more and more frequent in this country, may take either the acute or the chronic form The acute disease is characterized by a sudden onset of a violent diarrhea with prostration The chronic type, however, most often manifests itself in the shape of recurrent bouts of diarrhea lasting, usually, less than a week, and recurring about every two weeks During the intervening days, the patient may or may not be constipated Diagnosis is to be made only upon the discovery of the Entamoeba Histolytica in the stool In order to do this with consistent accuracy, stools should be examined as soon as they are passed—preferably within the next three minutes Material procured through a proctoscope or sigmoidoscope directly from an ulcer base is even better Alternatively, the mucous membrane of the lower rectum may be swabbed through a four-inch piece of soft rubber tubing In nondiarrheic cases, a dose of magnesium sulfate should be given the night before examination

The identification of the protozoon is a task to be entrusted only to highly-trained workers in this field

Pathologically, the amebic ulcer appears to be formed by the invasion of a rectal gland by the protozoon, which then invades the submucosa from the depth of the gland A small (one to two millimeter) elevation of the mucous membrane then occurs, with a pale yellow spot in the center This central necrotic area promptly breaks down to form the ulcer, which is characteristically flask-shaped, having a narrow opening and wide base The ulcers are discrete, and separated by areas of comparatively normal mucous membrane, in contradistinction to bacillary dysentery, which presents large transverse ulcers, tending to become confluent Edges of the lesions appear elevated Although characteristic when seen, these ulcers are often located high in the large bowel, and beyond the reach of the sigmoidoscope

Treatment When promptly diagnosed, the outlook in amebic dysentery of the colon is good The patient should be hospitalized, and one grain of emetine hydrochloride given intramuscularly, daily for one week Simultaneously, carbarsone, 0 25 Gm , is administered thrice daily, by mouth The carbarsone is continued for a total of twelve days, and daily stool examinations are performed, beginning at the time when the emetine is discontinued By this time, the amebae will ordinarily have disappeared from the stool, whereupon diodoquin is given orally three times daily, in doses of 0 63 Gm , and this regimen is continued for two weeks, after which stool specimens are again checked daily for five days If stools do not become and remain negative on this regimen, the final eradication of the amebae may prove difficult and time-consuming, and the patient should be referred to a competent gastroenterologist

Chronic Ulcerative Colitis—This is a serious and discouraging disease, and one which it is extremely important to recognize Final diagnosis will rest upon a consideration of the entire clinical picture, cardinal signs of which are a chronic, bloody diarrhea, with exacerbations and remissions, together with gradual anemia, weakness, and a discharge of blood, pus, and mucus The specific etiology is still in dispute, Bargen ascribing the cause to a specific diplococcus, while others lend more weight to metabolic and biochemical considerations

In advanced cases of this disease, sigmoidoscopy must be done with great care, as the bowel wall is frequently quite friable, and even an incautious air inflation may produce a perforation

The appearance of the bowel wall will depend on the stage of the disease observed The pathologic sequence of events is diffuse inflammation, followed by miliary abscesses, followed by miliary ulcers which stud the mucosa in a granular manner Later, these miliary lesions become confluent, and large ragged irregular ulcerations appear and become secondarily infected The bases of these ulcers will be gray and sloughing, or oozing blood, according to whether the ulcer is old or new, and whether the disease is in a state of exacerbation or remission The ulcers are essentially superficial, but may become deep with age

Complications of the disease are chiefly three—hemorrhage, polyposis, and arthritis X-ray, except in the early cases, reveals a contracted, tubular colon with loss of haustrations and rigidity of the wall Diagnosis is made by history, and sigmoidoscopic and roentgenologic findings It is usually possible to detect the early granular lesions upon digital examination

Prognosis is guarded

Treatment As with peptic ulcer, a trial of medical treatment should be made, the program consisting of a regimen of rest, a nourishing low-residue diet, very high vitamin intake, and such *symptomatic treatment as seems indicated* from time to time Penicillin is ineffectual in this condition, and the sulfonamides are chiefly valuable in the reduction of secondary infection

Eventually, many cases will come to colectomy, and it seems wise to perform this operation as soon as it becomes evident that medical treatment is unavailing It is usually advisable to do an ile-

ostomy several months before colectomy, this maneuver not only greatly improves the condition of the colonic lesions, but allows time for the terminal ileum to assume some of the functions of the large gut

Follicular Ulcers.—Occasionally, there may be seen on the rectal mucosa one or two pinhead-sized ulcers with light base, and sharp red edges. These resemble the ulcers of chronic ulcerative colitis, but are localized to only one or two follicles. As a rule, such ulcers heal readily under local applications.

Anginal Ulcers.—Very occasionally, an agranulocytic angina will give rise to extraoral ulcerations which may be found in the rectum or anus.

Diagnosis is made on the blood picture.

Treatment is the treatment of the constitutional condition.

Stercoral Ulcers.—The so-called stercoral ulcer is actually a traumatic ulcer produced by long-continued pressure on a debilitated bowel. With this in mind, it is easy to understand why the symptoms occur usually in elderly people with long-standing constipation. The site is more often sigmoidal than rectal. Preliminary symptoms of such an ulcer in the sigmoid are likely to be ascribed by the patient to his constipation, so that in many cases the first symptom is a peritonitis from perforation.

Factitial Ulcers.—Factitial proctitis, so named by Buie in 1930, is caused by irradiation of extrarectal structures, most usually the uterus. Some weeks following the application of the radium, the patient notices a discharge of blood from the anus, and later is conscious of a vague discomfort which may turn into an actual tenesmus with a discharge.

Sigmoidoscopically, a period of hyperemia and thickening of a local segment of the anterior rectal wall is succeeded by ulceration, which appears in the form of a grayish-white plaque with slightly depressed edges, and surrounded by telangiectatic vessels. The ulcer is situated low on the anterior wall, and is often transverse in its long axis. Symptoms include a dull ache, discharge, and varying degrees of tenesmus depending on nearness to the anorectal line. The ulcer may later encircle the gut, form a stricture, and even perforate to produce a rectovaginal fistula.

Treatment consists of discontinuance of the irradiation, irrigation, and soothing applications to the rectum, in some cases with stricture, colostomy becomes necessary or advisable.

Varicose Ulcers.—This unusual type of ulcer is the result of rectal varicose veins, as distinguished from true hemorrhoids. Its pathogenesis is similar to that of varicose ulcers of the leg. Clinically, a sharply-circumscribed, irregular ulcer with a red base, and about the size of a nickel or less is seen several inches up on the posterior rectal wall. The appearance of the ulcer is not in itself diagnostic, but if the patient is asked to strain, varicosities in the nearby rectal wall may become prominent. Varicose ulcers are usually superficial.

Treatment consists of rest and other measures aimed at relieving the venous congestion, together with medicated irrigations and topical applications.

Hemorrhoidal Ulcers.—This classification denotes the ulcers which are found on strangulated or otherwise traumatized hemorrhoids. The *underlying pathology is thrombosis and infection*. Diagnosis is made by inspection. Pain is present with these ulcers, because the lesions are within the grasp of the sphincters. Although the tendency of hemorrhoidal ulcers is to heal under appropriate conservative treatment, ordinarily the hemorrhoids will be removed as soon as the acute inflammation has subsided, and the ulcers with them.

Nephritic Ulceration.—Colonic ulcers due to nephritis are seldom seen by the clinician. They occur as a rule, when the nephritis is terminal, and are manifested by subjective symptoms which start with a thin diarrhea consisting chiefly of mucoid material. A little later, a discharge of pus, slough, and frequently some blood may appear. In the rare occasion in which the bowel may be observed in this condition, the ulcer will usually be found lengthwise of the gut, deep, and quite extensive. These ulcerations are more common in the higher bowel. According to Pennington, they are caused by the action of ammonium carbonate.

Diabetic Ulcerations.—Diabetic ulcers display no characteristic appearance. In fact, they should not be considered as true diabetic lesions, since they are apparently not caused by the disease per se. They are better considered as stercoral ulcers due to the constipation which may attend the diabetes, plus the lowered resistance to infection which goes with the disease.

Except for such palliative local treatment as may seem advisable, treatment should be merely that of the primary disease. The appearance of diabetic ulcers of the colon is a late sign, and usually occurs only in advanced cases which are out of control.

Trophic Ulcers.—These extremely rare lesions are caused by disease of the lumbar segments of the spinal cord. They are indolent, and are accompanied by the other proctologic signs of such disease—relaxed sphincter and diminished cutaneous sensation of the anal region.

Toxic Ulcers.—Certain drugs may produce ulcerations of the rectal mucous membrane even when taken by mouth, the commonest of these

TABLE 1.—Differential Diagnosis

	Tuberculosis	Congenital Syphilis	Chancre	Gummata
Location	Internal or external	Perianal	Anus or perineum	Skin or mucosa
Onset	Insidious		Gradual	Gradual
Aspect	Irregular, violaceous, undermined	Coppery	Single Indurated	Punched out, purple
Discharge	Foul		Serosanguineous	Slight
Laboratory	Biopsy or guinea-pig	Wassermann	Darkfield	Wassermann
Secondary to	Tuberculosis of lungs	Primary	Primary	General lues
	Chancroid	Granuloma Inguinale		Gonorrhea
Location	Perianal	Groin		Just above anorectal line
Onset	Acute	Gradual		Acute
Aspect	Soft, multiple, superficial, small with areolae	Raised granuloma tissue		Superficial
Discharge	Profuse, purulent	Thin, foul		Profuse, purulent
Laboratory	Bacillus Ducrei	Donovan bodies		Gonococcus
Secondary to	Primary	Primary		Primary
	L V Stricture	Bacillary	Amebic	Chronic Ulcerative Colitis
Location	Above stricture	Rectum and sigmoid	Anywhere in colon	Entire colon starting in rectum
Onset	Gradual	Acute	Acute or chronic	Gradual
Aspect	Irregular Confluent Superficial	Transverse Covered with necrotic slough	Discrete Multiple	Miliary abscess Miliary ulcer confluent
Discharge	Blood, pus Mucus debris	Bleeds with trauma	Pink mucus	Mucus, pus, blood, during exacerbations
Laboratory	Frei test	B Dysent	E Histol	Bargen?
Secondary to	Primary	Primary	Primary	Primary
	Anginal	Stercoral	Factitial	Varicose
Location	Rectal mucosa	Sigmoid	Anterior wall of rectum, low	High on posterior rectal wall
Onset	Acute	Gradual unless perforated	Gradual	Gradual unless hemorrhage
Aspect	Indefinite	Indefinite Perforations may be first symptom	Pearly plaque with telangiectasis if stricture	Sharp, irregular, red base
Discharge	Slight	Slight		Slight
Laboratory	White blood cells			
Secondary to	General disease	Constipation	Radium applications	Rectal varicosities or liver disease
	Hemorrhoidal	Nephritic (rare)	Diabetic (rare)	Trophic (rare)
Location	Hemorrhoids	Sigmoid or higher	Rectum and sigmoid	Rectum and sigmoid
Onset	Acute	Rapid	Gradual	Gradual
Aspect	Thrombosed hemorrhoid, surmounted by irregular ulcer	Extensive, diffuse	Irregular	May be deep
Discharge	Blood stained	Pus, blood, slough	Moderate	Slight
Laboratory		Blood chemistry	Blood chemistry	
Secondary to	Piles	Nephritis	Diabetes mellitus	Lumbar spine disease
	Toxic	Malignant		Fissure
Location	Rectum, sigmoid	Anus, rectum, and sigmoid		Posterior commissure anus
Onset	Abrupt	Gradual		Abrupt or gradual
Aspect	Diffuse, confluent, irregular	Hard raised nodular edges		Longitudinal, sentinel pile
Discharge	Bloody	Serosanguineous, sometimes purulent		Blood-streak on stool
Laboratory	Examination for heavy metal	Biopsy		

drugs are mercury (usually in the form of the bichloride) and arsenic. The ulcers present no characteristic aspect, but in cases in which large doses have been taken, or a bichloride enema given, the lesions are quite likely to be extensive.

Malignant Ulcers.—It is unnecessary to provide here a detailed account of cancer of the colon. Suffice it to note that the bases and edges of malignant ulcers are hard, the edges are elevated, and that biopsy should be done in all such cases.

Comment

It may be said that the diagnosis of certain ulcerations about the anorectum will be more or less self-evident, particularly the traumatic and hemorrhoidal types, and those associated with lymphogranulomatous stricture. In addition, certain other ulcerations are so rare, or are associated with other conditions of so much greater importance that they are not ordinarily diagnostic problems—among these are the anginal, nephritic, diabetic, trophic, and toxic. Moreover, the tuberculous, factitial, malignant, chancroidal, amebic, or gonorrheal ulcers, and healed gummata and the lesions of chronic ulcerative colitis have such well-defined characteristics that their true diagnoses should be suspected upon examination, and may usually be confirmed by laboratory test.

This leaves bacillary dysentery, stercoral, and varicose ulcers to be distinguished, and of these

three, the first can be diagnosed without question by the isolation of the specific organism in the stool

Summary

1 The various types of ulcers which appear about the anorectum have been enumerated and classified

2 Diagnostic criteria of each have been described

3 An outline of appropriate therapy has been given in most instances

---

"DOCTOR JONES" SAYS—

High and low temperatures—what they'll do to us and for us—you know, it's quite a study Folks'll go a thousand miles or more to get away from cold weather in the winter and a good many of 'em it appears to prolong their lives. The same time, low temperatures are preserving our food for us and one of the latest developments in medicine—where we always used to apply heat trying to prevent shock from accidents and severe operations, now they're finding that temperatures several degrees below normal are more effective. And I s'pose the future'll bring developments most of us haven't even thought of. History may repeat itself but science is always turning up something new

What made me think of it I was reading an article on this frozen food business. Sort of an abstract, it was, of a committee report (American Public Health Association) These electrical freezing units that're getting to be so generally used they seem to be able to preserve most anything, from a quart of strawberries to a quarter of beef And, speaking of meat, they say the temperatures commonly used in those locker units will kill the organisms of trichinosis in pork

The freezing process, they say, retains more of the nutritive value in food than any other method of preservation. Because frozen foods require less cooking than fresh, there's relatively little loss of vitamins. Frozen peas, cooked after a year's storage for example may have as much vitamin C in 'em as if they'd been cooked within three days of picking.

Vitamin C—that's the one that's most likely to be destroyed by heat. And they claim frozen foods usually hold their color and flavor better'n those that're canned and lose less of it in cooking than when they're fresh.

On the other hand, while freezing kills a lot of the germs that're in foods, it don't sterilize 'em. And stuff that's been frozen is more subject to spoilage after it's thawed out. At zero, taste and appearance will hold up for a year, so they say and at ten above for about six months. At temperatures above that some of the spoilage germs are liable to grow

The whole thing it's another example of elements destroying or preserving, depending on how they're applied. The cold that'll freeze the hair off a dog, if it's handled right will preserve the pork from a hog.—*Paul Brooks, M D., in Health News April 15 1946*

AMERICAN SOCIETY FOR RESEARCH IN PSYCHOSOMATIC PROBLEMS

The American Society for Research in Psychosomatic Problems held its annual meeting at the Hotel Pennsylvania, New York City, on May 11 In the morning, the "Contributions of Military Medicine to Psychosomatic Medicine" were discussed, followed by a lecture on "Psychosomatic Aspects of Orthopedic Practice" The annual dinner was held in the evening and, also, an illustrated parody, "New Advances in Psychosomatic Investigative Technic" by Bertram D Lewin, M.D

THE STEM PESSARY FOR DYSMENORRHEA

J Craig Potter, M D , Rochester, New York

(From the Department of Obstetrics and Gynecology of the University of Rochester, School of Medicine and Dentistry)

THIS review of 25 cases of girls with dysmenorrhea was made to determine if possible why there is such a difference of opinion among gynecologists as to the value of the stem pessary

The majority of these patients had pain with the first menstrual period However, 17 of the 25 were over twenty years of age before they sought medical help The pain had become more intense as they became older, and individually they were losing, when seen in the office, from one to seven days with each period Five of the patients had vomiting as a symptom which made mouth medication of no avail

In general, most of the severe cases occurred in individuals not abundantly endowed with the energies of health As to the pelvic findings, four had retroversions, five had acute anteflexions, and the remaining cases had grossly normal organs

The medical treatment of these patients followed the standard procedures rest, mild exercise, and good food As to drugs, coal tar products were given, and in the patients who vomited, sedatives were administered by rectum Next, antispasmodics and, finally, narcotics were tried All the patients were given thyroid medication and most, also, progesterone products

After the foregoing procedures proved of insufficient value, the next therapeutic step was the stem pessary inserted into the cervix A glass stem pessary with a 1 cm cross-section has been used in most of the patients, although hard rubber and metal Carlson pessaries have been tried

The technic of the procedure is as follows Under an anesthetic the patient is prepared and draped The anesthesia should be deep, as some of these cervices are difficult to dilate The Hegar type dilators are necessary, as it is difficult to accomplish dilatation with Goodell dilators in patients with a firm cervix

In cervices which tighten down quickly, it is sometimes difficult to insert the stem In these patients, a slight taper on the distal end is helpful The natural temptation is to place and control the stem by means of a tenaculum in its eye In doing this, great care should be used, as the glass is apt to break It is, therefore, wise not to insert it completely inside the uterus with the tenaculum The pessary should be anchored both anteriorly and posteriorly with a mattress suture of silkworm gut, otherwise, the sutures will cut through the cervix The suture is tied on the endocervical side more easily than on the vaginal side of the cervix

Usually, the stem is left in place three to four weeks, or at least through a menstrual period However, it may be left longer One patient went to northern Ontario, was snowed in, and wore the pessary for several months without harm

The pessary is easily removed in the office by snipping the silkworm gut

These patients have all been followed for over a year—some for fifteen years The results shown are their expressions and opinions These are listed below for brevity and ease of comprehension

Cases done	25
Cured	0
Made worse	0
Not helped	3
Helped	22

By "cured" is meant absolute absence of pain or discomfort I presume that this is a state that few women have, anyway None of these cases were unaware of menstrual discomfort after the use of the stem

By "helped" is meant that the patient, with medication, can stay at work or school This is a definite improvement, for these girls before, often with the same medication, were unhappily "in bed with a hot water bottle" The drugs used vary from aspirin to demeral, but they were not listed as "helped" if they could not keep at work, rely on completing plans, and be on their feet during menstruation A most interesting observation occurred in those patients who vomited—all 5 stopped Two of the 25 have become pregnant

A space was given to the heading "made worse" because in the past, I have often hesitated and not used the stem pessary for fear of causing pelvic infection

In going over the histories of the 3 listed as "not helped," nothing was learned that would be of prognostic value in other patients Other patients, with poorer mental and physical health, were helped

It seems to me that this series explains the difference of opinion in regard to the therapeutic value of a stem pessary in patients with dysmenorrhea To a perfectionist, all are failures because they are not without pain or discomfort

To an optimist, all but 3 were helped and improved to the point that they could stay on their feet and make appointments with confidence I think we should emphasize that we are helping not curing, these girls

In summary, a glass stem pessary helps the patient with dysmenorrhea, but does not cure her She should be given, in addition, some medication with menstruation

32 Strathallen Park

NEW DRUG FOUND EFFECTIVE IN TREATING HYPERTHYROIDISM

A new drug, thiobarbital, has been found effective in the treatment of hyperthyroidism, an excessive activity of the thyroid gland according to Elmer C. Bartels, M D of the Department of Internal Medicine at the Lahey Clinic Boston

Writing in the December 1 issue of the *Journal of the American Medical Association*, Dr Bartels said that thiobarbital in small doses, has apparently twelve times the effect of thiouracil one of a new group of substances with the power to decrease thyroid toxicity The action of the drugs brings the basal metabolic rate to normal and slows the heart beat Basal metabolism represents the energy expended to maintain respiration circulation, and secretion

The author stated that "28 patients with hyperthyroidism have received thiobarbital, and definite and satisfactory antithyroid response was obtained in all." Previously thiouracil although not proved to be a curative, was used effectively to improve the condition of severely sick patients before an operation was performed

Dr Bartels said that the "opportune moment for our initial trial use of thiobarbital came in October 1944, when a patient receiving thiouracil developed a fever reaction necessitating discontinuance of treatment and in whom further antithyroid therapy was thought essential before thyroidectomy "

The most effective results with thiobarbital have been obtained with the treatment of patients who were unable to tolerate thiouracil, the author said "Of 9 patients in whom toxic reactions to thiouracil developed, 7 tolerated thiobarbital accomplishing complete relief of hyperthyroidism "

Although reponse to treatment was found to be similar in every respect to that observed with thiouracil, experience has shown Dr Bartels said a high frequency of reactions to thiobarbital

The substitution treatment, when it is ready for use, will help patients of all ages because it corrects the fundamental defect that causes the high blood pressure, replacing the substance which the patient's own kidneys fail to produce

Right now Dr Grollman is searching for a way to make this hormone generally available to the million or more essential hypertension patients in the nation

When made by extracting it from kidneys, 100 pounds of hog kidneys are needed to supply one day s dose for one patient.

Since the patients would have to go on taking the extract daily throughout life, this is obviously not a practical source.

The effective agent may also be prepared from the liver oils of certain fishes Supplies of these fish-liver oils are also somewhat limited and are needed as sources of vitamin A and vitamin D (It is not the vitamins but another chemical in the oil which lowers blood pressure.) Certain plant oils may also ultimately be a source from which the compound may be made, Dr Grollman stated in a report to the third annual hormone conference at Mont Tremblant Canada.

If patients rush to the drug store to get one of the fish-liver oils now marketed for their vitamin content, they are doomed to disappointment Dr Grollman warned These oils do not contain the chemical in enough amount, if they contain it at all, to lower blood pressure.

Even with an abundant supply patients would soon find it difficult to take nearly two ounces of oil daily which is what would be required So Dr Grollman hopes the chemical itself can be extracted and put into a pill or some pleasant form of medicine.

—*Science News Letter Sept. 29, 1945*

TROPICAL ENCEPHALOPATHY: MALARIA AND SOLAR ETIOLOGY

JAMES L McCARTNEY, M D , F A C P , Garden City, New York

IN A preliminary report on tropical neuropsychiatry,[1] I pointed out that many neurologic sequelae may follow residence in the tropics, either as a result of climatic condition or the so-called tropical diseases Millions of men were sent to the tropics as a result of the war and many of these men succumbed to the effects of the sun and heat, while many more were victims of malaria During my assignment with the Navy in the Pacific Islands, I had an opportunity to see a large number of these patients The question was not why these men showed neurologic signs, but why more men did not show neurologic symptoms after working day after day in the terrific glare and heat of the tropical sun with inadequate diet and rest

It will be many years before we see all the devastating effects of the war, but reports indicate that 43 per cent of all the casualties were neuropsychiatric A neuropsychiatric examination of 190 veterans of World War II who had been in the tropics, and were discharged with a neuropsychiatric diagnosis, showed that 5 25 per cent showed symptoms that could be explained by solar etiology, while 3 94 per cent had symptoms which followed malaria

As pointed out in my former paper, the tropical etiology may show its effects, primarily, because of the underlying personality, but this is so even with causative agents found in this country One man may develop a delirium during an acute illness, while another man can stand high fever and extreme toxemia without cerebral signs One man may break down under stress and strain, while another remains mentally clear, even until old age Thus, in evaluating any neuropsychiatric picture, the total personality must be taken into account

Malaria

Our military forces operated in some of the world's most malarious areas [2] In such areas, malaria was by all odds the greatest disease hazard to our men, not only at the moment, but as a result of the frequent sequelae Barber[3] reported that in one combat zone, 36 54 per cent of the men showed clinical signs of malaria, while Talbot[4] reported that 66 per cent showed malarial findings, of which 6 5 per cent were malignant tertian type

In the malignant infection, the parasites are found in enormous numbers in the brain capillaries and the blood may contain several thousand per cubic millimeter In these cases, the capillaries may be plugged with masses of corpuscles bearing the parasites, together with phagocyte cells and occasional free parasites These masses of parasites often constitute definite embolic occlusions or thrombi, which in turn cause destruction of the brain tissue involved Occasionally, punctiform or even larger hemorrhages in ring form may occur in the white matter of the brain, with infarction and necrosis The brain tissue frequently has a leaden hue, due to the deposit of the black pigment from the parasites, and the endothelial cells of the capillaries may show much pigmentation because of invasion of these cells [5] An intense inflammatory reaction takes place throughout the brain tissue and meninges and this, at times, may be noted by an examination of the fundi Lumbar puncture will indicate increased intracranial pressure

When malaria finds its way into the brain tissue of a schizophrenic individual, the effects can be expected to be more devastating because of the inadequate capillary system in these individuals Lewis[6] pointed out that in these persons the capillary network is of a finer caliber than in normal persons In these patients the capillaries are thus more apt to be plugged

Since the brain center for heat regulation may be involved, and the body temperature may rise to as high as 110 F , the symptoms may resemble those of heat exhaustion or sunstroke Delirium almost always appears, and headache, restlessness, and prostration are usually marked The neck muscles may become rigid and the skin dry and flushed Coma or psychotic symptoms often follow and may be mistaken for apoplexy, acute alcoholism, medical shock, acute mania, or afebrile psychosis

With such involvement of the brain tissue, it is not surprising that many patients show typical optic neuritis, with clouding or dimness of vision, temporal or frontal headache, and deep pain in the orbit Persistent headache, mental confusion, lack of concentration, convulsions, amblyopia, amnesia, melancholia, signs of meningeal irritation or chronic encephalitis may follow such parasitemia Peripheral neuritis, with appropriate symptoms, is common Eighth nerve involvement causes vertigo and deafness There may be neuralgia or pains in the muscles and joints Paresis of the muscles is seen and may develop into paralysis, with atrophy of the muscles and degeneration reactions Since malaria may damage the endocrine glands, the dysfunction of the thyroid or adrenal gland will confuse the clinical picture Nausea, vomiting, or dysentery may bring on an avitaminosis

Where there is an underlying psychoneurotic personality, it is not uncommon to find a precipitation of a conversion hysteria or a neurasthenic syndrome

Case Reports of Malaria

Case 1—M-1, 23 years old, was inducted into the Army in 1941 He had an excellent record until January, 1943, when in New Caledonia he developed malaria with meningeal symptoms In February, deafness followed, and his stuttering that existed prior to induction became worse. His deafness improved, but the stuttering became worse and though he had not been in combat he was diagnosed as having psychoneurosis anxiety neurosis and was discharged in June 1943 Seen in September, 1943 he stated that he could not stand the sun or heat, frequently had headaches, and when he got nervous, he came out in a sweat his stomach became upset and he vomited. Smears for malaria were negative, red blood count was 3,810,000 with 15 Gm hemoglobin, sedimentation index, 7, and the Kahn test was negative. He showed mild nerve deafness in the right ear He felt he had to take it easy" in his work, and frequently had to take a day off He gets very excited and at these times can't talk. His sleep is not disturbed He is married, and his illness has had no effect on coitus. The neurologic examination showed hyperactive "jumpy" reflexes, no clonus no nystagmus negativo Romberg, and no past-pointing but eyegrounds appeared pale. Diagnosis was postencephalitis with conversion hysteria.

Case 2—M 2, 22 years old, was inducted into the Army in 1941. He had "sunstroke' while in training in California, but had no sequelae He had an excellent record. When in New Guinea he contracted malaria and was treated with quinine and atabrine he became very nervous and was discharged in May 1943, with the diagnosis psychoneurosis, mixed, severe. Seen in August, 1943 he insisted that he was not nervous before induction, and this was substantiated by a social history . When examined he was tense, irritable complained that he couldn t think, had crying spells, his mind "went blank,' had frequent headaches, no appetite, was nauseated all the time, argued all the time at home had to wear tinted glasses as he couldn't stand the sun couldn't stand the heat, his sleep was disturbed, and he had nightmares of combat He works regularly His sexual life is not affected He has excellent social understanding. Neurologic examination showed sweaty palms, hyperactive "jumpy' reflexes, and the eye-grounds were pale but showed many small vessels. The laboratory findings were all within normal limits. Diagnosis was tropical neurasthenia with postencephalitis.

Case 3—M-3 21 years old, was inducted into the Army in 1939 and before his discharge in February 1943, he had had malaria five times with increasing nervousness after each attack. He showed twitching of the right side of his face and right arm and leg. He was discharged with the diagnosis of psychoneurosis, mixed type. After his discharge he worked steadily in a shipyard and his physical condition remained about the same. Neurologic examination and all laboratory findings were essentially negative except increased knee jerks, slight tremors of the hands and a tic of the right side of his face. Diagnosis was psychoneurosis, habit tic, showing some evidence of postencephalitis (malaria)

Case 4—M-4, 20 years old enlisted in the Navy on June 7, 1942, and was sent to the South Pacific on September 18, 1942, but soon after his arrival developed malaria and became symptom free after medication except for headaches, general depression, and insomnia. On December 31, 1942 he was diagnosed as having psychoneurosis, situational, and he was discharged from the Navy April 1, 1943 He got only as far as the seventh grade in school married when 20 but soon was divorced and remarried just before enlistment to a woman ten years his senior He had never left home until he enlisted, and soon after leaving home he developed a nocturia and a pain in the lumbar region. On examination, he showed all negative findings except a blood pressure of 104/70, and he stated that he occasionally got ringing in the ears and a pain on the top of his head Diagnosis was psychoneurosis neurasthenia.

Case 5—M-5, 25 years old, enlisted in Marines on January 14, 1942 and was blown out of a fox hole October 11, 1942, and had amnesia for three days Thus was followed by headaches, tremors and combat dreams with insomnia. He developed malaria, and although his blood became free of the organisms his symptoms persisted He was discharged March 24, 1943, with the diagnosis psychoneurosis war neurosis. Two months after his discharge, he got a position driving a truck, but about every six weeks he had chills fever, his bones ached, and he had to stop work a few days. He got a thumping headache every day, he was irritable, had lost weight and had a poor appetite He occasionally had terrifying dreams. His blood had remained consistently negative for malaria, but his family doctor had given him quinine. The neurologic examination showed a positive Romberg, tremors of the hands and increased knee jerks. Diagnosis was postencephalitis, chronic, malaria.

Case 6—M-6 25 years old, was inducted into the Army on January 1, 1941, and in February, 1942 began to have pains in the left side. In January, 1943 he began to have pain in the left testicle and, to be nervous He gave a history of malaria in 1934 and says he had it again in 1942 He was married in 1936 He claims that he is unable to work since his discharge on April 24, 1943, when he was given a diagnosis of psychoneurosis. He says he is nervous and gets too hot and has periods when he shakes all over, has insomnia and gets more nervous after coitus, has to take a physic every day and vomits after every meal, has dizzy spells, headaches, and falls asleep during the day Examination showed tremors of the hands and tongue, cogwheel rigidity of the arm muscles, sluggish reflexes Achille s reflex almost clonus, and eyes that tear easily His face showed a mask-like expression. His legs twitched. He complained of cramps in muscles and said he is quick tempered Diagnosis was postencephalitis chronic malaria.

Effects of the Sun

While in the Marshall and Marianas Islands,

opportunity was given to make a detailed neuropsychiatric examination of 449 men Of this number 97 men, or 21 6 per cent, showed neurologic signs which I concluded were due primarily to the effects of the sun, either its heat or its reflection

Sunlight stimulates the nervous system, and this effect is beneficial within limits, but repeated exposure to intense sunlight and continued life in a hot climate may have a pathologic effect on the nervous system [7] Not infrequently, intense light whether direct or reflected, causes retinitis, photophobia, headache, and dizziness, and overheating the body in conjunction with high atmospheric temperatures may cause heat pyrexia or heat exhaustion

In sunlight, all wave lengths between 200 and 2,000 microns are liable to cause cell irritation In the retina, contractions of the rods are noted when there is exposure to any length between 226 and 800, but the retinal damage is worse when other constitutional factors are present, such as alcoholism, diet deficiencies, and reduced vitality from whatever cause

The sun's rays have a marked chemical effect on body tissues, as witnessed by the absorption of vitamin D, and the adverse effect of the sun on persons taking the sulfa drugs Intense sunlight is thought to induce an accumulation of cholesterol in the uncovered skin surfaces, and to mobilize histamine [5] It is a well-known fact that the sodium and chloride in the blood, as well as the vitamins, can become depleted as a result of prolonged and profuse sweating, and quite definitely so, when pathologic effects of the sun become manifest by vomiting or persistent diarrhea Dehydration may result from the same causes, or from inadequate ingestion of water, and the carbon dioxide combining power of the blood is likely to be reduced also

When the cooling mechanisms of the body fail to dissipate the excess heat which is generated from within or without, the temperature of the body rises, and, unfortunately, perspiration ceases as the temperature rises There may be a sharp rise of body temperature to 105 F, 110 F, or higher The blood loses its coagulability, and the blood and tissues show increase in acidity The organs become congested, and there is a hyperemia in the tissues, petechial hemorrhages frequently occur, there is congestion and edema of the meninges, and the myelin of the nerve cells and nerve fibrils liquify at the high temperatures Signs of congestion in the meninges, brain, and medulla may persist Intracerebral and spinal fluid may be increased in amount and show marked pressure Coagulative necrosis has been found in some cells of the central nervous system in such cases

Prolonged heat causes cramps, giddiness, faintness, and all the symptoms of shock The neurologic sequelae may be listlessness, muscular weakness, headache, vertigo, anorexia, hypotension, muscular twitching, restlessness, irritability, unreasonableness, and manifestations of hysteria The knee jerks may not return for some time The ability to sweat may be disturbed Persons who have suffered even slightly from the effects of the sun or heat may remain abnormally susceptible for many years Signs of Parkinsonism may slowly make their appearance as a result of the postencephalitis

Solar Cases

Case 1 —S-1, 30 years old, was inducted into the Army in 1942, with the history of having had rheumatic fever in 1940 followed by heart trouble He was in the Army from 1928 to 1930 and stationed in Hawaii, where he had a sunstroke He used to box and became punch-drunk He was discharged from the Army ten months after induction with the diagnosis rheumatism He said he couldn't sleep, his leg muscles twitch, has headaches and dizzy spells his eyes dilate and the sun bothers him He wakes up tired Neurologic examination showed dilated and unequal pupils, eyegrounds were hyperemic and left disk was fuzzy All reflexes were hyperactive There was slight past-pointing, and coordination was poor Laboratory findings were normal. A diagnosis was made of encephalitis with possible tropical neurasthenia

Case 2 —S-2, 20 years old, was inducted into the Army in 1941, with a history of having had a heat pyrexia during the summer of 1940, when he became unconscious He had no trouble with his military training until just a year after induction, when he had severe headache, generalized weakness, became unconscious, had convulsions, shouted in his sleep, and foamed at the mouth Two months later he had another attack, which was diagnosed as psychoneurosis, conversion type, but he showed no improvement, and three months later the diagnosis was changed to anxiety state, chronic, severe, and he was discharged from the Service He was examined two months after discharge and was still in uniform One month after discharge he got married but had made no attempt to find work He was content to live with his parents-in-law He said he felt very weak, his hands and legs trembled, he had terrifying nightmares, had insomnia, noises bothered him, he worried continually, couldn't walk two blocks without resting, had severe headaches, and had four attacks of unconsciousness during the previous weeks These attacks were at night while asleep, and during them he fights off his family, tears up the bedding, cries out, and foams at the mouth, but does not bite his tongue or soil himself The neurologic examination showed active and equal pupils, negative Romberg, tremors of the hands and tongue, and hyperactive reflexes A diagnosis was made of epilepsy from encephalitis (heat stroke)

Case 3 —S-3, 19 years old, was inducted into the

Army in 1942 and admitted to the base hospital in the South Pacific fifteen months later, after spending six months in the tropics He had paranoid ideas and homosexual delusions. In 1932 he had suffered a heat exhaustion, followed by "heart trouble" He was very temperamental, and had temper tantrums, and "sat at home' before his induction He had written home from the South Pacific that it was very hot and uncomfortable After his discharge he just stayed at home, and complained of frequent severe headaches. On examination, the neurologic was essentially negative except that he sweated freely and he said that he now sweats more than he used to The laboratory findings were within normal limits. A diagnosis was made of constitutional psychopathic state, emotional instability, with possible encephalitis, although his diagnosis at the time of discharge was dementia praecox, paranoid type. He showed no signs of psychosis when examined.

Case 4.—S-4, 25 years old, enlisted in the Navy in 1939 and early in 1942, he began to show tremors of the left hand. Two years after enlistment he was discharged with the diagnosis of psychoneurosis mixed type, conversion hysteria with anxiety and depression, existing prior to enlistment. According to the history, when ten years old he had St. Vitus Dance and was very nervous for six months He had no more trouble until he was on duty in Puerto Rico for nineteen months, and during this time he found the sun very trying On examination he appeared emotionally normal, showed a history of having worked regularly since discharge, but complained of tremors of the left hand and occasionally of the right hand, and legs being stiff when walking His eyes at times have the feeling of being drawn up The neurologic examination showed pin-point but reactive pupils, hyperactive reflexes, spastic gait, wax-like face, slow speech, tremors of the hands, and cogwheel muscular rigidity Laboratory findings were negative. A diagnosis was made of postencephalitis (Parkinsonism)

Case 5—S-5, 21 years old, was inducted into the Army in 1942 and two months later suffered a "heat stroke" He was sent to duty four days later Sixteen months later, while in the tropics, he was admitted to the base hospital with headache, dizzy spells, and scotomata. He was found to have a blood pressure of 146/104 and was discharged from the Service after six months in the hospital with the diagnosis of arterial hypertension caused by anxiety neurosis, chronic, severe. Three months after discharge he was examined and found to have been working steadily in strenuous labor He complained that heat bothered him and made him "weak as a cat" and his heart would start "racing." He is restless, his sleep is disturbed, and he gets easily excited He showed a sinus tachycardia, rate 120–130, with a blood pressure of 160/110 bitten fingernails, tremors of the hands, some past pointing, but otherwise the neurologic, eye-grounds, and laboratory findings were within normal limits A diagnosis was made of postencephalitis (heat) with anxiety neurosis.

Case 6—S-6, 42 years old, enlisted in the last war, and was in France two years. He was gassed and became nervous, and was diagnosed as having neurasthenia After the war he was declared not to have a neuropsychiatric disability He was sent to North Africa with a civilian construction company, and remained there from September 28 1942 to May 5, 1943, where he was badly affected by the sun. On his return to America he tried to enlist in both the Army and the Navy, but was rejected because of nervousness A private physician told him he suffered from nervous exhaustion and gave him sleeping pills. He stated at examination that he occasionally has insomnia, and his sleep is disturbed and restless, and he wakes up exhausted each morning dozes off during the day suffers from indigestion, and has slight pains about the body He has occasional headaches and dizzy spells. Before being sent to North Africa, he was given eleven hypodermic injections in his left arm for immunization and now had most of his discomfort in that arm. The neurologic examination showed a suggestive Romberg, slight digital tremors, hyperactive reflexes, and a "tingling" sensation in the left foot The spinal fluid was under some pressure All laboratory findings were within normal limits A diagnosis was made of postencephalitis, chronic, mild with neurasthenia.

Conclusions

Examination of men discharged from the armed forces because of neuropsychiatric disabilities, clearly emphasizes that many of those recovering from malaria (3 94 per cent) or the pathologic effects of the sun (5.25 per cent) show permanent sequelae that indicate encephalopathy

In some areas where it was necessary to send American fighting men, 36 to 66 per cent of the men showed signs of malaria, and of these 65 per cent had the malignant type of the disease

Prophylactic treatment of malaria by giving minimum medication may mask clinical symptoms while the infecting plasmodia are insidiously doing damage to the patient's tissues, and when the parasitemia finally overwhelms the host, a more serious type of disease is the usual result

Malaria frequently causes a positive Wassermann or Kahn reaction and, therefore, neurologic findings should not be diagnosed as signs of syphilis unless malaria is carefully ruled out Especially is this important since malaria, like syphilis, may simulate many specific disease syndromes

An active or passive congestion of the nervous system may result from excessive exposure to the sun or its heat, and chronic encephalitis may result.

Of neuropsychiatric casualties occurring in the tropics, 21 6 per cent showed pathologic effects from the sun

SERVICE-DEAFENED VETERANS HELP EACH OTHER

Veterans whose hearing was impaired while in the service are helping other veterans with a similar handicap—and, incidentally, are helping themselves too One of the greatest handicaps which a newly deafened man has to overcome is the restoration of his ease and self-confidence, even after he has acquired and been trained in the use of a hearing-aid and in lip reading More perhaps than any other partly disabled man, he has a strong tendency to feel himself shut off and apart from his fellows With many, this feeling is so strong that they avoid joining veterans' organizations

The work done for the veteran at the Army and Navy hospitals before discharge, excellent though it is, cannot, by the very nature of the problem, do more than start a man back over the bridge that leads the hard-of-hearing veteran to fulltime participtation in business and social life The Veterans Administration can give hearing aids and some therapeutic treatment, but again is not equipped to take the veteran all the way back

Impaired hearing, while a new problem to most veterans, is an old story to the New York League for the Hard of Hearing For many years, this organization has been engaged in solving the problems of living and earning a living for hard-of-hearing men, women, yes, and children Under the encouragement of the League, some veterans organized themselves into the Veterans Sounding Post No 1 The purpose of this organization was, in close cooperation with the League, to assist veterans, both men and women, whose hearing had been impaired in the service, to complete their readjustment to normal life

Through the League's cooperation, funds were made available and quarters rented at 480 Lexington Avenue, New York 17, N Y Trained teachers and consultants from the League Staff were available for lip-reading classes, voice and speech control (for hearing impairment often is reflected in speech defects), for the use and testing of hearing aids, and for meeting and intercourse with other similarly handicapped veterans Little by little in the company of others who were going through, or had been through, the difficulties of putting to practical use their newly acquired skills in lip-reading and the comfortable use of hearing aids, these men lost self-consciousness and awkwardness

They took part in meetings and discussions They participated in parties, dances, and excursions In some of these activities they were joined by people of normal hearing and so they found for themselves that they could take a normal part in life.

They re-established themselves in various trades, businesses, and professions Some have become active members of Leg on and VFW Posts, for in spite of its name, the Veterans Sounding Post is not a veterans organization competing for members It has a definite mission and one of its measures of accomplishment of that mission is to have its members' self-confidence sufficiently restored to take an active interest in normal veteran activities

The men who started this group hope that, as the success of their efforts grows, other veterans may be inspired to form other similar "posts" in various parts of the country Indeed, they already have received inquiries not only from widely scattered localities in the United States, but from veterans in several allied countries

For the moment they are mainly concerned in doing this cooperative job they have taken on, and the more veterans who know about the work, the better they can do it Any veteran, man or woman, or any friend of a veteran whom the Veterans Sounding Post might help is invited to write, telephone or visit VETERANS SOUNDING POST, 480 Lexington Avenue (Room 1140), New York 17, New York Telephone—Wickersham 2-1853

GASTROENTEROLOGICAL ASSOCIATION HOLDS CONVENTION IN JUNE

The National Gastroenterological Association this year resumes its annual scientific sessions with a three-day Convention in New York City on June 19, 20, 21, 1946

The program will consist of five Symposia and five additional short papers There will be two luncheon round-table conferences, one on Wednesday, June 19, on "Parasitology and Tropical Medicine From A Military and Civilian Standpoint" led by Dr Z Taylor Bercovitz, of New York City, the other on Friday, June 21, on "Socialized Medicine" led by Dr. William B Rawls, of New York City.

Among those presenting papers will be Dr Frank Co Tui, of New York University, College of Medicine, Dr M Herbert Barker, of Chicago, Col Samuel Paster, (MC), U S A., Dr Sidney A Portis, Chicago, Dr Stewart Wolf, New York Hospital, Dr Martin E Rehfuss, Philadelphia, Dr Max Thorek, Chicago, Dr Frank Glenn, New York City, Dr Fred W Rankin, Lexington, Kentucky, Dr Harry Bacon, Philadelphia, and Dr George T Pack and his associates from the Memorial Hospital in New York, who will present a symposium on "Carcinoma of the Gastrointestinal Tract"

THE RECRUDESCENCE OF SYPHILIS IN NEW YORK STATE*

ISADORE ROSEN, M D , New York City

THE situation regarding the prevalence of syphilis today is much the same as after World War I, with the exception, however, that our methods of therapy have made considerable progress Up to World War II the incidence of syphilis had been greatly reduced, not alone early infections, but a large percentage of serious complications that followed neglected cases Those of us who were teaching the subject were finding more and more difficulty in demonstrating to the students clinical manifestations which were becoming scarcer, and we had to resort to our collection of old lantern slides for teaching purposes, especially the cutaneous lesions of secondary syphilis For the past year or two the situation has been changing and today we are again able, without the aid of lantern slides, to show the various types of skin lesions of the disease

Organized methods of control of the spread of the infection are urgent and every effort should be directed to this end The clinician with his social workers should direct every effort toward the isolation of the active cases and investigation of the contacts and family, but this is only one link in the chain One of the major problems facing us from the Public Health standpoint is the follow-up of all syphilitic patients who have had penicillin therapy In every new therapeutic procedure time is a big factor in determining its actual curative value No drug, no matter how specific its promise, is 100 per cent effective, and it may require many years to prove its real value It seems to me steps should be taken to provide means for contacting all those individuals in order to check, not alone their serologic status of the blood and spinal fluid, but also cardiovascular, neurologic, and ophthalmologic findings Such examinations should be repeated periodically for at least five or more years. In this way only can we evaluate the ultimate results of any type of new therapy

I have great confidence in the therapeutic efficacy of penicillin in syphilis But, as with all new discoveries, certain phases are encountered which require careful consideration and debate regarding the permanency of cure

The main issue under discussion is the amount of the drug necessary to eradicate the infection There is no doubt in the minds of the majority of syphilologists that in primary seronegative syphilis, penicillin alone in dosage of at least 2,400,000 units, without any of the arsenicals or heavy metals, may be sufficient In the secondary and later stages, however, much uncertainty exists as to the best procedure to follow and opinions vary

From a review of the results with penicillin alone in secondary syphilis it appears that there has been too large a percentage of relapses, clinical or serologic, or both, especially where the dosage has been under 2,400,000 units And even with that amount recurrences are too frequent when compared with the results obtained by the plan followed by the Clinical Cooperative Group with arsphenamine and bismuth

It is well known that relapsing secondary syphilis is much more difficult to control with any form of therapy Our aim, therefore, must be to devise a plan which will ensure a minimum number of relapses It is my opinion that the excellent initial results obtained with penicillin in the secondary stage can be frustrated unless subsequent reinforcement with an arsenical and heavy metal is included Perhaps in a fair number of patients 2,400,000 units or more would be sufficient, but how is one to know in which of these patients this amount will not meet with our expectations—and time is an important element

Syphilis at present is being treated by the general practitioner, who, although capable of administering the drug, has had in most instances little experience with the behavior of the disease itself The mere fact that the acute manifestations have disappeared does not indicate eradication of the infection, and the danger lies in discontinuing treatment at this stage and the failure to follow up these cases for a number of years

Many of us have been called upon to interpret the existence of a persistent Wassermann reaction, some mildly, others strongly positive, most of them in men from the armed forces who have had treatment for syphilis, with penicillin, a year or more previously Clinical examination is entirely negative I find it difficult at times to decide upon the procedure to follow in these cases In many of those with repeated strongly positive Wassermanns I advise further treatment with bismuth and an arsenical, or an additional course of penicillin In those with weakly positive fluctuating reactions, I delay therapy but advise a follow-up course

Another feature which often complicates the picture is the conflicting reports on the same specimen sent to different laboratories at the

* Presented at the 14th Annual Conference of the New York Tuberculosis and Health Association March 21 1946.

same time, or from the same laboratory at different times

It might be advisable to organize a central laboratory where a carefully checked standardized technic could be developed as a final assay on these patients

In early syphilis the Wassermann test has been a fairly accurate guide in determining whether treatment was efficacious Before the use of penicillin, with the older methods of therapy properly carried out, the Wassermann reaction in the majority of patients became negative after two to four months' continuous treatment and remained so In the case of penicillin, the consensus seems to be that in the average case treated with what is at present considered an adequate dosage six months elapse before the Wassermann is reversed

In conclusion, I would like to reiterate that penicillin is one of the outstanding discoveries of the century for the treatment of syphilis, not only on account of its therapeutic effect, but because of the negligible reactions and by-effects on the human organism, the shortening of the time required for treatment, and, last, the important social gain it achieves in the rapid control of the contagious stage Until we are convinced, however, of the amount of the drug necessary to effect a permanent cure, we should insist upon reinforcement with an arsenical and heavy metal to prevent serious relapses and other complications Time alone will be the deciding factor

---

DOCTOR FIFTY-FOUR

(Apologies to E A Poe)

1

Once upon a midnight dreay,
Head a-splitting, body weary,
Phoned I for a doctor—
Federal Doctor Fifty-Four,
Pain, my progress did encumber—
Feverishly I dialed the number
Came a voice still steeped in slumber—
One that I'd ne'er heard before
'Twas the man assigned our district,
Federal Doctor Fifty-Four,
Doctor number fifty-four

2

"What's the trouble?" snapped the query,
Crisp it sounded, far from cheery,
Its accent irritating
Pierced my bosom to the core
Told about my pain and sorrow,
Another day he bid to borrow
"I'll be there upon the morrow,"
Only that and nothing more
How could he so lightly, smugly
My predicament ignore?
Federal Doctor Fifty-Four

3

Another that I called, disdainful
Flatly "no'd" me Faint and painful
Fell I full exhausted
On the frigid bedroom floor
Morning came and neighbors found me,
Into bed they gently downed me,
Placed the coverlets around me,
Left me there exhausted, sore
In consultation long they muttered
Right outside my bedroom door—
Just without my chamber door

4

All that day, with fever burning
Lay I rolling, tossing, churning,
Waiting for the call
Of Federal Doctor Fifty-Four
Neighbors, once again beside me,
Now with apprehension eyed me—
They had phoned for succor widely—
But no succor was in store
For federal doctors all had gone
On sit-down strike the night before—
For double pay and then some more

5

Neighbors, slyly and discretely
Called a "scab," old Doctor Heatley
Presently I heard him softly
Tapping at my chamber door
Quickly he applied his knowledge
Gained in practice and at college—
Gratefully I now acknowledge
Doctor Heatley, more and more
He had "run the line" of pickets,
Angry pickets, half a score,
Gathered at my very door

6

As I convalesce serenely
I can ponder long and keenly
O'er the way that things have changed
From what they were before
With doctor-patient ties outdated,
Hippocrates and Osler, hated
And family doctors, under-rated
The older system I'd restore,
More kindly and effective were
Physicians in the days of yore—
Would that they were here once more

7

We may sit and smile benignly,
But my plea is urgent, timely—
Be you up and doing
Lest these things that we deplore
Cause sweet freedom to forsake us
And that fatal day o'ertake us
When the current trends shall make us
Vassals of a dictator—
Slaves to social despotism
never dreamed of heretofore—
Freedom lost forevermore

—N M Gampfer, *J A M A*, *April 27, 1946*

ERADICATION OF BREAST CANCER, ITS FEASIBILITY AND CONSEQUENCES

A Reply

SIGISMUND PELLER, M D , New York City

IN ORDER to eradicate breast cancer in women, L. Gross[1] suggests that nursing of infants be stopped for one generation His proposal is based on the assumption that Bittner s "milk factor" which is essential for breast cancer in mice may play a similar role in women Having banned breast-feeding, transmission from the old to the new generation of the assumed milk factor will be interrupted and "this simple preventive measure may save the lives of many thousands of women "

Reading this proposal, three questions come to my mind First, whether animal experiments, however brilliant and clear-cut they may be, are a sound basis for proposals regarding the human second, and aside from the general problem, would this proposal, if relentlessly carried out for thirty years, effectuate eradication of human breast cancer, third, provided the goal has been achieved by the means suggested, would there not be unintended side effects, both restricting the benefit in the cancer field and creating harm to mankind in other areas?

In mice, apart from the milk factor, in the epidemiology of breast cancer other factors, likewise, are relevant Known to be involved are heredity, age, hormonal, dietary, and calorie factors, either promoting or retarding and even preventing appearance of breast cancer in animals

Regarding women and their breast malignancies, nothing has been learned so far as to whether an agent identical with, or similar to, the milk factor exists and what, if any, role it plays However, for the sake of argument we might assume that in women there exists a milk factor, namely, a virus-like agent which is transferred to the nursed baby, where it remains dormant and gives rise to a breast cancer twenty-five to seventy years later

On account of migration, marriage, and feeding customs, this agent, if existent, could not be limited to certain nations, social groups, stocks, or families. Though geographic and stock differences may be conceded, the agent would be practically universal Nevertheless, all over the world cancer of the breast in women is in the minority of all female cancers

Of women who enter the cancer age, about 4 to 5 per cent develop a primary cancer in the breast, 15 to 16 per cent in some other organ, and a small fraction of 1 per cent develops both, a breast cancer and another malignancy, while about 78 to 80 per cent remain cancer free In families with several women having cancer, some have a primary tumor in the breast, others in another organ and some remain free Pure breast cancer families, though sometimes found, as they must be, due to chance, are rare everywhere Apparently, in women the milk factor, if it exists at all, is not as all-important as it seems in mice, and there must be numerous mute carriers in analogy to clinically healthy carriers of bacillary diseases

Whether and when in a woman a primary tumor will appear in the breast, depends on a variety of factors such as stock, marital status, number of pregnancies, number of miscarriages, age at the last pregnancy, chronic inflammatory conditions in the breasts, and intensity of factors cancerogenic to organs *other than* breasts None of these factors is carcinocreative, they come into play only as regulators with regard to organ and time, after the still mysterious X which causes the cancerous reaction of the body had prepared the soil for them Whether X is a hereditary disposition of the body or a bodily reaction to some unknown organized living or physical or chemical agents does not matter in our present discussion

In women there are definite correlations between the incidence of cancer in the breast and in several other organs. In groups of women with a high frequency of breast cancer the incidence of cervical cancer is rather low and vice versa [2] Cases in point are (a) Jews compared with Gentiles, (b) the English versus Central Europeans, and (c) social strata differing from one another by the level of birth rates

The differences shown between these various groups ought to be considered from a dynamic point of view Where in a population the frequency of breast cancer is on the increase, the incidence of cervical cancer diminishes and vice versa An excellent example is provided by England's cancer statistics for a period of several decades It is as if we were dealing with a system of communicating tubes filled to some extent by a fluid If we press the liquid in one tube down, it rises in the others *

In England, since the beginning of this century, breast cancer mortality rates increased by about one fourth, and the rates of ovarian cancer

* The analogy does not go further; the effect of an increase of the whole amount of fluid by adding fluid from the outside has no parallel in cancer statistics.

were almost tripled, but the cervical rates diminished to such an extent* that the total standardized mortality from cancer of genitals plus breast remained about the same, namely 38 per 100,000 At the same time, the standardized total mortality from cancer of all organs varied only very little, the extremes were 94 and 98 per 100,000 There is, so to say, an active compensatory mechanism, which includes not only the breast and genital organs, but also the gallbladder and the stomach

A quantitative analysis of factors relevant to breast cancer, that is, of factors increasing its frequency and/or changing the age of its appearance, is incomplete and lends itself to unwarranted conclusions if attention is limited to breast cancer We cannot correctly comprehend the results of intensification or reduction of a factor which plays a role in the pathogenesis of breast cancer, if our study fails to encompass cancer of other organs Without having checked the occurrence in these other organs, we are under the impression that the difference in the breast cancer incidence as caused by the factor analyzed, is about fully reflected in the sum total of all cancers In other words, we are led to think that the total cancer incidence has increased (or has been reduced respectively) by about the same amount This impression is wrong

In human cancer pathology the function of most of the known factors is but a *redistribution* of primary tumors according to site and age There are known only a few agents capable of increasing the incidence of all cancers in a population Among these are radium, other radioactive substances, and, to a much smaller degree, tar Radium, for instance, may increase the incidence of lung and bone-neoplasms to such a degree that although in the exposed population there are almost no cancers of the stomach, intestines, kidneys, and bladder, the total cancer mortality is about four times that of an average population of the same age structure This we learned analyzing the conditions in the Joachimsthal radium mines [3]

An elimination of factors, like radium, is followed by a really diminished total cancer incidence But even so, the net gain in human life would be smaller than is indicated by the reduction of cancer incidence in the organs to which those substances have an affinity, as those cancers which in the exposed population failed to appear in the stomach, intestines, etc , would now appear there in their usual frequency

On the other hand, reduction or elimination of factors, such as birth rates, nursing, sun and ultraviolet rays, alcohol fibrosis, and cirrhosis,[4] greatly benefits the respective organs, diminishing the number of their primary tumors, but does not change appreciably the total cancer incidence What is and can be very much changed is the distribution of primary tumors by site and age

The custom of not nursing, either by delegating it to foster mothers from lower social strata, or by utilizing artificial feeding, has spread more, and earlier, among the middle class and the privileged than in general Nevertheless, the higher the social class the more breast cancer we find without an increase in the total cancer incidence, on the contrary, in this group, cancer mortality is lower

At present, women have about the same total cancer rate as men, although about a quarter of their primary cancers are located in the breast Thus, the cause of such a large group of tumors failed to increase the total sum of malignancies, apparently the "additional" cancers† have but replaced primary tumors in other organs This, too, supports my prediction that an eradication of breast cancer by the proposal under discussion would not reduce the sum total of cancer incidence

Taking the milk factor for granted, by the suggested elimination of natural feeding of infants at best about 20 to 25 per cent of all female cancers might be eradicated, but they will be substituted by an increased frequency of cancers in the ovaries, in the corpus, cervix, stomach, and gallbladder, perhaps, also, in the lungs A primary tumor in the last-mentioned organs has a much higher risk of death (case fatality rate) than breast cancer Therefore, the elimination of the "milk factor" will result in (*a*) a diminished incidence of breast cancer, an increased incidence in some other organs, plus and minus neutralizing each other approximately, (*b*) a mortality from breast cancer diminished and a mortality from cancer of some other organs increased to such an extent that the total mortality of the female population will be increased rather than unchanged

Moreover, abandoning breast-feeding most probably will be associated with an increased infant mortality and would deprive many mothers and children of the emotional gratification connected with nursing By the way, Gross' proposal would not suffer if the ban on natural feeding would be restricted to female babies only

The plan under discussion is in line with the general theory of combating cancer by restricting exposure to carcinogenic factors That practice failed in most instances, it has seldom been successful Examples of success are chimney sweeps in England and radium dial painters in New Jersey Prevention of exposure is seldom feasible

* The mentioned changes in the rates of genital and breast cancer are mostly due to falling birth rates.

† Additional from the male point of view

Moreover, elimination or restriction of factors having affinity to organs with a low case fatality rate, paradoxical as it may sound, is risky Removal of such factors, or of the exposure to them, is followed by (*a*) a decline of tumors with a low fatality rate, (*b*) a redistribution of cancer by site, and (*c*) by an increase in the number of tumors that have a high death toll Consequently, such a prevention policy causes an increase in the total cancer mortality

As prevention of tumors in one organ has repercussions in other organs, the intensifying of exposure to carefully selected carcinogenic factors has a greater chance of success Thus method would follow experience gained by statistical analysis of existing conditions in human society White Southerners[3] and the white personnel of the armed forces[4] are much more exposed to dermotropic agents than whites living in the northern tier of the country For this high exposure, they pay with an increased incidence of, and mortality from, cancer of the skin and lip Nevertheless, their total age specific cancer mortality rates are extremely low, since the easily curable surface cancers substitute for the deadly internal cancers This experience shows the way toward diminishing the total cancer mortality

Experience gained through statistical analysis of large groups of the population is equivalent to a human experiment It is gained with human beings, yet without depriving them of essential factors of health

Finally, I may mention that many a woman is undecided whether or not to nurse her baby As families without any cancer case among the relatives are rather rare, there is the possibility that the proposal made by Gross frequently will be referred to as a contraindication against breast feeding

"DOCTOR JONES" SAYS—

This wave of so-called juvenile delinquency (which, in the last analysis, is largely a symptom of adult delinquency)—folks worrying about it—it's started another wave of trying to do something about it. Of course waves—the kind I'm talking about—they soldom catch up with each other and they've soon spent their force.

One of the main things they're doing here and there—they're trying to provide recreational facilities for the teen-agers recreation of a sort that s reasonably safe and, the same time, "modern' enough to appeal to the youngsters. And for immediate effect I guess it's the most practical treatment. But it's like what the doctors call palliative treatment designed to relieve urgent symptoms but not expected to cure the disease

Being delinquent as Mr Webster puts it, is "offending by neglect or violation of duty or law" And a juvenile is a child—not old enough in years or experience to have mature judgment. Whether we like it or not, it's us adults falling in our duty that's primarily responsible when the youngsters answer the "call of the wild"

To cure the disease we've got to treat the underlying causes. Failure of home influences obviously that's been aggravated by wartime conditions But, regardless of that, parents—taking 'em by and large—even if they're intelligent and emotionally stable they lack adequate understanding of child psychology

These qualifications for child guidance—you could reasonably expect to find 'em in the schools the second line of defense But, if you do, it's my impression it's the exception rather than the rule. And the underlying reason, I believe, is that we don't pay our teachers enough. Ordinarily the young people that have the personal qualifications can't afford to qualify themselves technically and make teaching a career

Of course most of us—we can think of fine teachers that were good influences in our lives. But if they stuck to teaching, they did it at a sacrifice—the majority of 'em—even when a dollar'd buy a dollar's worth of stuff And what the average church pays its "sky pilot"—but that's another story

Anyway, to deal with the adult-juvenile delinquency problem calls for highly skilled child guidance.

It can't be done by well-intentioned mud
or bargain-rate measures. We might better
here also.—*Paul B Brooks, M D*,

THE TREATMENT OF LYMPHOGRANULOMA VENEREUM AND GRANULOMA INGUINALE

BORRIS A KORNBLITH, M D , F A C S , New York City

THE treatment of lymphogranuloma venereum is based upon the concept that we are dealing with a systemic virus disease Local therapy alone, surgical or palliative, has proved itself inadequate to combat this disease effectively Likewise, systemic agents alone have fallen far short of complete cure Systemic agents such as tartar emetic, the arsphenamines, typhoid vaccine, and radiotherapy have failed to affect this condition favorably The sulfonamides, however, have proved to be definitely effective Intravenous Frei antigen therapy has also proved effective Penicillin has no beneficial effect upon this disease

The various clinical manifestations of lymphogranuloma venereum require somewhat different management In general, a rational combination of a systemic agent supported by local palliative measures has proved most satisfactory thus far

The acute primary lesion requires no therapy It is evanescent, and disappears within three days to one week

The Local Adenopathies

The inguinal, femoral, and pelvic adenopathies generally respond to a single course of sulfathiazole or sulfadiazine A total amount of 28 Gm is given in divided doses of 2 Gm daily over a period of fourteen days If fluctuating abscesses have formed, these should be aspirated repeatedly as necessary under sterile precautions until the abscess cavity does not fill up again As a rule, no more than three aspirations are necessary Surgical procedures are contraindicated Incision and drainage only prolong the resolution of the adenopathies

In any case resistant to sulfonamide therapy Frei antigen may be used intravenously The antigen is given in 0 3 cc doses every other day for about fifteen injections

The Rectal Lesions

In general, a combination of the use of the sulfonamides by mouth and Frei antigen intravenously has produced the best effect in the cases in which the lesions are acute or subacute The patients lose their constitutional symptoms Their rectal pain is ameliorated The sanguinopurulent discharge is diminished after about two weeks of treatment The anatomic changes as observed by sigmoidoscopy, however, show little change until many months of therapy have passed After this period, evidence of slow regression will become apparent Epithelization of ulcerated surfaces, beginning fibrosis, and a subsidence of acute and chronic inflammation will now ensue The effect of the antigen therapy, if not completely curative, is definitely beneficial and helps to arrest the progress of the disease When the sulfonamides and the Frei antigen are administered to patients who already show fibrosis of their lesions, no evident effect is observed The fibrosis represents an end stage of the local process and, therefore, is not likely to be affected by any systemic therapy It must be remembered, however, that acute and subacute pathologic lesions have been demonstrated in the pelvic lymph nodes in cases of fibrous stricture as long as twelve years after the onset of the lesion It seems advisable, therefore, that even in these cases sulfathiazole in daily doses of 2 Gm be given for a period of at least two weeks, in an effort to cause these foci to subside

Rectal dilatation alone was found of definite benefit in those cases where active disease has completely subsided It is definitely contraindicated in tubular strictures, in acute proctitis, or pelvic inflammation It serves best in the "ring type" or diaphragmatic stricture The initial dilatation may require a general or spinal anesthetic Subsequent dilatations may be done in ambulatory patients, either digitally or with bougies

Colostomy is only rarely necessary as an emergency procedure In cases of partial intestinal obstruction colostomy may be optional This procedure should be seriously considered in cases with fulminating lesions which do not respond to palliative measures or attempts at systemic therapy with Frei antigen and the sulfonamides Cleansing of the distal loop after colostomy and rest have proved very useful and permitted a later closure in many cases

Rectal resection has thus far proved to be a procedure associated with a high mortality and is of doubtful value The tubular stenoses are associated with persistent pelvic inflammation Any procedure undertaken in this diseased tissue is analogous to incision of a phlegmon elsewhere with its associated complications of systemic dissemination of the virus sepsis and failure to heal

Incision and excision of fistulous tracts, and

repair of rectovaginal fistulas have proved unsatisfactory as long as any disease process remained active in the rectum itself

Palliative procedures, such as rest in bed, low residue, high vitamin diet, retention enemas of olive oil or cotton seed oil, rectal irrigation with tannic acid 2 per cent, have all proved of benefit.

Cases with Persistent Genital Lesions

This group comprised the chronic periurethral lesions, esthiomene, and various lymphedematous ulcerative lesions of the male and female genitalia The periurethral lesions may lead to urinary obstruction, and must be treated accordingly

The pendulous masses may be removed only after the ulcerative lesions are healed And here again, as in the rectal lesions, no surgery should be undertaken until all evidence of active disease has disappeared

Granuloma Inguinale

The successful therapy of granuloma inguinale is of great importance since there has been a definite increase in the number of cases of this disease, both in the southern part of the United States and especially in the coastal areas Acute lesions of this disease run a persistent chronic course and are infectious as long as they cannot be made to involute. Even if the lesions appear to involve the skin locally only, it is now obvious that the lymphatics are involved in all cases and that Donovan bodies can be demonstrated in the lymph nodes Therefore, the rationale of successful therapy is directed toward using a systemic agent for the radical cure of this disease

The current methods of therapy revolve about the use of antimony preparations intravenously or intramuscularly The preparation introduced in 1913 is tartar emetic (potassium antimony tartarate), in 1926, monosodium antimony thioglycollate, in 1933, fuadin (sodium antimony III bis-catechol disulfonate of sodium), and in 1936, anthiomaline (lithium antimony thioglycollate) The use of local excoriants such as 20 per cent resin of Podophyllum, actual cauterization, and curretting of granulation tissue have met with questionable success Radical excision is of value when the location of the lesion is suitable Surgery, however, should be resorted to only after systemic therapy was failed and the lesion is rendered as surgically clean as possible

Penicillin and the sulfonamides have no beneficial effect upon this disease

A combination of the methods described will yield good results especially in early cases A course of about fifteen injections of 5 cc of 1 per cent tartar emetic or the equivalent of the other antimony preparations, given in single injections on alternate days, will suffice to cause the involution of most of the acute and many chronic lesions There remains, however, about 20 per cent of cases resistant to antimony therapy These cases present a very serious public health problem because the lesions remain open and persistently infectious The cases that appear successfully treated will also break down again if therapy is not carried on for about six months after the local lesion has completely healed This involves a persistent follow-up Lapsed treatment is, unfortunately, the rule, rather than the exception It is therefore, quite as important to continue therapy after healing of local lesions as it is to heal obvious manifestations of this disease

When surgery is utilized, wide excision and plastic repair must be resorted to, and healing without drainage can be accomplished

1801 Marmion Avenue, Bronx

TAXES AND SECURITY

A South African native was told he had to be taxed because the government, like a father protected him from his enemies, cared for him when he was sick, fed him when he was hungry, gave him an education and for these reasons, needed money The old native said 'Yes I understand. It is like this I have a dog and the dog is hungry He comes to me and begs food I say to him, 'My dear faithful dog, I see you are very hungry I am sorry for you. I shall give you meat.' I then take a knife, cut off the dog's tail, give it to him and say 'Here, my faithful dog be nourished by this nice piece of meat.'"

FEMORAL HERNIAL APPENDICITIS IN AN AGED INDIVIDUAL

LEONARD K STALKER, M D , and G STUART ROTH, M D , Rochester, New York

(From the Department of Surgery, Highland Hospital)

ACUTE femoral hernial appendicitis in an individual more than 70 years of age constitutes a rare but interesting problem The diagnosis is infrequently made prior to operation, and, in the majority of instances, it has been recorded as a coincidental finding at the time of herniotomy When the degree of acute inflammation has necessitated emergency operation, the preoperative diagnosis has invariably been that of a strangulated hernia The most outstanding symptom is a tense, exquisitely tender, hernial swelling which so overshadows the other symptoms that complaints referable to the abdomen are not made Black and Waugh[1] reported from the literature an incidence of approximately 1 5 per cent of hernia of the appendix. However, the finding of the appendix alone in the hernial sac is more uncommon than this, and the finding of an acutely inflamed herniated appendix quite rare

One of us (Stalker)[2] has previously mentioned that approximately 0 3 per cent of all patients with acute appendicitis are more than 70 years of age In a review of a series of 82 cases of acute appendicitis occurring in individuals more than 60 years of age, he reported the clinical manifestations of the disease as atypical in more than one-half of the cases Perforation of the appendix had occurred in 51 of the 82 cases prior to surgical treatment He also states that the greatest mortality for acute appendicitis occurs in patients more than 60 years of age, and attributed this to the fact that the diagnosis was frequently overlooked or delayed because of the patient's age and because of the variability of the symptoms

Case Report

A woman, aged 75 years, was referred to one of us (Stalker) February 8, 1946, for surgical treatment of what was thought to be a right sided strangulated femoral hernia Ten days previous to this, while working in the kitchen, she had suddenly become nauseated and vomited She vomited undigested food particles four or five times during the next few hours There was no fever and no other abdominal symptoms For the next three days she felt nauseated, ate very little, but there was no vomiting On the fourth day, she developed a dull aching pain in the right inguinal region, and for the first time noted a slight bulging in the right femoral area The skin was reddened over the bulge and it was tender to palpation There was still no complaint of abdominal distress A physican was called for the first time and the diagnosis of a femoral hernia made The patient states that the hernia was reduced and that she was told to remain in bed for a few days She improved and no new symptoms developed Five days later (ten days after the onset of her illness), she again called her physician, because the mass in the right femoral region had recurred This time it was much larger, more painful, inflamed, and irreducible The diagnosis of a strangulated femoral hernia was made and she was referred to us for treatment

Examination at time of admission to the hospital revealed a dehydrated, ill-appearing, emaciated, elderly female who was in acute distress The blood pressure was 120 over 70 and the pulse rate, 128 The heart beat was irregular and the diagnosis of an auricular fibrillation without decompensation was made Her temperature was 101 F The leukocytes numbered 21,400 with 89 per cent neutrophils The abdomen was slightly distended and somewhat tender throughout the entire lower half There was a markedly inflamed, tender, fluctuating mass in the right femoral region, approximately 10 cm in diameter and surrounded by considerable induration The patient vomited small amounts of clear liquid material on two occasions, and for this reason the stomach was aspirated, but nothing unusual obtained She passed gas and had a bowel movement following an enema

There was no question about the presence of an abscess in the right femoral region, but the exact cause of this could not be determined It seemed reasonable to consider a femoral hernia into which a portion of omentum had herniated and become gangrenous On the other hand, because of our interest in appendicitis in older individuals, the possibility of an appendiceal abscess was entertained

Operation was performed as an emergency procedure The abscess in the right femoral region was incised and drained It contained approximately six ounces of colon smelling pus The femoral canal opened directly into the upper portion of this abscess cavity A probe was easily inserted into this opening and without difficulty it seemed to drop into the abdominal cavity Five grams of sulfathiazole were placed in the abscess cavity and the wound packed open

The abdomen was then opened through a low right pararectus incision There were considerable inflammatory changes in the right lower quadrant of the abdomen The distal third of the appendix was gangrenous and herniated into the femoral canal. It was adherent to the opening of the canal and perforated at the tip The appendix was freed up and an appendectomy performed Five grams of sulfathiazole and one Penrose drain were placed in the pelvis

The patient made an uneventful convalescence She was out of bed on her second postoperative day, and dismissed from the hospital on her sixteenth postoperative day

Comment

We have classified this case as one of femoral hernial appendicitis in which the appendix alone was herniated, and in which acute inflammation developed with subsequent perforation and abscess formation The local findings were so acute that attention was not directed toward the abdomen since gas and feces had continued to pass

It is interesting to note that the early manifestations of the appendicitis in this case were minimal, and that it was not until perforation had occurred

that surgery was considered This is, unfortunately, true in the majority of cases of appendicitis in this age group The clinical manifestations of the disease in these patients are usually minimal and atypical, and it is not until peritonitis has developed that aid is sought One of the reasons why this may occur is due to the age of the patient and the inborn feeling that surgery at this time of life is invariably fatal. This is no longer true for with the modern refinements, the operative risk in the aged is not high and if these patients can be seen before complications have developed, it is nearly comparable to that of the younger age groups.

THRUSH AS SEQUEL TO PENICILLIN TREATMENT

EUGENE E. MARCOVICCI, M.D., F.A.C.P. New York City

AMONG many cases of various infections that I have treated with penicillin in recent months, reaction to the drug occurred in 6 cases. The mildest case was an aphthous stomatitis with oral penicillin, the severest, a generalized giant urticaria and angioneurotic edema of the face, hands, and feet, following parenteral administration of the sixth dose of 20,000 units in a case of upper respiratory infection. The other 4 cases suffered the painful experiences associated with thrush.

All the cases are of certain interest because of the therapeutic suggestions which proved beneficial

Case Reports

Case 1.—A. F., age 22, suffering from infectious mononucleosis, from November 29, 1945 to December 10, 1945, developed, after three days of penicillin treatment (360,000 units), a parasitic stomatitis (thrush) involving cheeks, tongue, throat, and lips.

Case 2.—Mother of the above patient, age 45, had had virus pneumonia (*left lower lobe*) in January, 1946. After a similar amount of penicillin, she experienced the same reaction as her daughter, only a more severe stomatitis mycosa, involving the throat, tongue, cheeks, and gums.

Case 3.—Mrs. B., age 50, had virus pneumonia (left lower lobe), after 500,000 units of penicillin she developed an inflammation of all mucous membranes, and thrush, involving lips, tongue, cheeks, and pharynx, also rhinitis, conjunctivitis, vaginitis, and cystitis. (January, 1946.)

All 3 patients lived under good hygienic conditions and had excellent nursing care.

Case 4.—The patient, a man, age 46, was suffering with mild upper respiratory infection (April, 1946). He had controlled a previous attack (three months ago in California) with one dose of 300,000 units of calcium penicillin in peanut oil, he asked for repetition of the same treatment, which I declined to administer. Against advice, the patient used oral penicillin and developed aphthae and swelling of the tongue, which could be regarded as allergic stomatitis.

Case 5.—Mr. A., age 47, had been treated with penicillin for a generalized staphylococcus infection of the skin in October, 1945, and in December of the same year treatment was repeated for a respiratory infection. Giant urticaria and angioneurotic edema appeared after the third injection of 20,000 units. The condition was very severe and took four days to clear, notwithstanding the following therapeutic measures: limit baths, propradine hydrochloride ¼ grain three times daily, sodium salicylate 10 grains with ½ grain extr. belladon three times daily, local applications of Caligesic ointment or witch hazel, adrenalin in oil, ½ cc. every six hours.

Case 6.—M. A., age 22, had streptococcus throat, March, 1946. After 500,000 units of penicillin, became fever free. The throat was clean. On the fourth day, a new eruption covered the fauces and the pharynx which proved to be thrush.

Comment

I have not seen, as yet, in connection with penicillin treatment any mention of this harmless but unpleasant complication and I wonder if the possible explanation would be that penicillin reduces the resistance of the mucous membranes, and thus facilitates the parasitic, secondary invasion.

The state of nutrition of the afflicted patients was good because of well-controlled balanced diet. Whether the long lasting fever in the two pneumonia cases was the contributing factor, or incidental contamination in the penicillin itself, would have to be verified by further observation from other sources and bacteriologic findings as to parallel growth of Penicillium notatum and oidium albicans.

The treatment consisted in painting the areas with 1 per cent gentian violet and irrigations of the mouth and throat with alkaline gargle (2 per cent sodium carbonate).

120 East Fifty-fourth Street

CORRECTION NOTICE

In an editorial entitled "Increased Use of DDT," which appeared in the May 1 issue of the JOURNAL, an unfortunate error occurred. The last sentence in the next to the last paragraph should read as follows:

"On the basis of studies thus far made the U.S. Food and Drug Administration has established an *administrative tolerance of seven parts per million* or about 0.05 *grain* per pound." (The pound refers to produce.)

PREGNANCY IN HYPERTENSIVE DISEASE FOLLOWED BY THORACOLUMBAR SYMPATHECTOMY WITH RENAL BIOPSY AND COMPLETE RECOVERY

SALO M BOLTUCH, M D , F A C S , New York City

(From the Department of Obstetrics and Gynecology, Sydenham Hospital)

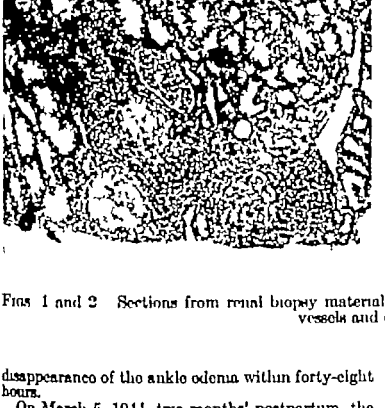
THE morphologic changes in the kidneys of patients who have died from essential hypertension and its complications are rather well established Knowledge of the intervening phases has been largely lacking Recently, however, studies by Castleman and Smithwick[1,2] in the Massachusetts General Hospital, in Boston, of biopsies of kidneys taken during sympathectomies have given a better understanding of the actual kidney damage in the various grades or stages of hypertension. As an example of the importance of these investigations, it has now been reported that in some cases the vascular changes are primarily outside of the kidneys, thus indicating that true, essential hypertension without renal changes does not exist Even when the kidney vessels themselves are involved, it has been shown that there may be at first no demonstrable renal parenchymal or functional alterations

Hypertensive women who become pregnant constitute a large group of obstetric patients, in many of whom all known tests offered until now have given little more than scant information of the outcome to be expected

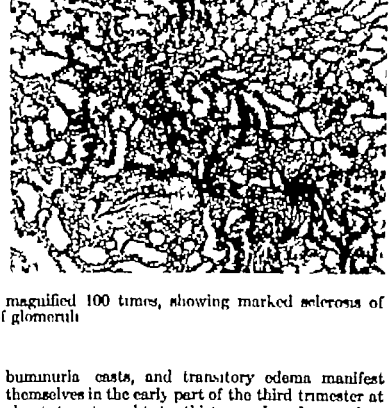
The case report is of interest for its uniqueness As far as I have been able to determine, only one case has been reported by R. S Siddall[3] from the Harper Hospital, in Detroit, of a pregnancy complicating hypertensive disease with renal biopsy findings In that patient, the renal biopsy was done two months before she became pregnant preparatory to a sympathectomy In my case, the renal biopsy was taken four months after delivery

Case Report

The patient, M H , Sydenham Hospital, (No 81244) was a 32-year-old white woman, married nine years, who had never been pregnant. Menarche occurred at the age of fifteen, every twenty-eight days, lasting from four to six days, moderate in the amount and painless In February, 1941, the patient had a dilatation and curettage and excision of cervical polyps for menometorrhagia At that time, the patient's blood pressure was 120/85 Her urinalysis was negative for albumin and casts, specific gravity was 1 018 The past history was otherwise negative for infections or other causes of hypertension Family history was irrelevant. Her last menstrual period was May 10, 1942 (Expected date of labor February 10, 1943)



The first trimester of pregnancy was uneventful. At that time, the blood pressure was 130/95 All the routine laboratory tests were made by Dr Morris Dinnerstein, with results of the more important ones as follows urinalysis was negative for albumin and glucose, specific gravity, 1 018–24 A complete blood count showed normal findings Kahn test was negative for syphilis A blood sugar was 118 mg , nonprotein nitrogen, 19 8 mg , and uric acid, 3 4 mg per 100 cc Blood urea clearances indicated normal function. Complete cystoscopic examination gave no evidence of urinary tract abnormality



The pregnancy progressed uneventfully except for the persistence of the hypertension ranging between 140/85 to 150/95 mm There was a gain of weight from 121½ pounds to 135 pounds (13½ pounds) On December 1, 1943, in the twenty-eighth week of pregnancy albuminuria was noted for the first time This increased from slight to marked degree and by December 15, 1943, many hyaline and granular casts also appeared The blood pressure rose to 175/120 mm. Funduscopic examination showed no neuroretinitis Some of the retinal arteries were tortuous and smaller than usual but not definitely constricted The veins were full, but there was no arteriovenous nicking

The patient was hospitalized on December 16, 1943 In the hospital the tests showed as follows nonprotein nitrogen varied between 26 5 and 28 mg per 100 cc , urea nitrogen, 12 25, uric acid, 2 9 The plasma CO_2 volume per cent was 50 and blood cholesterol 284 mg per 100 cc Total serum proteins were 5 4 Gm (The albumin being 3 5 per cent and globulin being 1 9 per cent) Thus the albumin-globulin ratio was 1 8 to 1 Urea clearance was well within normal limits Icteric index, 8 3, cephalin flocculation between 2 and 3 plus The course in the hospital in spite of strict dieting, complete bed rest, and restricted fluid intake, was characterized by gradually increasing blood pressure, to 235/155 mm

On December 26, 1943, (the patient received daily between 50 to 200 cc of 50 per cent glucose) albuminuria continued (4 plus), and along with this hyaline and granular casts occurred in increasing numbers The patient complained of almost constant pain in the head, which was at times so intense as to greatly interfere with her sleeping On December 28, 1943, blood pressure became temporarily lowered to 205/130 mm On January 3, 1944, the patient suddenly experienced cramplike pains in the uterus and sudden vaginal bleeding Abdominal examination showed a tense uterus The pulse was 120, blood pressure, 230/150 mm Fetal heart sounds were still present, violent movements were noticed by patient Impression partial premature separation of placenta Immediate delivery by cesarean section was decided upon. A low-flap cesarean section was done under general anesthesia Free blood was encountered in the uterine cavity The placenta was three-fourths separated and one edge was attached to the anterior wall of the lower segment The placenta showed no infarcts of appreciable size or any other abnormality A living, newborn baby girl, 3 pounds, 12 ounces was extracted and cried lustily

Recovery of the mother from the surgical standpoint was uneventful except for a mild, bilateral parotitis on the third postoperative day After an immediate drop in blood pressure, the former levels of 180/100 to 200/120 mm soon returned and were maintained during her stay in the hospital. Albuminuria gradually diminished, only a trace was present on the twelfth postoperative day when the patient was discharged from the hospital. She had complete relief from headaches and complete

FIGS 1 and 2 Sections from renal biopsy material magnified 100 times, showing marked sclerosis of vessels and of glomeruli

disappearance of the ankle oedema within forty-eight hours.

On March 5 1944, two months' postpartum the left retina was found to have a definite exudate below the macula, as well as greater nicking of the veins and occlusion in few of the vessels. The patient complained of intermittent headaches Her blood pressure was 200/120 mm.. Albuminuria and occasional hyaline casts persisted In spite of a strict salt-free diet, limited fluid intake, and bed rest during the next three months the blood pressure maintained at the levels of 200/100 to 230/120 mm. with persistent albuminuria (4 plus), hyaline casts, severe headaches, and nausea. At this time, she was referred to Dr J William Hinton, and was hospitalized in the Doctors' Hospital. On May 29, 1944, Dr Hinton performed a right thoracolumbar sympathectomy and on June 6, 1944, the same procedure on the left side. During the operation a wedge of kidney tissue was excised for biopsy Pathologic examination revealed marked sclerosis of small arteries and arterioles with partial obliteration of lumina and sclerosis of glomeruli of various degree and extensive round cell infiltration of the interstitial tissue (Figs. 1 and 2) She made an uneventful recovery Upon discharge from the hospital her blood pressure was 125/90 mm and for the first time her urine was free from albumin and casts. Examination during the next eighteen months showed blood pressure levels of 110/80 to 115/85 mm. No albuminuria or casts were present in the urine The patient feels and looks well has no headaches, eyeground examination is essentially negative.

Summary

This case tends to confirm the previously debatable, yet commonly held clinical opinion that essential hypertension (without kidney changes except for arteriosclerosis) is likely to go on to renal functional impairment when complicated by pregnancy The first evidence of renal vascular disease may be the discovery, at a routine prenatal examination, of an increase in blood pressure and albuminuria. As a rule a history of previous kidney disease may be elicited. During pregnancy, the symptoms of repeated headaches with persistent hypertension, albuminuria casts, and transitory oedema manifest themselves in the early part of the third trimester at about twenty-eight to thirty weeks of gestation. It is important but often very difficult, to distinguish between chronic glomerulonephritis and pre-eclamptic toxemia as treatment and prognosis are based largely upon a differentiation between the two Until now, it was accepted that clinical, conclusive evidence of chronic glomerulonephritis is the eyeground findings of albuminuric retinitis. It is absent in eclamptic toxemia (the ocular findings in my patient were of the essential hypertensive type) and as proved by the renal biopsy associated with arteriosclerosis of arteries and arterioles with early renal parenchymal involvement One of the distressing features, for the obstetrician, of this type of disease is the likelihood of intrauterine death of the fetus, or a premature separation of the placenta without the slightest warning. This case also adds some weight to the belief that in addition to the immediate dangers, these patients are usually left with permanent renal impairment by pregnancy even if operative intervention is undertaken before the onset, or early in the development of renal insufficiency

Conclusion

1 The pregnancy in this patient was the causative factor in producing the renal vascular lesion which once established aggravated the existing hypertension and did not subside after the pregnancy terminated

2. The surgical sympathectomy gave the patient relief if only temporary

3. It may be assumed from observations by Drs R. H Smithwick and B Castleman[2] that the renal damage after sympathectomies does not progress rapidly thereafter For this effect alone, sympathectomies in young women postpartum are well worth the surgical risk and effort involved

4 Additional data and studies of renal biopsies (as devised by Dr T N Horah,[1] of Harper Hospital Detroit, Michigan with a special punch biopsy instrument) taken during

will, in time, conceivably establish histologic standards for prognosis and treatments in hypertensive women who become pregnant This problem merits investigation

Grateful acknowledgment is made for the valuable advice of Dr Julius Jarcho, and to Dr J William Hinton for performing the bilateral sympathectomies, and for granting me permission to make photomicrographs of the renal biopsy

BETATRON FOR CANCER

Substantial improvement in the treatment of deep-seated internal cancers will be possible when scientists find a way to canalize the high energy electrons of the betatron outside of the vacuum chamber, Dr G Failla, of Columbia University, told members of the American Physical Society at their meeting in St Louis

In time it will be possible, he said, to achieve this canalization so that the electron beam will deliver its maximum energy to the cancer with very little beyond that depth The danger of damaging by overirradiation normal tissues in the neighborhood of the internal cancer will then be less

The betatron makes it possible to treat cancer with x-rays of 20 million to 100 million volts With all x-rays available heretofore, Dr Failla explained, the skin receives more ionizing energy than the underlying tissues traversed by the beam of radiation, but with the multimillion volt x-rays produced by the betatron, the situation is reversed The highest concentration of energy occurs at a considerable depth below the surface of the skin Beyond this level the dose drops slowly A beam of multimillion volt x-rays traversing the human body is therefore more apt to damage the skin area through which it leaves the body than the skin through which it enters it All organs in between will receive larger doses than the skin on either side Whether they are damaged or not will depend on the magnitude of the treatment and on their respective radiosensitivities

Damage to normal tissues, therefore, will continue to be the limiting factor in the treatment of deep-seated tumors

The importance of taking greater care to protect persons working with the betatron than is necessary for those working with ordinary x-ray machines was stressed by Dr Failla While the accepted permissible dose for continued exposure of the whole body to ordinary x-rays is one-tenth of a roentgen, the safety limit for betatron workers, Dr Failla believes, should be put at one-fifth of this, or 0 02 roentgen per day —*Science News Letter, Dec 15, 1945*

PRIMITIVE PHYSIC

The following are excerpts taken from a little volume on domestic medicine entitled *Primitive Physic, or An Easy and Natural Method of Curing Most Diseases* (text title, "A Collection of Receipts") It was written by the Rev John Wesley, founder of Methodism, and although considered by him the best of his many books, it is now almost forgotten. The first edition appeared in 1747, while the thirty-second and last edition was published in 1828 (The Army Medical Library has ten editions, beginning with the first)

A STITCH IN THE SIDE

Apply Treacle spread on a hot Toast

THE VERTIGO OR SWIMMING IN THE HEAD

Use the cold Bath for a month
Or, drop juice or Pimpernell into the Ear Morning and Evening
Or, in a May Morning, about Sunrise, snuff up daily the dew that is on Mallow Leaves,
Or, apply to the Top of the Head, shaven, a Plaister of Flour of Brimstone, and white of Eggs

RAGING MADNESS

Apply to the Head Cloths dipt in cold water
Or, set the Patient with his Head under a great Waterfall, as long as his Strength will bear
Or, pour Water on his Head out of a Tea-Kettle
Or, let him eat nothing but Apples for a month

At the end of the "Postscript" Wesley has this to say "In uncommon or complicated Diseases, or where Life is more immediately in Danger, I again advise every Man, without delay, to apply to a Physician that fears God "—*Army Medical Library News, vol 1, number 6*

CLINICOPATHOLOGIC CONFERENCE

Fourth Medical Division of Bellevue Hospital

Date. January 21, 1946
Conducted by Dr Henry C Fleming

Dr. Shirley Schmones-Wallach The patient, T D, a 39-year-old negro man, was admitted to Bellevue Hospital on October 30, 1945 He dated the onset of his present illness to a time three weeks prior to admission, when he noted progressive exertional dyspnea, orthopnea, ankle edema, vague abdominal pains, a cough productive of one teaspoonful of dark sputum daily, and a diminished urinary output. The edema gradually became generalized and included his face, he gained twenty pounds in this three-week period.

Past History —The patient's past medical history includes one other Bellevue Hospital admission at the age of 19 years for gonorrheal arthritis, he also had a chancre at about this time for which he was given treatment Between 1922 and 1928 the patient had three attacks of rheumatic arthritis Never, however, prior to present illness was the patient known to have any cardiac involvement He had malaria and typhoid fever many years ago

Physical Examination —Physical examination on admission revealed a patient who appeared moderately acutely ill, he was well oriented and cooperative The temperature was 98.2 F, pulse, 68, respirations, 16, and blood pressure, 190/94 (left), and 196/110 (right) The pupils reacted physiologically Fundoscopy revealed decreased arteriovenous ratio, increased silver-wire effect with spasticity Arcus senilis was present and there was a subconjunctival hemorrhage in the right eye Examination of the lungs revealed flatness of right base and crepitant rales at the left base The heart was enlarged, there was regular sinus rhythm Systolic murmurs were heard over the aortic, mitral, and tricuspid areas, the second aortic sound had a ringing quality Examination of the abdomen revealed the liver edge to be two to three fingerbreadths below the costal margin, it was not tender There was evidence of moderate ascites The spleen and kidneys were not palpated There was sacral and genital edema as well as one plus edema of the lower extremities There was slight atrophy of left leg muscles due to previous poliomyelitis. Neurologic examination was within normal limits

Laboratory Data.—Urine yellow, acid, specific gravity, 1 020, albumin, 3 plus, glucose and acetone, negative, no red blood cells but frequent hyaline and granular casts Stool no occult blood Blood count red blood count, 3,400,000, white blood count, 6,900 with 68 per cent polymorphonuclears, 3 band cells, 28 lymphocytes, 1 eosinophile. The hemoglobin was 80 per cent. Blood Wassermann and Kahn tests reactions were 4 plus Blood chemistry October 31, 1945—Blood nonprotein nitrogen, 180, albumin-globulin ratio, 1 5/2 5, creatinine, 1.87, sugar, 118, November 2, 1945—nonprotein nitrogen, 120, total protein, 3 7, creatinine, 1.87, sugar, 83 Venous pressure was 162 mm H_2O, arm to tongue, 15 secs, arm to lungs, 12 secs A roentgenogram of the chest revealed a small effusion at the bases of both lungs and the heart was enlarged in the transverse diameter An electrocardiogram revealed sinus arrhythmia, left electric axis deviation, rate, 74

Course On admission, the patient was digitalized with purodigin and he was given ammonium chloride He was placed on a salt-free diet with restricted fluid intake Oxygen was also administered The patient's temperature, pulse, and respirations remained within normal limits However, he gained weight daily so that by the fourth hospital day his weight had increased from 165 to 174 pounds. His general condition remained poor throughout his hospital course and on November 3, 1945, the evening of his fourth hospital day, the patient began to complain of severe abdominal pain, his respirations became acidotic in character, the heart sounds became weak, and the blood pressure fell to 100/74, the patient moaned and cried out repeatedly Fifteen minutes after the onset of this severe change in state, the patient suddenly expired

Discussion

Dr. Henry C Fleming This 39-year-old man's symptomatology, stated to have been of but three weeks' duration prior to his admission to Bellevue Hospital (October 30, 1945), consisted of increasing exertional dyspnea, orthopnea, ankle edema, vague abdominal pain, slightly productive cough, and oliguria The edema became generalized and within three weeks he had gained twenty pounds, the latter obviously from increasing generalized edema

There was some evidence of nutritional impairment, pronounced hypertension, and considerable cardiac insufficiency which contributed to the state of edema. The urine revealed a good

degree of concentration, curiously no red blood cells according to the protocol, but 3 plus albumin and frequent hyaline and granular casts, indicative of renal impairment The blood nonprotein nitrogen was 180 The albumin-globulin ratio was 1 5/2 5, and the red blood count was only 3,400,000

There was a history of three attacks of rheumatic arthritis between 1922 and 1928 but the protocol states that never, prior to the present illness, was the patient known to have cardiac involvement And as the physical signs of rheumatic heart disease were lacking, we are not justified, upon clinical grounds, in making that diagnosis

The patient also had a 4 plus Wassermann, hence, we must realize that a few perpendicular corrugations in the aorta may indicate the existence of syphilis, nevertheless, we have not the evidence of aneurysm, of a diastolic murmur, or even of the so-often heard tambour second sound We are not, therefore, justified in making a diagnosis of luetic heart disease There was considerable cardiac failure, but this was presumably upon a hypertensive basis

The absence of evidence of heart disease previously to three weeks before the onset of this illness in a 39-year-old man, with a rheumatic history and 4 plus blood Wassermann test but devoid of clinical evidence of the criteria by which we diagnose either rheumatic or luetic cardiac disease, should divert our attention to some other cause

The fundus findings distinctly indicate arterial disease, but whether this was primary or secondary cannot be delineated upon clinical evidence at this advanced stage of the uremic picture The diminished urinary output, the rapidly developing generalized edema, including fluid in the chest and abdomen with a reversal of the albumin-globulin ratio and characteristic urinary findings with the possible exception of the absence of erythrocytes, strongly suggests acute or subacute diffuse glomerulonephritis It is my impression that this man died in a state of uremia as a result of diffuse glomerulonephritis, that his generalized edema resulted from vascular permeability and blood protein depletion as a result of excessive albuminuria, thus favoring invasion of his serous spaces by transudate, and that this hypertension was created by his renal pathology

Dr Emanuel Appelbaum This case appears to be one of mixed pathology It would perhaps be best to discuss it from the standpoint of the organs involved To begin with, I believe the patient had hypertensive heart disease and luetic aortitis The heart failure was predominantly right-sided, except, possibly, during the terminal phase

With regard to the kidneys, I believe that there was nephrosclerosis and also some form of nephrosis, probably luetic The marked azotemia can be interpreted as either prerenal or renal in type Incidentally, there is some misconception regarding the term prerenal azotemia The term does not imply that the kidneys do not participate in the dysfunction, but rather that the genesis is outside of the kidney The basic mechanism, however, includes disturbance of glomerular filtration A prerenal azotemia depends, in the main, on marked diminution of renal blood flow, for which there is insufficient evidence in this case, although some oliguria was noted I am inclined to believe that there was some form of glomerular damage, probably an acute nephritis The ability of the kidneys to concentrate rules out chronic glomerular nephritis

It is difficult to interpret the terminal episode I am inclined to believe that the patient sustained an intra-abdominal vascular accident, either a mesenteric thrombosis or a retroperitoneal hemorrhage In proposing the possibility of mesenteric thrombosis, one must assume the presence either of a source for embolization, such as mural thrombi or vegetations, or the presence of a diffuse vascular disease

This leads us, of course, to the consideration of the presence of some form of diffuse arteritis, possibly periarteritis nodosa In the light of previous experience, there are not enough criteria in this case on which to base this diagnosis However, the evidence favoring the presence of a diffuse vascular disease, together with the presence of nephritis and severe terminal abdominal manifestations, makes it necessary to entertain, seriously, that possibility

Anatomic Diagnosis

Diffuse Subacute Glomerulonephritis, Early, Polyarteritis (Periarteritis) Nodosa of Kidney, Liver, and Pancreas

Hypertrophy and dilatation of heart, slight
Edema of lungs
Hydropericardium
Hydrothorax, bilateral
Edema of legs
Acute passive congestion of lungs, liver, spleen
Encephalopathy associated with arteriosclerosis

Dr H Spitz At autopsy the most important lesion was found in the kidneys They had the typical appearance of a "large white kidney" Each weighed 200 Gm The fibrous capsule could be stripped with ease, revealing a smooth, slightly opaque, pale, yellowish-tan surface There were no punctate hemorrhages and no infarcts present On section the cortex was widened, measuring up to 12 mm , and both cor-

tex and renal columns were unusually pale The pyramids were distinctly outlined, also paler than usual, and streaked with red The renal vessels showed no gross changes The heart was slightly enlarged The chambers were somewhat dilated and the left ventricle measured 20 mm in thickness There was slight diffuse thickening of the mitral valve, but no fusion or shortening of the cusps or chordae tendineae The myocardium showed no gross fibrosis and the coronary arteries were of average caliber and thin walled throughout There was 200 cc of clear serous fluid in the pericardial cavity but no fibrin Small amounts of similar fluid were present in either pleural cavity and the legs showed mild pitting edema The lungs were large, heavy edematous, and congested The right pleural cavity was partly obliterated by dense fibrous adhesions The liver and spleen were likewise congested The ascending aorta, just above the right anterior cusp, showed a white, slightly elevated patch with irregular wrinkling There was no diffuse or circumscribed aneurysmal dilatation and the aortic wall showed no gross thickening anywhere Only a few small subintimal lipoid plaques were found The brain and the remaining viscera showed no gross changes

Microscopic examination of the kidneys showed rather striking changes All the glomeruli were large, cellular, and anemic as seen in acute diffuse glomerulonephritis Hyalinization and epithelial crescent formation were absent The numerous leukocytes in the glomeruli were all mono- and polymorphonuclear eosinophils The tubules showed granular and fatty degeneration, desquamation of epithelial cells, and evidence of regeneration, such as flat cells lining dilated tubules and multinucleated epithelial cells Hyaline granular and cellular casts were present in many tubules Endothelial cells of the glomeruli and of some interlobular arteries showed, also, a moderate amount of fat There was in addition an interstitial infiltrate consisting mainly of small and large mononuclears and eosinophils The tubular and interstitial changes suggested that we are dealing with an early second stage of glomerulonephritis In addition to these lesions there was evidence of an associated vascular lesion involving principally the arcuate arteries and veins These blood vessels and a few of their small branches close to the main vessels showed fibrinoid necrosis of the media and intimal and adventitial proliferation of granulation tissue, often heavily infiltrated with eosinophils

Similar vascular changes were found in the perihilar adipose tissue Liver and pancreas showed scattered similar lesions affecting small arteries No other organs showed this change The brain showed small areas of softening, associated with arteriosclerosis The supravalvular aortic lesion was a circumscribed area of marked intimal thickening and hyalinization The subjacent inner half of the media showed considerable loss of elastica and prominent vasa vasorum and scarring The outer half of the media, however, was intact and the adventitia showed no changes This lesion, therefore, cannot be recognized as syphilitic The heart showed no histologic evidence of healed or active rheumatic fever The lungs were markedly edematous

Thus, the patient was suffering from diffuse glomerulonephritis and periarteritis nodosa, and died in uremia.

The association of glomerulonephritis and periarteritis nodosa has been repeatedly described[1-4] The presence of diffuse necrotizing vasculitis in cases of severe glomerulonephritis is well known Clinical and experimental data[1-7] support the concept of the allergic (hyperergic) nature of both conditions and one might suggest that the eosinophilic infiltration in the vascular lesions and in the glomeruli might be a further indication of related pathogenesis in this case The eosinophilic infiltration of the glomeruli is, otherwise, a rather unusual feature in acute glomerulonephritis. Extensive involvement of veins by the necrotizing process followed by organization has been reported but is also uncommon.[8] The tubular changes in this case are probably the morphologic expression of the nephrotic component of the clinical picture

Woman's Auxiliary

To the Medical Society of the State of New York

Introducing the New President

MRS ALFRED L MADDEN, of Albany, is the new president of the Woman's Auxiliary to the State Society

Mrs Madden received a Bachelor of Music degree at the College of St Elizabeth, Convent Station, New Jersey, and did graduate work at Skidmore College in Saratoga, New York She is the wife of Dr Alfred L Madden, chief of staff at the Brady Maternity Hospital, Albany, New York, and has three children, Tommy, age 14, Mary Leigh, 10, and Geraldine, two

In club work, Mrs Madden was Albany County Commander of the Field Army of American Cancer Society, from 1940 to 1946

She was vice-regent of the Albany Circle of the International Federation of Catholic Alumnae, from 1940 to 1944

In Auxiliary work, after being Albany County president, Mrs Madden was on the State Executive Board for four years as legislative chairman She is also a member of the American Woman's Association of New York City

Remarks by Dr William Hale Before Postconvention Meeting of the Executive Board

I UNDERSTAND that the Woman's Auxiliary in New York State has been celebrating the tenth anniversary of its founding No doubt you have already looked back and evaluated these ten years in the life of your organization It seems to me that you have gotten an excellent start during the first decade Although little of organizational value was done in the first few years, you later gave much of your activity over to education on the Wagner-Murray-Dingell Bill, voluntary medical care insurance, and the various pieces of state legislation

Perhaps progress has seemed slow The intervening war years meant slowing up of new membership and very often took old members into activities more directly connected with the war In spite of this fact you have progressed in your goal of usefulness to the medical profession

In turn the Medical Society has shown its approval of your activities by further entrusting you with tasks of considerable importance No doubt it will continue to do so It would be unfair to say that there are no limits to what the Auxiliary can do No one expects that you will give up all your household duties and primary interests to take over any strenuous duties As a matter of fact, your membership will be greatly benefited by having as many pleasant social functions as you can However, times will arise when the Medical Society will need your help When that time comes we know that we can depend on you to lend your talents and your time to help with important issues as they come along

I understand that you plan extensive reorganization during the coming year I need not tell you that in certain parts of the state you will find indifference and even opposition I am sure that you will handle these situations with the delicacy they require

It is unwise to try to force your way It is best to contact those you know are sympathetic and then work your way in from there Recognize the fact that in some counties there will be no fertile ground for the growth of an Auxiliary In other words, it is not needed However, we know that there are other unorganized counties which will be excellent material for new units of your organization

At all times you will receive cooperation from the officers and the staff of the Medical Society Your advisers will be especially interested in any problem that comes up

You have had a fine year with Mrs Griffin as your president Now with Mrs Madden to guide you in the coming year, I know you will go forward to begin an illustrious second decade in the history of the Auxiliary

---

TAKING VITAMINS IN WINE NOW SEEN AS POSSIBILITY

Science is making it easier all the time for you to take your vitamins—soon they may come in wine!

Fortification of wine with B vitamins has proved successful in experiments by Dr Agnes Fay Morgan, of the University of California

Dr Morgan does not recommend that other methods of taking vitamins be abandoned, but she does suggest that fortified wines may be useful as vitamin carriers for medicinal purposes

The main purpose of Dr Morgan's research, however, was to counteract the consumption of calories from alcohol, which burns up the body's store of B vitamins

Chronic wine drinkers, as a result of this burning up of B vitamins, contract an acute alcoholism which is often characterized by dermatitis, mental confusion and the digestive disorders of pellagra The fortification of wines with B vitamins may help prevent these symptoms

Legislative Bureau

Medical Society of the State of New York

DURING the 1946 session of the State Legislature the following bills have been signed by Governor Dewey. Those vetoed are likewise noted.

Signed by the Governor

Chapter 82 (Senate Int. 325—Hammer) permits payment of claims of health officers by municipalities for services rendered in investigating cases of death without medical attendance. Public Health Law

This Act takes effect immediately.

Chapter 93 (Senate Int. 367—Condon) gives employer or insurance carrier liable for workmen's compensation right to cause of action in seven-year lapsed cases. Workmen's Compensation Law

This Act takes effect immediately.

Chapter 94 (Senate Int. 370—Condon) provides average annual earnings of employee entitled to workmen's compensation shall consist of 300 times average daily wage for six-day worker and 260 times average daily wage for five-day worker. Workmen's Compensation Law

This Act takes effect immediately.

Chapter 113 (Senate Int. 691—Downey) revises Workmen's Compensation Law to eliminate references to industrial commissioner to industrial board and divisions of Labor Department and to substitute therefor the chairman of Workmen's Compensation Board, the Workmen's Compensation Board or other appropriate designation so that each section of law will be complete without reference to any other section or statute.

This Act takes effect immediately.

Chapter 121 (Assembly Int. 1490—Mailler) continues to July 1, 1947, provision permitting practice of medicine in hospitals by physicians and interns with certain educational qualifications and provision relating to medical students performing clinical clerkship. Education Law

This Act takes effect immediately.

Chapter 138 (Assembly Int. 438—MacKenzie) provides certain organizations exempted from regulation as fraternal benefit society and which limit their membership to employees of particular city or town or of one or more business corporations or firms having business interests in common and limit their membership to corporation with more than 5 000 employees, may provide surgical and medical as well as hospital benefits for employee, spouse, and children not over 18 years. Insurance Law

This Act takes effect immediately.

Chapter 154 (Assembly Int. 538—Tifft) strikes out provision that prison authorities in Cayuga and certain other counties may deliver cadavers to medical schools. Public Health Law

This Act takes effect immediately.

Chapter 166 (Senate Int. 734—Hammer) provides State Public Health Council shall have no executive, administrative, or appointive duties but shall, at request of Health Commissioner, consider any matter relating to preservation and improvement of public health and advise commissioner thereon. Sanitary Code may prescribe qualifications of district and local health officers, public health nurses, and other public health appointees who are paid from public funds, also persons not paid from public funds who are employed after January 1, 1947 as water treatment operators. Public Health Law

This Act takes effect immediately.

Chapter 180 (Assembly Int. 303—Riley) provides State Health Commissioner shall act in advisory and supervisory capacity to safeguard motherhood, to save infant life and prevent diseases and defects of childhood and shall cooperate with and stimulate local agencies in such matters and with other state departments to prevent duplication of effort. Public Health Law

This Act takes effect immediately.

Chapter 197 (Senate Int. 1130—Hammer) makes it a misdemeanor for a person knowing himself or herself to be infected with venereal disease to have sexual intercourse with another. Public Health Law

This Act takes effect immediately.

Chapter 200 (Assembly Int. 903—Ostertag) provides for integration of welfare services to needy persons under present system for furnishing single office at which needy may apply for all types of public assistance and care for investigation of family needs by single agency, for uniform standards of assistance and care within individual county, for abolition of cumbersome and costly settlement system and for stabilization of financial contributions to welfare by localities; local share for home relief, old age assistance, aid to dependent children and blind assistance is stabilized at 20 per cent. Social Welfare Law

This Act takes effect immediately.

Chapter 208 (Senate Int. 360—Condon) provides medical and surgical reports in workmen's compensation cases need not be verified to be used as evidence by claimants. Makes it a misdemeanor to influence any determination regarding a benefit or payment. Workmen's Compensation Law

This Act takes effect immediately.

Chapter 298 (Assembly Int. 1074—Catenaccio) authorizes youth guidance commission to adopt rules furnishing care for children whose mothers are working for their support and for children whose fathers are in U.S. armed forces or in maritime service and for children for whom care is not available in their home because of death, absence or incapacity of parent, municipality may charge fees for such care.

This Act takes effect immediately.

Chapter 310 (Senate Int. 2023—DiCostanzo) increases maximum and minimum awards in workmen's compensation cases for disability and death. Workmen's Compensation Law

This Act takes effect June 1, 1946.

Chapter 311 (Senate Int. 371—Condon) extends workmen's compensation coverage to domestic workers employed by same employer for minimum of forty-eight hour week in cities and villages of 40 000 or more; excepts those employed on farms and relieves employer from penalty for failure to secure compensation therefor. Workmen's Compensation Law

This Act takes effect January 1, 1947.

Chapter 320 (Senate Int. 821—Coudert) permits dissecting of dead body of human being when spouse or next of kin of deceased being charged with duty of burial shall authorize dissection by written instrument which shall specify purpose and extent thereof. Penal Law

This Act takes effect immediately.

Chapter 338 (Assembly Int. 621—Clancy) per

mits New York City until July 1, 1949, to impose tax not to exceed, one tenth of one per cent on gross receipts from businesses, professions, and commercial activities, other than financial business, and sales to persons within city, and to impose tax of one fifth of one per cent on gross incomes of banks, brokers, and other financial business General City Law

This Act takes effect immediately

SN-7618 EFFECTIVE ANTIMALARIAL DRUG

The new antimalarial drug, SN-7618, which the Army Medical Department played an important part in developing, has been found to be superior in many ways to quinine or atabrine, according to a recent announcement by the Office of the Surgeon General.

Studied in collaboration with the Interservice Board for the Coordination of Malarial Studies, SN-7618 was tested in experiments at Harmon General Hospital, Longview, Texas, and Moore General Hospital at Swannanoa, North Carolina, in addition to some overseas theaters of operations

Designed to obtain information on the value of the drug in controlling the symptoms and fever occurring in acute attacks of malaria, these studies included the observation of more than 600 malaria-stricken soldiers, who were administered different amounts of the drug in from one to seven days When notations had been made of symptoms such as the passing of the fever and the disappearance of malarial parasites from the blood stream, the patients were kept in the reconditioning section to determine the possibilities and time interval for relapse.

Comparisons were made of the results with those obtained in similar studies of atabrine, quinine, and other new drugs It was found that one day's treatment with SN-7618 promptly controlled fever and other symptoms and that the parasites rapidly disappeared from the blood

Observation periods of four months showed that 75 per cent of the men tested suffered relapses Though this number is similar to that found in experiments with quinine and atabrine, the interval between attacks was found to be longer when SN-7618 was used Patients soon acquired a preference for the drug because of its rapid action, which permitted them to leave the wards within two or three days

Though SN-7618 is considered superior to other antimalarial drugs in that it does not discolor the skin, upset the stomach, or cause a buzzing in the ears, it is not a one-treatment cure for vivax malaria Weekly doses of the drug can be taken to avoid relapse after an acute attack, but upon discontinuation of the treatment further relapses may occur

SN-7618 was so named because it was the 7,618th drug tested in the four-year program sponsored by the Committee on Medical Research The program was financed by the Office of Scientific Research and Development —*Office of the Surgeon General, Feb 15, 1946*

OPEN MARKET

The doctor who was spending his holidays painting in the Maritimes, entered a small village store and asked if they kept camel's hair brushes

"No sir, we don't," the storekeeper replied "You see, sir" he added apologetically "we never have no call for them Nobody in these parts seems to keep camels "—*Canadian Doctor, September, 1945*

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the JOURNAL. *The members of the committee are Oliver W H Mitchell M D , Chairman (428 Greenwood Place Syracuse), George Baehr M D and Charles D Post M D*

Obstetric Lectures for Sullivan County

DR. R. GORDON DOUGLAS associate professor of obstetrics and gynecology Cornell University Medical College, discussed practical everyday obstetrics at a meeting for the Sullivan County Medical Society on May 15, at 8 00 P.M., at the Monticello Hospital Monticello

Dr Milton G Potter, of Buffalo discussed operative obstetrics in a talk illustrated with lantern slides, at a meeting on May 22. The meeting took place at the home of Dr Harry Golombe, of Liberty

This postgraduate instruction was provided by the Medical Society of the State of New York with the cooperation of the New York State Department of Health.

Lecture by Dr Goldring

THE clinical aspects of glomerulonephritis was the subject of Dr William Goldring, associate professor of Medicine, New York University, College of Medicine at a meeting of the Rockland County Medical Society on May 21 The meeting was held at 4 00 P.M. at the Recreation Pavilion, Summit Park Sanatorium Pomona.

This instruction was provided by the Council Committee on Public Health and Education of the Medical Society of the State of New York

Management of Arthritis

THE Management of Arthritis, Acute and Chronic" was the subject of Dr L. Maxwell Lockie at the meeting of the Wayne County Medical Society on June 11

Dr Lockie is professor and head of the department of therapeutics and associate in medicine at the University of Buffalo School of Medicine.

Chemotherapy Lecture

DR. JAMES E. McCORMACK, instructor in medicine and assistant to the Dean at New York University, College of Medicine lectured to the St. Lawrence County Medical Society on June 13 His subject was "Chemotherapy and the Antibiotics."

Professor of Gynecology Lectures to Livingston County

DR. CLYDE L. RANDALL, professor of Gynecology, University of Buffalo School of Medicine discussed the significance and management of abnormal vaginal bleeding at a meeting of the Livingston County Society on May 15

This postgraduate instruction has been arranged as a cooperative endeavor between the Medical Society of the State of New York and the New York State Department of Health It was held at Craig Colony Sawyer

---

CORRECTION NOTICE

Medical News

Medical Memorial Group Campaigns for Merger of Fund Drives

A CAMPAIGN to merge all fund-raising drives for medical research in one organization to further the "war on the major maladies" which afflict the American people has been announced by Dr Harlow Shapley, chairman of the newly organized Medical Memorial Fund.

"The average citizen at present is bewildered by the multitude of appeals for this or that disease or medical problem" Dr Shapley stated at a recent meeting at the Union League Club

Saying that within twenty-five years medical research may be able to "lengthen the useful life of the average American by ten years," he expressed hope that the centralized fund will raise $10,000,000 through private contributions during its first year

The fund will concern itself primarily with the somewhat unsensational cardiovascular-renal diseases—diseases of the heart, arteries, and kidneys—which, Dr Shapley said, will kill 66,000,000 Americans alive today, but which hitherto have been apportioned only a negligible percentage of medical research funds

No attempt will be made to build up new research enterprises, but additional help will be distributed to already existing medical schools and research hospitals Money will be raised through a continuing campaign rather than through a concerted drive It is hoped within a few years to establish in this manner a fund of between $50,000,000 and $100,000,000 for medical research, independent of whatever research may be undertaken under government auspices

Psychoanalytic Society and Institute Elect Officers

THE New York Psychoanalytic Society and the New York Psychoanalytic Institute have announced the election of the following officers at the annual meeting held on May 21

Officers of the Society are president, Dr Philip R Lehrman, vice-president, Dr Henry A Bunker, secretary, Dr Emeline P Hayward, and treasurer, Dr Harry Weinstock The officers of the Institute are president, Dr Adolph Stern, vice-president, Dr Ruth Loveland, secretary, Dr Otto Isakower, and treasurer, Dr Harry Weinstock

American College of Radiology to Hold Annual Meetings

THE regular annual meeting of the members and fellows of the American College of Radiology will be held Saturday, June 29, at the Palace Hotel in San Francisco, California

The business to be transacted at the meeting will include the election of president and vice-president, election of two Chancellors to hold office for a term of four years, and three Chancellors for terms of one year, representing, respectively, the Radiological Society of North America, the American Roentgen Ray Society, and the American Radium Society, action upon the reports of officers and standing commissions and committees of the American College of Radiology, and consideration of amendments to the Constitution and Bylaws submitted by the Commission of Constitution and Bylaws and approved by the Board of Chancellors

New Fellows to the College will be welcomed at a Convocation, and a banquet will be held on the evening of June 29, with Dr Lowell S Goin, giving the presidential address

Personalities

Dr Olin West, of Chicago, after a service of over twenty-three years as Secretary-General Manager of the American Medical Association, retired from his official duties on April 1 Widely known to the members of the profession, he was active in upholding the traditions and ideals of the Association, and is succeeded in this office by Gen George H Lull, formerly of the U S Army, who rendered great and efficient service in the Office of the Surgeon General

• • •

•

Dr Elaine Ralli, associate professor of medicine, New York University, College of Medicine, is the new president of the Women's Medical Association of New York City She was elected on May 8 at the Association's annual meeting at the Cosmopolitan Club Dr Ralli is a graduate of Vassar College and the New York University, College of Medicine She has received three fellowships and has specialized in diseases of metabolism and nutrition

• • •

Lt Col Milton Kissin, of New York City, recently received the Soldier's Medal with a citation for "heroic actions and services" performed on August 19, 1945, while serving in the China-India-Burma Theater of Operations Colonel Kissin recently completed his terminal leave

• • •

Back from the South Pacific, where he treated victims of the atomic bomb explosions, is Dr Moritz Elias, of New York Mills, who is reopening practice in his home town *

* Asterisk indicates that item is from local newspaper

The appointment of Dr Arthur C Davis, of Glens Falls, as a member of the Board of Health, succeeding the late Dr Sherwood LoFevre, was announced in April.

Dr Davis is a veteran of World War II, having served in the Army Medical Corps.*

Dr Joseph L. Cirinclone, formerly captain in the Army Medical Corps, has resumed the practice of dermatology in Schenectady

Dr Cirinclone spent twenty-seven months in the Aleutian Islands and Alaska.

He returned to the United States in February, 1945 and was assigned as chief of the Dermatology Section at Foster General Hospital, Mississippi. In October of 1945 he was transferred to the Army General Hospital at Camp Butner, North Carolina, to head the newly organized skin center

A graduate of St Louis University School of Medicine, Dr Cirinclone interned at Ellis Hospital and later spent two years on postgraduate study at the New York Skin and Cancer Hospital.*

Dr C Gregory Barer, has returned to Bronxville after an absence of two and a half years in the military service. He is reopening his practice in that town.

Dr Barer held the grade of commander, in the Navy, and served for a year at Quonset Point, Rhode Island, and later at the Naval Air Station at Pensacola, Florida, where he took special training as a flight surgeon. After completion of his course there, he was stationed for eighteen months at Cherry Point, North Carolina, at the Marine Corps Air Station *

Dr William G Terwilliger, former resident of Highland, received his honorable discharge from the Navy, March 20 1945 During his three years and eight months of service Dr Terwilliger rose to the rank of captain

Dr Terwilliger has resumed the practice of medicine in New York City *

Dr C Harris Brown, former captain in the U.S Medical Corps of the 83rd Division has opened an office for general practice of medicine in Gloversville

Dr Brown was graduated from Albany Medical College in 1942

After serving a year as an intern at the Waterbury Hospital, Waterbury Connecticut he entered the medical corps with the rank of first lieutenant and was attached to the 83rd Division.

Besides receiving the five battle stars, he was also awarded the Bronze star for outstanding work during the campaigns

Dr Brown was promoted to the rank of captain, and started his terminal leave on November 30, 1945 He recently completed two months of additional study of medicine at the Albany Hospital, where he was attached to the medical house staff *

Maj Leonard Stone, of New Brighton has been placed on inactive status after thirty-four months with the Army Medical Corps. Entering active duty upon completion of his internship at Mount Sinai Hospital, Manhattan, Major Stone served fourteen months in the European Theatre *

Dr Joseph J Witt, who has returned from active service with the Navy, has opened an office in Utica and will specialize in chest diseases.

Dr Witt was commissioned a lieutenant commander in May, 1943, and was promoted to commander in November 1945

He participated in the invasions of the Philippines and Bornea and went into Japan with the first occupation troops. He also served as medical officer aboard an LST for a year *

Dr John J Keenan, Troy Hospital gynecologist, who had been serving as a captain in the Army Medical Corps, has been returned to inactive service. He will resume practice in Troy While in service Dr Keenan was gynecologist to WAC installations in the Seventh Service Command.*

Dr James C. Harberson, formerly chief of the surgical service of the United States Army General Hospital at Camp Edwards, Massachusetts, with the rank of colonel, has begun the private practice of general surgery in Watertown.*

Dr George C von Borstel, who left his medical practice on August 25, 1942, to enter the Army, has resumed his practice in Scotia. He was recently appointed Village of Scotia health officer

He served for about one year in New Guinea, and then was returned to this country

A graduate of Albany Medical College, class of 1926, he interned at Ellis Hospital. For three years he was a physician at the General Electric Company, and then practiced medicine in Scotia for thirteen years before entering service *

Two doctors plan to take up practice in the Smith town community in the near future. Comdr George J Miller formerly of Hicksville, will be associated with Dr Frank E B McGilvery and Dr W W Curtis. Dr Davis D Moore, of Islip, has leased Dr Turrell's office.

Dr Moore served in the Army for over four years, and as lieutenant colonel was chief of Medical Service at Mason General Hospital after serving overseas with the Second General Hospital in North Ireland and England. Before entering the Army, Dr Moore was on the staff of the Presbyterian Medical Center and the visiting staff of the Neurological Institute

Dr Miller recently completed a tour of duty at the U.S Naval Hospital in Jacksonville, Florida. Previously he was with Orthopedic Unit at St Albans.*

Announcement has been made by Dr Charles W Scheib, who has served Little Neck and the adjoining communities as a physician for many years, that Dr Frank N Higginson is now permanently associated with him in his office in Little Neck

A graduate of Queens University in Canada, where he received his M D degree in 1928, Dr Higginson was recently separated from the Army after more than four years of service *

. . .

Dr Archie L Neighbors, of Poughkeepsie, who has served for nearly four years in the armed forces, has resumed his practice as an eye, ear, nose, and throat specialist

Dr Neighbors enlisted in the Army in July, 1942, with the rank of captain He was promoted to major in December, 1943, and prior to going on terminal leave he was promoted to the rank of lieutenant colonel.

Dr Neighbors went overseas in February, 1943, and was stationed for some time at Casablanca and at an Army hospital center in Naples, Italy

He was graduated from the University of Pennsylvania Medical School in 1934

After serving an internship at Staten Island Hospital, he was on the house staff of the Manhattan Eye, Ear, Nose, and Throat Hospital in New York City and then served as resident physician on the eye, ear, nose, and throat service at St Luke's Hospital, New York City During that time he took postgraduate study at the New York Eye and Ear Infirmary and at the graduate school of medicine at the College of Physicians and Surgeons, Columbia University *

. . .

Returning to private practice after forty months in the Army as a major, Dr William C Emm is reopening his office in Syracuse

He served overseas in France and Germany with the 123rd Evacuation Hospital and the 195th General Hospital before returning to the States to Rhoades General Hospital.

Dr Emm was graduated from Syracuse University, College of Medicine, in 1935 and interned in Syracuse Memorial Hospital. He was a member of the staffs of Memorial, St Joseph's and St Mary's Hospitals *

.

Dr Morton A Jacobson, of Yonkers, recently discharged as a major in the Army Medical Corps, has begun private practice as an ear, nose, and throat specialist

Called to active service from the reserves in March, 1941, Dr Jacobson served in this country, in the European theater and in the Pacific area during World War II

A graduate of the New York Medical College in 1936, Dr Jacobson interned at Metropolitan Hospital in New York City for two years and was resident physician at the Bronx Eye and Ear Infirmary for two years before beginning active service as a lieutenant

He was engaged in ear, nose, and throat work at the Station Hospital at Fort Bragg, North Carolina, before going to England in March, 1944, where he was assigned to the 216th General Hospital *

Dr Joseph Jacobson has resumed the practice of surgery, by appointment, at his office in Kingston. He served for four years with the U S Navy, with the rank of commander Three years of that time he served as thoracic surgeon at the U S Navy Hospital in St Albans *

. . .

Dr E Yale Clarke has announced his entrance into the practice of medicine in Glens Falls He will be associated in practice with his father, Dr H E Clarke, for many years one of the leading practitioners in that city He will specialize in diagnosis and internal medicine

Dr Clarke was born in Glens Falls and received his early training at the local schools

His medical education was acquired at Albany Medical College where he received his M D degree in 1938 He interned at the U S Marine Hospital, Chicago, Illinois, and then took a two-year residency at the Jefferson County Sanatorium, Watertown, New York In 1941 he became a staff member of the Metropolitan Life Insurance Company Sanatorium at Mt McGregor, where he remained until the U S Army accepted him in the Medical Corps

Since being discharged from service, Dr Clarke has been in Washington, D C , at the George Washington School of Medicine, where he pursued a two-month refresher course in internal medicine *

. .

Doctors should never lose sight of the humane qualities of unselfishness and humility while practicing their profession, Dr Charles Bamman Meding, executive surgeon of the Harlem Eye and Ear Hospital, cautioned on April 5 on the eve of his eightieth birthday, stressing that "he has looked a little beyond the physical" in his sixty years of practice Dr Meding spoke at a dinner given in his honor by the hospital's board of trustees at the Hotel Commodore

. .

Paying their respects to the man who was their physician for thirty-six years, nearly 1,000 Northern Westchester residents said goodbye to Dr and Mrs Edward F Briggs recently, on the occasion of his retirement

All races, colors, and creeds were found among the well-wishers All ages were represented Besides Dr L W Haynes and other physicians, guests included clergymen, businessmen, workingmen, school children, babies in arms, young couples, veterans, housewives, and whole families

Born in Sidney Center, New York, on March 20, 1884, Dr Briggs began his practice in New York City In 1925 he opened his Mount Kisco office The former Lena Churchill Elmendorf, Mrs Briggs came to Mount Kisco in 1916 to found its first hospital in a house on Steward Place She was formerly superintendent of nurses at Nyack Hospital

A Legionnaire and a captain in World War I, Dr Briggs was presented with a resolution honoring him

Dr Briggs has headed the local Red Cross fund drive for five years, bringing it "over the top" each year Among the gifts the couple received was a silver tray signed by 37 area physicians, including the staff at Northern Westchester Hospital *

. . .

Dr Frank C Furlong, former resident of Poughkeepsie, was elected president of the Eastern New York Eye, Ear, Nose and Throat Association at a meeting held recently in Schenectady, Dr John D Gulick, Schenectady, was elected vice-president and Dr Martin Freund, Albany, secretary-treasurer *

Dr Gerald Harrigan, of Great Neck, was elected chief medical inspector for the Great Neck Public Schools at a recent meeting of the Great Neck Board of Education.

His new duties will start July 1, 1946, when Dr Alfred H. Parsons retires as medical supervisor Dr Harrigan was graduated from the University of Wisconsin Medical School in 1932, serving as resident physician of the Graduate Hospital of the University of Pennsylvania for two years and later as resident surgeon of the Doctor s Hospital of New York City

Dr Harrigan began practice in Great Neck in October, 1935 Since 1936 he has been a member of the surgical staff of Nassau Hospital and of Meadowbrook Hospital where his work has included tumor surgical services He joined the medical staff of the United States Navy in October 1942, and received his honorable discharge on March 28 1946, at which time he held the rank of lieutenant commander *

Dr Charles B Dugan, who was seventy two on April 19 will retire as Health Officer of Beacon on June 30

Dr Dugan has had an interesting and varied career He taught school for two years at Arthursburg and was superintendent of schools for four years at Huntington Massachusetts. However, the teaching profesion did not appeal to him as much as he thought it would so he entered Medical School at Ann Arbor, Michigan, from where he was graduated with the degree of Doctor of Medicine in 1910.

On April 14 Dr Will H Schwartz celebrated his seventy ninth birthday and his fiftieth year as a physician.

The Albany Medical College has awarded him the "Gold Decoration in recognition of fifty years of meritorious service to Humanity '

Dr Schwartz was born April 14 1867, at Pillar Point, Jefferson County He received his early education at Dexter High school and Lowville Academy

He attended college at Burlington, Vermont, and received the degree of doctor of medicine at Albany Medical College on his birthday, April 14 1896. In that year, he established a practice at Colton, where he is still active. *

Two Niagara Falls physicians, who have been in practice for the last half century, were honored by the Niagara Falls Academy of Medicine at a dinner in Lewiston on April 23 Honored were Dr Norman W Price, of Lewiston Road, and Dr E. A. Palmer of Hotel Niagara.

Dr Price, a native of Newburgh, Ontario, was graduated from the Toronto School of Medicine in 1896 and for many years was a clinical assistant in eye work in Toronto In 1900 he came to Niagara Falls to take over the practice of Dr Mc Cartney, and has practiced there since that time He has done postgraduate work in eye, ear, nose, and throat study in New York and Philadelphia.

Dr Palmer was graduated from the Albany School of Medicine in 1896, and practiced in Saratoga Springs until 1917 At that time he entered the United States Army Medical Corps as a captain. Retiring from the Army with the rank of major in 1933, he set up practice in Niagara Falls.

Both Dr Price and Dr Palmer are members of the Niagara Falls Academy of Medicine, the Niagara County Medical Society and the New York State Medical Society and are on the staffs of the Memorial and Mount St Mary s hospitals. Dr Price is a Fellow of the American College of Surgeons and Dr Palmer is a member of the Association of Military Surgeons. *

The appointment of four more Schenectady County physicians as medical examiners for the Veterans Administration has been announced.

They are Dr Raymond J Byron, Dr Louis Cohen Dr Edmund D Colby, and Dr Joseph H Naumoff, all of Schenectady *

Dr Edward M. Auringer, of Addison has completed his internship at the Jersey City Medical Center and is awaiting orders for an assignment as first lieutenant in the Medical Corps.

County News

Albany County

A regular meeting of the County Society was held on May 29 in the auditorium of the Albany College of Pharmacy The business session was held as usual but the scientific session was omitted in order that a full discussion of the proposed fee schedule of the Northeastern New York Medical Service, Inc., might be held Election of the following new members also took place Dr Michael A. Blase graduate of Albany Medical College, 1942, Dr Arthur D Hengerer Cornell Medical College, 1939, and Dr Thomas G Fitzgerald University of Vermont College of Medicine 1939

Dr Raymond C Leddy, president of Albany County Medical Society, Dr Homer L. Nelms, president-elect, Dr A. L. Mann, Dr Emerson Crosby Kelly, Dr Alfred L. Madden and Dr James W Bucci, members of the advisory board to the Auxiliary, were honored at the annual spring luncheon and election of officers of the Woman s Auxiliary to Albany County Medical Society held recently at the DeWitt Clinton Hotel *

Bronx County

The role of chemotherapy in the prevention and treatment of mastoiditis and its complications was the subject discussed at the May meeting of the County Medical Society Dr Clarence H Smith was the lecturer and the discussants were Dr James B McGrath Dr Hyman D Silver, Dr G B Gilmore, and Dr Joseph Popper

Broome County

Representatives of the medical profession in Southern-Central New York on April 9 attended the annual dinner meeting of the Broome County Medical Society in the Binghamton Club

Among those present were Dr J C Zillhardt society vice-president and program chairman, Dr Victor W Bergstrom, society president and Dr A. Wilbur Duryee, associate professor of medicine Columbia University College of Physicians and Surgeons, who discussed "Management of Phlebitis.'

Chemung County

As a tribute to one of Elmira's most beloved physicians and surgeons who died October 12, 1944, the Chemung County Medical Society presented the first annual Elliot T Bush Memorial Lecture at its spring teaching day meeting April 24 at the Mark Twain Hotel.

Memorial speaker was Dr Charles A Janeway, of Boston, who lectured on "Clinical Uses of Products of Human Plasma Fractionation" Dr William T Boland, president of the Medical Society, was chairman.

At the afternoon session, Dr William F Lipp, associate professor of medicine, University of Buffalo, School of Medicine spoke on "Hepatitis and Cirrhosis of the Liver—Recent Advances," and Dr Harold G Wolff, associate professor of medicine and associate professor of psychiatry at Cornell University Medical College, New York City, lectured on "Headache"

Chairman of the afternoon session was Dr F S Hassett, chairman of the society's program committee

Dr Elliot T Bush, who died at 64 after being engaged in professional practice twenty-eight years, was a member and former president of the Medical Society He was a former president of the staff at Arnot-Ogden Hospital and held full surgeoncies at both Arnot-Ogden and St Joseph's hospitals At the time of his death he was senior urologist at both institutions

A resolution recommending that the Annual Elliot T Bush Memorial Lecture be perpetuated passed by unanimous vote at the last meeting of the Chemung County Medical Society *

• • •

Preliminary steps in the first public health survey ever made of Chemung County was taken in April.

Dr Harry S Mustard, lecturer of the DeLamar Institute of Public Health Service, Columbia University, College of Physicians and Surgeons, made the initial start in the survey

He will return later, probably early in June, to complete the city-county study

His findings will be turned over to the Chemung County Medical Society The society in turn will contact city, county, and possibly state authorities to have the recommendations for public health improvements carried out

The public health survey will be financed by funds given by the Visiting Nurse and Tuberculosis Association *

Cortland County

Dr James Lowry Miller, assistant clinical professor of dermatology, College of Physicians and Surgeons, Columbia University, spoke on syphilis at a meeting of the Cortland County Medical Society in April in the staff room of Cortland Hospital.

Dutchess County

Members of the Dutchess County Medical Society have unanimously endorsed the $10,000 drive of the Dutchess County Cancer Committee

The Medical Society endorsed the drive for funds at a meeting recently, Mr R Watson Pomeroy, who is chairman of the county cancer fund committee, said *

Franklin County

A clinicopathologic conference was held on April 17 by the Saranac Lake Medical Society in the John Black Room of the Saranac Laboratory Cases were presented by Dr Edwin M Jameson

Erie County

Dr Stockton Kimball, of Buffalo, has been appointed dean of the School of Medicine of the University of Buffalo by Chancellor Samuel P Capen.

Dr Kimball succeeds Dr Edward W Koch, dean for sixteen years, who died February 9 He took over the direction of the Medical School in time to observe the one hundredth anniversary of its founding The school, established in May, 1846, joined with the entire university in celebrating the centennial

Dr Kimball served as assistant dean under Dr Koch for nineteen months, and was made acting dean after Dr Koch's death *

• • •

Medicine's newest advances in ten different fields were presented by outstanding authorities at the One Hundredth Anniversary meeting of the University of Buffalo Medical Alumni Association on April 5 and 6 in the Hotel Statler

The highlight of the two-day program was the Centennial Banquet on Friday evening Dr Morris Fishbein, editor of the *Journal of the American Medical Association*, was the main speaker Dr Edward E Cunniffe, president of the Medical Society of the State of New York, related the University of Buffalo's contribution to the medical profession in New York State since the school's founding Another highlight was the class reunions on April 6 Dr William J Orr, president of the association, was general chairman

Fulton County

Dr Clarence H Smith, of New York City, was the guest speaker at the April meeting of the Fulton County Medical Society His topic was "The Role of Chemotherapy in the Treatment of Otitis Media and Mastoiditis"

The speaker was introduced by Dr J F Sarno, of Johnstown, president of the Society Following Dr Smith's talk there was a general discussion

During the business session Dr A J D'Errico, who recently returned from the U S Army, was welcomed back to the Society *

Kings County

A panel discussion on group practice and voluntary health insurance was held at a joint meeting of the Medical Society of the County of Kings and the Academy of Medicine of Brooklyn, on May 21 Those who took part in the discussion were Dr Dean Clark, medical director, Health Insurance Plan of Greater New York, Dr John J Wittmer, medical director, Consolidated Edison Company, Dr Frederic E Elliott, medical director, United Medical Service, and Dr William B Rawls, chairman of the Coordinating Council, Five County Medical Societies of Greater New York.

• • •

An obstetric conference on diabetes and pregnancy was held on May 28 in MacNaughton Auditorium, under the sponsorship of the Committee on Maternal Welfare of the Medical Society of the County of Kings Drs George E Anderson, Duncan W Clark, and Milton B Handelsman participated in the open discussion by invitation

Jefferson County

Dr William Dock, professor of medicine, Long Island College of Medicine, spoke to the members of the Society at their May meeting on the subject of peptic ulcer and gastric cancer At the April meeting, Dr George H. Koepf, associate in physiology and instructor in medicine of the University of Buffalo, School of Medicine, discussed the treatment of thyrotoxicosis with thiouracil and other agents.

Monroe County

The County Society celebrated its one hundred and twenty-fifth birthday anniversary on May 9 Featured at the meeting was an address, "Progress in Medical Science in the Last Century and a Quarter," given by Dr John F Fulton

Dr Fulton is professor of physiology, Yale University School of Medicine, founder and editor of the *Journal of Neuro-physiology*, chairman of O.S R.D committee on decompression sickness, compiler of the Bibliography of Aviation Medicine, and author of a text on physiology of the nervous system and many papers dealing with the history of medicine.

His talk was illustrated by an exhibit in the Society's museum depicting the changes and improvements in drugs and surgical implements during the past century, as well as exhibits prepared by the manufacturers of technical and clinical instruments, showing their evolution

In addition there was on display in the Municipal Museum a reproduction of an old-time doctor's office.*

Plans for an educational campaign and cooperation with the Health Bureau and the Monroe County Medical Society to combat rheumatic fever were discussed at a meeting in April of the new committee on rheumatic fever of the Tuberculosis and Health Association of Rochester and Monroe County

As part of the educational program mapped by the committee leaflets exhibits and a sound film on this disease are available for groups desiring information. They may be secured through the Tuberculosis and Health Association.*

Montgomery County

Hypertension was the subject discussed at a meeting of the Montgomery County Medical Society on Thursday April 25 Dr Charles E Poindexter, associate clinical professor of medicine, College of Physicians and Surgeons, Columbia University, spoke on medical treatment of hypertension and Dr J William Hinton, associate clinical professor of surgery, also of College of Physicians and Surgeons, Columbia University, discussed the surgical treatment.*

Nassau County

The cooperation of the Nassau County Medical Society the Nassau County *Department of Health*, and the responsible heads of hospitals in the county was given to the Nassau County Cancer Committee in its drive for a cancer home. The proposed home will have a medical staff to supervise its operation and maintenance.

While the same number of cancer cases was reported in Nassau County in 1945 as in 1944, the deaths caused by this disease showed an upswing to more than 700, it was reported in April by Dr Earle G Brown, Nassau's health commissioner *

Oneida County

The establishment of a cancer clinic in the county was recommended at a meeting of the Oneida County Medical Society held in the county hospital on April 9 The recommendation followed the reading of a report by Dr John S Fitzgerald, Utica, on the work necessary for the establishment of such a clinic as well as the staff necessary to make the clinic effective.

Dr Fitzgerald, head of a committee appointed to investigate the clinic possibilities in this area, stated that St. Elizabeth Hospital had offered facilities to house the clinic.

The Society also heard a short report on the possibility of retaining Rhoads General Hospital as a veterans' institution. They learned that a survey is being made at this time for the purpose of determining what staff material is available here and also the civilian aid that could be guaranteed The society learned that the care of the veterans was the first interest, and that the retention of the hospital would depend upon the special qualifications of the staff that would be available

Five new members were admitted to the organization at the meeting, most of whom were through transfer from other medical societies in the state

The group stood for a moment of silence in memory of Dr Edwin M Griffith, of Chadwicks, who died last month He was a member of the local society for a number of years.

At the conclusion of the business session, Dr Howard MacFarland introduced Dr William Hale, Utica, president-elect of the State Medical Society

Dr Hale urged support of the American Cancer Society's campaign to raise twelve million dollars for education, research, and service to patients.

Onondaga County

Doctors in the Army and Navy spoke to members of the Onondaga County Medical Society on their medical experiences in the Pacific and European Theatres of Operation at the May meeting. Those who spoke were Lt. Col Herbert R Diaso, (MC) - AUS, Lt. Comdr Raymond J Lovett, (MC) - USNR, Maj William J Michaels, (MC),AUS and Comdr William E Pelow, (MC),USNR.

Prior to the business session of this meeting the annual meeting of the underwriting members of Central New York Medical Plan Inc., was held.

Dr Ferris DeWardt, of the Mayo Clinic gave a lecture on "Carcinoma of the Uterus" to members of the Syracuse Academy of Medicine on May 21

Orange County

With about one-half of the living past-presidents attending, the Orange County Medical Society held a dinner in honor of its former presiding officers on April 9

Dr J Unger, of the New York Post-Graduate Hospital New York City, addressed the members after dinner on "Blood Transfusion with Special *Reference to the Rh Factor*" There was no formal program other than the address and the physicians and surgeons of this 140-year-old association devoted the evening to renewal of social relationships.

Of the twenty-seven past-presidents surviving, the following doctors were present M A. Stivers H. F Pohlman, Samuel W Mills, and Ross L Schmitt, of Middletown, William J Carr, Edward C Thompson, Daniel L O Leary, and Earl C Waterbury, of Newburgh, Walter W Davis, of Chester, Thomas D McMenamin, of Highland

Falls, George F Kenney and H F Murray, of Port Jervis, H. F Morrison of Tuxedo, and Dr Earl R Van Amburg, of Pine Bush *

Queens County

The Queens County Medical Society held a joint meeting with the Queens County Bar Association on May 28 The Honorable James T Hallinan, Justice of the Supreme Court, gave a talk entitled "The Doctor as a Witness"

Rensselaer County

Dr Charles D Rancourt was the speaker at the dinner meeting of the County Society on May 14 at the Troy Club He spoke on "Roentgenology in World War II"

Dr William Shields has been named chairman of arrangements for the annual outing which is to be held in June Returned servicemen will be the featured guests of the society at this affair

Rockland County

Dr Leon H Griggs, associate professor of medicine, New York University, College of Medicine, discussed common diseases of the skin, illustrated with color photography, at the April meeting of the Rockland County Medical Society *

St Lawrence County

Dr George H Koepf, associate in physiology and instructor in medicine at the University of Buffalo, School of Medicine, spoke on medical treatment of toxic thyroid at a meeting held for the St Lawrence County Medical Society on April 11, at the Potsdam Club, Potsdam *

Saratoga County

The Saratoga County Medical Society, of which Dr Frederick G Eaton is president, at a meeting in April, went on record as approving the work of the American Cancer Society in its present drive

The local society's committee on cancer is Dr Joseph Lebowich, chairman, Dr Frederick J Ressegue, Dr Earl H King, Dr Carl R Comstock, Jr, and Dr Webster M Moriarta *

* * *

The County Medical Society has joined the Northern New York Medical Service, the organization providing insurance for surgical care in eleven counties besides Saratoga Dr John Heslin, of Albany, former Saratogian, is vice-president of the service, and Dr Joseph L Kiley is chairman of the local society's committee

The service is not yet in operation in Saratoga County, but the Society expects that it will start in the near future *

Seneca County

The regular semiannual meeting of the Seneca County Medical Society was held at the Armitage Tea Room in Seneca Falls on May 9 with twenty-one members present Dr Stanley B Folts, president, presided A business meeting was held in the morning, followed by lunch and the scientific program Dr Walter W Street, professor of medicine, Syracuse University, College of Medicine, gave an illustrated lecture on "Cardiac Arrhythmias."

Schuyler County

Dr William C Stewart, president of the County Medical Society, has been appointed a member of the executive committee of the Schuyler County Division of the Women's Field Army of the American Society for the Control of Cancer Dr Paul Willwerth, health officer of Montour Falls, and Dr John Burton, health officer of Micklenburg, were also appointed to the committee

Sullivan County

Dr Raymond J Pieri, professor of clinical obstetrics, and Dr Robert C Schwartz, instructor in clinical pediatrics, both of Syracuse University, College of Medicine, discussed pregnancy and the Rh factor at a meeting of the Sullivan County Medical Society on April 24

Ulster County

Dr Harold W Brown, professor of parasitology, DeLamar Institute of Public Health, College of Physicians and Surgeons, Columbia University, spoke on tropical diseases in the returning veteran at a meeting held April 4 at the Governor Clinton Hotel, Kingston *

Wayne County

The Wayne County Medical Society held its second meeting of the year on April 9 at the Hotel Wayne at Lyons with Dr Leon H Griggs, associate professor of dermatology and syphilology at Syracuse University, College of Medicine, as guest speaker

Dr Griggs' talk concerned the diagnosis and treatment of the common diseases of the skin, illustrated by numerous Kodachrome slides

A formal case report of a carbon monoxide death requiring action under the Workmen's Compensation Law was made by Dr G W Pasco, of Wolcott

Dr Robert Vogt, who practiced in Sodus for three years, was introduced to the society as the incoming district health officer Dr Vogt is taking the post vacated by Dr R S Westphal, whose new post will be with the Rochester Department of Health as assistant to Dr Albert D Kaiser *

Westchester County

Alcoholism—acute and chronic was the general subject discussed at the May meeting of the Westchester County Medical Society Dr Louis I Sharpe, assistant professor of psychiatry, Bellevue Hospital, spoke on "The Treatment of Acute Alcoholism by the General Practitioner" Mr Marty Mann, executive director, National Committee for Education on Alcoholism, and Dr John G Lynn, chief psychiatrist of the Psychiatric Institute, Grasslands Hospital, discussed "Chronic Alcoholism and Its Treatment" A discussion on this latter topic was given by Dr S Bernard Wortis, director, Psychiatric Division, Bellevue Hospital Judge Thomas N Fasso gave a talk entitled "Acute Alcoholism in Westchester as Seen by a City Judge"

The most valuable of all education is the ability to make yourself do the thing you have to do when it has to be done, whether you like it or not—Huxley—*Clinical Medicine, March, 1946*

Necrology

Louis Berman, M.D , of New York City, died on May 16 at the age of 53 He was a founder of the New York Endocrinology Society and the author of many books and technical articles on nutrition, metabolism, diet, and endocrine glands In 1924 Dr Berman was credited with the discovery of the internal secretion of the parathyroid gland. He also discovered the value of adrenal cortex in the treatment of Paget s disease and the curative value of ovarian residue for certain breast tumors.

Dr Berman received his medical degree from the College of Physicians and Surgeons, Columbia University, in 1915 From 1921 to 1928 he was an associate in biologic chemistry at Columbia University He was visiting endocrinologist at the Central Neurological Hospital, where he also had served as a visiting neurologist. He was a former member of the board of directors of the National Crime Prevention Institute and the American Chemical Society a member of the New York Academy of Sciences and of the American Ethnological Association the American Medical Association, the American Genetic Association, the American Therapeutic Society and was editor from 1935 to 1936 of the department of endocrinology of the *Journal of Medical Practice*

Robert H Breed, M.D , of Wappingers Falls, died on May 17 He was 66 years old Dr Breed was senior attending surgeon at Vassar Brothers Hospital. He was graduated from the Columbia University College of Physicians and Surgeons, in 1904, was a visiting surgeon at Highland Hospital, Beacon, and St Francis Hospital, Poughkeepsie, and a consulting surgeon at Matteawan State Hospital in Beacon and Hudson River State Hospital in Poughkeepsie.

Charles Edward Caverly, M.D , of New York City, died on May 22 at the age of 53 He was graduated from Columbia University, College of Physicians and Surgeons in 1917 At his death, Dr Caverly was assistant clinical professor of obstetrics and gynecology at Columbia University, associate attending obstetrician and gynecologist at Sloane Hospital and Vanderbilt Clinic, and also director of obstetrics at St. Francis Hospital. He was a member of the American College of Surgeons and of the medical societies of New York State and County the New York Obstetrical Society and a Diplomate of the American Board of Obstetrics and Gynecology

Grove P M Curry, M.D , of Mount Kisco died on May 13 He was 80 years old He received his medical degree from New York University, College of Medicine, in 1892 From 1907 to 1920 he was health officer and registrar of Mount Kisco Dr Curry was a member of the American Medical Association and the Medical Society of the State of New York

Bruno Daniel, M.D , of New York City, died on May 21 He was 47 years old Dr Daniel was the senior psychiatrist at the Manhattan State Hospital, on Ward s Island. He was a member of the American Medical Association, the Medical Society of the State of New York, and the American Psychiatric Association. Dr Daniel received his medical degree in 1923 from the University of Breslau.

Henry Kendall, M.D., of New York City, died on May 8 at the age of 63 He was a specialist in gastroenterology and for many years program chairman of the New York Chapter, Gastro-Enterological Association He had been associated with Sydenham, Mount Sinai, and Polyclinic hospitals, and the Hospital for Joint Diseases and had served on the faculty of the New York Polyclinic Post-Graduate School. He was graduated from Long Island College of Medicine in 1905 He was honorary examining physician for the Jewish Theological Seminary, a member of the American Medical Association, and the State and County medical societies

Sherwood Le Fevre, M.D., of Glens Falls, died on March 17 He received his medical degree from Albany Medical College in 1891 He was 78 years old Dr Le Fevre was attending ophthalmic surgeon at the Glens Falls Hospital

Frederick James O'Connor, M.D , of Syracuse, died on March 20 For a quarter of a century, Dr O Connor was one of Syracuse s outstanding specialists In 1900 he was graduated from the College of Medicine of the University of Toronto Until July, 1945, he was associated with Syracuse University as professor of otolaryngology He was 62 years old

George W Ross, M D., of Port Ewen, died on April 8 He was 70 years old Dr Ross was a member of the staff of the Kingston Hospital and a member of the Ulster County Medical Society and the State Medical Society He was graduated from Albany Medical College in 1899

Henry Seymour Rothbart, M.D , of Brooklyn, died on July 27, 1943 He was 32 years old Dr Rothbart was a member of the American Medical Association and of the state and county societies. He was a graduate of the Long Island College of Medicine, class of 1935 and had been clinical assistant in obstetrics and gynecology at the Greenpoint Hospital, and assistant gynecologist in the outpatient department of Beth Moses Hospital

Milo Le Roy Seccomb, M D , of Auburn died on May 16 at the age of 66 Dr Seccomb was president of the Cayuga Health Association for six terms. He was a member of the American Urological Society and the Western Ontario Urological Society, and was urologist at the City and Mercy hospitals He was graduated from the Syracuse University, College of Medicine, in 1904

Lyman Spalding, M D , of New York City, died on May 15 at the age of 53 He received his medical degree in 1916 from the New York Homeopathic Medical College. Since 1933, Dr Spalding had been an eye specialist in the medical department of the Consolidated Edison Company, New York

Kenneth B Wallace, M.D., of New Rochelle, died on May 13 He was 56 years old For more than twenty years he had been attending obstetrician at the New Rochelle Hospital and the Grasslands Hospital of Eastview He was graduated from the New York Homeopathic Medical School in 1916 Dr Wallace was a member of the Westchester County, New Rochelle, and State medical societies.

Blakely R. Webster, M D., of Dannemora died on May 10 He was 62 years old He received his medical degree in 1907 from Cornell University Medical College He became a junior assistant at Mattewan State Hospital in 1912 In 1919 he was transferred to Dannemora and became superintendent at the State Hospital there in 1935

James Watson White, M D , 69, of Montclair, New Jersey, died on May 15 He received his medical degree in 1905 from Albany Medical College Dr White had been on the New York Post-Graduate Hospital staff since 1919 and was associate professor of clinical ophthalmology at the Post-Graduate Medical School from 1934 to 1938 and professor of clinical ophthalmology, executive officer of the Medical School's Department of ophthalmology and director of the hospital's service of ophthalmology from 1939 until his death. He was on the consulting staffs of Roosevelt Hospital, New York, Mountainside Hospital, Montclair, Essex County Contagious Disease Hospital, Belleville, New Jersey, Brooklyn Eye and Ear Hospital, and the Newark, New Jersey, Eye and Ear Infirmary He had been associated with the Herman Knapp Memorial Eye Hospital in New York

---

ARE THE FRONTIERS ALL GONE?

Since the Cherokee Strip was settled, and the last range was fenced in, we have read of "our vanished frontiers" We are sometimes led to believe that opportunities are something we used to have, and that discoveries were something that ended when the Pacific Ocean was reached At the present time we are concerned about the returning veteran, more especially the return of military doctors to civilian practice For some of the things we have read lately, and some of the talks we have heard, we might believe that opportunity is something in the past for them also

We find ourselves unable to get too much worked up over this sort of philosophy We are sure that those who have what it takes will get along all right Most of the men we know who resumed the private practice of medicine after World War I have done right well, the rest probably wouldn't have been much better off if they had not been in the war From two to four years is not too long for patients to return to doctors they liked before, most of them will return, and the rest were a shifting clientele anyway, who came to me today and to you tomorrow These considerations are from the purely bread-and-butter side

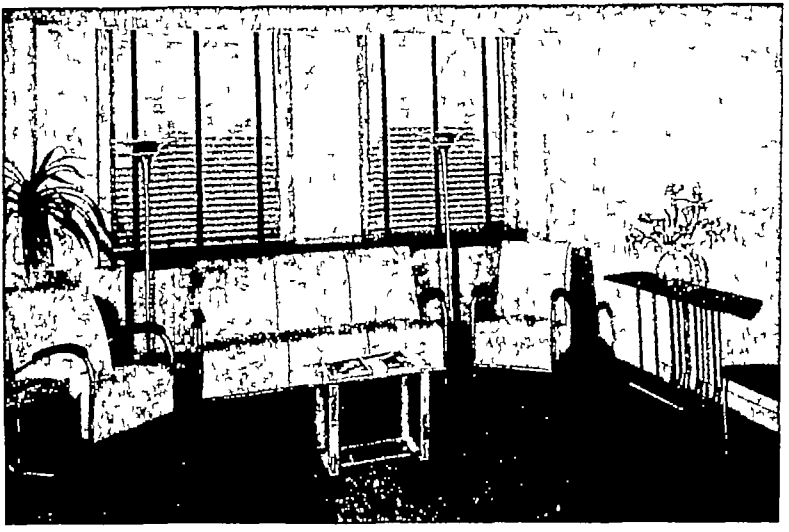
From a broader viewpoint, opportunities abound Organized medicine, which includes institutions for medical teaching, does owe the returning veteran the opportunity and place to complete his medical education, or to augment it, if he desires With such a backlog of those who desire it, this will be a Herculean job, but indications are that it is being met

There are thousands of young men who went into the service from their internships and who have never practiced

Opportunities stretch before them to the horizon. There were thousands of localities which were insufficiently supplied with doctors even before the war These localities were *not* in huge piles of masonry in the middle of big cities

Their attention is invited to the vast number of things that we do not know The discoverer of any one of them will have his name in capital letters in medical histories from the discovery on

Frontiers are always ahead They are like the end of the rainbow that we can see reaching the ground among the trees But when we get there, it is still ahead, beckoning us on —*Rocky Mountain Medical Journal, Jan , 1946*



IT'S THE TRUTH

No one seemed to take much notice of Dr Brown as he sat around with his colleagues in a postconvention gathering He tried to get in a word now and then, but somebody with a stronger voice always took command of the conversation

At last the talk turned on the subject of dogs, and Dr Brown felt sure that his chance would come, for he owned a dog of which he was proud

"There are some dogs," remarked Dr Robinson, "that have more intelligence than their masters"

"That's quite right," piped up Dr Brown, "I've got one like that"—*Canadian Doctor, Sept , 1945*

What does YOUR OFFICE *say about you?*

Does it favorably impress your patients with your professional ability your position in the community your success your achievements your progress?

That's exactly what DOEHLER METAL FURNITURE can do for you, if you install it in your reception room, your office and your examining rooms, because it's smart, modern, sturdy, sanitary and stays clean and attractive

It builds greater "patient faith" in you and we suggest that "bills for services rendered" might be paid sooner That's an ideal

Good medical reasoning Good business sense don't you think?

Hospital News

Reform in Mental Hygiene Needed

THE whole setup of the mental hospital needs drastic reconsideration and planning, the National Committee for Mental Hygiene declared in its annual report recently made public

To meet the postwar challenge for greater effort to prevent mental disorders the committee also recommended more child guidance facilities, more training of psychiatrists, more community clinics, development of family care of mental patients, and a vigorous educational campaign against the public ignorance of mental disorders

Declaring that while a number of general hospitals are establishing their own psychiatric units, there are only about 100 for the country as a whole, the report continued

"Over the years we have come to feel that the worst feature of our treatment of mental cases is that mental hospitals are almost always isolated, they are set off by themselves, far from other hospitals, from research centers, and from medical schools This isolation, though in many cases inevitable, is symbolic of the public attitude

"Much can be done to combat the handicap of isolation when once we realize the problem Reforms which the National Committee has been especially recommending are the adequate supervision of parole patients, the development of family care, the establishment of clinics and consultation services in communities, and the establishment of adequate social services At the same time we think the whole set up of the mental hospital needs drastic reconsideration and planning"

Child guidance clinics, the report stated, are a means of incorporating psychiatry into community activities The first child guidance clinic was established in Chicago thirty-seven years ago, yet vast areas of the country still have no community clinics, it said

Baruch Fund Provides Bellevue Rehabilitation Plan for Disabled

THE personal interest that "the old family doctor" shows toward his patient has been added to the routine of the modern hospital in a plan known as P A P —physical ability profile—now being developed at Bellevue Hospital's Department of Physical Medicine

P A P is a system for rehabilitation of disabled patients after surgical and medical treatment have been completed, it has been explained by the Baruch Committee on Physical Medicine, which financed the work in a $250,000 grant to the New York University, College of Medicine in February The college is affiliated with Bellevue Hospital

The principle of P A P is that a hospital's responsibility does not end when the operation has been completed or when the last treatment is given, doctors explained

For example, the surgeon's job is done when he finishes an amputation, but the patient who faces life with one leg can hardly be considered cured P A P helps to train him to meet the problems of everyday life, and, if it cannot equip him to return to his old job, to advise him in what fields he may be fitted

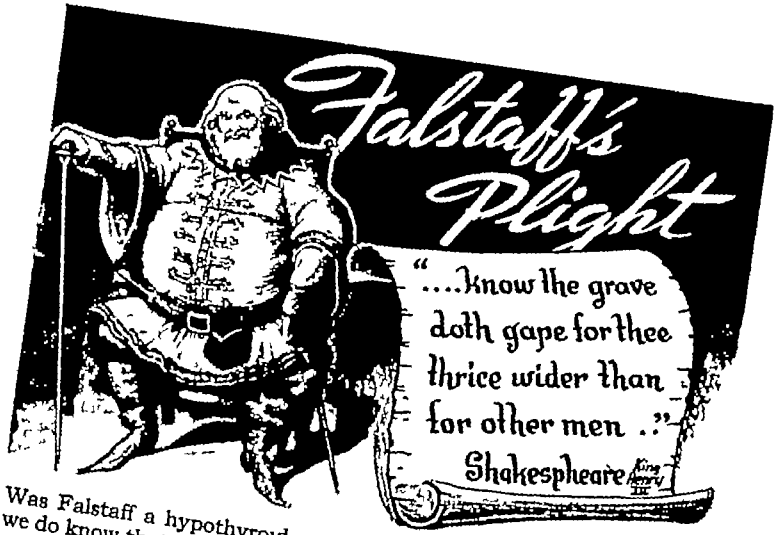
Disabled patients may go to the Department of Physical Medicine from any of Bellevue Hospital's other wards, after other treatments have been completed They are first put through a series of thirty-seven tests, and the results are recorded on their physical ability profile

When all the progress possible has been made, a final P A P on the patient is drawn up This includes a summary of jobs and activities for which the disabled person is fitted

Regional Survey of Health Facilities to Be Made

WITH the warning that hospitals throughout New York State are exceeding the occupancy-rate safety level of 85 per cent, Assemblyman Lee B Mailler, of Orange County, as State chairman of the Joint Hospital Board, State Postwar Public Works Planning Commission, on April 22 opened the Syracuse regional hospital planning meeting in the College of Medicine, Syracuse University

More than 250 representatives from the 113 hospitals of the 15-county region attended Carl P Wright, secretary of the New York State Hospital Association and superintendent of the Syracuse General Hospital, presided at the all-day gathering



"Essentially, today's meeting has been called to inaugurate a hospital survey of the Syracuse region, one of six regions in the state," asserted Dr John J Bourke, Joint Hospital Board survey director

Dr Bourke, one of the principal speakers at the morning session, outlined the provisions of the Hill-Burton Bill which will provide Federal grants-in-aid for hospital construction and rehabilitation throughout the nation The survey director declared the regional planning in New York State is "going ahead on the presumption that the Hill-Burton Bill, already passed by the Senate, will be passed, before too long, by the House"

Conferences Given at Mount Sinai

THE Mount Sinai Hospital, New York City, is offering the following departmental conferences during the latter part of June radiology, June 17, pediatric, June 20, medical and surgical thoracic disease, June 20, medical x-ray, June 20, radiology, June 24, gynecology, June 25, pediatric, June 27, medical and surgical thoracic disease, June 27, and medical x-ray, June 27

Was Falstaff a hypothyroid case? We cannot say for certain, but we do know that excessive weight is as much of a threat to life today as it was in Falstaff's time

To guard against the dangers of hypothyroid obesity, the modern physician employs THYROBROM, a *bromin ated* thyroid preparation with clinically proved advantages over plain thyroid.

THYROBROM provides every physiological effect of thyroid U S P, but minimizes the thyrotoxic manifestations of plain thyroid.

In a controlled clinical series[1] of 60 obese cases receiving daily doses of thyroid U S P, 31 patients reported palpitation and nervousness When THYROBROM was employed in an identical manner in the same group only 11 patients reported such symptoms Moreover, THYROBROM was over 35 % more effective than thyroid U S P in the average weight reduction achieved

Each THYROBROM tablet contains *brominated* thyroid 2 gr, made from the finest grade of clean fat free, desiccated whole thyroid THYROBROM'S iodine content, 0 2 %, equals the U S P standard for thyroid

THYROBROM may be prescribed in hypothyroid obesity or in any indication for thyroid U S P It may be tried in cases in which thyroid U S P is not well tolerated

ADMINISTRATION *Adults*—½ to 1 tablet (1 to 2 gr) daily, preferably given in the morning Dosage may be gradually increased to meet individual requirements, but should seldom exceed 4 gr per day Discontinue if untoward symptoms arise Therapy should be controlled by periodic examinations Any thyroid preparation is contraindicated in cardiac disease, adrenal cortex insufficiency, hypertension, diabetes and hypothyroidism secondary to pituitary dysfunctions

HOW SUPPLIED Bottles of 30 tablets, grooved for easy division

Hospitals Seek Nurses

THE city's hospitals are still in "desperate" need of additional nurses, Dr Edward M Bernecker, Commissioner of Hospitals, said recently

Dr Bernecker spoke during a special program broadcast by WNYC to mark the birthday of Florence Nightingale and National Hospital Day

He said Miss Nightingale revolutionized methods of treatment of the sick and should be an inspiration to young girls who might choose a nursing career

Newsy Notes

The $2,500,000 Lebanon Hospital, Mt Eden Parkway and the Concourse, returned to its owners by the Army after more than two years of military use, was rededicated to peacetime needs on April 28

It was to be ready to function as the Bronx's newest hospital for general needs late in May or early in June, Dr Edward Kirsch, executive director, said

Since the 11-story structure was returned by the Army in January, the staff has been working overtime to prepare it for its first civilian patients

Postwar shortages have slowed the complete equipping of the institution, but it has been fully redecorated and the opening is not expected to be delayed

The hospital, first dedicated on June 6, 1943, but turned over to the Army the following month, will have 210 beds for adult patients and accommodations for 30 infants In an emergency, 240 adults could be cared for, Dr Hirsch said *

• •

Recognition of the importance of Albany Hospital in the regional plan to make the city a greater center for the teaching and practice of specialized medicine is emphasized in two subscriptions amounting to $2,000 from out-of-town companies to the hospital's $3,000,000 building fund, Alfred Renshaw, chairman of the committee on corporation subscriptions, announced on May 20

The contributions, each for $2,000, are from the Beech-Nut Packing Company of Canajoharie and the Hughes Autograf Brush Company of Watervliet Watervielt sends nearly 250 patients yearly to Albany Hospital, Mr Renshaw pointed out *

• •

Army engineers have started work on plans and specifications for a 43-million-dollar hospital program, involving nine new hospitals and additions to five others, the War department announced recently

A field survey to determine necessary engineering has been authorized for a new hospital at Albany, having 800 beds for general medical and 200 beds for neuropsychiatric patients Its estimated cost is $10,423,706 *

•

The Nassau-Suffolk General Hospital is under the new management and ownership of Robert H Bailey of Amityville, a director of the First National Bank of Farmingdale and North Amityville developer It is understood that the plan is to reconvert the building into a general hospital *

• • •

A gift of property valued at $200,000 has been made by the Board of Managers of the Bellevue Hospital School of Nursing to the New York University-Bellevue Medical Center The property was deeded to the Board of Managers last year by the late Mrs William Church Osborn, for thirty-two years president of the School of Nursing, who died last March 30

The land fronts 173 feet on East Thirty-second Street, 200 feet on Franklin D Roosevelt Drive, and 252 feet on East Thirty-first Street It will be used as part of New York University's $15,000,000 section of the N Y U -Bellevue Medical Center

• • •

As part of the educational program of the Department of Mental Hygiene the Rochester State Hospital, Syracuse Psychopathic Hospital, and Willard State Hospital joined forces to put on an institute for Public Health Nurses of central New York at the Willard State Hospital on June 11 to 12

Prominent men in the field of psychiatry took part in the discussion This is the second year for such a program at Willard State Hospital and it is anticipated that other regional institutes will be held in the course of the summer and fall, at other hospitals

• • •

The board of directors and the medical and surgical staff of the Chenango Memorial Hospital met at the hospital Thursday evening, April 4

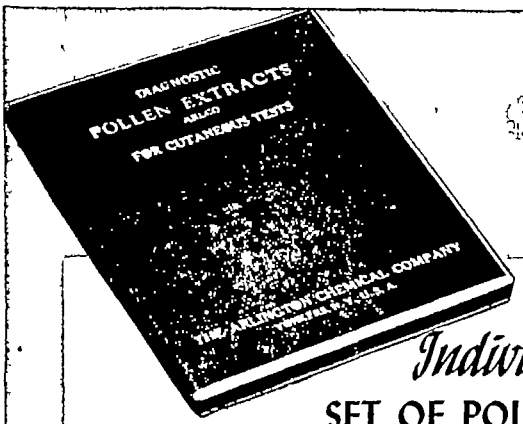
The board and staff expressed appreciation of the wide interest shown by the community in hospital expansion

To further assist in planning, the board decided to employ an outstanding hospital consultant to make a thorough, complete, and comprehensive study of all phases of the hospital's operation and expansion plans

The board unanimously approved the report and recommendations of the staff, together with appointments for the current year and expressed its appreciation for the high standards of medical and surgical work being done at the hospital *

• •

The Capital City Container Company has donated $3,000 to the Albany Hospital Building Fund Also among latest contributors was the Detroit Supply Company, which subscribed $1,500 to the hospital's expansion program



The hospital seeks a total of $3,000,000 in a drive launched last winter *

• •

Approximately $45,900 of the $75,000 quota in the current cancer fund drive in Nassau County will be used to finance a cancer hospital in the county,

•

The rapid development of "a new generation of practical nurses" as a means of overcoming the "desperate shortage of bedside nurses in the nation's hospitals" was advocated Sunday, March 31, by Dr E M Bluestone, director of Montefiore Hospital, in the Bronx

Dr Bluestone's proposal accompanied the announcement that Montefiore's School of Practical Nursing for Men and Women began its sixth class on May 1

Open to persons between the ages of 18 to 45 with elementary school educations or their equivalent, the school conducts a one-year course that qualifies graduates to take the State Board examinations for a license as a practical nurse *

• •

A department of diabetes and cardiovascular disease has been opened at Ellis Hospital as the final step in the institution of a program of education and rehabilitating treatment for afflicted persons

The department has four private rooms, six semi-private (two-bed) rooms, and one four-bed ward, all with sound-proof ceilings In addition it has a shock room for treatment of diabetic coma cases and emergency cardiac patients

Featuring the department's program will be a plan to educate patients in caring for themselves when they return home Several rooms have been set aside for this purpose

A laboratory on the floor for doctors and nurses also will be used in educating the patients

Both the diabetic and cardiac departments have existed at Ellis Hospital a number of years, but this is the first time both have been centralized and given a section of the hospital for exclusive use *

• • •

The Columbia County Association in the City of New York launched its campaign to raise $25,000 within its organization for the proposed Columbia Memorial Hospital with a subscription of $5,000 at a special dinner-meeting in April at the Princeton Club *

•

Further indication of overcrowded conditions in hospitals was shown on April 11 at the monthly meeting of the Health and Hospital Board when the quarterly report for Jamestown General Hospital listed a daily average of 128 patients in the 100-bed hospital for the first three months of the year In March the average reached a new high of 131

• •

A free cancer detection clinic—first of its kind in the city—was recently established at Queens General Hospital, Jamaica, to provide diagnostic services for supposedly well persons, the Queens Cancer Committee announced at its headquarters in Jamaica

The clinic will be opened to all individuals who qualify for clinical care in city hospitals and is designated to be the forerunner of similar clinics in all Queens hospitals

The work will be financed by the cancer committee, which is currently appealing for $138,000 in Queens to support its activities *

• • •

Robert Hoe, president of the board of trustees of Vassar Brothers Hospital, is serving as general chairman of the capital funds campaign for the $750,000-expansion project of the Poughkeepsie institution *

•

The goal in the Rockaway Beach Hospital's campaign for money to replace the present building has been raised from $350,000 to $1,500,000 after a change of building plans

The quota in the campaign was fixed at $350,000 when it started in 1944 but the drive was interrupted last winter for a revision of plans, increasing the hospital's capacity

The new structure will have 165 beds and include the most modern equipment *

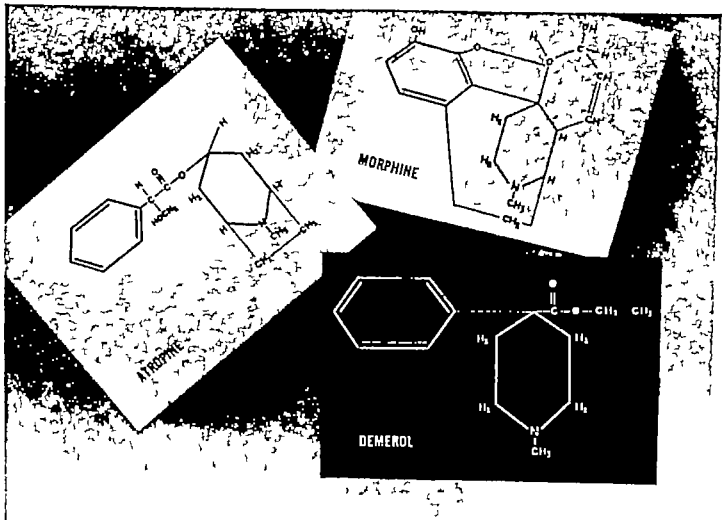
•

Mr P Erskine Wood, president of the North Country Community Hospital, announced early in April plans for a new $1,500,000 addition to the Glen Cove Hospital *

• • •

The convalescent hospital at Camp Upton is among 14 Army hospitals which will be closed by June 30, according to a War Department announcement in Washington Decreases in patients and available medical personnel were given as the reasons for the closing order

The announcement was made by Maj Gen Norman T Kirk, Army surgeon general, who reported that the total number of Army patients had shrunk from 312,000 last August to 129,000 on March 1 this year He said a survey showed adequate facilities would remain to house comfortably all remaining patients *



Improvements

O A Gottschalk, deputy Veteran's administrator for New York, has announced distribution of more than $30,000 worth of sports equipment for the state's eight Veterans Administration hospitals, including Batavia, Bath, and Canandaigua

Summer sports programs for the veterans will be started as soon as the weather permits, Gottschalk said Many physically handicapped men will be able to play such games as croquet, lawn bowling, and horseshoe pitching, while the more active men will compete in baseball, softball, golf, tennis, volley ball, and badminton

The rapid development of "a new generation of practical nurses" as a means of overcoming the "desperate shortage of bedside nurses in the nation's hospitals" was advocated Sunday, March 31, by Dr E M Bluestone, director of Montefiore Hospital, in the Bronx

Dr Bluestone's proposal accompanied the announcement that Montefiore's School of Practical Nursing for Men and Women began its sixth class on May 1

Open to persons between the ages of 18 to 45 with elementary school educations or their equivalent, the school conducts a one-year course that qualifies graduates to take the State Board examinations for a license as a practical nurse *

• • •

A department of diabetes and cardiovascular disease has been opened at Ellis Hospital as the final step in the institution of a program of education and rehabilitating treatment for afflicted persons

The department has four private rooms, six semi-private (two-bed) rooms, and one four-bed ward, all with sound-proof ceilings In addition it has a shock room for treatment of diabetic coma cases and emergency cardiac patients

Featuring the department's program will be a plan to educate patients in caring for themselves when they return home Several rooms have been set aside for this purpose

A laboratory on the floor for doctors and nurses also will be used in educating the patients

Both the diabetic and cardiac departments have existed at Ellis Hospital a number of years, but this is the first time both have been centralized and given a section of the hospital for exclusive use *

•

The Columbia County Association in the City of New York launched its campaign to raise $25,000 within its organization for the proposed Columbia Memorial Hospital with a subscription of $5,000 at a special dinner-meeting in April at the Princeton Club *

• •

Further indication of overcrowded conditions in hospitals was shown on April 11 at the monthly meeting of the Health and Hospital Board when the quarterly report for Jamestown General Hospital listed a daily average of 128 patients in the 100-bed hospital for the first three months of the year In March the average reached a new high of 131

• • •

A free cancer detection clinic—first of its kind in the city—was recently established at Queens General Hospital, Jamaica, to provide diagnostic services for supposedly well persons, the Queens Cancer Committee announced at its headquarters in Jamaica

The clinic will be opened to all individuals who qualify for clinical care in city hospitals and is designated to be the forerunner of similar clinics in all Queens hospitals

The work will be financed by the cancer committee, which is currently appealing for $138,000 in Queens to support its activities *

•

Robert Hoe, president of the board of trustees of Vassar Brothers Hospital, is serving as general chairman of the capital funds campaign for the $750,000-expansion project of the Poughkeepsie institution *

• •

The goal in the Rockaway Beach Hospital's campaign for money to replace the present building has been raised from $350,000 to $1,500,000 after a change of building plans

The quota in the campaign was fixed at $350,000 when it started in 1944 but the drive was interrupted last winter for a revision of plans, increasing the hospital's capacity

The new structure will have 165 beds and include the most modern equipment *

• • •

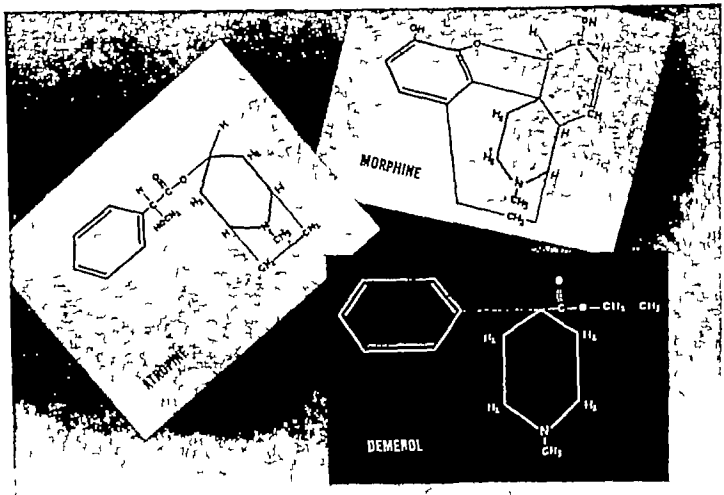
Mr P Erskine Wood, president of the North Country Community Hospital, announced early in April plans for a new $1,500,000 addition to the Glen Cove Hospital *

• • •

The convalescent hospital at Camp Upton is among 14 Army hospitals which will be closed by June 30, according to a War Department announcement in Washington Decreases in patients and available medical personnel were given as the reasons for the closing order

The announcement was made by Maj Gen Norman T Kirk, Army surgeon general, who reported that the total number of Army patients had shrunk from 312,000 last August to 129,000 on March 1 this year He said a survey showed adequate facilities would remain to house comfortably all remaining patients *

Improvements



O A Gottschalk, deputy Veteran's administrator for New York, has announced distribution of more than $30,000 worth of sports equipment for the state's eight Veterans Administration hospitals, including Batavia, Bath, and Canandaigua

Summer sports programs for the veterans will be started as soon as the weather permits, Gottschalk said Many physically handicapped men will be able to play such games as croquet, lawn bowling, and horseshoe pitching, while the more active men will compete in baseball, softball, golf, tennis, volley ball, and badminton

• •

A new 1946 model ambulance, the first of three to be presented anonymously to the Roosevelt Hospital by a West Side business concern, to cover emergencies in the district bounded by Thirty-ninth and Eighty-sixth Streets from Fifth Avenue to the Hud-

son River, was commissioned on May 13 at the hospital, by Dr Edward M Bernecker, Commissioner of Hospitals *

. . .

Work of sound-conditioning of a large portion of the Alice Hyde Hospital was begun in April with a crew of two men from an Albany concern making installation of the acoustical material

The $4,000 project of applying the noise-deadening material was recently approved by the Hospital Board of Directors who felt the elimination of noise is essential to the comfort and rapid improvement of all patients *

At the Helm

The resignation of former Surrogate Harry H. Flemming as president of the board of directors of the Kingston Hospital was accepted with regret at a recent meeting of the board Mr Flemming has served the hospital as treasurer, and later as president of the board of directors, for a quarter of a century *

. . .

Dr Donald R Gorham has been appointed a member of the staff of the Veterans Hospital in Canandaigua He will serve as a part-time clinical psychologist while continuing his duties as head of the department of psychology at Keuka College *

Appointment of Dr Louis G Knapp as a resident physician at Binghamton City Hospital has been announced by Acting Supt Marion E Sawtelle

Miss Dorothy E Aul has been appointed to the position of physiotherapy technician at the hospital *

. . .

Dr Maurice A Donovan, of Schenectady, has been appointed attending cardiologist of Ellis Hospital *

. . .

Mrs Helen L Warren, superintendent of Samaritan Hospital, has been named to head a survey of Troy's Hospital needs and postwar building program *

. . .

Dr Alexander A Kosinski, of Schenectady, has been named fulltime pathologist at the Leonard Hospital to succeed Dr Stephen H Curtis, who has resigned after twenty-five years' service with the hospital *

. . .

At the annual meeting of the physicians comprising the staff of the Eastern Long Island Hospital, the following officers were elected and comittees appointed for the ensuing year chief of staff, Dr George P Bergman, Mattituck, secretary, Dr Donald Currie, Shelter Island, representatives from the staff to the executive board, Dr Donald Currie and Dr J Mott Heath, medicine, Dr H Stevens, Southold, Dr Stanley Jones, Mattituck, Dr William Kaplan, Greenport, surgery, Dr A C Loper, Greenport, Dr Donald Currie, Shelter Island, Dr Jack Cantor, Riverhead, obstetrics, Dr J Mott Heath, Greenport, Dr Hallock Luce, Riverhead, laboratory and x-ray, Dr Stanley Jones and Dr Donald Currie

. . .

Dr Harold A Pooler, supervising psychiatrist at Binghamton State Hospital, has been promoted to the assistant directorship of Utica State Hospital.

Dr Pooler, a veteran of World War II, was a member of the Binghamton institution's staff from 1928 to 1941 before he entered service *

. . .

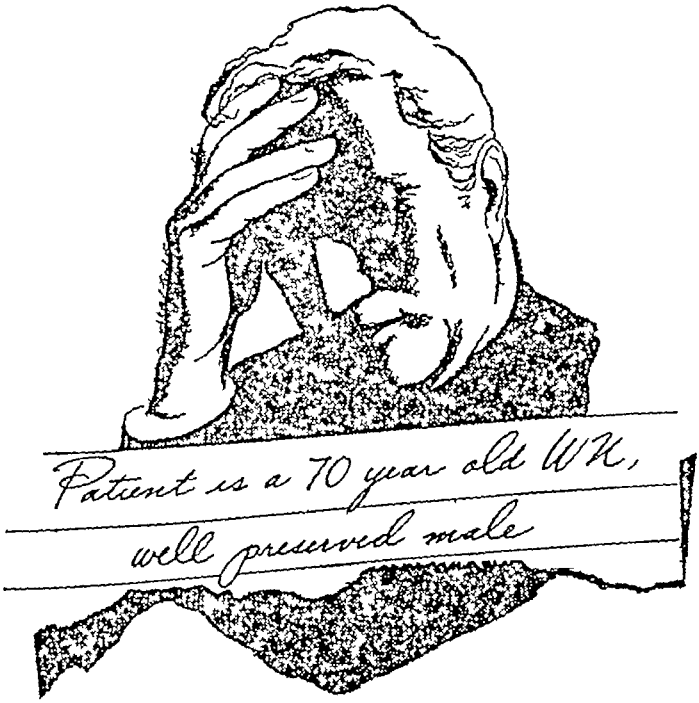
Several assignment changes of staff officers at Rhoads General Hospital were announced recently by Col A J Canning, commanding officer of Rhoads

Maj John N Dill has been appointed chief of the GI Section on the medical service Capt Benjamin F Glasser now is chief of the septic surgery section, while Capt George M Kirkwood is head of the officers' surgical section A new post quartermaster, Capt. Edward J Slutts, also has been named *

. . .

The 21st annual meeting of the Hebrew Hospital Association of Sullivan County was held April 28 at the Monticello Hospital, at which President Max H Rhulen presided.

The financial statement for the past fiscal year showed the hospital to be in excellent condition Reports were also submitted on behalf of the Ladies Linen Society, the Medical Board, and the Women's Auxiliaries of South Fallsburgh and Woodridge



It was announced at the meeting that Max Spector, executive director of the hospital, had been appointed, through the office of Governor Dewey, Commissioner for this district of the Postwar Public Works Planning Commission This district commission will be in charge of financial assistance to be given by the State for additional hospital facilities which may be required to be constructed in the Counties of Sullivan, Orange, Ulster, and Rockland. Mr Spector is at present the president of the Hospital Council covering three of these counties, having succeeded Dr Moore of the Horton Memorial Hospital at Middletown *

. . .

Dr T Roosevelt Gathings has been appointed clinical assistant at Bronx Hospital and Dr A J Sayers has been appointed in the same capacity to Lincoln Hospital

---

Teach people to think and you have freedom
teach them what to think and you have tyranny —
Clinical Medicine, March 1, 1946

Truly well nourished? Then he'd be outstanding. The hurdles of mastication, digestion and absorption which the aged have to meet frequently threaten nutritive intake. Only by careful inquiry can the vitamin status of elderly patients be determined.

"Severe atypical deficiency disease," states Spies[1], "like other forms of nutritive failure, can be successfully corrected by the application of four essentials." One of these is administration of the four critical water-soluble vitamins *in high dosage*.

Squibb Basic Formula is the identical formula used by Spies[1,2] and Jolliffe and Smith[3] —based on years of clinical experience.

Each Squibb Basic Formula Vitamin tablet contains thiamine HCl 10 mg., niacinamide 50 mg., riboflavin 5 mg., ascorbic acid 100 mg.

For our newest professional leaflet with complete information, write on your prescription blank "Nutritive Failure," and mail to Squibb Professional Service Department, 745 Fifth Avenue, New York 22, N. Y.

Basic Formula SQUIBB

MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

SUGGESTIONS FOR CONTRIBUTORS TO THE *NEW YORK STATE JOURNAL OF MEDICINE*

The NEW YORK STATE JOURNAL OF MEDICINE asks its contributors to follow the suggestions listed below in the preparation of their articles In this way they will greatly facilitate the expeditious publication of the JOURNAL These suggestions have been devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles.—It is earnestly desired that scientific articles shall not exceed 6 JOURNAL pages at the outside Longer articles tend to lower reader interest An average of five or six seems to be the most desirable from this point of view Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e g , twelve manuscript pages will make five JOURNAL pages

Manuscripts —Papers must be typewritten on one side only of white sheets consecutively numbered, and be *double spaced* with one-inch margins They should be prepared with great care so as to be typographically correct All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin This is imperative for rapid and accurate composition by the printers

Titles.—The title should be *brief* and typed in capital letters The subtitle can be longer and should be typed in caps and lower case letters Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives Directly under his name should be the hospital or institution with which he is affiliated

Subheadings.—Subheadings should be inserted by the author at appropriate intervals

References.—It is the unfailing practice of the NEW YORK STATE JOURNAL OF MEDICINE to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference A list, consecutively numbered, of these references should follow at the end of the manuscript (Note that spelling in list is same as in text) The arrangement should be as follows and should include all items

a *Books*—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed , Philadelphia, Lea & Febiger, 1927, vol. 5, p 57

b *Periodicals*—author's surname followed by initials, name of periodical, volume, page, month (day if necessary), year of publication Thus, Leahy, Leon J New York State J Med 40 347 (March 1) 1940

NOTE The JOURNAL does not include titles of articles

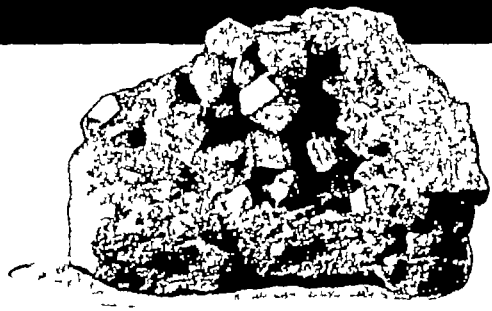
Case Reports —Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences All unimportant details should be deleted with such general negative statements as fit the case

Tables —While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page For that reason it is urged that they be reduced as much as possible to descriptive language

Illustrations —These should be kept to the minimum necessary to make clear the points to be registered by the author In some instances they are imperative to proper understanding, in others they are merely picturesque The latter can be excluded to good effect, both as to space and the not inconsiderable cost

When illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black India ink on white paper *Do not use typewriter for lettering* The smallest lettering on 8 × 10 inch copy should be no less than 1/4 inch high. Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch If finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer divisions In the case of finely ruled paper, only blue-lined paper can be accepted Lettering and all markings must be large enough to be readable after reduction Mail rolled or flat, never fold Photographs should be very distinct and show clear black and white contrasts They must be on glossy white paper Avoid round and oval photographs

Whenever possible "crop" photographs, i e, mark portion that can be excluded when reproduced Crop marks should be on *margin* of photographs *Do not run pencil lines through photographs*



It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

HYDROSULPHOSOL

Provides all 9 desired requisites as a superior therapy in thermal, acid and caustic burns.

Provides for mechanical exclusion of air at site of burn • Insures prompt relief of pain • Aids in abating burn shock • Bacteriostatic influence • Non-toxic effect • STIMULATES TISSUE REPAIR • Rapidly reduces inflammation and edema • Results in absence or marked reduction of scar tissue • Tends to shorten convalescent period.

HYDROSULPHOSOL is a true solution of sulfur bearing compounds resulting solely from the reduction of flowers of sulfur by a catalytic process. In aqueous solution it is capable of rapidly releasing its high concentration of sulfhydryl ion (-SH radical) in such form as can be effectively utilized by the body in the synthesis of sulfur-containing amino acids – functionally active in cell stimulation and directly related to tissue respiration and repair

Unlike the sulfa group and many other sulfur compounds Hydrosulphosol is non toxic when administered orally or topically applied in heavy concentrations and will not result in damage to liver and kidney function

Reprints of scientific papers by authoritative investigators available on request

AVAILABLE FORMS

AQUEOUS SOLUTION:
Bottles of 8 4 and 1 fluid ounce

OINTMENT:

AUTHORITATIVE clinical investigators place strong emphasis on the importance of the barrier in conception control.

In a recent comprehensive report,[1] physicians indicated an overwhelming preference for the diaphragm and jelly method (93% of 36,955 new cases).

In keeping with these expressed opinions we continue to suggest that for the optimum in protection the physician prescribe the combined use of occlusive diaphragm and spermatocidal jelly.

You assure your patient a product of highest quality when you specify *Ramses*

EMPHASIS ON BARRIER

Competent observers report:

Jellies and creams used without mechanical devices yield relatively high protection, but studies have not proven them fully dependable to block the external os or to invalidate all sperm.[2]

"When no type of occlusive pessary can be fitted or when the woman refuses to use one the only other reliable method is the use of the condom. With proper technic and instruction this method is highly reliable but has many disadvantages which the diaphragm method overcomes.[3]

anti-Rh

To Prevent Transfusion Reactions to accurately clarify ETIOLOGY OF ERYTHROBLASTOSIS FETALIS

Prepared in 1cc Ampules $5.00

Our anti-Rh serum—artificially produced by the injection of rhesus blood into guinea pigs—offers a high percentage of correct positive results since many of the anti-Rh sera of human origin do not agglutinate all the variants. We invite you to write for our illustrated brochure "The Story of Blood Groups" a comprehensive treatise on the various blood grouping sera.
